

About the Provider Management and Enrollment System (PMES)

Big Picture

The transition to PMES is part of a larger effort – Modernization of the Texas Medicaid Management Information System (MMIS). Using a phased approach, this effort will replace legacy technology systems with an ecosystem that better reflects the Texas Medicaid business model today and is more adaptable for future needs.

The anticipated results will be more efficient, system-driven processes and enhanced data capabilities that better support our business objectives.

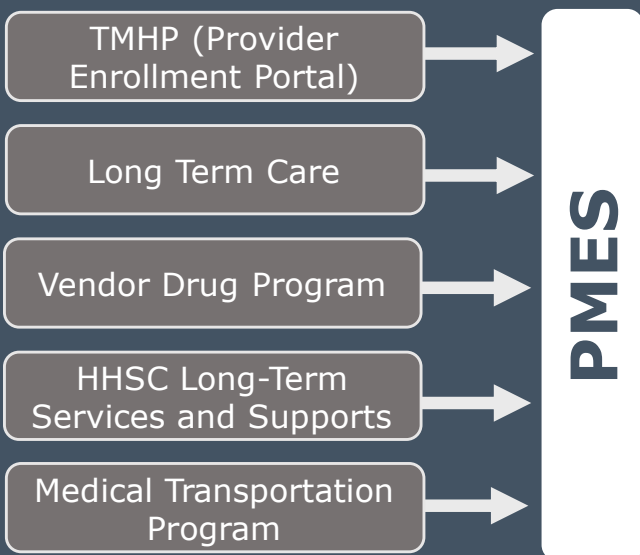

Note

PMES is the **first step** in eliminating the TPI. Full adoption of the NPI code-set and standard is expected by 2023 when the other two related projects above are complete.

PMES System Consolidation

PMES consolidates and replaces old manual enrollment processes and Texas Medicaid Healthcare Partnership (TMHP) systems.

The single system will streamline and simplify the process for providers applying for and managing their enrollment with Texas Medicaid and other HHSC programs.

About the Provider Management and Enrollment System (PMES)

Benefits for Providers

1 Single system for managing information

Providers will no longer have to go to multiple systems if they have different lines of business. Updating information and renewing enrollment will be less burdensome.

2 Streamlined, online "smart" application

Providers will no longer have to apply for each program and will now apply once through a single, online application. The system will present only relevant fields to be completed and eliminates redundancy.

3 Shortened timeline for enrollment & revalidation

Processing cycle for submissions will be reduced with real-time workflows, electronic application validation, and error checking. PMES also sends status alerts and automatic reminders for upcoming due dates. Application fees will be payable through the system too.

Implementation Milestones
