Section II. Executive Overview of RHP Plan

Regional Healthcare Partnership (RHP) 6 is honored to participate in the Texas Healthcare Transformation and Quality Improvement Program. The 20 counties, anchored by University Health System, are committed to working together to make significant progress over the next five years toward the \textit{triple aim goals of assuring patients receive high-quality, patient-centered care, in the most cost-effective ways}. RHP 6 also strives to leverage local and federal waiver financing to:

- Further develop and maintain a coordinated care delivery system
- Improve outcomes while containing cost growth
- Improve and prepare the health care infrastructure to serve a newly insured population

RHP 6 includes the following counties: Atascosa, Bandera, Bexar, Comal, Dimmit, Edwards, Frio, Gillespie, Guadalupe, Kendall, Kerr, Kinney, La Salle, McMullen, Medina, Real, Uvalde, Val Verde, Wilson, and Zavala. This RHP represents nine percent of the Texas population and covers more than 24,000 square miles. The majority of RHP 6 residents are Hispanic (54%). Twenty percent of the RHP 6 population did not complete high school, and 16% live below the poverty line. The per capita income is $35,989. Twenty-four percent of residents lack health coverage.
Each county varies in terms of its demographics, socioeconomics, and current health care infrastructure, but nearly every county in RHP 6 is designated as a Health Provider Shortage Area (HPSA) for primary care mental health and/or dental care. As a result, the counties within RHP 6 face similar community needs and health challenges.

- RHP 6 seeks to improve quality and patient satisfaction.
- A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions. Leading causes of death in RHP 6 include cardiovascular disease, cancer, and diabetes.
- Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages.
- There is a shortage of high quality mental and behavioral health services that are integrated with physical health care services and/or provide crisis stabilization.
- Lack of interconceptional and prenatal care for women and primary and preventive pediatric care results in poor maternal and child health outcomes.
- High rates of communicable disease and potential for vaccine preventable diseases due to low vaccine coverage levels in the community.

The vast majority of health care infrastructure is located in Bexar County, home to over 73% of RHP 6 residents. The Bexar County Hospital District, dba University Health System, is the primary safety-net hospital. University Health System has a long history of partnering with private hospitals, both non-profit and for-profit, to meet the needs of Bexar County and south Texas residents. Major hospital partners in Bexar County include CHRISTUS Santa Rosa Health System, Children’s Hospital of San Antonio, Methodist Healthcare, Baptist Healthcare System, Nix Health, Clarity Child Guidance Center, and Southwest General Hospital. Bexar County is also home to the University of Texas Health Science Center at San Antonio (UTHSCSA), which provides training to future doctors, nurses, dentists and other health care providers. The San Antonio Metropolitan Health District is a full service city-county health district which provides leadership and services for San Antonio and Bexar County to prevent illness and injury, promote healthy behaviors, and protect against health hazards.

In the surrounding areas, six hospital districts provide services through their hospitals, which include: Dimmit County Memorial Hospital, Frio Regional Hospital, Guadalupe Regional Medical Center, Medina Regional Hospital, Uvalde Memorial Hospital, and Val Verde County Regional Medical Center. Gillespie County recently established a new hospital authority.

Hill Country Memorial Hospital and Peterson Regional Medical Center are private/non-profit hospitals which serve residents in Gillespie and Kerr Counties, respectively. The following counties do not have hospitals: Bandera, Edwards, Kendall, Kinney, LaSalle, McMullen, Real, and Zavala.
Community Mental Health Centers (CMHCs) are an important part of the regional partnership. Lack of access to mental and behavioral health services has been identified as a critical issue within RHP 6 and the state. Four organizations are actively partnering with hospitals and other entities in unprecedented ways to help improve the delivery and quality of health care in RHP 6. These entities include Bluebonnet Trails Community Services, Camino Real Community Center, Center for Health Care Services, and Hill Country Mental Health and Development Disabilities Centers.

Furthermore, these entities have partnered with local health departments, Federally Qualified Health Centers, elected county officials, community organizations, and other stakeholders to understand community needs, identify new sources of local funding, and ensure investments are made in a collaborative manner.

The 120 Delivery System Reform Incentive Program (DSRIP) projects proposed in this plan address the needs of the broader community. Projects span the breadth of opportunities presented in the RHP Planning Protocol. Projects include expanding medical homes and primary care, increasing access to specialists, implementing technology to perform telemedicine and manage patient registries, and numerous other initiatives. The projects differ in size, scope, and targeted population, but each is geared to achieve specific outcome measures and population-focused improvements. Together, these efforts will enable RHP 6 to achieve the goals of the Triple Aim – improving the health of a population and patients’ experience of care while lowering the associated cost of that care.

Section III. Community Needs Assessment

Regional Healthcare Partnership (RHP) 6 comprises approximately 9% of Texas’ population and geography. Like much of Texas, RHP 6 has a high uninsured rate and reported health outcomes are often poor. Key health challenges include limited access to primary and specialty care, unmet mental and behavioral needs, chronic disease, and poor maternal and child outcomes. The need for improved health care infrastructure will continue to increase as the population is expected to grow and more Texans gain health care coverage under the federal Affordable Care Act.

Demographics

Population

The 20 counties in RHP 6 cover 24,734 square miles or approximately 9.5% of the total land area of Texas. In 2010, there were 2.3 million people living in this region, accounting for 9% of the state’s population. Seventy-three percent (73%) of the RHP population resides in Bexar County. The majority of RHP 6 residents are either Hispanic (54%) or Anglo (37%). This differs from the state as whole, which is 46% Anglo and 38% Hispanic.

Forty-three percent of the Bexar County population speaks a language other than English (primarily Spanish) in the home, compared to 34% across the state. The range varies dramatically within the region. For example, 12% of Bandera County residents and 72% of Zavala County residents speak languages other than English outside the home.

In terms of age, 26% of the RHP 6 population includes children under the age of 18 years, while 12% of residents are age 65 years or older. While 73% of the total population resides in Bexar County, only

---

66% of the region’s seniors reside there. The counties with disproportionately higher senior populations include Comal, Kerr, Gillespie, and Kendall.4

**Education**

The educational attainment of residents within RHP 6 is consistent with the rest of the state. Nearly 20% of residents ages 25 years and older did not finish high school or obtain a GED. The percent of residents finishing high school varies among counties by a range of 58% (Zavala) to 91% (Kendall).5

**Economics**

In 2010, the per capita income in RHP 6 was $35,989, compared to $38,609 statewide. Individual counties vary widely as evidenced by Zavala County’s per capita income of $17,892 and Gillespie County’s of $44,723.6

In 2010, the unemployment rate for RHP 6 was 7.4%, better than the state’s rate of 8.2%. As expected, the unemployment rate is correlated with education and per capita income and again, varies widely by county. Zavala County had an unemployment rate of 15.6%, while Gillespie County had the lowest rate at 4.8%.7

In 2009, some 380,000 residents, approximately 16% of the population, lived below the poverty line in RHP 6. Forty percent of those living below poverty were children under the age of 18 years. Poverty rates varied significantly by county with Kendall County at 8.6% and Zavala County at 35.6%.8

RHP 6 is home to many companies and organizations that employ a significant number of residents from each of the 20 counties. Some of the major employers are listed in Table 1.

Insurance Coverage

In 2009, some 471,000 residents (24%) of RHP 6 lacked health insurance coverage. A major reason for the lack of coverage was the large number of residents, particularly in rural areas, that work for small businesses or who are self-employed. In Texas, only 31% of firms with fewer than 50 employees offer health insurance. Of those with coverage, 317,000 residents were enrolled in Medicare and more than

---

355,000 residents were enrolled in Medicaid. Seventy percent of Medicaid enrollees were children. Of the adults enrolled in Medicaid, 54% were blind and/or disabled.\textsuperscript{12}

**Current Health Care Infrastructure**

In 2009, there were 33 acute care hospitals in RHP 6, including nine public and three private/nonprofit hospitals. In addition, there were four psychiatric hospitals. RHP 6 had a total of 7,430 licensed acute care beds, 77% of which were staffed. Sixty-five percent of the 746 licensed psychiatric beds were staffed.\textsuperscript{13}

In 2010, acute care gross patient revenue in the region totaled $13.7 billion. Net patient revenue totaled $4.7 billion and hospitals provided $1.7 billion in uncompensated care.\textsuperscript{14}

Table 2 shows the number of health care providers in RHP 6 in 2009. As stated previously, the population of RHP 6 represents about 9% of the state’s population, and the percent of providers in RHP 6 is consistent with population distribution. Health professionals within the region tend to be primarily located in Bexar County.\textsuperscript{15}

\textsuperscript{13} Texas Department of State Health Services. Health Currents System. \url{http://www.dshs.state.tx.us/hcquery/}, accessed July 25, 2012.

Nearly every county in RHP 6 is designated as a Health Provider Shortage Area (HPSA) for primary care and/or mental health as shown in the maps below. A HPSA is a geographic area, population group, or health care facility that has been designated by the federal government as having a shortage of health professionals. Sixteen of 20 counties are designated as a HPSA for dental services. HPSAs are designated using several criteria, including population-to-clinician ratios. This ratio is usually 3,500 to 1 for primary care, 5,000 to 1 for dental health care, and 30,000 to 1 for mental health care.¹⁶

Current Delivery System Initiatives

RHP 6 Performing Providers are currently participating in the following initiatives, some of which are funded by the United States Department of Health and Human Services:

- Partnership for Patients
- EHR Incentive payments

Projected Major Changes

Demographics

The total population in RHP 6 is expected to grow 6% between 2010 and 2015. The population change projections for 2015 vary widely by individual counties within RHP 6. The Hispanic population will experience the largest net growth of 106,000 residents. The Anglo population is expected to decrease by 2%.\(^\text{17}\)

According to the Center on Budget and Policy Priorities, there are four contributing factors to Texas’ projected population growth, which also apply to most of the counties in RHP 6. These include:\(^\text{18}\)

1. **“Natural growth”** (i.e. births minus deaths). Texas has the nation’s second highest birth rate which has been attributed to a variety of demographic, socio-economic, and cultural factors. Natural growth accounted for 55% of Texas’ population increase between 2010 and 2011.

2. **Continued international migration** given Texas’ proximity to Mexico. International migration accounted for 18% of Texas’ population growth between 2010 and 2011.

3. **Low cost of living** due to supply of land and low housing prices.

4. **Oil and gas industry.** The recently developed Eagle Ford Shale significantly impacts RHP 6 “producing counties” including Atascosa, Dimmit, Frio, La Salle, McMullen, Wilson, and Zavala, as well as two “peripheral counties” (Bexar, and Uvalde) involved in non-production activity. The shale activity is projected to create nearly 117,000 full-time jobs by 2021.\(^\text{19}\)

Insurance Coverage

The Patient Protection and Affordable Care Act and the Health Care and Education Reconciliation Act, collectively known as the Affordable Care Act (ACA), were signed into law in March 2010, and, for the most part, upheld by the United States Supreme Court in June 2012. One intent of this law is to increase the accessibility and affordability of health coverage for currently uninsured individuals. This coverage will be available through subsidized insurance exchanges and, if Texas elects, the expansion of Medicaid up to 133% of the Federal Poverty Level. Texas’ current uninsured rate of 24% is projected to decrease to 15% in 2014 even if Texas chooses not to expand Medicaid coverage. If Texas expands

\(^{19}\) University of Texas at San Antonio. Economic Impact of the Eagle Ford Shale, May 2012. [http://utsa.edu/today/2012/05/shalestudy.html](http://utsa.edu/today/2012/05/shalestudy.html), accessed July 25, 2012.

52 ★ RHP 6 Plan ★ March 8, 2013
Medicaid, the uninsured rate is projected to be 12%. Those remaining without coverage would include individuals eligible but electing not to enroll in Medicaid or subsidized programs, individuals not eligible for subsidized coverage, and undocumented residents. RHP 6 expects this legislation to affect its uninsured population in a manner consistent with that of the entire state.

Health Care Infrastructure and Environment

With the rise of insured individuals, the demand on health care infrastructure will also increase. One of the key aims of Texas’ 1115 waiver is to “improve and prepare the health care infrastructure to serve a newly insured population.” This will require improved access to primary and mental health care, effective management of chronic disease, enhanced technology, and innovative payment mechanisms to promote high quality care and reduce the costs associated with that care.

Key Health Challenges

Health Care Quality

According to the Agency for Healthcare Research and Quality’s 2011 report, Texas ranks last in the nation on health care quality. The report is based on 155 quality measures which include disease prevention efforts, deaths from various conditions, cancer treatment, and how well health care providers manage chronic conditions such as diabetes. Under the category of “Types of Care,” Texas scored “weak” on preventive measures, acute care measures, and chronic care measures. Under the category of “Care by Clinical Area,” Texas scored “weak” on diabetes, heart disease, and respiratory measures, and “average” on cancer measures.

The University of Wisconsin Population Health Institute, funded by the Robert Woods Johnson Foundation, publishes an annual County Health Rankings Report. The health outcomes rankings are based on equal weighting of mortality and morbidity measures. The health factors rankings shown in Table 3 are based on weighted scores of four types of factors: behavioral, clinical, social and economic, and environmental. Highest rankings (lowest numbers) indicate better performance. Of the 221 Texas counties reviewed, Kendall, Comal, and Gillespie performed well, however Atascosa, Dimmit, Edwards, Frio, Kerr, LaSalle, Real, Uvalde, Val Verde, and Zavala ranked in the lower half of all Texas counties. Kinney and McMullen counties were not ranked in the report.

---

21 Texas Healthcare Transformation and Quality Improvement Program.

The Texas Health and Human Services Commission (HHSC) has published various reports related to potentially preventable hospitalizations and readmissions. Between 2005 and 2010, HHSC found that RHP 6 had 125,090 potentially preventable hospitalizations, about 8.5% of the entire state. The conditions studied include bacterial pneumonia, dehydration, urinary tract infection, angina, congestive heart failure, hypertension, asthma, chronic obstructive pulmonary disease, and diabetes. The hospitalizations are considered “potentially preventable” because “if the individual had access to and cooperated with appropriate outpatient health care, the hospitalization would likely not have occurred.” These hospitalizations amounted to $2.9 billion in hospital charges, roughly $1,700 per adult living in the region’s 20 counties.24

A January 2012 Medicaid report found that, excluding newborns, the potentially preventable readmissions rate in the Medicaid population was 3.7% overall, 0.8% for obstetrics, 4% for non-obstetric pediatrics and 8.4% for non-obstetric adult stays.25

### Health Care Provider Shortage and Access to Care

Given the high number of counties in RHP 6 designated as HPSAs, this region, like the rest of the state, is in need of additional providers. Recent reports show Texas ranking 45th in the nation in the number of physicians per capita. The state’s growing population, increased longevity of its residents, vast expanses of rural and border areas, growing prevalence of chronic diseases, greater availability of specialty services, and breakthroughs in medical science are all contributing to an accelerating demand for physicians.26

The shortage of providers is one reason many hospitals report high emergency room utilization. Not only is this an expensive way to deliver health care, but it also means that the individuals accessing this care tend to receive less preventive care, less comprehensive care, and they often delay seeking treatment until the illness is advanced. Greater access to high quality care has been shown to result in improved health outcomes.

---

**Mental and Behavioral Health**

In Texas, community mental health centers (CMHC) provide services to a specific geographic area of the state, called the local service area. Four community centers serve RHP 6 as shown in Table 4.

**Table 4. RHP 6 Community Mental Health Centers**

<table>
<thead>
<tr>
<th>Community Center</th>
<th>Counties Served</th>
</tr>
</thead>
<tbody>
<tr>

<td>Bexar</td>
</tr>
<tr>
<td>Hill Country Mental Health and Developmental Disabilities Centers</td>
<td>Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde, Val Verde</td>
</tr>
</tbody>
</table>

In addition to providing services, CMHCs have specific responsibilities. The Texas Department of State Health Services requires each authority to plan, develop policy, coordinate, allocate and develop resources for mental health services in the local service area.27

A March 2011 report published by the Hogg Foundation for Mental Health and Methodist Healthcare Ministries warns the most severe health profession shortages are in mental health services, with Texas ranking far below the national average in number of mental health professionals per 100,000 residents. Less than 33% of the state’s 48,700 practicing doctors accept Medicaid patients.

Nearly every county in RHP 6 is designated as a HPSA for mental health. Inadequate mental health services results in avoidable costs to hospital and criminal and juvenile justice systems.28 Strategic planning sessions sponsored by the Bexar County Commissioners Court and Methodist Healthcare Ministries identified the following issues:

- Inadequate and fragmented continuum of care for children with behavioral health diagnoses
- Need for integrated behavioral health and primary care services
- Inadequate access to care management and resource navigation
- Inadequate services for individuals who have been arrested or incarcerated either as a result or precipitated by unmet behavioral health needs
- Inadequate resources for special needs populations (e.g., homeless adults, sex offenders) including efficiencies such as integrated behavioral and primary care, pharmacy services, telemedicine, and physician extenders
- Inadequate outpatient care for adults with moderate acuity behavioral health needs to support reductions in hospital readmissions and the inappropriate use of emergency departments

---

The FY 2010 Texas Medicaid Managed Care STAR Program Quality of Care Report found that among Medicaid members hospitalized for mental illness, only 45% had a follow-up visit within 7 days of discharge from the hospital, and 72% had a follow-up visit within 30 days of discharge from the hospital. The STAR Program rate for mental health readmission within 30 days was 11%.  

### Chronic Disease
Cardiovascular disease, cancer, unintentional injuries, and diabetes top the list of causes of death in RHP 6. Of the 16,000 deaths in 2008, 60% were due to these potentially preventable causes. Disease management and wellness programs are critical to reducing morbidity and mortality of these diseases.

### Maternal and Child Health
Of the 36,000 live births in RHP 6 in 2008, only 59% of mothers received prenatal care within the first trimester. Six percent of births occurred to girls under 18 years of age and 44% of births were to unmarried mothers. Bexar County, which has the highest number of births in RHP 6, reports an adolescent (ages 13-17 years) pregnancy rate of 30.6 per 1,000 women, compared to 26.1 for the state. This rate is even higher in nine other RHP 6 counties. Nine percent of babies were born with low birth weight. Prematurity and low birth weight can contribute to long term health and economic costs to the family and society.

For children, access to primary and preventive care is especially important. The FY 2010 Texas Medicaid Managed Care STAR Program Quality of Care Report provides the following statistics on utilization of preventive care services for the Bexar Service Area:

- Sixty-five percent of STAR members who turned 15 months old during the measurement year had six or more well-child visits with a physician provider during their first 15 months of life
- Less than 80% of children in their 3rd, 4th, or 5th year of life had at least one well-child visit
- Less than 62% of adolescents had at least one well-care visit.

---

2012 Bexar County Community Health Improvement Plan

San Antonio Metropolitan Health District and the Bexar County Community Health Collaborative presented a Community Health Improvement Plan for Bexar County in May 2012. This plan, shown in Table 5, was compiled with input from multiple stakeholders and based on the 2010 Bexar County Community Health Assessment. It sets priorities for health improvement and engages partners and organizations to develop, support, and implement the plan.32

single mothers. For chlamydia, gonorrhea, syphilis, and HIV, the number of cases increased between 2003 and 2008. This increase was most pronounced for Chlamydia where the number of cases increased from 6,742 in 2003 to 8,849 in 2008.

Rural Health Care

More than half of the counties in RHP 6 (Dimmit, Edwards, Frio, Gillespie, Kerr, Kinney, LaSalle, McMullen, Real, Uvalde, Val Verde, and Zavala) are designated by the Health Resources and Services Administration’s Office of Rural Health Policy as rural counties. According to a Kronkosky Charitable Foundation Research Brief on Rural Healthcare, rural populations face a variety of economic, cultural, social, educational, and political disparities, which reduce the ability to live a healthy life, and the need for all types of health care services continues to grow. Federally Qualified Health Centers, Rural Health Clinics, and Critical Access Hospitals are government-supported facilities that serve as safety net health care providers for rural populations. Table 6 lists the Federally Qualified Health Centers serving RHP 6.

</tr>
</tbody>
</table>

An additional 33 providers are designated as Rural Health Clinics by the Centers for Medicare and Medicaid. One hospital, Medina Community Hospital, is designated as a Critical Access Hospital. Eight counties in RHP 6 do not even have hospitals: Bandera, Edwards, Kendall, Kinney, LaSalle, McMullen, Real, and Zavala.

The National Rural Health Association (NRHA) has identified the following issues of particular interest to rural communities:38

- Access to health care services, particularly health disparities and physician shortages
- Health information technology to improve communication and health care quality
- Mental health services, particularly relating to provider shortages and lack of insurance coverage
- Substance abuse
- Oral health

While 24% of the entire region is uninsured, the uninsured rate for the designated rural counties of RHP 6 is 31%, and the ten rural counties make up 61% of the region’s geographic area. This underscores the importance of safety net providers and helps explain why the issues described above of are particular relevance to RHP 6. The residents of these counties tend to be older and less educated, experience lower per capita income and more poverty than the region as a whole, further compounding the challenges faced here.

**Conclusion**

RHP 6 represents a vast geographic area of both rural and urban communities where rates of insurance coverage are low and poor health outcomes are common. Continued population growth is expected to exacerbate current health challenges, including limited access to primary and specialty care, unmet mental and behavioral health needs, prevalence of chronic disease, and poor maternal and child outcomes. Near-term decisions, including potential Medicaid expansion and the prevalence of the use of health insurance exchanges, could have significant impact on the health status of residents and outcomes of RHP 6 initiatives. The opportunity to implement transformative projects through the 1115 waiver funding will help RHP 6 address the needs of this community.

**Summary of Community Needs**

University Health System, the RHP 6 Anchor, conducted the community needs assessment with input from the Performing Providers and other stakeholders. Demographic, insurance, and health care infrastructure data were collected from HHSC and United States Census resources and compiled for each county in the region. Hospital, university, health department, and community mental health center leaders reviewed and validated these data and provided comment on anticipated changes to these measures throughout the waiver period. These leaders and other stakeholders also provided specific information on initiatives funded by the U.S. Department of Health and Human Services, and health care needs specific to their local communities. The draft community needs assessment was posted to our dedicated RHP 6 Web site (www.TexasRHP6.com) to allow public review and comment. These contributions from the public and our partners, in conjunction with a variety of data sources available via the internet, provided the content for this needs assessment.

The following table summarizes the needs that exist throughout the region. RHP 6 plans to address these needs through the selected DSRIP projects.

Section IV. Stakeholder Engagement

A. RHP Participants Engagement

Providers within RHP 6 have been actively engaged in 1115 waiver activities since before it was approved by the Centers for Medicare and Medicaid Services. University Health System’s President and Chief Executive Officer, George B. Hernandez, participates in HHSC’s Executive Waiver Committee which began in June 2011. Mr. Hernandez continued to be in regular communication with public hospitals around the state and local private hospitals in and around Bexar County. Industry groups such as Teaching Hospitals of Texas (THOT), Texas Organization of Rural and Community Hospitals (TORCH), the Texas Hospital Association (THA), the Texas Medical Association (TMA), and the Texas Council of Community Health Centers, served to educate their members regarding 1115 waiver developments.

In February 2012, HHSC created a Clinical Champion’s Workgroup. Meetings and conference calls were held between February and May 2012. RHP 6 was represented by the following physicians who contributed to the development of the RHP Planning Protocol.

- Dr. Bryan Alsip, Chief Medical Officer, University Health System
- Dr. Barbara Turner, University of Texas Health Science Center at San Antonio
- Dr. John Holcomb, Texas Medical Association
- Dr. Jim Martin, CHRISTUS Santa Rosa Health System
- Dr. Jan Patterson, University of Texas Health Science Center at San Antonio

During the month of February 2012, University Health System contacted hospital CEOs and county judges in the proposed region and adjacent areas to provide education about the 1115 waiver and gauge interest in participating with Bexar County. Based the feedback collected from these conversations, University Health System submitted the preliminary RHP Regions Survey to HHSC on February 24, 2012.

On March 21, University Health System hosted a regional stakeholder meeting with HHSC. University Health System mailed letters to hospital CEOs, county judges, and county commissioners inviting them to attend. During the meeting, Stanley Stewart provided an overview of the waiver. The meeting was attended by 57 individuals.

Following the stakeholder meeting, and as HHSC finalized the geography of Region 6, numerous phone conversations and meetings began taking place. Performing Providers began networking with University Health System and each other, sharing information with their boards and stakeholders, and discussing new opportunities to transform healthcare with entities they might not have worked with previously. A list of these meetings is included in Addendum A.

As the Anchor, University Health System led efforts to inform RHP participants and stakeholders regarding the 1115 Waiver through its dedicated Web site: www.TexasRHP6.com, which was launched
May 1, 2012. This site has served both to educate and inform as well as to receive input into the RHP 6 plan and DSRIP projects. A secure portal within the Web site allows Performing Providers to submit their RHP organization information, contribute to development of the community needs assessment, propose initial plans for DSRIP projects, and provide examples of stakeholder engagement from their communities.

Further, University Health System hosted two meetings with other anchoring entities - El Paso Hospital District and University of Texas Health Science Center at Tyler – to share anchor processes, best practices and lessons learned. University Health System’s CEO gave a waiver presentation to the Ector County Hospital District (Region 14). University Health System also shared its RHP 6’s valuation methodology with Regions 12 and 18.

Given the large number and value of projects proposed for our region, University Health System will promote and facilitate learning collaboratives through the remaining four years of the demonstration program. Following completion of the RHP Plan, University Health System will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include the following:

- Identify participants
- Establish Learning Collaborative goals
- Develop a calendar of regular meetings, site visits, and/or conference calls
- Develop a plan to communicate ideas, data, and successes across the region and state
- Organize a learning event and invite experts and other Performing Providers from outside the region to share knowledge and best practices
- Adopt metrics to measure success

University Health System will seek to provide facilitation and administrative assistance as needed to ensure the success of these endeavors. The RHP 6 website will be available to the Learning Collaboratives to network and share ideas, challenges, and success stories with colleagues. RHP 6 hopes to make significant transformational progress on its project milestones to achieve waiver goals and share what we learn with the rest of the State.

Additionally, University Health System plans to provide support to RHP 6 participants in meeting semi-annual reporting requirements. University Health System has contracted with Performance Logic, a vendor that hosts a web-based project management tool. Previously implemented by hospitals participating in the California Medicaid waiver, the tool includes a module specially designed to manage the categories, milestones, measures, values, and Intergovernmental transfer (IGT) contributions unique to DSRIP projects.
B. Public Engagement

The dedicated Web site has proven to be a robust tool for communicating with partners and stakeholders in our region. Screen shots of the website are included in Addendum B. As of December 18, 1,653 unique individuals have visited the website, creating a total of 17,912 page views. The average visitor spends nearly five minutes viewing the site. The site includes an overview of the 1115 waiver, news updates, state waiver resources, and provides the opportunity for visitors to submit comments, ask questions, and sign up to receive emails. Over 170 visitors have submitted their email addresses. Using this database, University Health System has emailed numerous updates about how RHP 6 is participating in the 1115 waiver. Examples of these communications are included in Addendum C.

University Health System leaders have met and/or held conference calls with numerous stakeholders and local businesses interested in participating in the waiver. Examples include:

- Federally Qualified Health Centers
- Home health agencies
- Information Technology vendors
- County and city officials
- Indigent care coordinators
- Advocacy groups
- Healthcare Access San Antonio

In addition, University Health System leaders served as invited guest speakers at meetings of the following organizations:

- Teaching Hospitals of Texas (March 30, 2012)
- Bexar County Medical Society (May 23, 2102)
- Alamo Area Council of Governments (June 27, 2012)
- The Health Collaborative Board of Directors (August 2, 2012)
- Methodist Healthcare Ministries (December 3 and December 4, 2012)

All but one Performing Provider eligible for a Pass 1 allocation are participating in the DSRIP incentive program. South Texas Regional Medical Center will participate in the Uncompensated Care Pool only.

On October 25, 2012, University Health System announced its upcoming public meeting scheduled for November 7, 2012. The announcement was emailed to stakeholders, posted on the Web site, and communicated publicly via a press release on November 2, 2012. A draft of the RHP Plan (including Pass 1 projects) was posted to the website on November 6, 2012. Stakeholders were invited to submit comments electronically and/or in person at the public meeting. The public meeting was attended by 55 individuals representing 35 organizations. The official public comment period for Pass 1 of the RHP Plan was November 6 through November 9, 2012.

University Health System hosted a webinar on December 13, 2012, to update stakeholders on the RHP Plan. The meeting was announced November 30, 2012, through email and on the Web site. An updated
draft of the RHP Plan was posted December 11, 2012. The official public comment period for the Final RHP Plan was December 11 through December 14, 2012.

Since its launch, the TexasRHP6.com website has included a “Comments and Feedback” tool which allows all stakeholders to submit questions and feedback to the anchor at any time. University Health System will continue to update and engage stakeholders using the dedicated website and emails targeted to stakeholders who provide email addresses. Additional public meetings will be held as needed.
Section V. DSRIP Projects

A. RHP Plan Development

RHP 6 is assigned to Tier 2 for the 1115 Medicaid Waiver. According to the Program Financing and Mechanics Protocol, Tier 2 regions contain at least 7 percent and less than 15 percent share of the statewide population under 200 percent Federal Poverty Level as defined by the U.S. Census Bureau: 2006-2010 American Community Survey (ACS) for Texas. As a Tier 2 region, RHP 6 must select a minimum of 12 projects from Categories 1 and 2 combined, with at least 6 of the 12 projects selected from Category 2.

RHP 6 has identified 79 projects in Pass 1, 36 projects in Pass 2, and five projects in the Anchor Pass (Pass 3) for a total of 120 projects. Due to the size of our region, RHP 6 implemented Pass 1 and 2 using a decentralized approach. Performing Providers were encouraged to identify projects that were most appropriate for their service areas. In most cases, the services areas included the county where the provider is based. The Community Mental Health Centers (CMHCs) are unique because their service areas span multiple counties, and in some cases, regions. This provided an opportunity for new networking and collaboration to occur that had not existed previously. Many hospital providers collaborated with their county indigent care programs, Federally Qualified Health Centers (FQHCs) and other provider practices and stakeholders in developing projects best suited to meet the needs of their residents. In Bexar County, numerous meetings were held between University Health System, The Center for Health Care Services, private hospital providers, and other stakeholders to discuss potential projects, make selections, and ensure projects were not duplicative.

The process for submitting projects was iterative and began July 9, 2012, when University Health System first requested submission of projects. This occurred early in the development of the RHP Planning Protocol, which was ultimately finalized and approved on October 1, 2012. This early submission, and those that followed, provided opportunities for regional partners to become familiar with the type of projects eligible for incentives and to share ideas with one another. University Health System made a sequence of updates to the project narrative templates as we received new information from HHSC and revisions to the RHP Plan template and protocols. Final Pass 1 narratives and electronic workbooks were due October 26, which provided time for University Health System to conduct an administrative review of proposed projects and provide feedback to performing Providers to ensure the formats and content were in compliance with Waiver protocols.

As Performing Providers submitted their project proposals, University Health System compiled matrices to share project information with regional partners and encouraged them to network with each other as appropriate. University Health System also reviewed the proposed valuations of similar projects across the region and assessed these for consistency. A complete list of projects considered, including those not submitted in the RHP Plan are listed in Addendum D.
University Health System, with input from Performing Providers, compiled the community needs assessment and posted the document on our RHP 6 Website on August 28, 2012. Each county varies in terms of its demographics, socioeconomics, and current health care infrastructure, but nearly every county in RHP 6 is designated as a Health Provider Shortage Area (HPSA) for primary care mental health and/or dental care. As a result, the counties within RHP 6 face similar community needs and health challenges.

- RHP 6 seeks to improve quality and patient satisfaction.
- A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions. Leading causes of death in RHP 6 include cardiovascular disease, cancer, and diabetes.
- Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages.
- There is a shortage of high quality mental and behavioral health services that are integrated with physical health care services and/or provide crisis stabilization.
- Lack of interconceptional and prenatal care for women and primary and preventive pediatric care results in poor maternal and child health outcomes.
- High rates of communicable disease and potential for vaccine preventable diseases due to low vaccine coverage levels in the community.

The 20 counties are committed to working together to make significant progress over the next five years toward addressing our community needs, expanding access to care, and achieving the specific triple aim goals of assuring patients receive high-quality, patient-centered care, in the most cost-effective ways. RHP 6 also strives to leverage local and federal waiver financing to:

- Further develop and maintain a coordinated care delivery system
- Improve outcomes while containing cost growth
- Improve and prepare the health care infrastructure to serve a newly insured population

On September 6, University Health System proposed a methodology for Performing Providers to use in evaluating, prioritizing, and selecting their projects. Many providers reported that this methodology was helpful, and two other regions (12 and 18) requested permission to use it as well. While RHP 6 did not require Providers to use this methodology, many did submit projects that scored highest on the evaluation criteria.

Each Performing Provider was given a custom template containing their Pass 1 allocation spread across all four categories per the PFM Protocol. University Health System also included a recommended range for the number of Category 1 and/or Category 2 projects anticipated from each Performing Provider.
based on HHSC’s allocation, maximum project value, and provider size. Using the template, Performing Providers were asked to list and briefly describe each proposed project, and then scored the project(s) using the criteria below:

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Description</th>
</tr>
</thead>
</table>
| Achieves Waiver Goals | Relative to your other proposed projects, to what extent does this project achieve the following waiver goals:  
- Triple Aim: assuring patients receive high-quality and patient-centered care, in the most cost effective ways  
- Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our counties  
- Further develop and maintain a coordinated care delivery system  
- Improve outcomes while containing cost growth  
Performing Providers may consider the following attributes when scoring projects on this domain:  
- Will the project impact one or more of the goals?  
- Does the project primarily impact Medicaid and/or uninsured residents?  
- How significant is the expected impact? To what extent will it “move the dial”?  
- Is there strong evidence, as shown by literature review, best practices, and/or past experience, that the proposed project will be effective in its impact? |
| Addresses Community Need(s) | Relative to your other proposed projects, to what extent does this project address community needs? Performing Providers are advised to reference the draft RHP Community Needs Assessment, available at [http://www.texasrhp6.com/rhp-plan/](http://www.texasrhp6.com/rhp-plan/).  
Performing Providers may consider the following attributes when scoring projects on this domain:  
- Will the project address one or more community needs?  
- How significant is the expected impact? To what extent will it “move the dial”?  
- Is there strong evidence, as shown by literature review, best practices, and/or past experience, that the proposed project will be effective in its impact? |
| Project Scope | Relative to your other proposed projects, how “big” is this project? Performing Providers should consider targeted improvements/increases in:  
- Outreach to the targeted population  
- Patient visits/encounters  
- Providers recruited/trained  
- Savings estimated from avoiding/preventing unnecessary ER visits or hospitalizations |

Addresses Community Need(s)  
Scale:  
1 to 5  
1=Minimal impact on community need(s)  
5=Greatest impact on community need(s)  

Achieves Waiver Goals  
Scale:  
1 to 5  
1=Minimal impact on waiver goals  
5=Greatest impact on all waiver goals  

Project Scope  
Scale:  
1 to 5  
1=Small numbers/percent of population impacted  
5=Large numbers/percent of population impacted
The Delivery System Reform Incentive Program (DSRIP) projects proposed in this plan address the needs of the broader community. Projects span the breadth of opportunities presented in the RHP Planning Protocol. Projects include expanding medical homes and primary care, increasing access to specialists, implementing technology to perform telemedicine and manage patient registries, and numerous other initiatives. The projects differ in size, scope, and targeted population, but each is geared to achieve specific outcome measures and population-focused improvements.

The table below lists the Performing Providers who are exempt from Category 4 reporting according to the criteria in paragraph 11.e. in the Program Funding and Mechanics Protocol.
B. Project Valuation

As described above, University Health System recommended Performing Providers use four criteria to value DSRIP projects, specifically:

1. To what extent does it achieve waiver goals?
2. To what extent does it address community needs?
3. What is the project scope?
4. What is the project investment?

For each proposed project, the scores across each of the criteria in the proposed methodology were summed to produce a total score, called the Value Weight of Project. Using this assessment, Performing Providers were able to value projects for submission to the RHP Plan. The template calculated initial project values for the selected projects based on the Performing Provider’s allocation of funding and project scores, as shown in the example below:

<table>
<thead>
<tr>
<th>Total DSRIP Potential Allocation</th>
</tr>
</thead>
<tbody>
<tr>
<td>DY2</td>
</tr>
<tr>
<td>-------</td>
</tr>
<tr>
<td>$500,000</td>
</tr>
</tbody>
</table>

| Brief Project Description | Value Weight of Project | Value | | | |
|---------------------------|-------------------------|-------| | | |
| | | | | | |
| Open a school-based clinic at Waiver Elementary School | 18 | $255,000 | $480,000 | $675,000 | $1,026,000 | $2,436,000 |
| Implement scheduling model at Waiver Clinic | 12 | $170,000 | $320,000 | $450,000 | $684,000 | $1,624,000 |
| **TOTAL CATEGORY 1 AND 2** | **30** | **$425,000** | **$800,000** | **$1,125,000** | **$1,710,000** | **$4,060,000** |
| | | | | | |
| TOTAL CATEGORY 3 | | | | | $1,365,000 |
| TOTAL CATEGORY 4 | | | | | $575,000 |

Performing Providers were advised that they may need to adjust the number of projects and/or the project values upon consideration of such factors as availability of local matching funds (IGT) and consistency of project valuations across the region. Category 3 measures were often valued using a similar distribution. Many providers also conducted more detailed valuations for their projects by assessing the anticipated investments and community benefit, particularly savings resulting from avoiding unnecessary healthcare costs. The likelihood that a project would reduce morbidity and mortality was also factored into the valuation of many projects. Further, the Community Mental Health Centers worked together with their industry association to engage a health economist in valuing their projects. This was important since many of their projects cross regional boundaries and these organizations placed great emphasis on ensuring consistency throughout the state.
Project valuations do range significantly within our region. This is attributed to the diversity of providers and markets they serve. Given that 75% of the region’s population lives in Bexar County, it was not surprising that the project valuations for Bexar County providers would be valued much higher than similar projects for smaller hospitals in rural counties.

**DSRIP Projects narratives and tables are included on the following pages:**

Category 1: Infrastructure Development ................................................................................................. 71

Infrastructure development projects lay the foundation for delivery system transformation through investments in technology, tools, and human resources. Performing Providers participating in Category 1 projects may include hospitals, community mental health centers (CMHCs), local health departments, physician practices affiliated with academic science health centers, and physician practices not affiliated with academic health science centers, as defined in Section II of Attachment J (Program Funding and Mechanics Protocol).

Category 2: Program Innovation and Redesign ..................................................................................... 615

Program Innovation and Redesign projects emphasize the piloting, testing, and replicating of innovative care models. Performing Providers participating in Category 2 projects may include hospitals, community mental health centers, local health departments, physician practices affiliated with academic science health centers and physician practices not affiliated with academic health science centers, as defined in Section II of Attachment J (Program Funding and Mechanics Protocol).

Category 3: Quality Improvements ...................................................................................................... 1070

The goal of Category 3 is to assess an outcome of a project implemented under Category 1 or 2. As described in the Program Funding and Mechanics Protocol, each Category 1 and 2 project is required to have an associated Category 3 outcome measure.

Category 4: Population-Focused Improvements (Hospitals Only) ...................................................... 1591

Population-focused improvements are “pay for reporting” measures reported by hospitals that demonstrate the impact of delivery system reform investments made under the demonstration. With limited exceptions, all hospital Performing Providers shall report on all Category 4 population-focused improvement measures described in Attachment I: RHP Planning Protocol and categorized in six domains:

- Domain 1: Potentially Preventable Admissions
- Domain 2: Potentially Preventable Readmissions – 30 days
- Domain 3: Potentially Preventable Complications
- Domain 4: Patient-Centered Healthcare
- Domain 5: Emergency Department
- **Optional** Domain 6: Children and Adult Core Measures
C. Category 1: Infrastructure Development

Identifying Project and Provider Information:

Title: 1.1.1 Establish more primary care clinics: Expand Primary Care Capacity
Unique RHP ID#: 159156201.1.1 – PASS 1
Performing Provider: VHS San Antonio Partners, LLC d/b/a Baptist Health System
Performing Provider TPI: 159156201

Project Summary:

Provider Description: Baptist Health System includes five acute- (Baptist Medical Center (623 beds), Mission Trail Baptist Hospital (110 beds), North Central Baptist Hospital (280 beds), Northeast Baptist Hospital (379 beds), and St. Luke’s Baptist Hospital (282 beds)) which offer 1,674 licensed beds. In 2011, Baptist Health System was recognized by U.S. News and World Report for earning more, high performing specialty rankings (5) than any other health system in the San Antonio metropolitan area. All five hospitals have earned Accredited Chest Pain Center designation, as well as Primary Stroke Center Certification. Medicare has designated each as Texas’ only Medicare Value Based Care Centers. The system also includes Baptist Regional Children’s Center, Baptist Breast Center, HealthLink wellness and fitness center, Baptist M&S Imaging Centers, community health and wellness programs, ambulatory services, rehabilitation services, air medical transport, School of Health Professions, and other health-related services and affiliations. It is part of the Nashville, Tennessee-based Vanguard Health Systems.

Intervention(s): This project will establish additional primary care locations in Bexar County and add incremental primary care providers thus increasing the number of patients receiving timely primary care services in Bexar County for both acute illness and chronic disease management.

Need for the project: There is a shortage of primary care providers in Baptist Health System’s primary service area. Per the 2011 Carnahan report there was a need for 413 additional Primary care providers in our five sites’ service areas. The prevalence of chronic disease in RHP 6 as demonstrated in the Community Needs Assessment, particularly diabetes and CHF, is further complicated by a shortage of providers, high % of uninsured making Texas last in the nation in health care quality.

Target population: Bexar County residents needing a primary care provider. The shortage of healthcare providers in RHP6 is further complicated by almost half a million uninsured residents (471,000 in 2009). The uninsured and those with Medicaid are the most underserved as many physician practices do not take these patients. All of our primary care sites accept uninsured and Medicaid patients. Our sites cover the northeast, north central, west, downtown and southeast county. We are locating new providers adjacent to new freestanding ED locations (> 20% uninsured) which will provide a draw and referral potential so patients will know where new providers are and days/hours of service. BHS is also targeting a large downtown location and south Bexar County which is the most underserved, highest uninsured or Medicaid related patient population.

Category 1 or 2 expected patient benefits:

Provide incremental primary care visits ranging from a minimum of 5,433 additional visits in DY 2 to a minimum of 16,300 additional visits by DY5. Our clinics and sites all accept Medicaid plans and self pay patients.

Potential indigent population targeted through this expansion is incremental primary care visits approximating:
DY 2 + 851
DY 3 + 6399
DY 4 + 8495
DY 5 + 8753
TOTAL = 24,899  or  53% of incremental visits projected.
Category 3 outcomes:  Diabetes Care: HbA1c poor control (<9%).

<table>
<thead>
<tr>
<th>Project Description:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baptist Health System (BHS / Baptist) will <strong>improve primary care access</strong> for our community through Baptist Managed Service Organization (MSO) and supporting our hospitals with recruitment/relocation of providers targeting underserved areas by <strong>establishing more primary care clinics and providers increasing number of primary care visits</strong> year over year.</td>
</tr>
</tbody>
</table>

The **goals of this project** will be to increase access to primary care providers by (1) adding additional primary care offices (2) adding additional physician providers and (3) otherwise increase availability and choice for our community to manage their health in an appropriate setting using a primary care provider.

This project allows San Antonio/RHP6 to develop a more robust primary care delivery platform. By increasing provider availability, those needing primary care can develop medical home relationships and improve preventive and health maintenance care. With expanded access to primary care, patients will have improved disease prevention, improved management of chronic conditions and regular follow up care which can intervene and prevent worsening conditions. This will not only reduce the use of the ER for primary care but will improve population health particularly related to the chronic diseases that are prevalent in RHP6 such as diabetes, cardiovascular disease and cancer.

There are **multiple challenges** to this issue including: identification and engagement of those in need, provide resources for initiatives, identification and incentivization of providers to serve this population, and the members of this population taking ownership for their own health needs. This project will seek to recruit and incentivize primary care physicians and provide automated tools to track, monitor and improve chronic disease management of our MSO patient population—as an example, BHS will also provide our MSO physicians with valuable tools such as Crimson for monitoring and improving our performance in managing the health of our patients.

The **five year expected outcome** is that by increasing primary care sites and providers, Baptist will meet community/population needs of improving access to primary care. Disease prevention will be increased by improved access to care and chronic conditions will be better managed by regular primary care and early interventions. These outcomes will be achieved by accomplishing the project goals noted above.

This **project meets the RHP Regional Goals**:
- **Triple Aim**: assuring patients receive high-quality, patient-centered care, in the most cost effective ways
- Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our counties
• Further develop and maintain a coordinated care delivery system
• Improve outcomes while containing cost growth

This project meets the following RHP identified Community needs:
CN.1 Texas ranks last in the nation on health care quality
CN.2 A higher prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions.
CN.3 Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsured combined with health care provider shortages.

Through BHS Operational Improvement Office, BHS staff will use P-3 Quality Improvement Milestone to further enhance the Process Improvement (PI) impact on improving care, quality and cost for our patients.

Starting Point/Baseline:
BHS MSO had 54,334 patient visits in existing 11 Primary Care Sites for Calendar year ending 12–31-11 which will be the baseline. Adding new locations and/or providers will increase patient access and number of patient visits beginning 1-1-2012.

We will track both the # of new locations opened after 1-1-2012 and the incremental patient visits/encounters performed annually in supported Primary Care locations and will report increased visits > 54,334.

Rationale:
The reason for selecting this project is that currently Baptist hospitals’ service areas have a demonstrated need for Primary Care Providers of BMC = 114, MTB = 136, NEB = 152 and SLB = 11 or a total for the BHS market of 413 Primary Care providers per the 2011 Carnahan Report.
BHS will recruit/employ/relocate Primary Care providers to serve Bexar County needs by expanding primary care physicians in these key geographical areas.

This project is aligned with the Triple AIM Goals:
- Increases access for all patients including Medicaid and uninsured patients
- Increasing access to physicians and specialists improves patient outcomes through chronic disease management and earlier intervention for acute conditions
- Eliminates inappropriate and costly use of Emergency Room visits

This project also aligns with the RHP 6 Community Needs Assessment by improving access, outreach and care for the areas’ underserved and chronically diseased patient population.
- RHP 6 is expected to have 6% population growth with Bexar County up to 15% growth between 2010- 2015; and Texas ranks 45th in the nation in # of physicians per capita.
Increasing access improves disease prevention, patient outcomes through chronic disease management and earlier intervention for acute conditions
- Eliminates inappropriate and costly use of Emergency Room visits

This project certainly is in accord with national initiatives such as Accountable Care organizations. This project meets Community needs CN.1, CN.2, CN.3 as noted in the narrative section above.
**Related Category 3 Outcome Measure(s):**

Texas ranks last in the nation in healthcare quality and weak in quality of diabetes care. The diabetes rate in Bexar County is 10% overall and the rate of diabetes for African Americans and Hispanic is more than double the rate Whites. BHS primary care sites have selected Category 3 Project outcome measure:

| \_IT-1.10 Diabetes Care: HbA1c poor control (> 9%) - NQF 0059 Stand Alone Measure |
| Baptist MSO new location employed primary care practitioners will reduce year over year the % of their patient practice meeting the identified criteria with an HbA1c > 9%.

**Relationship to other Projects:**

This project would have the added advantage of developing/preparing staff for the medical home concept:

| Category 2 : Project Area 2.1 Enhance/Expand Medical Homes |
| Category 2 : Project Area 2.3 Redesign Primary Care |
| Category 2: Project Area 2.11 Conduct Medication Management |

Expanding access to Primary Care practitioners in our underserved areas also supports the patient population focused improvements in Category 4 : Population Focused Measures

| RD-1 Potentially Preventable Admissions |
| 1. Congestive Heart Failure Admission rate |
| 2. Diabetes Admission rate |
| 4. Chronic Obstructive Pulmonary Disease Admission rate |
| 5. Bacterial Pneumonia immunization |

| RD-2 30 day readmissions |
| 1. Congestive Heart Failure Admission rate |
| 2. Diabetes Admission rate |
| 4. Chronic Obstructive Pulmonary Disease Admission rate |
| 5. Stroke |

**Relationship to Other Performing Providers’ Projects in the RHP:**

CHRISTUS facilities, University Health System, and Baptist have all identified the expansion of Primary care as a Category 1 Project and there is demonstrated need for all efforts as evidenced by the need for 413 more primary care providers just in Baptist hospital primary service areas.

**Plan for Learning Collaborative:**

Following completion of the RHP plan, University Health System (anchor) will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include goals, regular meetings, site visits, conference calls, communication plan development, organizing learning event, and adopt metrics to measure success.
**Project Valuation:**

Baptist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

In valuing this project, Baptist took into account the extent to which the expansion of primary care would potentially meet the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.

The expansion of primary care clinics addresses a substantial, community need to increase access to primary care while advancing the Waiver goal of improving outcomes while curbing the risk of healthcare costs. Primary care is one of the most cost effective methods to increase health outcomes.

**Project Summary:**

**Provider Description:** Baptist Health System includes five acute- (Baptist Medical Center (623 beds), Mission Trail Baptist Hospital (110 beds), North Central Baptist Hospital (280 beds), Northeast Baptist Hospital (379 beds), and St. Luke’s Baptist Hospital (282 beds)) which offer 1,674 licensed beds. In 2011, Baptist Health System was recognized by U.S. News and World Report for earning more, high performing specialty rankings (5) than any other health system in the San Antonio metropolitan area. All five hospitals have earned Accredited Chest Pain Center designation, as well as Primary Stroke Center Certification. Medicare has designated each as Texas’ only Medicare Value Based Care Centers. The system also includes Baptist Regional Children’s Center, Baptist Breast Center, HealthLink wellness and fitness center, Baptist M&S Imaging Centers, community health and wellness programs, ambulatory services, rehabilitation services, air medical transport, School of Health Professions, and other health-related services and affiliations. It is part of the Nashville, Tennessee-based Vanguard Health Systems.

**Intervention(s):** This project establishes additional specialty care locations and providers in Bexar County increasing patient access for timely, specialty care services for acute and chronic disease management.

**Need for the project:** There is a shortage of specialty care providers in Baptist Health System’s primary service area. For example, per the 2011 Carnahan report there was a need for +108 new cardiac care providers, +79 psychiatrists, and +301 additional providers for pediatric related specialties.

The prevalence of chronic disease in RHP 6 as demonstrated in the Community Needs Assessment, particularly diabetes and CHF, is further complicated by shortage of providers, high % of uninsured making Texas last in the nation in health care quality. The CNA also identifies a shortage of high quality mental and behavioral health services and a lack of inter-conceptional and prenatal care for women and primary and preventive pediatric care results in poor maternal and child health outcomes.

**Target population:** Bexar County residents needing improved access to specialty care in cardiac disease, psychiatry, maternal/infant health and other targeted specialties including hospitalists who are trained to manage acute hospital conditions using Evidence Based Medicine and improving quality of care while reducing costs and LOS.

**Category 1 or 2 expected patient benefits:** Provide incremental specialty care visits ranging from a minimum of 9,359 additional visits in DY 2 to a minimum of 46,794 additional visits by DY5. All supported clinics and sites all accept Medicaid plans and self pay patients.

**Potential indigent population targeted with expansion is incremental specialty care visits approximating:**

**Category 3 outcomes:**

Congestive Heart Failure 30 day readmission rate
Acute Myocardial Infarction (AMI) 30 day readmission rate

**Project Description:**

Baptist Health System will **improve care access** for our community population by increasing access to specialty care providers.

The **goals of this project** will be to increase access to specialty care providers by

1. adding additional specialty care offices/clinics
2. adding additional physician providers and
3. otherwise increase availability and choice for our community to manage their health in an appropriate setting when accessing a specialty care provider.

Through Baptist Managed Service Organization Clinics and supporting our hospitals with recruitment/relocation of providers targeting underserved areas, Baptist will continue to recruit specialists to meet the critical access shortages in Bexar County.

This project will allow San Antonio to augment our primary care delivery platform by increasing specialists that (1) meet the shortage needs of our area particularly for the underinsured and (2) increase provider availability to shorten time to treatment for both prevalent acute and chronic conditions, while expanding access to preventive and health maintenance care. With expanded access overall, health will be improved and cost of healthcare reduced. This will also reduce the use of the ER and will improve population health particularly related to the chronic diseases that are high need in RHP6- including diabetes and cardiac disease.

There are **multiple challenges** to this issue including: identification and engagement of those in need, resourcing of initiatives, identification and incentivization of providers to serve this population, and the members of this population taking ownership for their own health needs. BHS will meet these challenges by recruiting specialists dedicated to improving the care provided to our RHP population and to their specific needs where specialty care is severely needed. BHS will also provide our MSO physicians with valuable tools such as Crimson for monitoring and improving our performance in managing the health of our patients.

The **five year expected outcome** is that by increasing specialty care sites and providers, Baptist will meet community/population needs of improving access to specialty care especially in cardiac disease, behavioral health and maternal/pediatric health. Disease prevention will be increased by improved access to care and both acute and chronic conditions will be better managed, when indicated, by improved access to specialists and early interventions. These outcomes will be achieved by accomplishing the project goals noted above.

This **project meets the RHP Regional Goals:**

- Triple Aim: assuring patients receive high-quality, patient-centered care, in the most cost effective ways
- Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our counties
- Further develop and maintain a coordinated care delivery system
- Improve outcomes while containing cost growth
RHP 6 Community Needs assessment shows that Texas scored “weak” on clinical care areas of diabetes, heart disease and respiratory measures. We will recruit cardiology specialties and neurosciences specialties as two critical examples. These actions meet both “triple Aim” goals as well as match our Community Needs.

The Community Needs Assessment also shows that Texas ranks far below the national average in number of mental health professionals per 100,000 residents. Almost every county in RHPA is designated as a HPSA for mental health. Baptist will recruit additional psychiatrists including psychiatric hospitalists.

RHP 6 Needs also focus on Maternal and Child Health issues and Baptist will recruit and or expand access to medical providers for these specialty areas.

In summary, this project meets the following RHP identified Community Need Goals:

- CN.1 Texas ranks last in the nation on health care quality
- CN.2 A higher prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions.
- CN.3 Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages.
- CN.4 There is a shortage of high quality mental and behavioral health services that are integrated with physical health care services and/or provide crisis stabilization.
- CN.5 Lack of inter-conceptional and prenatal care for women and primary and preventive pediatric care results in poor maternal and child health outcomes.

In the implementation of this project, Baptist will endeavor for continuous quality improvement by monitoring the patient volumes and patient utilization to ensure that progress is being made towards meeting the project milestones. Additionally, Baptist will ensure that all MSO specialty clinics make ongoing efforts to meet or exceed all nationally recognized protocol or quality benchmarks for specialty care providers.

Through BHS Operational improvement Office, BHS staff will use P-3 Quality Improvement Milestone to further enhance the PI impact on improving care, quality and cost for our patients.

Starting Point/Baseline:

BHS MSO had **92,590** patient visits in existing 20 Specialty Care Sites for Calendar year ending 12–31-11 which will be the baseline and **94,586** Hospitalists visits for a total of **187,176** patient visit encounters. Adding or supporting new locations and providers will increase patient access and number of patient visits beginning 1-1-2012.

We will track both the # of new locations opened/supported after 1-1-2012 and the incremental patient visits/encounters performed annually in these locations and will report increased visits > 187,176. As Baptist assists other physicians/practices with relocating incremental specialty care providers to Bexar County, that impact will be included as accretive to the community.

Rationale:

This project was selected for focus on the critical provider shortages cited in the Community Needs Assessment as well as there is a demonstrated need in BHS hospitals' primary service area for
additional physician specialists Carnahan 2011 needs assessment. As examples cardiac care alone indicates +108 providers, Psychiatry +79 and for Pediatric related specialties there is a need of +301 specialty providers. All specialties are detailed in the Carnahan report.

BHS will expand specialty care access with goals of prevention and health maintenance through health care organizations and through establishment of alternative health care delivery channels. These partnerships and new alternative delivery channels will be enhanced through new locations, new platforms and expanded hours in conjunction with and in addition to BHS supported primary care practices.

This project is aligned with the Triple AIM Goals:
- Increases access for all patients including Medicaid and uninsured patients
- Increasing access to physicians and specialists improves patient outcomes through chronic disease management and earlier intervention for acute conditions
- Eliminates inappropriate and costly use of Emergency Room visits

The core components of the project are:
(a) Increase service availability
(b) Increase number of specialty clinic locations
(c) Implement transparent, standardized referrals across the system
(d) Conduct quality improvement for project

This project also aligns with the RHP 6 Community Needs Assessment by improving access, outreach and care for the areas’ underserved and chronically diseased patient population.
- RHP 6 is expected to have 6% population growth with Bexar County up to 15% growth between 2010-2015; and Texas ranks 45th in the nation in # of physicians per capita. Increasing access improves disease prevention, patient outcomes through chronic disease management and earlier intervention for acute conditions
- Eliminates inappropriate and costly use of Emergency Room visits
- Addresses chronic disease states where health ratings are poorest in Texas as noted above in project narrative

This project certainly is in accord with national initiatives such as Accountable Care organizations. This project meets ALL of the Community needs CN.1, CN.2, CN.3, CN.4, and CN.5 as detailed above.

Related Category 3 Outcome Measure(s):

IT- 3.2 Congestive Heart Failure 30 day readmission rate (Stand Alone Measure)
IT- 3.5 Acute Myocardial Infarction (AMI) 30 day readmission rate (Stand Alone Measure)
Cardiovascular disease is the largest cause of preventable death in Texas in RHP6. Texas is rated “weak” in heart disease.

By adding Cardiac and other specialty providers, Baptist can provide cardiac interventions and chronic disease management improving the cardiac health of Bexar County. This includes evidence based strategies including CHF Navigator, relationships with post-acute care providers with active CHF and cardiac management programs. Adding specialty providers aids our Primary care provider base and patient population in establishing medical homes that address their health needs.
**Relationship to other Projects:**

This project would have the added advantage of supporting these additional Category 1 and 2 projects:

2.1 Enhance/Expand Medical Homes
2.2 Expand Chronic Care Management Models
2.5 Redesign for Cost Containment
2.7 Implement Evidence Based Disease Prevention Programs
2.10 Use of Palliative Care Programs

Expanding Specialty Care access also supports the patient population focused Category 4 improvements in:

RD-1 Potentially Preventable Admissions
1. Congestive Heart Failure Admission rate
2. Diabetes Admission rate
3. Behavioral Health and Substance Abuse Admissions
4. Chronic Obstructive Pulmonary Disease Admission rate
5. Hypertension Admission Rate

RD-2 30 day readmissions
1. Congestive Heart Failure Admission rate
2. Diabetes Admission rate
3. Behavioral Health and Substance Abuse Admissions
4. Chronic Obstructive Pulmonary Disease Admission rate
5. Stroke

**Relationship to Other Performing Providers’ Projects in the RHP:**

University, Baptist, and Methodist systems have all cited expanding specialty care as a DSRIP Initiative. Per the Carnahan 2011 Needs Assessment for Bexar and surrounding counties, there is a critical need for additional providers in all of the areas and our community should be well served by all of this active recruitment and expansion.

**Plan for Learning Collaborative:**

Following completion of RHP plan, University Health System (anchor) will facilitate formation of working groups of performing providers pursuing similar projects. These working groups will develop a learning collaborative structure which may include goals, meetings, site visits, conference calls, communication plan development, a learning event, and adopt metrics to measure success.

**Project Valuation:**

Baptist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

In valuing this project, Baptist took into account the extent to which the expansion of specialty care would potentially meet the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.

The expansion of specialty care clinics and providers will help address a substantial need in the community for increased access to specialty care. It also advances the Waiver goal of improving...
outcomes while curbing the risk of healthcare costs, because early intervention and chronic disease management are cost effective methods to increase health outcomes.

TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $9,881,871
Identifying Project and Provider Information:

Title: 1.10.1 Enhance improvement capacity within people
Unique RHP ID#: 159156201.1.3 – PASS 1
Performing Provider: VHS San Antonio Partners, LLC d/b/a Baptist Health System
Performing Provider TPI: 159156201

Project Summary:

Provider Description: Baptist Health System includes five acute- (Baptist Medical Center (623 beds), Mission Trail Baptist Hospital (110 beds), North Central Baptist Hospital (280 beds), Northeast Baptist Hospital (379 beds), and St. Luke’s Baptist Hospital (282 beds)) which offer 1,674 licensed beds. In 2011, Baptist Health System was recognized by U.S. News and World Report for earning more, high performing specialty rankings (5) than any other health system in the San Antonio metropolitan area. All five hospitals have earned Accredited Chest Pain Center designation, as well as Primary Stroke Center Certification. Medicare has designated each as Texas’ only Medicare Value Based Care Centers. The system also includes Baptist Regional Children’s Center, Baptist Breast Center, HealthLink wellness and fitness center, Baptist M&S Imaging Centers, community health and wellness programs, ambulatory services, rehabilitation services, air medical transport, School of Health Professions, and other health-related services and affiliations. It is part of the Nashville, Tennessee-based Vanguard Health Systems.

Intervention(s): This project will establish and staff an office of Operational Improvement. We will train Baptist staff and physicians on Lean and other Process Improvement (PI) tools. Using trained staff and a variety of PI tools, we will improve efficiencies and reduce variation in care processes resulting in improvement in quality measures and reduced costs.

Need for the project: The Institute of Medicine (IOM) states that the majority of medical errors result from faulty systems and processes, not faulty individuals. Enhanced staff training and focus on tools to improve processes, reduce waste, and eliminate variation in care all contribute to Triple Aim goals of improving patient flow and increasing access for all patients, a more coordinated care delivery system and improving patient safety and quality while reducing costs.

This project also ENABLES 2.8 which is the practical application of these tools to improve efficiency and quality.

Target population: The specific target population is Baptist employed staff and both employed physicians as well as other medical staff leaders. By training staff with tools to improve processes, eliminate waste and reduce variation in care we are not only improving the quality of care provided to our patients but also creating increased access to care through reduced LOS, reduction in barriers in throughput all of which benefits the residents of Bexar County needing access to acute care.

Category 1 or 2 expected patient benefits: With at least 128 employees/physicians trained in PI tools by end of DY3 and at least five improvement projects completed each year, by DY 4 and 5, we will have measureable improvement in patient quality measures from our Scorecard such as reduction in readmissions, reductions in hospital acquired conditions and reduction in falls. All of these quality improvements are direct benefit to the patients treated in Baptist hospitals and other entities. Over 26% of BHS’ Inpatient population is Medicaid or Uninsured indigent and another large % have Medicaid supplemental to Medicare. Over 43% of BHS’ Outpatient population is Medicaid or Uninsured indigent and another large % have Medicaid supplemental to Medicare. The impact of staff training to yield quality and cost improvements through standardization while reducing variation will greatly benefit this patient population.

Category 3 outcomes:
Congestive Heart Failure 30 day readmission rate  
Acute Myocardial Infarction (AMI) 30 day readmission rate  

**Project Description:**

BHS proposes the implementation of lean and six sigma performance improvement methodology to improve safety, quality, and efficiency. Sigma six is a widely accepted clinical methodology to improve the quality and efficiency of the delivery of healthcare services. Baptist will implement sigma six in Category 1 Project 10.1 Enhance Performance improvement capacity within people, which will ENABLE Category 2 Project 8 Apply process improvement methodology to improve quality/efficiency. Various tools will be used to drive continuous improvement including, but not limited to, FMEA (failure mode evaluation analysis) value stream mapping, process mapping, identification and elimination of waste and non-value added processes via direct observation and data collection.

The **goals** of this project are

1. Establish and staff an office of Operational improvement
2. Train BHS staff and physician on lean and other PI tools
3. Use trained staff and array of PI tools to improve efficiencies and reduce variation in care processes to drive improvement in quality measures

Various **challenges** faced by BHS during this implementation include educating a large number of staff on lean, changing the way problems are approached and improved upon, empowering front-line staff to identify opportunities for improvement along with capturing their ideas to make the improvement, and the significant amount of variation that exists within BHS and all healthcare processes.

To address these challenges, BHS proposes a performance improvement infrastructure to educate employees on lean and performance improvement tools. Training is accomplished through various avenues including a four day lean practitioner training where employees are trained on lean principles and tools and how to apply them to a live project through their training. In addition, targeted training sessions will focus on transferring knowledge to employees and physicians on how to identify and eliminate waste.

BHS will track all trained staff along with their individual knowledge of specific lean tools with the goal of developing teachers and lean leaders. BHS will track all performance improvement activity in a project tracking application that tracks project details including metrics impacted and staff involvement.

The **five year goals** are to have a substantial workforce that is trained and using various PI tools in approaching work and cost efficiencies, reducing variation in processes while improving clinical care, patient outcomes and improving the total patient experience.

This **project meets the RHP Regional Goals:**

- Triple Aim: assuring patients receive high-quality and patient-centered care, in the most cost effective ways
• Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our counties
• Further develop and maintain a coordinated care delivery system
• Improve outcomes while containing cost growth

This project meets the following RHP identified Community needs:
CN.1 Texas ranks last in the nation on health care quality
CN.2 A higher prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions.

BHS Operational improvement Office will use P-3 Quality Improvement Milestone to further enhance the PI impact on improving care, quality and cost for our patients.

Starting Point/Baseline:
An Operational Improvement Department has been formed to support the lean deployment for BHS. This department consists of a Vice President of Operational Improvement and Operational Improvement Engineers trained and certified in lean and/or six sigma. As of September 2012 there are 71 BHS employees trained as lean practitioners. The source for this information is the BHS lean practitioner employee roster maintained in the Operational Improvement Department at BHS.

Rationale:
Having an office responsible for performance improvement will increase the improvement capacity in BHS by championing the knowledge transfer of lean and other quality improvement tools to BHS staff. Ongoing training by the office of Operational Improvement will increase the capacity for performance improvement activities on a continuous basis.

Capturing employee ideas for improvement through an employee suggestion mechanism and implementing those ideas fosters a culture of continuous improvement. Encouragement of continuous improvement throughout all levels of the organization will accelerate the lean culture change that promotes employee empowerment to encourage change for improvement

This project’s Core Components are:
(a) Provide training and education to clinical and administrative staff on process improvement strategies, methodologies and culture.
(b) Develop an employee suggestion system that allows for identification of issues that impact the work environment, patient care and satisfaction, efficiency and other issues aligned with continuous process improvement.
(c) Continuous Quality Improvement. BHS recognizes that a substantial part of this project is geared towards enhancing quality improvement—in fact the entire project is the implementation of one comprehensive quality improvement methodology. In addition BHS will Participate in face-to-face learning (i.e. meetings or seminars) at least twice per year with other providers and the RHP to promote collaborative learning around shared or similar projects as listed in P-3 of the quality improvement milestones of the DSRIP Menu.

This project is aligned with the Triple AIM Goals:
- Improving patient flow and infrastructure processes increases access for all patients including Medicaid and uninsured patients
- Improving flow and processes contributes to a more coordinated delivery system
- Improving flow and processes, reducing variation and increasing care reliability improves patient safety and outcomes and reduces costs, eliminating waste from system

This project also aligns with the RHP 6 Community Needs Assessment by improving access, outreach and care for the areas’ underserved, diseased patient population by equipping BHS leaders and staff with PI tools and knowledge to improve patient flow and increase access to care. This project addresses CN1 and CN2 as detailed above.

This project is directly in accord with national initiatives such as Accountable Care organizations.

**Related Category 3 Outcome Measure(s):**

</tr>
<tr>
<td>IT 3.5</td>
<td>Acute Myocardial Infarction (AMI) 30 day readmission rate</td>
</tr>
</tbody>
</table>

Cascading performance training tools to front line leadership and staff employees as well as the establishment of the employee suggestion line, will better position our organization’s clinical and non-clinical staff to evaluate current treatment plans, patient education, discharge tools and transitional care methods for the above clinical conditions and to work intra departmentally, with medical staff and with other providers to redesign and improve the care process for potentially preventable readmissions.

Cardiovascular disease is the largest single cause of death in Bexar County. Improving internal and transitional care and patient education through staff working knowledge and utilization of PI tools will assist BHS in reducing readmission rates for the above cardiac conditions and improve population health.

**Relationship to other Projects:**

The project is a direct link to 2.8 Apply Process Improvement Methodology to Improve Quality/Efficiency. Lean tools can be utilized to improve cycle times in facilities/clinics and improve patient flow and experience by identifying constraints, wastes, and non-value-added steps from the patient’s perspective.

This project supports Texas Waiver 1115 and Triple Aim goals to improve outcomes while containing cost growth. Lean is utilized to improve outcome via the identification and elimination of waste in processes. These tools focus on reducing undesirable variation in clinical practices which supporting Triple Aim concept of optimizing the health system and system integration.

Additionally, this process and education enables many of the improvements to be made in Category 4:

- RD-1 Potentially Preventable Admissions
- RD-2 30 Day Readmissions
- RD-3 Potentially Preventable Complications
- RD-5 Emergency Department

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $9,300,584**
Identifying Project and Provider Information:

Title: 1.9.2 Improve access to specialty care: Pediatric Subspecialty Expansion
Unique RHP ID#: (TPI Pending).1.1 – PASS 1
Provider Name: Children’s Hospital of San Antonio
TPI: 020844903

Project Summary:

Provider Description: Children’s Hospital of San Antonio (CH of SA) is a 249 bed academic children’s hospital serving San Antonio, New Braunfels, the Southern and Western boarders of Texas, as well as the Central Texas hill country.

Intervention(s): The primary goal of this objective is to increase the capacity to provide pediatric sub-specialty care services and the availability of targeted specialty providers to better accommodate the high demand for such services.

Need for the project: On September 21, 2012, CH OF SA Santa Rosa Children’s hospital converted to a free-standing children’s hospital and is now officially called Children’s Hospital of San Antonio. This was the first step toward creating a Tier 1 Children’s hospital, which will be the focal point for a network of pediatric services. This project will enable CH of SA to create the much needed geographically dispersed network of pediatric specialty care services throughout the community.

Target population: This project will target the pediatric population, ages 0 – 17, which currently account for more than 26% of the total population. In Bexar and Comal counties, an estimated 14% of the population is covered by Medicaid or indigent. Increasing subspecialty care access for this population can significantly improve patient health outcomes, patient satisfaction, utilization patterns and help to reduce healthcare costs.

Category 1 or 2 expected patient benefits: CH of SA converted to a free-standing children’s hospital in September 2012 and is in the process of developing a network of pediatric services with its new Academic partner. The goal of this project is to increase access to subspecialty care by adding 1 new subspecialty care clinic in DY2, 1 in DY3, 1 in DY4 and 1 in DY5. This benefit to patients is reflected in our milestones. Furthermore, this project will enable CH of SA to increase the number of subspecialist by 4 in DY3, 3 in DY4, and 3 in DY5. With each new clinic, CH of SA estimates patient visits to be 1,000 in DY3, 1,500 patient visits in DY4, and 2,000 patient visits in DY5. CH of SA expects that approximately 20% of the patients served in these new clinics will be Medicaid or indigent.

Category 3 outcomes: [IT-9.2] The goal is to reduce pediatric emergency department visits in DY4 and DY5. Targets will be determined based on the baseline established in DY3.

Project Description:

Children’s Hospital of San Antonio (CH of SA) will create a free-standing, Tier 1 Children’s hospital, which will be the focal point for a network of pediatric services throughout the community. As part of this network, CH of SA will improve the access to sub-specialty care by establishing practices and creating clinics and other sites of services to improve access to care for children with subspecialty healthcare needs. Additionally, CH of SA will serve as an aggregator where needed or desired to bring smaller practices together to improve efficiencies in care delivery models and further expand access points.

Goals and Relationship to Regional Goals:

Project Goal:
The primary goal of this project is to increase the capacity to provide pediatric sub-specialty care services and the availability of targeted specialty providers to better accommodate the high demand for such services. Targeted specialties include, but are not limited to:

- Pediatric Neurosurgery
- Otolaryngology
- Orthopedics
- Surgery
- Cardiology
- Nephrology
- Plastic Surgery
- Endocrinology
- Gastroenterology

This project meets the following regional goals:

- Triple Aim: assuring patients receive high-quality, patient-centered care, in the most cost effective ways.
- Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our counties
- Further develop and maintain a coordinated care delivery system
- Improve outcomes while containing cost growth

**5-Year Expected Outcome for Provider and Patients:**

Children’s Hospital of San Antonio expects to increase the number of specialty care clinics by 4, and 10 new pediatric specialists from the targeted list of specialties over the next five years. This increase will result in more available appointment times, increased patient awareness of available services, improved patient health outcomes, improved patient satisfaction, improvement in utilization patterns, and reduction in cost of services.

In the implementation of this project, CH of SA will endeavor for continuous quality improvement by monitoring the patient volumes and patient utilization to ensure that progress is being made towards meeting the project milestones. Additionally, CH of SA will ensure that all specialty care clinics make ongoing efforts to meet or exceed all nationally recognized protocol or quality benchmarks for specialty care clinics.

**Starting Point/Baseline:**

According to 2010 3d Health physician need study, Shortage of 20 pediatric sub-specialists in S.A. MSA; limited number of sites of care – most are congregated near the acute care facilities rather than spread across the region.
**Rationale:**

As stated in the RHP Community Needs Assessment, chronic disease management (CN.2) and provider shortages (CN.3) are major issues facing the region. Furthermore, recent data indicates that the San Antonio MSA has an estimated deficit of 20 Pediatric Subspecialists. This deficit is projected to intensify over the coming years due to physician retirements and increased demands from growth in the 00 to 18 age cohort.

Additionally, current conditions in Bexar county are not conducive for retaining and attracting the base of pediatric specialists needed to serve the current population. By creating a free-standing, Tier 1 children’s hospital, CH of SA is well positioned to help fill the gaps in pediatric sub-specialty care.

This project will include the following components:

- **a) Increase service availability with extended hours:** a broad network of specialists will be established through this program, which will allow for improved access to pediatric specialists and the opportunity to expand hours of care in selected locations as necessary.

- **b) Increase number of specialty clinic locations:** the proposed plan is to develop a broad based network of specialty clinics, which will improve access throughout the geographic market and to leverage more limited pediatric specialists through rotations to various clinic sites.

- **c) Implement transparent, standardized referrals across the system:** the proposed network will use a common information system and scheduling process to minimize delays in scheduling specialty visits and to assure that patients can access needed specialists in the right location wherever they may be located.

- **d) Quality Improvement for project using methods such as rapid cycle improvement.** Activities may include, but are not limited to, identifying project impacts, and identifying “lessons learned.” Network performance metrics to include scheduling issues, patient satisfaction issues and specialty physician needs will be monitored using the common network information system. Any identified performance gap will be addressed on a real time basis to ensure that the network is functioning at the highest levels to achieve the Trip Aim: improved access, quality and outcomes.

Three major milestones were selected to ensure that this project achieves the intended results:

1) **Conduct specialty care gap assessment based on community need:** this will establish which specialties should be targeted

2) **Launch/expand a specialty care clinic:** This will address the needs of the community thereby improving access to specialty care services.

3) **Increase the number of specialist providers, clinic hours and/or procedure hours available for the high impact/most impacted medical specialties:** this is a necessary element to improving overall access to specialty care.

**Unique community need identification numbers the project addresses:**

- CN.1 – Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.

- CN.2 - High prevalence of chronic disease and related health disparities require greater
prevention efforts and improved management of patients with chronic conditions.

- CN.3 - Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages.

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**

On September 21, 2012, CH OF SA Santa Rosa Children’s hospital converted to a free-standing children’s hospital and is now officially called Children’s Hospital of San Antonio. This was the first step toward creating a Tier 1 Children’s hospital, which will be the focal point for a network of pediatric services. This project will enable Children’s Hospital of San Antonio to create the much needed geographically dispersed network of pediatric specialty care services throughout the community.

**Related Category 3 Outcome Measure(s):**

OD-9, right Care, Right Setting:

IT-9.2 – Appropriate ED Utilization
  - Reduce pediatric Emergency Department visits (CHIPRA Core Measure)

**Reasons/rationale for selecting the outcome measure:**

The emergency department frequently becomes the focal point in the health care system when care is poorly coordinated. With shortages in many pediatric specialties, chronic disease management is a critical area of concern due to the impact it can have on ED utilization. The primary objective of this project is to improve access by establishing pediatric specialty practices, clinics and other sites of services. By providing a more geographically dispersed network of specialty care, patients with chronic diseases will have greater access to these much needed services, which will reduce ED utilization. For this reason, improvement target IT-9.2, ED appropriate utilization will be used as an improvement measure for this project.

**Relationship to other Projects:**

Expanding pediatric specialty care supports/reinforces several of the Category 1 and 2 projects: By increasing the number of pediatric sub-specialist and clinics, patients will have better access to providers who are equipped to manage their chronic diseases (project 1.3 & 2.2); this project will also support projects (2.1) Enhance/Expand Medical Homes, as it will give providers participating in medical home better access to specialty care for their patients; and ultimately, this project reinforces the objective of (2.4) Redesign to Improve the Patient Experience.

Additionally, this project will support each of the population focused improvements in Category 4: RD-1, Potentially Preventable Admissions; RD-2, 30 day re-admissions; RD-3, Potentially Preventable Complications; and RD-4; Patient-Centered Healthcare

**Relationship to Other Performing Providers’ Projects in the RHP:**

University Health System
Baptist Medical Center
Methodist
Plan for Learning Collaborative:

Following completion of the RHP plan, University Health System (anchor) will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include goals, regular meetings, site visits, conference calls, communication plan development, organizing learning event, and adopt metrics to measure success.

Project Valuation:

The valuation of CH OF SA projects use a method which ranks the importance of each project based several key factors. First, CH OF SA considered the extent the project helps further the goals of the Waiver, which are to (a) enhance access to health care, (b) increase the quality of care, and (c) improve the cost-effectiveness of care provided in the community. Next, CH OF SA considered the degree of need for the project in the community as addressed and identified in the Community Needs Assessment. The size of the required investment was also considered, which included considerations of personnel, equipment, time and complexity as well as the cost of the time, effort, and clinical resources involved in implementing the project. Finally, CH OF SA reflected on the scope of the project: the number of patients that would be affected, including the type of patients; the number of patient visits or encounters; how many providers or staff members would be added; the costs that would be avoided as a result of the project; and the ripple effect the project would have on all members of the healthcare system. These factors were weighed against the amount of funding available. We believe this approach is the best methodology available to assess the impact of the project, the investment of the performing provider and the overall value to the community to the extent community resources are available to help fund DSRIP projects. Final project valuation and funding distribution across categories was then determined based on the valuation provisions in the Program Funding and Mechanics Protocol.

The pediatric population often requires subspecialists in order to adequately address the unique needs of this population. Therefore, the expansion of specialty pediatric care will meet the Waiver goal to increase access to appropriate care by helping address a substantial need in the community for increased access to specialty care. This increase in access will also lead to better health outcomes for this vulnerable population, and ultimately increased efficiency of healthcare resources as the population becomes less reliant on EDs to receive appropriate care.

**Identifying Project and Provider Information:**

| Title: 1.1.1 – Establish more primary care clinics: Primary Care Expansion Program |
| Unique RHP ID#: (TPI Pending) 1.2 – PASS 1 |
| Provider Name: Children’s Hospital of San Antonio |
| TPI: 020844903 |

**Project Summary:**

Provider Description: Children’s Hospital of San Antonio (CH of SA) is a 249 bed academic children’s hospital serving San Antonio, New Braunfels, the Southern and Western boarders of Texas, as well as the Central Texas hill country.

Intervention(s): The primary goal of this objective is expand the capacity of primary care by developing a geographically dispersed network of pediatric primary clinics throughout San Antonio.

Need for the project: On September 21, 2012, CH OF SA Santa Rosa Children’s hospital converted to a free-standing children’s hospital and is now officially called Children’s Hospital of San Antonio. This was the first step toward creating a Tier 1 Children’s hospital, which will be the focal point for a network of pediatric services. This project will enable CH of SA to create the much needed geographically dispersed network of pediatric primary care services throughout the community.

Target population: This project will target the pediatric population, ages 0 – 17, which currently account for more than 26% of the total population. In Bexar and Comal counties, an estimated 14% of the population is covered by Medicaid or indigent. Increasing primary care access for this population can significantly improve patient health outcomes, patient satisfaction, utilization patterns and help to reduce healthcare costs.

Category 1 or 2 expected patient benefits: Working with its new academic partner, CH of SA seeks to enhance primary care capacity for the Medicaid and the indigent population by adding new clinics and hiring new physicians to serve the community. To accomplish this, CH of SA will open 1 clinics in DY2, 2 in DY3, 2 in DY4 and 2 in DY5. Furthermore, it will hire 1 new pediatrician in DY2, 2 in DY3, 2 in DY4, and 2 in DY5. With each new clinic, CH of SA estimates that it will have the ability to offer 1,170 urgent care appointments in DY 4 and an additional 810 in DY 5. CH of SA expects that approximately 20% of the patients served in these new clinics will be Medicaid or indigent.

Category 3 outcomes: [IT-9.2] The goal is to reduce pediatric emergency department visits in DY4 and DY5. Targets will be determined based on the baseline established in DY3.

**Project Description:**

Children’s hospital of San Antonio (CH of SA) will develop a geographically dispersed network of pediatric primary care clinics throughout Bexar County to enhance access points, increase available appointment times, and promote patient awareness of available services and overall primary care capacity, all of which will ultimately result in better health outcomes, patient satisfaction, appropriate utilization and reduced cost of services.

Recent physician demand analysis indicates a shortage of over 100 primary care physicians in the San Antonio area. Due to the growth of the population and impending physician retirements,
this deficit is likely to grow in the coming years. The primary focus will be on the expansion of Pediatric practices, pediatricians, but could also include mid-level providers and Family Medicine practices

**Goals and Relationship to Regional Goals:**

**Project Goal:**

The primary goal of this objective is to expand the capacity of Pediatric primary care to better accommodate the needs of children in the community. Increased access to primary care allows patients to receive the right care at the right time in the right setting. This will be accomplished by:

- Assisting established practices with new expansion and replacement of retiring physicians.
- Adding new practices in areas with significant access issues
- Serving as an aggregator where needed or desired to bring smaller practices together to improve efficiencies in care delivery models.

This project meets the following regional goals:

- Triple Aim: assuring patients receive high-quality and patient-centered care, in the most cost effective ways.
- Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our counties
- Further develop and maintain a coordinated care delivery system
- Improve outcomes while containing cost growth

**5-Year Expected Outcome for Provider and Patients:**
Children’s Hospital of San Antonio expects to increase the number of primary care access points by at least 7 new clinics over the next five years. This increase will result in more available appointment times, increased patient awareness of available services, improved patient health outcomes, improved patient satisfaction, improvement in utilization patterns, and reduction in cost of services.

In the implementation of this project, CH of SA will endeavor for continuous quality improvement by monitoring the patient volumes and patient utilization to ensure that progress is being made towards meeting the project milestones. Additionally, CH of SA will ensure that all pediatric primary care clinics make ongoing efforts to meet or exceed all nationally recognized protocol or quality benchmarks for pediatric primary care clinics.

**Starting Point/Baseline:**
According to the 2010 3d Health assessment, there is a shortage of 40 Pediatricians in Bexar County.

**Rationale:**
In the current health care system, more often than not, patients receive services in urgent and emergent care settings for conditions that could be better managed in a primary care setting. This often results in more costly, less coordinated care and a lack of appropriate follow-up care. To further complicate matters, Texas has a growing shortage of primary care doctors due to a decline in the number of medical students choosing to go into primary care. The recent community needs assessment identified healthcare provider shortages as a major issue facing RHP 6. With 26% of the population under the age of 18 and projected future growth of this age cohort over the next five years, access to pediatric primary care will only intensify.

The primary objective of this project is to establish more pediatric primary care clinics and practitioners in order to expand access to pediatric primary care.

**Three major milestones were selected to ensure that this project achieves the intended results:**

1. Establish additional/expand existing/relocate primary care clinics: this will be a critical factor to increasing pediatric access to primary care.
2. Train/hire additional primary care providers and staff and/or increase the number of primary care clinics for existing providers: this is an equally critical factor to increasing pediatric access to primary care.
3. Enhanced capacity to provide urgent care services in the primary care setting: by increasing access to primary care, patients can access their primary care provider for urgent care services that are appropriate for the primary care setting rather than using the ED.

**Unique community need identification numbers the project addresses:**

- CN.1 – Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.
- CN.2 - High prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions.
- CN.3 - Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages.

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**

On September 21, 2012, CH OF SA Santa Rosa Children’s hospital converted to a free-standing children’s hospital and is now officially called Children’s Hospital of San Antonio. This was the first step toward creating a Tier 1 Children’s hospital, which will be the focal point for a network of pediatric services. This project will enable Children’s Hospital of San Antonio to create the much needed geographically dispersed network of pediatric primary care services throughout the community.
**Related Category 3 Outcome Measure(s):**

OD-9, Right Care, Right Setting:

IT-9.2 – Appropriate ED Utilization

- Reduce pediatric Emergency Department visits (CHIPRA Core Measure)

**Reasons/rationale for selecting the outcome measure:**

According to a recent physician demand analysis, there is an estimated shortage of 40 pediatricians in Bexar County. This shortage of pediatricians can cause significant access issues, forcing parents/guardians to use the ED as their child’s primary care provider for acute illness management and preventative care needs. The primary goal of this project is to help established practices expand, replace retiring physicians, and add new practices in areas with significant access issues. The ED Appropriate Utilization improvement target is an accurate measure for determining the impact this increased access has on ED utilization.

**Relationship to other Projects:**

Expanding pediatric primary care supports/reinforces several of the Category 1 and 2 projects: By increasing the number of pediatricians, patients will have better access to providers who are equipped to manage their chronic diseases (project 1.3 & 2.2); this project will also support projects (2.1) *Enhance/Expand Medical Homes*, as it provide additional pediatricians who could potentially participate in a medical home model; and this project also reinforces the objective of (2.4) *Redesign to Improve the Patient Experience*, in that increased access to primary care will result in greater overall patient satisfaction.

Additionally, this project will support each of the population focused improvements in Category 4: RD-1, *Potentially Preventable Admissions*; RD-2, *30 day re-admissions*; RD-3, *Potentially Preventable Complications*; and RD-4; *Patient-Centered Healthcare*

**Relationship to Other Performing Providers’ Projects in the RHP:**

- University Hospital
- Baptist Medical Center
- Frio Regional Hospital
- Guadalupe Regional Medical Center
- Peterson Regional Medical Center
- Medina Regional Hospital
- Val Verde Regional Medical Center
- University of Texas Health Science Center

**Plan for Learning Collaborative:**

Following completion of the RHP plan, University Health System (anchor) will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include goals, regular meetings, site visits, conference calls, communication plan development, organizing learning event, and adopt metrics to measure success.
Project Valuation:

The valuation of CH OF SA projects use a method which ranks the importance of each project based on several key factors. First, CH OF SA considered the extent the project helps further the goals of the Waiver, which are to (a) enhance access to health care, (b) increase the quality of care, and (c) improve the cost-effectiveness of care provided in the community. Next, CH OF SA considered the degree of need for the project in the community as addressed and identified in the Community Needs Assessment. The size of the required investment was also considered, which included considerations of personnel, equipment, time and complexity as well as the cost of the time, effort, and clinical resources involved in implementing the project. Finally, CH OF SA reflected on the scope of the project: the number of patients that would be affected, including the type of patients; the number of patient visits or encounters; how many providers or staff members would be added; the costs that would be avoided as a result of the project; and the ripple effect the project would have on all members of the healthcare system. These factors were weighed against the amount of funding available. We believe this approach is the best methodology available to assess the impact of the project, the investment of the performing provider and the overall value to the community to the extent community resources are available to help fund DSRIP projects. Final project valuation and funding distribution across categories was then determined based on the valuation provisions in the Program Funding and Mechanics Protocol.

The expansion of primary care will help address a substantial need in the community for increased access to primary care. It also advances the Waiver goal of improving outcomes while curbing the risk of healthcare costs, because primary care is one of the most cost effective methods to increase health outcomes. The positive benefits of preventative primary care are especially prevalent in the pediatric population because many clinical issues can be identified and addresses before they become chronic or even acute conditions.

### Identifying Project and Provider Information:

| Title: 1.1.2 Expand existing primary care capacity |
| Unique RHP ID#: 020844901.1.1 – PASS 1 |
| Provider Name: CHRISTUS Santa Rosa Health System (CSRHS) |
| TPI: 020844901 |

### Project Summary:

**Provider Description:** CHRISTUS Santa Rosa Health System (CSRHS) is a Catholic, non-profit health and wellness system with three adult acute care hospitals, one short-stay surgical hospital, two free standing emergency departments and several physician joint-venture ambulatory surgery centers. With a combined total of 496 beds, CSRHS currently serves the San Antonio and New Braunfels markets which has a total population of 1.9 million.

**Intervention(s):** This project will expand primary care capacity by increasing the number of primary care clinics, hours and staffing, which will improve overall access for the targeted population.

**Need for the project:** Texas has a growing shortage of primary care providers due to the needs of an aging population. This is especially true for the far Northwest side of San Antonio, which is considered a medically underserved area and has an identified need of 106 primary care physicians. CHRISTUS Santa Rosa Family Health System currently does not have an adequate number of physicians to expand into this service area and will need to add an additional four providers to its practice over the next four years.

**Target population:** The target population for this project lives on the far northwest side of San Antonio, which is currently considered to be a medically underserved area. The total population for this area is estimated to be at 464,000, and 12% of that population is either Medicaid eligible or indigent.

**Category 1 or 2 expected patient benefits:** In the last twelve months, the existing primary care clinic had 29,494 total office visits. The goal of this project is to increase access by offering an additional 4,500 office visits in year four of the program and an additional 3,750 visits in year five. This increase in capacity will provide much needed access to the uninsured, underserved, indigent and Medicaid population. CSRHS expects that approximately 20% of the patients served in this clinic will be Medicaid or indigent.

**Category 3 outcomes:** [IT-9.2] The goal of this project is to improve ED utilization in DY4 and DY5. Targets will be determined based on the baseline established in DY3.

### Project Description:

Texas has a growing shortage of primary care doctors and nurses due to the needs of an aging population, a decline in the number of medical students choosing primary care, and thousands of aging baby boomers who are doctors and nurses looking towards retirement. The shortage of primary care workforce personnel in Texas (CN.3) is a critical problem that can be addressed under this waiver. The shortage of primary care providers has contributed to increased wait times in hospitals, community clinics, and other care settings. Expanding the primary care workforce will increase access and capacity and help create an organized structure of primary care providers, clinicians, and staff. Moreover, this expansion will strengthen an integrated health care system and play a key role in implementing disease management programs. A greater focus on primary care will be crucial to the success of an integrated health care system. Furthermore, in order to effectively operate in a medical home model, there is a need for residency and training programs to expand the capabilities of primary care providers and other staff to effectively provide team-based care and managed population health.
The CHRISTUS Santa Rosa Family Health Center (CSRHC) is a NCQA Level III Patient-Centered Medical Home accredited program providing comprehensive outpatient medical and wellness care to pediatric and adult patients while training physicians in the specialty of Family Medicine. The CSRFHC’s goal is to provide quality, comprehensive, interdisciplinary and multidisciplinary outpatient medical care of varying severity to all patients seeking care in a teaching environment. Additionally, all physicians successfully graduating from this program will be fully trained to operate patient-centered medical homes.

Goals and Relationship to Regional Goals:

Project Goals:
The goal of this project is to expand primary care capacity by increasing the number of primary care clinics, hours and staffing, which will improve overall access for the targeted population.

This project meets the following regional goals:
- Triple Aim: assuring patients receive high-quality and patient-centered care, in the most cost effective ways.
- Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our counties
- Further develop and maintain a coordinated care delivery system
- Improve outcomes while containing cost growth

5-Year Expected Outcome for Provider and Patients:
CSRHS plans to expand beyond its existing clinic space and add an additional 4 primary care physicians over the next four years. By expanding the number of primary care clinics, physicians, hours and staffing, this project will result in a decrease in the number of patients that receive services in urgent and emergency settings, therefore resulting in improvement in the overall health of the population and reduction in costs.

In the implementation of this project, CSRHS will endeavor for continuous quality improvement by monitoring the patient volumes and patient utilization to ensure that progress is being made towards meeting the project milestones. Additionally, CSRHS will ensure that all primary care clinics make ongoing efforts to meet or exceed all nationally recognized protocol or quality benchmarks for primary care clinics.

Starting Point/Baseline:
1 clinic location in Downtown San Antonio, 13 primary care providers, 29,494 total office visits

Source: CHRISTUS Santa Rosa Family Health Center internal records
Rationale:

In 2010, Texas had 176 patient care physicians per 100,000 population and 70 primary care physicians per 100,000 population with a state ranking of 46 and 47, respectively (comparable ratios for US total are 219.5 and 90.5, respectively). From 2001 to 2011, the Texas physician workforce grew 32.3%, exceeding the population growth of 25.1%. Primary care physician workforce grew only 25% in the same period. From 2002 to 2011, Texas increased medical school enrollment 31% from 1,342 to 1,762 in line with the national call by the Association of American Medical Colleges to increase medical school enrollments by 30%. In 2011, there were 1,445 medical school graduates. Coincidentally, there were 1,445 allopathic entry-level GME positions offered in the annual national Resident matching program (there were 31 osteopathic slots). The Texas higher Education Coordinating Board recommends a ratio of 1:1 entry-level GME positions for each Texas medical school graduate. The number of Texas medical school graduates is expected to peak at over 1,700 in 2015. This implies a need for 400 additional GME positions by 2015. The shortage of GME positions or residency slots may be the single most problematic bottleneck in Texas’ efforts to alleviate the state’s physician Shortage. Resident physicians provide low-cost care to needy populations and tend to remain in the state in which the complete their residency training.

Consistent with what is occurring at the state level, RHP 6 is in need of additional providers. By expanding its existing clinic and adding four additional primary care providers over the next five years, CHRISTUS Santa Rosa Health System (CSRHS) hopes to increase the number of primary care physicians practicing in Bexar County, thus improving primary care access to the community, while also strengthening an integrated health care system.

The core project components include:

a) **Expand primary care clinic space**: CSRHS will add an additional primary care clinic to its CHRISTUS Santa Rosa Westover Hills Campus in DY2.

b) **Expand primary care clinic hours**: CSRHS will add a total of 4 new primary care physicians by DY5. In doing so, the number of available appointment hours will be increased according.

c) **Expand primary care clinic staffing**: As a result of the additional clinic and physicians, CSRHS will increase the number of clinic staff to adequately support the additional volume.

Two major milestones were selected to ensure that this project achieves the intended results:

1) **Establish additional/expand existing/relocate primary care clinics**: The addition of a clinic and new providers in far northwest San Antonio will allow CSRHS to increase access in a currently underserved area.

2) **Train/hire additional primary care providers and staff and/or increase the number of primary care clinics for existing providers**: CSRHS plans to hire a total of 4 new primary care providers by DY5 to staff the new clinic in far northwest San Antonio. This will provide much needed access to this underserved area.

Unique community need identification numbers the project addresses:

- **CN.2** – High prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions.
**CN.3 -** Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages.

**How the project represents a new initiative or significantly enhances an existing delivery system:**

The CHRISTUS Santa Rosa Family Health Center, an NCQA level III medical home, is planning to expand to a new medically underserved location in San Antonio. To adequately provide the much needed access to this population, CSRHS will increase the number of primary care providers by 4 over the next four years.

**Related Category 3 Outcome Measure(s):**

- OD-9 Right Care Right Setting
- IT-9.2 ED Appropriate Utilization
  - Reduce all ED visits

**Reasons/rationale for selecting the outcome measure:**

The lack of primary care access has a direct correlation with increased utilization in the ED. The growing shortage of primary care workforce personnel in Texas is a critical problem that has contributed to increased wait times in hospitals, community clinics, and other care settings. Patients with non-emergent issues are using the ED for their primary care needs, which is a costly burden to the health care system. The primary goal of this project is to train more workforce members to serve as a primary care provider, which will help address this substantial shortage, therefore giving patients a less costly alternative to the ED.

**Relationship to other Projects:**

Expanding primary care supports/reinforces several of the Category 1 and 2 projects: Increasing the number of physicians rotating through the primary care residency program will have a direct impact on *Expanding Primary Care Capacity (1.1)*; this project not only will increase the number of available physicians to participate in medical homes (2.1), it will also ensure that they are trained in the medical home concept; finally, the medical home concept of this training program also reinforces the *Redesign of Primary Care (2.3), the Redesign to Improve the Patient Experience (2.4)*

**Relationship to Other Performing Providers’ Projects in the RHP:**

- University Hospital
- Baptist Medical Center
- Children’s Hospital of San Antonio
- Frio Regional Hospital
- Guadalupe Regional Medical Center
- Peterson Regional Medical Center
- Medina Regional Hospital
- Val Verde Regional Medical Center
- University of Texas Health Science Center
**Plan for Learning Collaborative:**

Following completion of the RHP plan, University Health System (anchor) will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include goals, regular meetings, site visits, conference calls, communication plan development, organizing learning event, and adopt metrics to measure success.

**Project Valuation:**

The valuation of CHRISTUS projects use a method which ranks the importance of each projects based several key factors. First, CHRISTUS considered the extent the project helps further the goals of the Waiver, which are to (a) enhance access to health care, (b) increase the quality of care, and (c) improve the cost-effectiveness of care provided in the community. Next, CHRISTUS considered the degree of need for the project in the community as addressed and identified in the Community Needs Assessment. The size of the required investment was also considered, which included considerations of personnel, equipment, time and complexity as well as the cost of the time, effort, and clinical resources involved in implementing the project. Finally, CHRISTUS reflected on the scope of the project: the number of patients that would be affected, including the type of patients; the number of patient visits or encounters; how many providers or staff members would be added; the costs that would be avoided as a result of the project; and the ripple effect the project would have on all members of the healthcare system. These factors were weighed against the amount of funding available. We believe this approach is the best methodology available to assess the impact of the project, the investment of the performing provider and the overall value to the community to the extent community resources are available to help fund DSRIP projects. Final project valuation and funding distribution across categories was then determined based on the valuation provisions in the Program Funding and Mechanics Protocol.

The recruitment and expansion of primary care clinics and physicians will help address a substantial need in the community for increased access to primary care. It will also go a long way towards achieving the Waiver goal of improving outcomes while curbing the risk of healthcare costs, because primary care is one of the most cost effective methods to increase health outcomes.

### Identifying Project and Provider Information:

**Title:** 1.9.2 Improve access to specialty care  
**Unique RHP ID #:** 112742503.1.1 – PASS 1  
**Performing Provider:** Clarity Child Guidance Center  
**Performing Provider TPI:** 112742503

### Project Summary:

**Provider Description:** Clarity Child Guidance Center is a non-profit children’s psychiatric hospital located in San Antonio, Texas, providing a continuum of services, from preventive therapy to acute care. Our 52-bed hospital, along with day treatment and outpatient therapy will help over 8,000 children. Patients primarily arrive from Bexar County, with a county seat that is the 7th largest city in the nation. However, 20% of Clarity’s patients arrive from surrounding rural counties, which often lack any psychiatric services.

**Intervention(s):** This project will provide the “right care at the right time”, in order to assess children’s psychiatric needs and provide the appropriate treatment plans. Five beds of a 20 bed expansion will be reserved as a regional psychiatric service to assess patients sooner and provide the appropriate treatment plan. Since Clarity offers a continuum of services, the appropriate treatment plan is expected to involve preventive outpatient therapy, thereby avoiding acute care in some cases. We will also free up busy emergency rooms from patients who present with psychiatric symptoms, yet psychiatric care is not immediately available.

**Need for the project:** Over 1,300 children present at local emergency rooms presenting with psychiatric symptoms, only to be “boarded” for care. We propose creating a children’s regional psychiatric service where the patient can be assessed and treatment plans implemented, bypassing ER’s where psychiatric services are often not available. We anticipate that over 300 children and adolescents per year can be assessed for services, with a continuum of care provided that can result in treatment plans such as a referral, individual, family or group therapy, medication evaluation, medication management, psychological assessments and consultations or partial hospitalization as alternatives to acute care hospitalization.

**Target population:** Children and adolescents, ages 3-17, primarily with the Medicaid population, as we are a disproportionate share hospital and one of only a few resources providing serious mental health care in our region. Expanding our continuum of services, including preventive behavioral health services, to more Medicaid children has a substantial community impact.

**Category 1 or 2 expected patient benefits:**
- Divert patients from presenting at ERs where care is not readily accessible
- Assess patients (>300) for best treatment courses related to mental health in DY4 and DY5
- Provide the appropriate level of care to patients ages 3-17
- Thereby, decreasing unnecessary hospital admissions for acute care, while increasing preventive treatment options such as outpatient therapy and increasing satisfaction 2%

**Category 3 outcomes:**
Our goal is to reduce the behavioral health acute admission rate for children and adolescents, with the percentage improvement to be determined after creating a baseline in DY3.

### Project Description:

Clarity Child Guidance Center proposes to provide regional psychiatric services to children ages 3-17 in a setting where a continuum of care is available, to effectively divert patients from local
ER settings into the appropriate care level.

A report completed in 2010 by Methodist Healthcare Ministries researched children's psychiatric beds in our region and revealed a 21 bed deficit, which has grown to 65 beds over the past two years. The Texas Department of State Health Services concurs with those findings, noting that in the last 17 years, psychiatric beds have shrunk by more than 30%, while demand continues to soar. Compounding the problem is the increased incidence of mental health crises. Root causes of mental health illness can often be traced to abuse and neglect of children in our community, increased obesity (which leads to depression and other mental illnesses), increased single parent homes and other factors which all lead to substantial increases in mental health needs. As a result of the increased need in children's mental health care and lack of access, 1,300 children annually present to ERs with a psychiatric condition. However, most regional hospitals do not provide psychiatric services. These hospitals have coined the term "boarding," keeping a patient in the ER until a bed is made available at another facility that does provide care.

As a solution, Clarity Child Guidance Center provides a continuum of mental health services for children ages 3-17, including acute inpatient hospitalization. We are uniquely positioned to expand capacity for the shortage of inpatient care beds for children, by creating a regional children’s psychiatric emergency service. This regional emergency service for children's psychiatric needs will help to divert the 1,300 children being boarded at ERs to a facility where appropriate mental health care can be provided. This also frees beds in ERs for patients who can be treated at local hospitals. Busy ER's turn a bed over about every two hours, meaning that creating a regional access point for children's psychiatric emergencies could open thousands of traditional ER beds by caring for children more appropriately in Clarity CGC's clinical settings.

It is Clarity CGC’s history and focus on children’s mental health and a continuum of care, including outpatient therapy and day treatment that will prevent many children from being hospitalized. Our expected outcome is a reduction in Pediatric ER visits to hospitals that lack care while offering a treatment plan that includes options such as outpatient therapy, day treatment, and if medically necessary, acute emergency services.

**Goals and Relationship to Regional Goals:**
Our goal is reduce ER admissions in settings where care is not readily available, while providing a continuum of mental health services to children ages 3-17. By providing the right care in the right setting, we can reduce admissions and increase preventive care treatment.

**Project Goals:**
- Divert patients from presenting at ERs where care is not readily accessible
- Assess patients for best treatment courses related to mental health
- Provide the appropriate level of care to patients ages 3-17
- Thereby, decreasing unnecessary hospital admissions for acute care, while increasing preventive treatment options such as outpatient therapy

This project meets the following regional goals:
- Triple Aim: assuring patients receive high-quality and patient-centered care, in the most cost effective way; and
- Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our counties
Challenges:
The primary challenge for this project will be the coordination and communication with regional hospitals that don’t offer psychiatric care for children ages 3-17 to ensure their knowledge and processes for referring patients to our regional services. With effective communication and coordination, the project will be successful.

5-Year Expected Outcome for Provider and Patients:
Clarity Child Guidance Center expects to see improvements in behavioral healthcare outcomes for patients assessed and treated. Patients will be surveyed on satisfaction and improvements initiated as a result of all metrics.

Starting Point/Baseline:
The following data/information about our organization would help establish a baseline in DY2:
- Nearly 7,000 children served through outpatient therapy services resulting in 21,000 outpatient visits
- The largest concentration of trained professionals already on staff, with capacity to grow to increase service availability through the creation of a regional children’s psychiatric emergency service

Rationale:
Project 1.9.2 seeks to increase the capacity to provide specialty care services and the availability of targeted specialty providers to improve access to specialty care. As one of only four providers for children in our region suffering from serious mental illness, and the only nonprofit providing services to children as young as three, we believe we are uniquely qualified to expand and enhance service availability. The project option of 1.9.2 is the best alignment to our project goal, as we will be increasing capacity to behavioral health services, while increasing the number of providers.

Project Components:
With the design, development and deployment of the Regional Children’s Psychiatric Services project, we propose to meet all required project components.

a) Increase service availability with extended hours. Through collaboration and a referral network, we will increase service availability by creating a regional psychiatric emergency service for children ages 3-17. The psychiatric emergency service shall be available 24/7 to the community.
b) Increase number of specialty clinic locations. A 65-bed deficit of children’s psychiatric beds exits in our community. This project seeks to increase the number of beds to 20, with five beds reserved for a regional psychiatric service. This effort inherently increases capability and capacity, which is the intent of item b).c) Implement transparent, standardized referrals across the system. Clarity Child Guidance Center is part of the health information exchange effort to create a pathway for transparent, standardized referrals. Even independent of this effort, we maintain a large referral base (both referring in or out of our system). We intend to expand the referral base as a result of this project.d) Conduct quality improvement for project using methods such as rapid cycle. A project management team will deploy this initiative, creating the opportunity for quality improvements. Further, standardized processes within our hospital system allow for rapid cycle improvements, through suggestions, policy updates, and various
councils and committees who evaluate metrics and processes for improvement opportunities.

**Unique community need identification numbers the project addresses:** Our project aligns with the Region’s needs as outlined in the Community Needs Assessment, specifically to the following identification areas:

- **CN.1** Texas ranks last in the nation on health care quality. *In particular, Texas ranks last on nearly all mental health indicators.* An investment in a behavioral health project such as Clarity CGC’s creates the foundation to change this trend.

- **CN.2** Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages. *We care for the uninsured and under-insured daily.* We are one of only four providers in the region that offer serious mental health treatment for children ages 3-17, and we are the only provider on the 1115 waiver list that would provide services specifically as young as three.

- **CN.4** There is a shortage of high quality mental and behavioral health services that are integrated with physical health care services and/or provide crisis stabilization. *Clarity CGC currently offers the largest concentration of child and adolescent professionals in the region, through our partnership with Southwest Psychiatric Physicians and our affiliation with The University of Texas Health Science Center’s Department of Psychiatry.* We are uniquely positioned to increase the number of providers, services, and integrate with physical health. Part of our project planning is to expand our affiliation with UTHSC to the Pediatrics Department.

Our project represents both a new and expanded initiative. First, it’s new in its thought process of creating a regional psychiatric emergency service to prevent “boarding” of children in hospitals who lack appropriate providers and care and who merely transfer their patients to our facility and precious few others, on average 12 hours after admission. Second, it’s an expanded initiative in that Clarity CGC offers a continuum of services based on decades of service. We offer outpatient therapy, day treatment and acute inpatient hospitalization (for a fraction of the cost of standard pediatric ER settings). Third, through our established affiliation with The University of Texas Health Science Center’s Department of Psychiatry, we are positioned to form a similar affiliation with Pediatrics, creating a system of integrated care.

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**

This project reflects a new initiative in that it seeks to regionalize psychiatric emergency services where care is available, versus the many existing ER’s where children are “boarded” for care. As for data to support the need, one in five children will be diagnosed with a mental, emotional or behavioral disorder (affecting over 80,000 children in Bexar County alone).

Clarity CGC is a disproportionate share hospital and will continue to serve Medicaid/CHIP children presenting with psychiatric symptoms in order to assess and provide the best treatment plan.

Texas ranks last in per capita spending on mental health care for children amongst all states. Improvements in mental health delivery and outcomes are critical for our overall community’s
health.

**Related Category 3 Outcome Measure(s):**

We have selected a measure within OD-2, “Potentially Preventable Admissions” and the related standalone outcome measure of 3-IT 2-4. This measure’s goal is to reduce Emergency Department visits for one of several optional target conditions, one of which is behavioral health/substance abuse. However, because this measure is available only for patients 18 and older, we were advised by HHSC to utilize the custom/optional measure of 2.13 to address that our outcomes would be related to youth, ages 3-17. Our project is of benefit to all performing providers in the region, as children are presenting in local Emergency Rooms without access to “right care, right setting” and displacing beds for treatment plans that can be addressed effectively by the local hospitals. Further, treating children when they are children prevents a host of unwelcome outcomes, including but not limited to suicide, incarceration, dropout, alcohol and drug abuse and many other societal ills.

Our Category 1 Project, to improve access to specialty care, directly links to potentially preventable admissions, a key outcome of 2.13. Improving the health of low-income populations will lead to long-term sustainable outcomes while decreasing societal burden.

**Relationship to other Projects:**

Improving behavioral care outcomes is a key tenet of the 1115 Waiver and also prominently noted in the Community Needs Assessment for our Region. The Center for Healthcare Services (CHCS) has multiple companion projects in the behavioral health areas of Category 1 and 2. Our project (112742503.1.1) will have several integrated links with the multitude of CHCS projects. Specifically, our project ties into Category 4 measures such as Potentially preventable admissions (RD-1.3); 30-day readmissions (RD-2.3); Patient Centered healthcare (RD-4.1), including patient satisfaction and medication management; and finally, Emergency Department (RD-5). We believe we will be exempt from many of the measures in RD-3, potentially preventable complications (PPCs), as our hospital is specialized in behavioral health treatment.

**Relationship to Other Performing Providers’ Projects in the RHP:**

The Center for Healthcare Services has multiple companion projects in the behavioral health areas of Category 1 and 2. Following completion of the RHP Plan, our anchor, University Health System will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure. University Health System will seek to provide facilitation and administrative assistance as needed to ensure the success of these endeavors. The RHP 6 website will be available to the Learning Collaborative to network and share ideas, challenges, and success stories with colleagues. RHP 6 hopes to make significant transformational progress on its project milestones to achieve waiver goals and share what we learn with the rest of the State.
**Plan for Learning Collaborative:**

In addition to the information shared directly above, we are members of the Bexar County Health Collaborative. Additionally, we are a teaching hospital, affiliated with the UTHSC, where outcomes will be openly shared as part of the learning process. Staff is also members of the Community Resource Coordination Group (CRCG) for both Bexar County and the surrounding counties. We are also members of the MDRC, a group of medical directors that meets quarterly that was formed by Judges at the Probate Court. Ideas will be shared, tested, and solutions provided as part of our membership process.

**Project Valuation:**

The total scope of adding additional services, including a bed expansion, hiring additional providers, infrastructure updates, etc., is close to $8M in scope. Local funding is in the form of IGT funding by our affiliation partner, University Health System, who will provide $1,968,152. The 1115 Waiver will add $2,350,064 in funding for a total of $3,936,807. The remaining costs will be covered through development efforts of our nonprofit agency and self-funding through bonds. The populations that will be served are youth ages 3-17, and the community benefit is immense, not only in line with the Community Needs Analysis, but with Texas’ woeful lack of providers and access to mental healthcare.

### Project Summary:

**Provider Description:** Connally Memorial Medical Center (CMMC) is a 44-bed hospital in Floresville, TX. CMMC is the sole community hospital serving Wilson County with a population of 43,000.

**Intervention(s):** CMMC will establish hospital owned and operated specialty clinics for targeted specialty care services based on community need.

**Need for the project:** Establishing specialty care clinics will allow CMMC to expand specialty services for most impacted specialties and improve access for targeted populations. A project to expand high impact specialty care is needed in Wilson County and the surrounding areas. The leading causes of death in Wilson county are related to cardiovascular conditions (30% of all deaths) and heart diseases (24%). Based on the GMNEC Model for physician to population ratios, Wilson County has a shortage of 34 physicians (representing all specialties). Additionally, Wilson County has been designated as a Health Provider Shortage Area as well as a Medically Underserved Area by the U.S. Department of Health and Human Services.

**Target population:** Our target population would be all of Wilson County. Currently in Wilson County 10% of the population lives below the federal poverty level. Additionally, 23% of our patients are either Medicaid eligible or indigent/self pay, so we expect they will benefit from this service.

**Category 1 or 2 expected patient benefits:** The project seeks to provide 17,402 specialty clinic encounters/consults from DY2 – DY5. Hospital does not currently operate any specialty clinics, therefore all specialty encounters/consults will be new services provided to community, thus increasing access to care.

**Category 3 outcomes:** IT-1.6 Cholesterol Management for patients with cardiovascular conditions
Our goal is to reduce the total blood cholesterol level for patients with known heart disease. Goal is TBD

### Project Description:

Connally Memorial Medical Center proposes to establish hospital owned and operated specialty clinics for targeted specialty care services based on community need. Specialty clinics will provide care for unassigned patients and will coordinate care with primary care clinics, and hospital emergency department to expand access to specialty services. Connally Memorial Medical Center serves a population of over 40,000 residents.

### Goal and Relationship to regional Goals:

The overarching goal of this project is to improve clinical health outcomes for residents of...
Wilson County. We will work toward achieving that goal by recruiting specialty providers to Wilson County, establishing specialty care clinics and implementing an electronic health record within these clinics to better coordinate care and referrals from primary care physicians.

**Project Goals**
1. Increase the number of specialty providers
2. Increase the number of patients seen in specialty clinics

This project meets the following regional goals.
1. Improves outcomes while containing cost growth.
2. Develops and maintains a coordinated care delivery system.
3. Assures patients receive high-quality and patient-centered care in the most cost effective ways.

**Challenges:**
The primary challenge for this project will be to recruit specialty providers to our community. Small and rural communities, such as Wilson County, have historically had a difficult time attracting and retaining physicians.

**5 Year expected outcome for Provider and Patients:**
Connally Memorial Medical Center expects to see improvements in the number of specialist providers available to treat patients in Wilson County. Additionally, the provider expects to see improvements in the health outcomes for chronic diseases and health disparities outlined in the community needs assessment.

**Starting Point/Baseline:**
No current baseline exists as the hospital does not currently own and operate any specialty clinics. Therefore, the baseline number for encounters as well as the participating providers begins at 0 in DY 2.

**Rationale:**
CMMC has chosen the project option of *Expanding high impact specialty care capacity in most impacted specialties*. Establishing specialty care clinics will allow CMMC to expand specialty services for most impacted specialties and improve access for targeted populations. Additionally, specialty care clinics allow for enhanced care coordination for those patients requiring intensive specialty services. A project to expand high impact specialty care is needed in Wilson County and the surrounding areas. The leading causes of death in Wilson county are related to cardiovascular conditions (30% of all deaths) and heart diseases (24%). Based on the GMNEC Model for physician to population ratios, Wilson County has a shortage of 34 physicians (representing all specialties) Additionally, Wilson County has been designated as a Health Provider Shortage Area as well as a Medically Underserved Area by the U.S. Department of Health and Human Services. In addition to already being underserved, the Wilson County population is expected to increase by 24% by 2015.

**Project Components**
   a) Identify high impact/most impacted specialty services and gaps in care coordination – CMMC will conduct a formal specialty needs assessment to determine most impacted specialty services and gaps in care.
b) Increase the number of residents/trainees. CMMC will not initially address this component due to the fact that provider does not offer a residency training program.

c) Design workforce enhancement initiatives to support access to specialty providers. CMMC will recruit additional specialty providers to support goal of providing additional services in underserved markets.

d) Conduct quality improvement for project using methods such as rapid cycle improvement – CMMC will expand and implement hospital EMR to specialty clinics. We will create a registry of patients seen in CMMC inpatient setting and emergency department to help facilitate clinical follow up to outpatient setting. Reports will be run monthly and shared with specialty clinic staff at monthly meetings. Meetings will be held monthly to discuss any issues associated with communication between hospital and clinic providers as well as patient transfers.

Community need Identification number:
- CN.2 (A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions. Leading causes of death in RHP 6 include cardiovascular disease, cancer and diabetes.)
- CN.3 (Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and healthcare provider shortages.)

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative.
Currently there are no hospital based clinics in Wilson County. The Wilson County medical community is a system of independent medical providers including private physician groups, clinics and Connally Memorial Medical Center. Our project will improve access for targeted patients while helping CMMC reach capacity for treating patients with specialty needs. More specifically, we will increase the number of specialty clinic locations and service availability. This will in turn allow patients to have greater access to hospital resources including quality improvement, case management and social services.

Related Category 3 Outcome Measure(s):

OD-1 Primary Care and Chronic Disease Management

IT-1.6 Cholesterol Management for patients with cardiovascular conditions

Reasons/rationale for selecting the outcome measures:
Total blood cholesterol is directly related to the development of coronary artery disease (CAD) and coronary heart disease (CHD), with most of the risk being associated with low density lipoprotein cholesterol (LDL-C). When LDL-C levels are high, cholesterol can build up within the walls of the arteries, causing atherosclerosis, the build up of plaque. Hemorrhagin or clot formation can occur at the site of plaque build-up, blocking arteries and causing heart attack and stoke. Reducing cholesterol in patients with known heart disease is critically important, as treatment can reduce morbidity (heart attack and stroke) and mortality by as much as 40%. The National Cholesterol Education Program (NCEP) has established guidelines for managing cholesterol levels in patients with heart disease. The guidelines established the need for close
monitoring of LDL cholesterol in patients with coronary heart disease and set a target for LDL-C of less than or equal to 100 mg/dL for such patients. Cholesterol screening and control depends on the combined efforts of patient, physician and organization. Lifestyle factors and new medications offer tangible means for reducing cholesterol and the risk of heart disease.

Relationship to other Projects:
This project’s focus on treating patients with cardiovascular conditions and preventing conditions such as heart attack and stroke supports our Category 1 project in our RHP: 135151206.1.1- Expand Specialty Care Capacity. Related Category 4 measures include potentially preventable admissions in RD-1 and Potentially Preventable Complications in RD-3.

Relationship to Other Performing Providers’ Projects in the RHP:
n/a

Plan for Learning Collaborative:
n/a

Project Valuation:
Wilson County is underserved by many specialty care providers. The possible expansion of Medicaid services in 2014, with the inherent pent-up demand for services, will exacerbate this shortage. Multiple sources of information document a specialty care shortage in many specialties. Many health specialty services have wait times of greater than 2 weeks for the third available appointment, our primary care network is growing rapidly, the northern county area of Wilson and Karnes Counties are rapidly growing in population. Expanding specialty services will also expand preventive services for patients in this area. Our electronic medical record will allow seamless referrals and communication between our primary care and specialist providers. Additional specialty access will improve the quality of care and health care outcomes in the community.

Identifying Project and Provider Information:

Title: 1.1.1 ESTABLISH MORE PRIMARY CARE CLINICS
Unique RHP ID#: 135151206.1.2 – PASS 2
Performing Provider: Connally Memorial Medical Center
Performing Provider TPI: 135151206

Project Summary:

Provider Description: Connally Memorial Medical Center (CMMC) is a 44-bed hospital in Floresville, TX. CMMC is the sole community hospital serving Wilson County with a population of 43,000

Intervention(s): Connally Memorial Medical Center proposes to establish additional hospital owned and operated primary care clinics.

Need for the project: Additional primary care clinics will provide care for unassigned patients and will coordinate care with other medical providers, including hospital emergency department and specialty physicians. By enhancing access points, available appointment times, patient awareness of available services and overall primary care capacity, patients and their families will align themselves with the primary care system resulting in better health outcome, patient satisfaction, and appropriate utilization and reduced cost of services.

Target population: Our target population would be all of Wilson County. Currently in Wilson County 10% of the population lives below the federal poverty level. Additionally, 23% of our patients are either Medicaid eligible or indigent/self pay, so we expect they will benefit from this service.

Category 1 or 2 expected patient benefits: The project seeks to provide 12,000 primary care clinic encounters/consults from DY2 – DY5

Category 3 outcomes: IT-6.1 Percent improvement over baseline of patient satisfaction scores

Our goal is to increase the level of patient satisfaction for patients in primary care clinics. Goal is TBD.

Project Description:

Connally Memorial Medical Center proposes to establish additional hospital owned and operated primary care clinics. Additional primary care clinics will provide care for unassigned patients and will coordinate care with other medical providers, including hospital emergency department and specialty physicians.

Connally Memorial Medical Center serves a population of over 40,000 residents.

Goal and Relationship to regional Goals:

The overarching goal of this project is to expand primary care to better accommodate the needs of the Wilson County patient population as identified by the RHP needs assessment, so that patients have enhanced access to services, allowing them to receive the right care at the right time in the right setting.

We will work toward achieving that goal by recruiting more primary care providers to Wilson
County, establishing more primary care clinics and implementing an electronic health record within these clinics to better coordinate care and referrals from other providers.

**Project Goals**

3. Increase the number of primary care providers
4. Increase the number of patients seen in primary care clinics

**This project meets the following regional goals.**

4. Improves outcomes while containing cost growth.
5. Develops and maintains a coordinated care delivery system.
6. Assures patients receive high-quality and patient-centered care in the most cost effective ways.

**Challenges:**
The primary challenge for this project will be to recruit primary care providers to our community. Small and rural communities, such as Wilson County, have historically had a difficult time attracting and retaining physicians.

**5 Year expected outcome for Provider and Patients:**
Connally Memorial Medical Center expects to see improvements in the number of primary care providers available to treat patients in Wilson County. Additionally, the provider expects to see improvements in the health outcomes for chronic diseases and health disparities outlined in the community needs assessment.

**Starting Point/Baseline:**
No current baseline exists as the hospital does not currently own and operate any specialty clinics. Therefore, the baseline number for encounters as well as the participating providers begins at 0 in DY 2.

**Rationale:**
CMMC has chosen the project option to establish more primary care clinics. In our current system patients receive services in urgent and emergent care settings for conditions that could be managed in a more coordinated manner if provided in the primary care setting. This often results in more costly, less coordinated care and a lack of appropriate follow up care. Patients may experience barriers in accessing primary care services secondary to transportation, cost, lack of assigned provider, physical disability, inability to receive appointments in a timely manner and a lack of knowledge about what types of services can be provided in the primary care setting. By enhancing access points, available appointment times, patient awareness of available services and overall primary care capacity, patients and their families will align themselves with the primary care system resulting in better health outcome, patient satisfaction, and appropriate utilization and reduced cost of services.

Based on the GMNEC Model for physician to population ratios, Wilson County has a shortage of 34 physicians (representing all specialties) Additionally, Wilson County has been designated as a Health Provider Shortage Area as well as a Medically Underserved Area by the U.S. Department of Health and Human Services. In addition to already being underserved, the Wilson County population is expected to increase by 24% by 2015.
Community need Identification number:
- CN.1 Texas ranks last in the nation on healthcare quality. RHP 6 is challenged to deliver improved quality and patient satisfaction
- CN.2 A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions. Leading causes of death in RHP 6 include cardiovascular disease, cancer and diabetes.)
- CN.3 Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and healthcare provider shortages.)

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
Currently there are no hospital based clinics in Wilson County. The Wilson County medical community is a system of independent medical providers including private physician groups, clinics and Connally Memorial Medical Center. Our project will improve access for targeted patients while helping CMMC reach capacity for treating patients with primary care needs. More specifically, we will increase the number of primary care clinic locations and service availability. This will in turn allow patients to have greater access to hospital resources including quality improvement, case management and social services.

</thead>
<tbody>
<tr>
<td>OD-6 Patient Satisfaction</td>
</tr>
<tr>
<td>IT-6.1 Percent improvement over baseline of patient satisfaction scores</td>
</tr>
</tbody>
</table>

Reasons/rationale for selecting the outcome measures:
The intent of the HCAHPS initiative is to provide a standardized survey instrument and data collection methodology for measuring patients' perspectives on hospital care. The surveys are designed to produce comparable data on the patient's perspective on care that allows objective and meaningful comparisons between institutions on domains that are important to consumers. Public reporting of the survey results is designed to create incentives for institutions to improve their quality of care. Public reporting will serve to enhance public accountability in health care by increasing the transparency of the quality of institutional care provided in return for the public investment.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $600,080**
Identifying Project and Provider Information:
Title: 1.9.1 Expand high impact specialty care capacity in most impacted medical specialties: Improving Rural Access to Specialty Care
Unique RHP ID#: 112690603.1.1 – PASS 1
Performing Provider: Dimmit Regional Hospital (previously Dimmit County Memorial Hospital)
TPI: 217884001

Project Summary:
Provider Description: Dimmit Regional Hospital (previously Dimmit County Memorial Hospital) is a 45-bed hospital located in Carrizo Springs, TX. The hospital serves Dimmit County, population approximately 10,000, across 1,329 square miles.
Intervention(s): The project will expand the range of specialty care services and providers available to our rural population. Increasing access will decrease transfers to specialist providers in San Antonio.
Need for the project: Currently the hospital has a very high rate of patient transfers for its size (100/month). This rate is expected to increase as the population continues to grow in response to nearby oil and natural gas operations. A shortage of local specialty providers is the main cause for these transfers with the most notable gap being the lack of a general surgeon. Currently these transferred patients travel 100+ miles to San Antonio to for specialty care.
Target population: The target population is our patients in need of specialty care. Our current Medicaid inpatient utilization rate is 67% and our low income utilization rate is 70%. Approximately 32% of our population is uninsured.
Category 1 or 2 expected patient benefits: Cut the patient transfer rate in half (to 50/month) through specialty care capacity expansion and quality improvements.
Currently we are recruiting a general surgeon, an internal medicine physician, and a general practitioner. Recruitment into these and other specialties will likely be completed by the end of DY 3. Based on these specialties with the need and potential for recruitment, we anticipate 2,000 specialty visits and/or procedures by the end of DY 4 for these new specialties. In DY 5 we have set a goal to increase this number to 2,500 specialty visits and/or procedures for these new specialties.
For all specialist providers we expect an average of 2 visits per patient per year.
Category 3 outcomes: IT-6.1 Our goal is to improve patient satisfaction scores over DY 3 baseline, specifically in regards to the patient’s rating of doctor access to a specialist. Actual percentage improvement goals TBD in DY 3.

Project Description:
Dimmit Regional Hospital proposes to expand its specialty care capacity to meet the needs of its growing rural population.
Dimmit Regional Hospital (DRH) is seeking to improve access to specialty care for its rural community. DRH is a 45 bed non-profit public hospital owned by Dimmit Regional Hospital District. It is located approximately 100 miles southwest of San Antonio. Currently, due to the extremely limited specialty services offered by DRH, the patient transfer rate is very high (avg. 100/month). These transferred patients are required to drive 1.5 – 2 hours one way for specialty care in San Antonio. This places an undue hardship on a low income rural population that is 86% Hispanic. These transfers are anticipated to increase dramatically as the rural population is experiencing a large growth in population, due to the nearby Eagle Ford shale natural gas and oil operations. DRH seeks to eliminate this hardship on local families by expanding high impact specialty care capacity in the most impacted medical specialties, improving local access to
specialty care.

We will reduce patient transfers and reach the associated Cat. 3 outcome improvement target (improve patient satisfaction scores – patient’s rating of doctor access to a specialist) through implementing the project in 4 steps from DY 2 – 5. First, we will conduct a specialty care gap analysis to identify the medical specialties with the highest potential for positive impact on the health of our population, i.e. our greatest community need. This will also establish a baseline for the future steps of our project.

Next, we will train care providers and staff on processes, guidelines and technology for referrals and consultations into selected medical specialties. Then we will increase the number of specialist providers, clinic hours and/or procedure hours in targeted specialties. During the two years following this expansion in capacity we will attend semi-annual learning collaborative meetings hosted by the RHP 6 anchor facility. At these meetings we will share lessons learned and commit to implementing at least one “raise the floor” improvement initiative each year. We will then assess the impact of these specialty care improvement initiatives through ensuring that specialty care patients receive satisfaction surveys. We will put forward ideas and initiatives aimed at increasing the response rate of these surveys. These specialty care patient satisfaction surveys will also allow us to collect accurate data for achievement of our Cat. 3 outcome improvement target.

Goals and Relationship to Regional Goals:
Project Goals:
- Increase access to specialty care in the local rural community, currently a HPSA
- Improve patient rating of doctor’s access to a specialist (see Cat. 3 improvement target)
- Reduce the patient financial, health and access costs associated with a high patient transfer rate by cutting this rate in half.
- Ensure staff are well trained in medical specialty referral guidelines, processes and technology
- Implement “best practices” from semi-annual RHP 6 Anchor learning collaborative attendance, improving the quality of specialty care provided.

The project meets the following regional goals:
- Work together to make significant progress towards the Triple Aim goals of assuring patients receive high-quality and patient-centered care, in the most effective ways.
  - Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our region.
  - Further develop and maintain a coordinated care delivery system.
  - Improve outcomes while containing cost growth.

Improving rural access to specialty care in our community will significantly decrease the number of patients that are transferred more than 1.5 hours away to San Antonio for care. The alleviation of this financial hardship for patients within our low-income rural community will better serve the residents of our region. Better training of staff and redesigning clinics for improved cycle time will improve outcomes while containing cost growth.

Challenges:
In the past, a significant challenge to supporting greater specialist capacity has been low patient volumes. However, with the recent natural gas/oil boom at the Eagle Ford Shale operation, the Carrizo Springs population is growing rapidly. This growth in population is expected to continue for many years. This presents an opportunity to attract specialists into our community to support
the health needs of our growing population.

5-Year Expected Outcome for Provider and Patients:
The 5-year expected or desired outcome is to cut the average rate of transfers in half (to 50/month). This project is related to regional goals because it will improve the health care infrastructure to better serve the Medicaid and uninsured residents of our region. It will reduce the cost to the patient, the hospital and the payer. This project will achieve this through conducting quality improvement projects using methods such as rapid cycle improvement and continual project evaluation.

Starting Point/Baseline:
*Improving Rural Access to Specialty Care* does not resemble any current or previous project we have ever implemented. Each component of the project is unique. Therefore, no baseline has been established at this time. Baselines for each milestone will be established according to the time period outlined below:

**Milestone 1 [P-1]:** Current specialty services: podiatry, pediatric dentistry, ENT and cardiology. Most notable gap is lack of a general surgeon. Timeline: baseline will be established upon completion of the specialty care gap assessment in DY 2.

**Milestone 2 [P-2]:** 0, a training program of this kind has never been implemented prior to this project. Timeline: DY 2

**Milestone 3 [P-2]:** 50% of staff and providers trained in referral guidelines, process and technology. Timeline: baseline is derived from Milestone 2 goal achievement in DY 2.

**Milestone 4 [I-22]:** Currently 4 specialist providers. Timeline: DY 2, Baseline may change if any DY 2 provider changes occur.

**Milestone 5 [P-21]:** 0, attendance at RHP 6 anchor learning collaboratives or implementation of “raise the floor” improvement initiatives has never occurred previously.

**Milestone 6 [I-23]:** TBD in DY 3 after accomplishment of I-22

**Milestone 7 [I-27]:** 0, patient satisfaction surveys have not been sent to specialty clinic patients prior to the implementation of this project.

**Milestone 8 [P-21]:** 2 meetings attended in DY 4 with at least 1 “raise the floor” improvement initiative implemented.

**Milestone 9 [I-23]:** TBD in DY 3 after accomplishment of I-22

**Milestone 10 [I-27]:** 60% received surveys in DY 4 (based on Milestone 7 goal achievement in DY 4),

Rationale:
The primary reason this project option was selected is the overwhelming need in the community for specialty care providers. DRH currently offers: podiatry, pediatric dentistry, ENT and cardiology. The lack of a general surgeon is one notable gap in specialty services. The limited number of specialty services offered by DRH has caused the patient transfer rate to be very high for a small rural hospital (avg. 100/month). Many of these patients have to drive 1.5 – 2 hours one way for specialty care in San Antonio. This places an undue hardship on our low income rural population that is 86% Hispanic. These transfers are anticipated to increase dramatically. The population of our rural community is experiencing large growth associated with the nearby Eagle Ford shale natural gas operation.

The selected milestones and metrics were chosen according to what addressed the DRH patient population needs with the highest degree of impact. Increasing specialty care capacity while ensuring proper training will improve the quality of care while avoiding future costs.
associated with untrained staff. In DY 4-5, the improvement milestones were chosen to focus on patient satisfaction with increased access to higher quality specialty care services. This keeps the focus on the patient experience, quality of care and cost.

**Project Components:**

Through “Improving Rural Access to Specialty Care”, we propose to meet all required project components, except for component B.

A. **Identify high impact/most impacted specialty services and gaps in care and coordination.**
   
   This component will be accomplished in DY 2. We plan to hire a third-party healthcare consultant to perform this specialty care gap assessment. The results of this assessment will establish a firm baseline for our project in those specialty care areas where there are gaps in coverage. Currently there are only 4 specialty care providers in the following areas: podiatry, pediatric dentistry, ENT and cardiology. A notable gap in specialty care is the lack of a general surgeon.

B. **Increase the number of residents/trainees choosing targeted shortage specialties.** This project component will not be addressed in this project. The reason this component is left out is because of the small size of the hospital (45 licensed beds) and its rural location (100+ miles southwest of San Antonio). Currently our facility does not have the resources, space or staff to provide residencies for physicians. Not only this, local housing for these residents would be extremely difficult to find, considering the recent natural gas/oil boom. Also, completing this project component is unrealistic given the few specialists available in our area to provide such training.

C. **Design workforce enhancement initiatives to support access to specialty providers in underserved markets and areas (recruitment and retention).** Our community is an underserved market considering the lack of specialty care services and its designation as a HPSA. We plan to meet this project component through two different implementation steps. First we will train care providers and staff on processes, guidelines and technology for referrals and consultations into selected medical specialties. Then we will increase the number of specialist providers, clinic hours and/or procedure hours in targeted specialties. This will occur in DY 2 and DY 3.

D. **Conduct quality improvement for project using methods such as rapid cycle improvement.** We plan to meet this project component through participating in face-to-face learning (i.e. meetings or seminars) at least twice per year with other providers and the RHP. These meetings will be to promote collaborative learning around shared or similar projects. We will then implement at least one “raise the floor” improvement initiatives established at the semiannual meeting per year for DY 4 and 5.

**Unique community need identification numbers the project addresses:**

- CN.1 – Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.
- CN.3 – Many residents in RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages.

Currently residents of DRH’s service region do not have access to most specialty services, due to severe shortage of local specialty care providers. Implementation of “Improving Rural Access to Specialty Care” address; the triple aim goals of the waiver, the RHP 6 goal of improving the health care infrastructure to better serve the Medicaid and uninsured residents of the region, and addresses a severe specialty provider shortage area. This project will help alleviate an ongoing financial hardship on our 86% Hispanic, Medicaid and uninsured population.
Related Category 3 Outcome Measure(s):

OD-6 Patient Satisfaction
IT-6.1 Percent improvement over baseline of patient satisfaction scores (all questions within a survey need to be answered to be a stand-alone measure)
(3) patient’s rating of doctor access to a specialist

Reasons/rationale for selecting the outcome measures:
The selected Category 3 outcome measure is directly linked to the improvement milestones in DY 4-5 for the 1.9.1 project option that was chosen. Implementing “Improving Rural Access to Specialty Care” is directly related to the patient’s view of how easy it is for him or her to access a specialist. Focusing on this outcome will help the Medicaid and uninsured population have better and better access to local specialty care. This will directly impact patients, most of whom cannot afford to travel 100 miles or more into San Antonio for care. Also, patients are more likely to receive specialty care faster than if they had scheduled an appointment at a large facility in San Antonio. DRH understands and is better equipped to meet the needs of its population than specialty care providers 100 miles to the northeast in San Antonio.

Relationship to other Projects:
The primary way this project supports, reinforces and enables other projects in the RHP is its contribution towards the RHP 6 goals. Implementing “Improving Rural Access to Specialty Care” will improve the health care infrastructure and better serve our Medicaid and uninsured population. It will do this by expanding specialty care capacity to reduce a severe shortage of providers while focusing on patient satisfaction. Increasing the capacity for local specialty care providers and training for their staff will help develop a coordinated care delivery system. This is another RHP 6 goal. Most importantly, this project achieves the triple aim waiver goals of assuring patients receive high-quality and patient-centered care in the most cost effective way.

Related Category 4 Population-focused measures:
RD-3: Potentially Preventable Complications (PPCs)
RD-4: Patient-centered Healthcare

Relationship to Other Performing Providers’ Projects in the RHP:
University Hospital, PA: 1.9
Baptist Medical Center, PA: 1.9
Methodist Hospital PA: 1.9
Uvalde Memorial Hospital, PA: 1.2
Medina Regional Hospital, PA: 1.1
Frio Regional Hospital, PA: 1.1
Val Verde Regional Medical Center, PA: 1.9
UTHSCSA, PA: 1.9

Plan for Learning Collaborative:
DRH plans to participate in an RHP-wide learning collaborative with other providers with similar projects. “RHP 6 is committed to transforming health care in our region and throughout the state. Given the large number and value of projects proposed for our region, University Health System, as the RHP 6 anchor, will promote and facilitate learning collaboratives.” Following completion of the RHP Plan, University Health System will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include the following:
-Identify participants
- Establish Learning Collaborative goals
- Develop a calendar of regular meetings, site visits, and/or conference calls
- Develop a plan to communicate ideas, data, and successes across the region and state
- Organize a learning event and invite experts and other Performing Providers from outside the region to share knowledge and best practices
- Adopt metrics to measure success

DRH plans to be a significant part of learning collaboratives with other performing providers with similar projects.

**Project Valuation:**

Of all potential DSRIP projects considered, DRH has chosen “Improving Rural Access to Primary Care”. This project scored high in all categories used to assess project value to the RHP and to our community. Categories included in the valuation process included: project scope, achieves waiver goals, and addresses community needs and project investment. These categories were assigned by University Health System, the RHP 6 anchor.

In addition to valuing potential projects based on these 4 areas, the project selected fills the most pressing and important community healthcare need. The population of the service region is growing rapidly. Currently, an average of 100 patient transfers/month to San Antonio (over 100 miles+ away) are occurring at DRH. This is number is expected to climb exponentially as the population grows to accommodate workers moving for the Eagle Ford shale natural gas boom. The population needs local providers of high impact specialty care services to remain healthy, lower their costs and overcome geographic isolation.

A detailed outline of the costs associated with each component, including the cost of recruiting specialty providers, cannot be reliably assessed at this time. This will be assessed after process milestone 1.1 is achieved. Achievement of this milestone will identify high need specialty care shortages and recommend specialty care services with the most impact for the patient population.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $5,237,598**
Identifying Project and Provider Information:
Title: 1.6.2 – Establish/expand access to medical advice and direction to the appropriate level of care to reduce Emergency Department use for non-emergent conditions and increase patient access to health care.
Unique RHP ID#: 112690603.1.2 – PASS 2
Performing Provider: Dimmit Regional Hospital (previously Dimmit County Memorial Hospital)
Performing Provider TPI: 217884001

Project Summary:
Provider Description: Dimmit Regional Hospital (previously Dimmit County Memorial Hospital) is a 45-bed hospital located in Carrizo Springs, TX. The hospital serves Dimmit County, population approximately 10,000, across 1,329 square miles.
Intervention(s): This project will introduce an urgent medical advice line while simultaneously creating a “fast track” triage system for the ED. These changes will decrease ED wait times.
Need for the project: Currently the average time between when an ED patient arrives and when he or she is seen by a physician is 90 minutes. This time has the potential to increase as the population continues to grow in response to nearby oil and natural gas operations. We are already seeing more trauma cases in the ED as a result of this growth and type of employment. A higher number of trauma cases results in a longer wait for ED patients with non-emergent medical conditions.
Target population: The target population is our ED patients with non-emergent conditions. Our target population also includes patients who could be seen in a primary care clinic instead of the ED for their urgent medical condition. Providing greater access to same-day primary care appointments through an urgent medical advice line would decrease ED volume. Our current Medicaid inpatient utilization rate is 67% and our low income utilization rate is 70%. Approximately 32% of our population is uninsured.
Category 1 or 2 expected patient benefits: The project will reduce the average “door to doc” time in our ED from 90 minutes to 60 minutes by the end of DY 4. In DY 4, we have set a goal to reduce this baseline 90 minute wait time (current DY 2 baseline time) to no longer than an average of 45 minutes. Typically our ED averages 11,000 admissions per year. If each of these patients wait for 90 minutes (our current average), this amounts to 16,500 hours or 1.88 years of total wait time to see a doctor. However, if by DY 5 we cut this wait time to an average of 45 minutes, this equates to a 50% reduction in “door to doc” time in our ED. This translates into an additional 8,250 hours or 344 total days our ED patients have outside of our emergency room. This has a very real impact on the health and well-being of our population. In addition to this benefit, lower acuity patients will utilize a new urgent medical advice line while higher acuity patients will benefit from a more effective and efficient ED.
Category 3 outcomes: IT-9.2 – Our goal is to reduce all ED visits. The actual percent reduction in ED visits realized in DY 4 and DY 5 is TBD in DY 3.

Project Description:
Dimmit Regional Hospital proposes to reduce ED wait times by reducing the number of ED patient visits for non-emergent conditions through a new urgent medical advice line and through a new ED fast-track system.
Dimmit Regional Hospital (DRH) is seeking to improve access to urgent care for its rural community. DRH is a 45 bed non-profit public hospital owned by Dimmit Regional Hospital District. It is located approximately 100 miles southwest of San Antonio. Currently the rural population is experiencing a large growth in population, due to the nearby Eagle Ford shale
natural gas and oil operations. The nature of the work performed and the work environment these individuals are exposed to has caused a dramatic increase in the number of ED patients with acute, emergent conditions. This has resulted in excessive wait times for ED patients with non-emergent conditions.

The proposed project will develop clinical protocols for an urgent medical advice line within the first year (DY 2). A vetting process will also be established for these protocols within RHP 6. After these protocols are developed, ED nurses will be trained on these clinical protocols. ED nurses will be assigned to staff this urgent medical advice line. Finally, in this first year an assessment will be conducted on ED workforce needs for an ED “fast track” system. The plan for such a system will be developed along with its implementation timeline.

During the second year of the project (DY 3), ED patients will be informed and educated with regards to the urgent medical advice line. The goal is to have at least 10% of ED patients seen in this year informed about the urgent medical advice line, with at least 5% who utilize it in the first year. Also, the number of mid-level providers in the ED will be increased to support the implementation of the ED “fast track” system during this year.

In the third and fourth years of the project (DY 4 – DY 5), the project performance will be measured based on advice line utilization and the average “door to doc” ED patient waiting times. It is our goal to increase utilization of the advice line while decreasing average “door to doc” times substantially during these two years.

**Goals and Relationship to Regional Goals:**

**Project Goals:**

- Increase access to primary care in the local rural community, currently a HPSA
- Reduce utilization of the ED by patients with non-emergent conditions
- Reduce the average time spent waiting for care by ED patients
- Improve the patient experience and quality through reducing cycle time while improving provider productivity.

The project meets the following regional goals:

- Work together to make significant progress towards the Triple Aim goals of assuring patients receive high-quality and patient-centered care, in the most effective ways.
- Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our region.
- Further develop and maintain a coordinated care delivery system.
- Improve outcomes while containing cost growth.

This project and its goals contribute toward achieving regional goals. The project will achieve these through educating patients on the benefit of utilizing primary care services (clinics and the urgent medical advice line) instead of ED services. Nurses will triage patients to primary care clinics based on developed, vetted clinical protocols. Also, it will improve patient satisfaction and quality of care through reduced wait times. This will improve efficiency and outcomes while reducing cost. Finally the urgent medical advice line will increase access to primary care advice and emergent care (when necessary – ED fast track) during times when local primary care clinics are closed.

**Challenges:**

Currently, the average time between patient arrival in the ED and being seen by a physician is 90 minutes. Without an urgent medical advice line coupled with an ED “fast track” system, this average wait time is expected to increase dramatically. Already ED physicians are experiencing a
higher rate of trauma patients. This is a direct result of working conditions experienced by those employed by companies taking advantage of the local Eagle Ford natural gas and oil boom. This high rate of trauma patients (expected to increase with the projected growth of the population) has already caused ED patients with non-emergent conditions to experience wait times that are excessive.

5-Year Expected Outcome for Provider and Patients:
The five year expected outcomes for Dimmit Regional Hospital and for our patients are: a 50% reduction in average patient “door to doc” time in the ED, at least 15% of DY 5 ED patients have used the urgent medical advice line on at least one or more occasions, and at least 45% of patients who respond to the urgent medical advice line survey report advice was appropriate.

This project is related to regional goals because it will improve the health care infrastructure to better serve the Medicaid and uninsured residents of our region. It will reduce the cost to the patient, the hospital and the payer. This project will achieve this through conducting quality improvement projects suggested during the semi-annual RHP 6 learning collaboratives and continual project evaluation.

Starting Point/Baseline:
Baselines for Process Milestones are effectively 0 at this time as this project is new for Dimmit Regional Hospital. There is not currently any similar project in our service region as we are the only hospital within our rural community. Baselines for process milestones extending to DY 4 and DY 5 will be set in DY 2 and/or DY 3.

Baselines for Improvement Milestones are listed below:
The average ED “door to doc” time is approximately 90 minutes. The [I-13] - 0, The baseline will be established by the end of DY 2 after the ED nurse advice line has been implemented [I-15] - 0, no advice line currently exists. Survey would begin in DY 4 [I-X] - 90 minute ED patient “door to doc” time average in DY 2.

Rationale:
A reduced ED waiting time is important because it reduces the number of patients who leave without being seen (LWOBS). This ensures compliance under EMTALA. An urgent medical advice line will reduce wait times by providing a source of medical advice for patients with non-emergent medical conditions. Our hospital is located within a designated Healthcare Professional Shortage Area (HPSA). This creates a high percentage of patients that do not have access to a primary care physician. However, the area is growing and primary capacity expansion is moving forward. An urgent medical advice line will facilitate access to primary while also aiding patients during times when primary care clinics aren’t open.

Despite the high potential for impact the urgent medical advice line will have on our population, Dimmit Regional Hospital anticipates a regular flow of non-emergent patients in the ED. This is due to a 32% average rate of uninsured residents combined with the low per capita income level throughout our rural community. Also, the increase in primary care capacity will be gradual; it will take time for the supply of primary care physicians to catch up to the high demand in our community. The selected milestones and metrics were chosen according to what addressed the DRH patient population needs with the highest degree of impact.

Project Components:
  a. Develop a process (including a call center) that in a timely manner triages patients
seeking primary care services in the ED to an alternate primary care site. Survey patients who use the nurse advice line to ensure patient satisfaction with the services received. This component will be included in the project by achieving process milestones: P-1, P-3, P-5, and P-6. A patient satisfaction survey will be sent to patients who utilize the nurse advice line with goals to improve scores in DY 4 and DY 5 (improvement milestone I-15).

b. Enhance linkages between primary care, urgent care, and Emergency Departments in order to increase communication and improve care transitions for patients. This component will be included in the project by the achievement of these process milestones: P-1, P-3, P-5, and P-6.

c. Conduct quality improvement for project using methods such as rapid cycle improvement. This component will be included in the project by the achievement of these process and improvement milestones: P-1, I-13, I-15 and I-X. The achievement of improvement milestone I-X is especially critical to reducing cycle time of ED processes, impacting patient wait times.

Unique community need identification numbers the project addresses:

- CN.1 – Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.
- CN.3 – Many residents in RHP 6 lack access to medical and dental care due to high rates of un-insured and health care provider shortages.

Currently residents of DRH’s service region lack sufficient access to primary care services as they live within a rural community and a designated HPSA. This project would be the first of its kind in our region. An urgent medical advice line, if successful, has the potential to be adopted by rural hospital in nearby communities. This would decrease ED admits for non-emergent conditions throughout the rural service areas of RHP 6. Implementation of this project addresses; the triple aim goals of the waiver, the RHP 6 goal of improving the health care infrastructure to better serve the Medicaid and uninsured residents of the region. This project will help alleviate an ongoing financial hardship on our 86% Hispanic, Medicaid and uninsured rural population.

Related Category 3 Outcome Measure(s):

OD-9: Right Care, Right Setting
IT-9.2 - Reduce all unnecessary ED visits (including ACSC)

Reasons/rationale for selecting the outcome measures:

The selected Category 3 outcome measure is directly linked to the improvement milestones in DY 4-5: [I-13], [I-15], [I-X]. The [I-13] milestone ensures that utilization of the urgent medical advice line by ED patients is increasing over time. This will lead to fewer unnecessary ED admits or fewer patients who visit the ED for non-emergent conditions and higher community utilization of primary care services. The [I-15] milestone ensures that patients’ trust in the advice provided by the nurse is increasing over time. This will lead to fewer unnecessary ED admits or fewer patients who visit the ED for non-emergent conditions and higher community utilization of primary care services. Also this milestone will provide the opportunity to evaluate the performance of nurses assigned to staff the urgent medical advice line, including how well they are following established clinical protocols. The [I-X] milestone will ensure that ED wait times
are significantly reduced. This will allow for higher quality care, higher patient satisfaction and reduced ED length of stay. This will free up ED physicians to spend more time on caring for patients with emergent conditions. The “fast track” system used to achieve a shorter cycle time (decreased patient waiting times) will also allow for an opportunity to inform patients of the urgent medical advice line.

**Relationship to other Projects:**
The primary way this project supports, reinforces, enables and is related to other projects and interventions within the RHP plan are through contribution to RHP 6 goals. The project will achieve these by educating patients on the benefit of utilizing primary care services (clinics and the urgent medical advice line) instead of ED services. Nurses will also triage patients to primary care clinics based on developed, vetted clinical protocols. Also, it will improve patient satisfaction and quality of care through reduced wait times. This will improve efficiency and outcomes while reducing cost.

Related Category 4 Population-focused measures:
- **RD-1: Potentially Preventable Admissions**
- **RD-4: Patient-centered Healthcare**
- **RD-5: Emergency Department**

**Relationship to Other Performing Providers’ Projects in the RHP:**
We are not aware of any other providers in the RHP proposing similar projects.

**Plan for Learning Collaborative:**
DRH plans to participate in an RHP-wide learning collaborative with other providers with similar projects. RHP 6 is committed to transforming health care in our region and throughout the state. Given the large number and value of projects proposed for our region, University Health System, as the RHP 6 anchor, will promote and facilitate learning collaboratives. Following completion of the RHP Plan, University Health System will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include the following:
- Identify participants
- Establish Learning Collaborative goals
- Develop a calendar of regular meetings, site visits, and/or conference calls
- Develop a plan to communicate ideas, data, and successes across the region and state
- Organize a learning event and invite experts and other Performing Providers from outside the region to share knowledge and best practices
- Adopt metrics to measure success

DRH plans to be a significant part of learning collaboratives with other performing providers with similar projects.

**Project Valuation:**
This project scored high in all categories used to assess project value to the RHP and to our community. Categories included in the valuation process included: project scope, achieves waiver goals, and addresses community needs and project investment. Dimmit Regional Hospital also values each project based on the following factors: the potential impact on health of our population, the resources necessary to implement the project, and level of improvement.
anticipated in overall patient satisfaction. Dimmit Regional Hospital also took into account the extent to which reducing ED waiting times and reducing the volume of non-emergent ED patient visits would potentially meet the goals of the region and the Waiver.

Identifying Project and Provider Information:
Title: 1.1.2 Expand Primary Care Capacity
Unique RHP ID#: 112688002.1.1 – PASS 1
Performing Provider: Frio Regional Hospital
Performing Provider TPI: 112688002

Project Summary:
Provider Description: Frio Regional Hospital is a 22 bed hospital in Pearsall, Texas serving the people of Frio and LaSalle Counties with a combined population of about 25,000.
Intervention(s): This project will expand access to primary care by recruiting additional physicians, building new clinic space and increasing efficiencies in clinic offices.
Need for the project: There is a serious lack of primary care in these counties, resulting in a number of inefficiencies in healthcare delivery. Chronic care management results with a high percentage of patients with uncontrolled diabetes, hypertension, and heart disease.
Target population: The target population is our patients needing primary care appointments without having to wait for 4 – 6 weeks. About 1/3 of our community lives below the poverty line, and we expect that they will be better able to access primary care.
Category 1 or 2 expected patient benefits: We seek to increase office times so that patients can access care after normal business hours and on weekends. It is hoped to decrease the wait time for an appointment by at least 1 week.
We anticipate in DY 4 for the new primary care provider we recruit in DY 2 to have an estimated panel size of at least 1,800 patients. With this panels size, we are setting a goal in DY 4 of 3,600 visits or 1,800 patients X average of 2 visits per patient = 3,600 visits. However, since the new primary care provider’s panel size may grow at a slower rate than anticipated, we will also lengthen clinic hours. Patient visits during these extended hours will be included in this total. In DY 5 we expect our new primary care provider’s panel to have grown to at least 2,000 patients. Resulting from this panel size we expect at least 4,000 visits in DY 5. Again, visits made during extended clinic hours will be included.
Category 3 outcomes: Our goals are to increase the number of diabetes management measures such as retinal eye examination, foot examination and microalbumin/neuropathy test.

Project Description:
DSRIP Project 1.1.2, “Expand Primary Care Capacity” is important to Frio County because of poor access to primary care in our area. Many untreated conditions increase in acuity. This overloads available emergency services.

Project Goals:
The project will increase opportunities to obtain primary care by increasing the number of physicians, physician assistants and nurse practitioners. This necessitates an increase in available office space to house clinics. Additional training will be provided to clinic office staff to enable better scheduling of patient appointments and reducing the number of “no shows”. Improving for primary care, will enable patients to avoid the emergency room, resulting in fewer transfers to tertiary facilities for additional services.

This project will meet the following regional goals:
- The project will encourage working together to make significant progress towards the Triple Aim goals of assuring patients receive high-quality and patient-centered, in the most effective ways
• The project will improve the health care infrastructure to better serve the Medicaid and uninsured residents of our region.
• The project will further develop and maintain a coordinated care delivery system. Finally the project will improve outcomes while containing cost growth.

The project achieves an improved infrastructure for Medicaid and uninsured residents through increasing primary care capacity. The project will increase capacity by expanding the number of primary care clinics and/or expanding existing space/hours. The project develops and maintains a coordinated care delivery system through improvements in EHR, HIT and communication systems. The project improves outcomes while containing cost growth by providing access to primary care providers. Patients who now rely on the emergency room for primary care will then have access to a less costly and more appropriate mode of care.

Challenges:
Frio County is designated as a “Health Professional Shortage Area.” Because of the payer mix, it has been difficult to recruit physicians as well as other health professionals. This presents a major challenge. Frio Regional Hospital will increase its’ efforts to recruit physicians, employing professional recruiters to do so. Another obstacle is the lack of training among clinic employees on scheduling patients. As electronic medical records are implemented, and additional training is provided, this will improve efficiencies. There is also a lack of available clinic space, so either new construction or refurbishing of existing space is necessary.

Expected Outcome for Provider and Patients in 5 Years:
Our aim is to improve the ability of patients to access primary care by increasing the numbers of physicians and mid-level providers, improving clinic staff efficiency and providing more clinic space. Achieving this goal should reduce our non-emergent ED patient volume by 15 to 20% by the end of DY 5. Clinical outcomes we expect to be significantly improved in five years are those related to the management of prevalent chronic diseases specific to our population. We have reflected this expected patient benefit and impact by selecting Category 3 improvement targets centered on improving diabetes care by increasing: retinal eye exams, foot exams, microalbumin/nephropathy screenings.
### Starting Point/Baseline:

Between October 1, 2011 and September 30, 2012 area primary care clinics had patient visits of roughly 38,000. The community is served by 6 FTE Family Practice Physicians and 1 FTE OB/Gyn. Given the population of Frio County of 16,163 the number of family practitioners should number 18 FTE’s. Based on these calculations, another 12 Family Practitioners are needed. There are 2 Physician Assistants and 2 Nurse Practitioners. In addition, there are 26 employed by these primary care clinics. Some offices utilize electronic medical records and some do not. None of those mentioned are trained in this project.

### Rationale:

Frio County is medically underserved as are most counties in RHP 6. There is a shortage of physicians and other health professionals. Our community has a significant amount of diabetes, obesity, heart disease, and hypertension. Untreated, these chronic conditions lead to further complications. A main source of health education is the clinic office. With a physician shortage, it is difficult to address and manage chronic conditions. This is further complicated by high levels of uninsured. Thirty percent of the population lives below the poverty line. Many work for small businesses that cannot afford to provide health care benefits. This translates to 25% of the population being uninsured. In general the citizens of the area tend to less educated and have a lower per capita income.

The statistics of Frio County are consistent with RHP 6. This region is noted for high uninsured rates and poor health outcomes. Our population is 54% Hispanic and 37% Anglo. In Frio County it is approximately 76% Hispanic and 24% Anglo. Geographically, around 61% of RHP is rural and “feeds” the tertiary systems in San Antonio. Because of the lack of primary care management, many acute worsen and require transfers to tertiary center emergency departments.

The region is undergoing an “oil boom” which has attracted new people to the area. It is expected to tax existing resources to expand services. The area has been challenged in attracting primary care physicians and mid-level practitioners. An expansion in healthcare coverage could have a significant impact on making recruitment more attractive.

To reiterate from earlier, there are three aspects to our project:

A) Recruit primary care physicians and mid-level practitioners to allow for expanded and extended hours of service.

B) Increase Clinic Space to accommodate the increase in medical professionals

C) Provide training to Clinic Staff to enable greater efficiencies in scheduling and providing appointments, including extended office hours for follow-up care.

The project addresses the above stated needs for our area and RHP 6, especially:

- CN.3 Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care providers shortages.

Process milestones selected were:

1. P-4 – Expand the hours of a primary care clinic, including evening and/or weekend hours, and P-4.1 will be the metric increasing hours over the baseline. Current operating hours for the area primary care clinics is 9:00 AM to 5:00 PM Monday through Friday. There are no appointments available after hours or on weekends.
2. P-5 – Train, hire additional primary care providers and staff as evidenced by P-5.1 Documentation of increased numbers of providers and staff in Pearsall, Dilley and Cotulla.

The improvement target selected is (1.1.2) I-12 with the milestone to be the increase in clinic visits as evidenced by improved access.

I-12.1 – Will be documentation of increased visits
I-12.2 – Documentation of the number of unique patients or size of patient panels.

This will significantly improve the general standards of care by management of chronic conditions. Better access to medical care will increase opportunities to educate patients on becoming more compliant with treatment. The cost of not managing chronic conditions is reflected in use of the emergency services both locally and by transfer. Specifically, diabetes management is being targeting as a response to community input. It is estimated that nearly a third of the population is either diabetic or at risk of developing diabetes. Better management will reduce the overall cost of providing care.

**Related Category 3 Outcome Measures(s)**

We have chosen 3 non-stand- alone measures from Category 3:

Outcome Domain – 1 (Primary Care and Chronic Disease Management)

IT – 1.12 Diabetes Care; Retinal Eye Exam
    1.13 Diabetes Foot Care exam
    1.14 Diabetic Care: Microalbumin / Neuropathy

Frio County has a high incidence of diabetes. This condition creates complication in other conditions causing a strain on local resources. Increased access to primary care should result in better management of diabetes and its complications.

**Relationship to other Projects:**

1.1.2 – Expanding Primary Care Capacity provides a foundation to numerous other 1115 Waiver Projects across various categories. Without proper access to primary care almost any of the other projects would be difficult to accomplish. It relates to other projects as follows:

    2.2 - Expansion of the chronic care management model seeks to reduce unnecessary acute and emergency room utilization by of easy access to primary care. Primary care can better manage chronic conditions such as hypertension, obesity and diabetes. Timely screenings identify conditions at an early stage that permit better management and leads to a more efficient use of resources.

    2.3 - Redesign Primary Care – Expansion of the chronic care management model above places more demands on PCP’s and their clinics to provide easy access. Timely screening for early detection of chronic conditions requires efficient scheduling. Expansion of primary care capacity increases the likelihood of this outcome.

    2.4 - “Redesign to improve Patient Experience” depends upon easy access to primary care. A major frustration is the long wait time for appointments, up to 6 weeks. Expanding primary care capacity reduces wait times, making it easier for patients to remember appointments. “No shows” decrease the patient experience.

Category 1.1.2 “Increasing Training of Primary Care Workforce” directly relates to expanding
primary care capacity in that an adequate primary care physician staff with support staff enables the primary care physician and mid-level providers to see more patients and schedule necessary screenings.

1.3 – “Implement a Chronic Disease Management Registry” indirectly relates in that chronic disease requires adequate primary care to manage the chronic disease.

1.10 – “Enhance Performance Improvement and Reporting Capacity”. Performance improvement processes will be integrated to the expansion of primary care capacity and the category 3 outcomes of screenings for diabetic patients. Since these activities are major component to clinic efficiency, education will be provided to physicians and their staffs.

<tbody>
<tr>
<td>Out of all potential DSRIP projects considered, Frio Regional Hospital has chosen DSRIP Project 1.1.2, “Expand Primary Care Capacity”. This project received a score of 5 on a scale of 1-5 in all categories used to assess project value to the RHP and to our community. Categories included in the valuation process included: project scope, achieves waiver goals, and addresses community needs and project investment.</td>
</tr>
</tbody>
</table>

This project will affect all citizens of Frio County. It will have a positive impact on neighboring communities especially San Antonio, in that local primary care will reduce the need for transfers to that community. It will allow patients to seek care locally and avoid the complications resulting from unmanaged chronic conditions. Frio Regional Hospital is the main provider of acute care in Frio County. These efficiencies will positively impact Frio Regional Hospital along with the rest of our community.

### Year 2 (10/1/2012 – 9/30/2013)

**Milestone 1**

- **[P5]:** Train/hire additional primary care providers and staff.
- **Metric 1 [P-5.1]:** Documentation of increased number of providers and staff.
- **Baseline:** Six physicians, 2 mid-levels, 4 full-time schedulers, 2 FTE Administration, 26 full-time staff.
- **Goal:** Add one additional physician and/or mid-level; add one scheduler, hire one additional full-time Administrator and increase staff.
- **Data Source:** Hospital reports, policy, contracts, or other documentation

**Milestone 1 Estimated Incentive Payment:** $319,209

**Year 2 Estimated Milestone Bundle Amount:** $319,209

### Year 3 (10/1/2013 – 9/30/2014)

**Milestone 2**

- **[P-4]:** Expand primary care clinic availability by 12 hours including evening and/or weekend hours.
- **Metric 1 [P-4.1]:** Increased number of primary care clinic hours over baseline.
- **Baseline:** Current hours; 9-5 weekdays
- **Goal:** Extended hours on some weekday evenings and weekends, with extended coverage on holidays.
- **Data Source:** Posted hours/clinic documentation.

**Milestone 2 Estimated Incentive Payment:** $370,006

**Year 3 Estimated Milestone Bundle Amount:** $370,006

### Year 4 (10/1/2014 – 9/30/2015)

**Milestone 3**

- **[I-12]:** Increase primary care clinic volume and evidence of improved access.
- **Metric 1 [I-12.1]:** Documentation of increased number of visits.
- **Baseline:** Combined DY 3 new primary care provider visit volume (recruited in DY 2) with visit volume during expanded hours (expanded in DY 3)
- **Goal:** 3,600 patient visits to new primary care provider combined with patient visits during expanded hours.
- **Data Source:** EHR

**Milestone 3 Estimated Incentive Payment:** $395,819

**Year 4 Estimated Milestone Bundle Amount:** $395,819

### Year 5 (10/1/2015 – 9/30/2016)

**Milestone 4**

- **[I-12]:** Increase primary care clinic volume and evidence of improved access.
- **Metric 1 [I-12.2]:** Documentation of increased number of visits.
- **Baseline:** Combined DY 3 new primary care provider visit volume (recruited in DY 2) with visit volume during expanded hours (expanded in DY 3)
- **Goal:** 4,000 patient visits to new primary care provider combined with patient visits during expanded hours.
- **Data Source:** EHR

**Milestone 4 Estimated Incentive Payment:** $411,798

**Year 5 Estimated Milestone Bundle Amount:** $411,798

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $1,496,832
Identifying Project and Provider Information:
Title: 1.7.1 Implement telemedicine program to provide or expand specialist referral services in an area identified as needed to the region.
Unique RHP ID#: 112688002.1.2 – PASS 2
Performing Provider: Frio Regional Hospital
Performing Provider TPI: 11268802

Project Summary:
Provider Description: Frio Regional Hospital is a 22 bed hospital located in Pearsall, Texas serving Frio and LaSalle Counties with a combined population of approximately 25,000.

Intervention(s): This project will implement telemedicine to provide patient consultations by a cardiologist for inpatient, outpatient and emergent situations.

Need for the project: There is no resident cardiologist and patients must wait for a visiting cardiologist or travel to San Antonio for consultation. This will provide a more timely delivery of care to our patients.

Target population: The target population is our patients needing cardiology consults. About 1/3 of our population lives below the poverty level and this program will make it easier for them to access cardiology services.

Category 1 or 2 expected patient benefits: We expect to provide 100 telemedicine cardiology consults in DY4 and 200 in DY5. The rate of consults per patient is expected to average between 1 and 2 consults per patient per year. We expect to reduce the number of transfers and improve the quality of care delivered to our inpatients.

Category 3 outcomes: We expect to reduce the number of readmissions for patients diagnosed with congestive heart failure and coronary artery disease.

Project Description:
DSRIP Project 1.7.1, “Implement telemedicine program to provide or expand specialist referral services in cardiology” is important to Frio County because of the high incidence of cardiac disease in our area. Most patients presenting in the emergency department with heart problems, must be shipped to other facilities because of the lack of cardiac assessment. The goal is to provide cardiology consults via telemedicine with a San Antonio based cardiologist in our emergency department so that patients receive care in a timely manner. Prompt and accurate diagnosis can reduce complications. Prompt treatment improves patient outcomes. It can also prevent unnecessary transfers which can overload available emergency services in San Antonio as well as ambulance services. Additional training will be provided to emergency room staff to assist the cardiologist making the diagnosis.

Frio County is designated as a “health professional shortage area”. Because of the payer mix, it has been difficult to recruit primary care physicians, not to mention cardiologists. This presents a major challenge. Frio Regional Hospital will increase its’ efforts to recruit an internal medicine physician, employing professional recruiters to do so. This will provide back-up support for the cardiologist on site. However, recruitment will take time and with the projected population growth will continue to strain the emergency department. Another obstacle is the lack of training among emergency department nursing staff in conducting cardiologist directed patient...
examination. As electronic medical records are implemented, and additional training is provided, this will improve efficiencies. There is also a lack of available space for increasing demand, so that new construction may be necessary. There have been issues with the local EMS in the past in terms of coordination care between patient pick-up and arrival at the emergency department. A new EMS has been hired by Frio County and it will be necessary to work closely with them to develop protocols. It will be necessary to better coordinate care with the local nursing home as well.

Our aim is improve the patients outcomes in cardiac events by improving the assessment process.

This project will meet the following regional goals:

- The project will encourage working together to make significant progress towards the Triple Aim goals of assuring patients receive high-quality and patient-centered, in the most effective ways
- The project will improve the health care infrastructure to better serve the Medicaid and uninsured residents of our region.
- The project will further develop and maintain a coordinated care delivery system. Finally the project will improve outcomes while containing cost growth.

The project achieves an improved infrastructure for Medicaid and uninsured residents by providing access to specialists who otherwise would only be available after traveling 70+ miles to San Antonio. The project develops and maintains a coordinated care delivery system through improving the link between primary care physicians, patients and specialists. The project improves outcomes while containing cost growth by creating an alternative to specialist recruitment to our rural area. This project aims to improve outcomes through greater access to specialists, specifically reducing 30 day re-admission rates for CHF and CAD (Cat. 3 improvement targets).

Starting Point/Baseline:
Currently, there is no on-site specialist assessment of patients in our emergency department. Consultations occur between the emergency room physician and the appropriate physician in the facility accepting the referral. We have a cardiologist who visits the community every week and would like to provide assessments via telemedicine. We have to develop appropriate training as well as policies and procedures to provide this service.

Rationale:
As evidenced in the RHP Community Needs Assessment, access to (or lack of) specialty care is a serious issue in Texas, especially in rural parts of Texas. The following Community Needs are specifically related to this project and were identified locally in Frio as well:

CN.1 Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.
A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions. Leading causes of death in RHP 6 include cardiovascular disease, cancer, and diabetes.

Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages.

One of the greatest challenges across the nation and especially in RHP 6 to provide quality care in rural areas which don’t have access to specialty physicians. Frio County is medically underserved as are most counties in RHP 6 and has no resident specialists. There is a shortage of physicians and other health professionals. The use of technology to deliver health care from a distance, or telemedicine, has been demonstrated as an effective way of overcoming certain barriers to such as exist in rural areas. With a physician shortage, it is difficult to address and manage chronic conditions. This is further complicated by high levels of uninsured. Thirty percent of the population lives below the poverty line. Many work for small businesses that cannot afford to provide health care benefits. This translates to 25% of the population being uninsured. In general the citizens of the area tend to less educated and have a lower per capita income. Telemedicine can ease the gaps in providing crucial care for those who are underserved, principally because of a shortage of sub-specialty providers.

The statistics of Frio County are consistent with RHP 6. This region is noted for high uninsured rates and poor health outcomes. Our population in RHP 6 is 54% Hispanic and 37% Anglo. In Frio County it is approximately 76% Hispanic and 24% Anglo. Geographically, around 61% of RHP is rural and “feeds” the tertiary systems in San Antonio. Because of the lack of primary care management, many acute worsen and require transfers to tertiary center emergency departments. Frio County has a high percentage of its population categorized having cardiac conditions. A more efficient method of processing patient through put in the emergency department will reduce unnecessary transfers and better coordinate with local primary care physicians.

The region is undergoing an “oil boom” which has attracted new people to the area. It is expected to tax existing resources to expand services. The area has been challenged in attracting primary care physicians and mid-level practitioners which has led to excessive use of the emergency department. An expansion in healthcare coverage could have a significant impact on making recruitment, both in primary care and emergency care, more attractive.

The project option selected was:

1.7.1 Implement telemedicine program to provide or expand specialist referral services in an area identified as needed to the region.

Required core project components:

a) Provide patient consultations by medical and surgical specialists as well as other types of health professionals using telecommunications

b) Conduct quality improvement for projects using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned”, opportunities to scale all or part of the project
to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

This will significantly improve the general standards of care provided in the emergency department. More efficient throughput will improve improvement coordination of chronic care between the primary care physicians and the emergency department.

The overall goal of the proposed telehealth projects is to reduce disparities in access, outcome, cost and satisfaction that are created by geographic barriers. Specifically, we hope to achieve the following goals:

1.) Increase the knowledge and capacity of rural primary care physicians to manage complex chronic conditions
2.) Increase patients’ timely access to specialty care and reduce geographic barriers
3.) Create the ability for specialists to provide direct patient consults to patients based at rural clinics
4.) Improve efficiency in the rural referral process by letting specialists divert unnecessary referrals and decreasing the wait time for urgent referrals
5.) Provide service in HPSA’s
6.) Enhance access to other health care services (case management, education, etc.)

**Related Category 3 Outcome Measures(s)**

We have chosen 2 stand-alone measures from Category 3:

<table>
<thead>
<tr>
<th>Measure Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IT – 3.2</td>
<td>Congestive Heart Failure 30 day readmission rate</td>
</tr>
<tr>
<td>IT – 3.6</td>
<td>Coronary Artery Disease (CAD) 30 day readmission rate</td>
</tr>
</tbody>
</table>

Frio County has a high incidence of diabetes which is a risk factor for heart trouble. This condition creates complications causing a strain on local resources. Increased efficiency in the emergency department through use of telemedicine should improve access to primary care which should result in better management of heart disease and its complications.

**Relationship to other Projects:**

1.7.1 –“Implement telemedicine program to provide or expand specialist referral services in an area identified as needed to the region”, provides a basis for more efficient assessments and more initiation of care. It is closely related to the Category 4 project “Improves Quality”. It provides better coordination with primary care physicians to provide better management of chronic conditions. In rural communities there is a close relation between primary care and the emergency department. Many of the physicians who staff the emergency department also work in the community as primary care physicians. Coordination of care is necessary to better manage chronic conditions.

2.2- Expansion of the chronic care management model seeks to reduce unnecessary acute and emergency room utilization by of easy access to primary care. Primary care can better manage chronic conditions such as hypertension, obesity and diabetes. Timely screenings identify conditions at an early stage that permit better management and leads to a more efficient use of resources.

2.3 - Redesign Primary Care – Expansion of the chronic care management model above
places more demands on PCP’s and their clinics to provide easy access. Timely screening for early detection of chronic conditions requires efficient scheduling. Expansion of primary care capacity increases the likelihood of this outcome.

2.4 - “Redesign to improve Patient Experience” depends upon easy access to primary care. A major frustration is the long wait time for appointments, up to 6 weeks. Expanding primary care capacity reduces wait times, making it easier for patients to remember appointments. “No shows” decrease the patient experience.

1.10 – “Enhance Performance Improvement and Reporting Capacity”. Performance improvement processes will be integrated to the expansion of primary care capacity and the category 3 outcomes of screenings for diabetic patients. Since these activities are major component to clinic efficiency, education will be provided to physicians and their staffs.

**Plan for Learning Collaborative:**

University Health System in San Antonio as the anchor hospital for RHP 6 is promoting and organizing learning collaborative. Frio Regional Hospital will participate with those hospitals performing similarly related projects to network and share best practices and solutions.

**Project Valuation:**

Out of all potential DSRIP projects considered, Frio Regional Hospital has chosen DSRIP Project 1.7.1, “Introduce, Expand, or Enhance Telemedicine/Telehealth”. This project received a score of 5 on a scale of 1-5 in all categories used to assess project value to the RHP and to our community. Categories included in the valuation process included: project scope, achieves waiver goals, and addresses community needs and project investment.

This project will affect all citizens of Frio County. It will have a positive impact on neighboring communities especially San Antonio, in that appropriate care delivered locally will reduce the need for transfers to that community. It will allow patients to seek care locally and avoid the complications resulting from unmanaged chronic conditions. Frio Regional Hospital is the main provider of acute and emergent care in Frio County. These efficiencies will positively impact Frio Regional Hospital along with the rest of our community.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $399,000
### Identifying Project and Provider Information:

| Title: 1.1.2 Expand Existing Primary Care Capacity - GRMC |
| Unique RHP ID#: 138411709.1.1 – PASS 1 |
| Performing Provider: Guadalupe Regional Medical Center |
| Performing Provider TPI: 138411709 |

### Project Summary:

**Provider Description:** GRMC is a 125 bed city/county community hospital serving a population of approximately 100,000 in 8 counties.

**Intervention(s):** This project initially moves a long standing indigent clinic to the hospital campus, improving access and security. Short and long term goals are to increase the volume and scope of services to improve continuity, access and effectiveness of chronic disease care in the community.

**Need for the project:** The current clinic was in an unsafe and difficult to access building with no security, and is open for very limited hours during the month. Funding was based exclusively on charitable donations and volunteer time. The availability of clinics willing to accept chronic disease patients for free in Guadalupe County and surrounding communities does not exist.

**Target population:** The target population are indigent and uninsured patients with chronic disease such as diabetes, hypertension, CHF and COPD. We expect 100% of these patients to meet the financial qualifications of indigent or Medicaid. Eventually the clinic may grow to provide services for other chronic disease patients who do not have primary care support.

**Category 1 or 2 expected patient benefits:** The project seeks to increase patient volume by 100% in year three (80 patients per month) 150+% (120 patients per month) in year four and 200+% more (200 patients per month) in year five.

**Category 3 outcomes:** Our goal is to proactively manage uninsured patients with chronic disease, with a specific focus on diabetes. The hospital’s Prescription Assistance Program, which receives no federal funding, will be the primary resource used to ensure that patients receive necessary medications. The clinic will also provide regular free lab checks, ongoing education, and continuity of care. All these actions are intended to improve health and reduce unnecessary hospital admissions.

### Project Description:

**Project description:** A long standing, loosely organized group called the Christian Free Clinic is at risk of closing due to the current building’s unsafe condition and lack of medical resources. Local indigent and uninsured patients with chronic diseases who seek medical care at this clinic four evenings a month would have no medical options other than the ER. As a result of this need, and need to expand healthcare access to residents of Guadalupe County and its contiguous communities, GRMC will be providing space to this clinic, as well as augmenting its current structure with staff and resources to expand care to patients who are underserved and without insurance.

**Challenges identified:** The existing clinic building is in poor condition (i.e., no wheelchair access) limited personnel support, limited hours and medical resources, and no access to lab or imaging reports. Additionally, there is no well formalized process in place to track patients,
which makes it difficult to follow up with patients.

Project goal(s):
- Expand primary care access to indigent and uninsured population by relocating clinic to the hospital campus.
- Expand clinic hours of operation from one evening a week to three days a week.
- Add additional staff to clinic to provide for extended hours. Staff would include: one physician extender, one medical assistant/receptionist and one front office receptionist.
- Prevent unnecessary ER visits and hospital readmissions for uninsured diabetic population, who have been identified through the Christian Free Clinic, recently discharged from the hospital or local primary care clinics that do not have the time or means to support diabetic management and education for their patients.
- Prevent the number of diabetic-related hospital visits by providing diabetic education, access to free diabetic medications through the hospital’s prescription assistance program (for the uninsured or indigent population) and access to physician medical management for this chronic disease.

This project not only aims to address access to care, but provides access to medication to help those manage chronic illnesses. This project will also provide one-on-one education, free lab screenings to monitor A1C levels, and provide a system for follow-up care for patients with diabetes.

Ongoing quality initiatives this project will help to address:
- Avoidable hospital readmissions
- Medication education and management
- Transitional care resource for uninsured patients
- Improve ER patient flow & wait times
- Assist with patient follow up and compliance of medications and lab work, specifically for the diabetic population.

This project relates to the following RHP 6 Regional Goals:
- Triple Aim: assuring patients receive high-quality and patient-centered care, in the most cost effective ways. This project will support this goal by connecting patients to the necessary healthcare resources and/or services for free or at a substantially reduced cost.
- Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our counties. This project will help meet this goal by expanding clinic access and healthcare resources to patients in the hospital’s eight-county service area who are identified as underserved and without insurance. Patients with Medicaid would fall into the financial classification to receive care.
- Improve outcomes while containing cost growth. This project will seek to impact this goal by connecting patients to necessary medications to manage their chronic illness, helping to avoid ER visits and potential inpatient hospital visits.

5-year expected outcome – This project aims to improve primary care access and outcomes of the uninsured and indigent population with identified chronic illnesses, specifically, those individuals diagnosed with diabetes. By expanding clinic hours to provide for day-time and evening healthcare access, it is expected that unnecessary emergency room visits will be reduced, readmission rates for diabetic related illnesses will be reduced and the less fortunate in
the community will have a dedicated resource to receive care and access to medications to help them manage their chronic illness.

**Starting Point/Baseline:**

Project Baseline: The clinic is currently seeing 6-10 patients per week, most who are being treated for one or more chronic illnesses. The hospital’s Prescription Assistance Program (PAP), which is a not for profit entity that receives no federal funding, provides uninsured and indigent patients with prescription medications for $15 a month. A large portion of patients who receive medication through the PAP have received care at the Christian Free Clinic. There are currently 84 Christian Free Clinic patients who are receiving medications through the PAP.

Once the clinic has been relocated, and staff levels and hours of operation have increased from one evening a week to three days a week with extended evening hours, we project patient volume to increase by 100% over baseline in year three, 150+% over baseline in year four, and 200+% over baseline in year five, based on the patient volume from the prior year’s reporting period.

**Rationale:**

1.1.2 Expand existing primary care capacity

Required core components:
- a) Expand primary care clinic space
- b) Expand primary care clinic hours
- c) Expand primary care clinic staff

Project core components will be addressed as follows:

We selected Project Option 1.1.2, Expand Existing Primary Care Capacity, after discovering the poor facility condition of Seguin’s Christian Free Clinic. The Clinic is in extreme need of safer access and increased square footage to provide primary care services to local uninsured and indigent patients. GRMC selected this project as a means to extend supportive resources to the clinic and voluntary providers who currently treat clinic patients one evening each week. GRMC views this clinic relocation as an opportunity to build on the Christian Free Clinic’s structure and augment the clinic with additional clinical staff support to provide the ability to expand clinic hours and care for underprivileged patients who cannot afford healthcare. The clinic expansion will be specifically carried forth with the addition of a physician extender, medical assistant and front office receptionist. One of the primary goals of this clinic is diabetic disease management and prevention, given that the majority of the patients currently being treated at the Christian Free Clinic are diagnosed with diabetes. Currently, 84 patients who receive care at the Christian Free Clinic are receiving medications from the Prescription Assistance Program (PAP) at the hospital.

The PAP, which is a department of the hospital, is supported by various local donors, as well as the hospital. Neither the PAP, nor any services related to the clinic project receives any federal funding.

The unique community needs identified the project addresses are: CN 2 & CN3. This project will address access to primary care for the uninsured and focus on chronic disease management of
diabetes.

GRMC would take this clinic on as a new project initiative, as there is no community clinic owned or supported by the hospital at this time to enhance access to primary care services to the uninsured, nor is there a local community clinic willing to see patients for free except for the Christian Free Clinic. GRMC would build on the Christian Free Clinic’s structure, which is a non-profit tax exempt organization, and offer expanded services by means of hours, staff, and educational resources. The Christian Free Clinic in its current location and weekly operating schedule sees on average 6-10 patients a week, approximately 40 patients a month.

The prevalence of Type II Diabetes in Guadalupe County is currently 11.7%, compared to the national rate of 8.3%. It is currently an unmanaged issue in Seguin and surrounding communities, due to lack of patient access to medical care, affordability of diabetic medications, and lack of educational resources and follow-up support services.

Expanding clinic hours will impact the greater community due to the fact there is not a clinic open and available during normal business hours (8-5pm) that is willing to accept patients free of charge. Currently, diabetic patients end up in the emergency room, and are often times costly admissions because they cannot acquire or afford their diabetic medications. By focusing on the diabetic population in this clinic, we expect to see a reduction in unnecessary ER visits, reduction in diabetic related hospital admissions and readmissions, and a greater rate of diabetes management/compliance given the access to free healthcare resources.

**Related Category 3 Outcome Measure(s):**

We selected Improvement Target (IT)-1.10 Diabetes care: HbA1c poor control (>9.0%) – NQF 0059 (stand-alone measure) from Category 3, due to the high prevalence of patients diagnosed with diabetes in the Seguin and surrounding communities; and, because it is one of the leading causes of death in our region, as noted in our community needs assessment.

The goal of this clinic is not only to expand access to care for those who are uninsured, but to proactively manage those patients who have been diagnosed with diabetes. Clinic staff will ensure that patients receive their prescribed medications by means of the hospital’s Prescription Assistance Program, receive free regular lab checks, and on-going education for their illness, by arranging follow-up appointments to the clinic.

Our Category 1 project will impact the target of this outcome, as well as impact the greater community due to the fact there is not a clinic resource open and available at normal business times. Currently, these patients end up in the emergency room, and are often times costly admissions because they cannot acquire or afford their diabetic medications.

**Relationship to other Projects:**

This project will support GRMC’s Transitional Care Project, RHP 2.12, and Patient Navigation Project, RHP 2.9 by providing a valued clinic resource for follow up care for those patients identified without insurance and a primary care physician. The collaboration of these two projects will help ensure these patients receive follow up care once out of the hospital or Emergency Room.

By focusing on the diabetic population in this clinic, we expect to see a reduction in unnecessary ER visits, reduction in diabetic related hospital admissions and readmissions, and a greater rate of diabetes management compliance given the access to free healthcare resources.
In addition, RHP Projects: 2.2, 2.7, 2.9, 2.11 will also be impacted by the addition of this clinic because of its focus and slated resources on chronic disease management of diabetes and prevention.

Related projects include:
- 2.2 Expand Chronic Care Models
- 2.7 Implement Evidence-based Disease Prevention Programs
- 2.9 Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care
- 2.11 Conduct Medication Management
- 2.12 Implement/Expand Care Transitions Program

Category 4 population measure:
RD-1. Potentially Preventable Admissions, 2ii
#2 Diabetes Admission Rates
ii. Uncontrolled Diabetes (derived from AHRQ Prevention Quality Indicator (PQI) #14)
   a. Numerator: All inpatient discharges from all participating hospital age 18 and older with ICD-9-CM principal diagnosis code for uncontrolled diabetes, without mention of a short-term or long-term complication within the demonstration year
   b. Denominator: Number of residents age 18 and older living in the RHP counties

Relationship to Other Performing Providers’ Projects in the RHP:
N/A

Plan for Learning Collaborative:
GRMC is interested in participating in a learning collaborative with other regional partners pursuing similar projects.

Project Valuation:
The scope of this project should be categorized as a large project, due to the amount of staff resources, supplies and systems that will be needed to develop, train, and manage a growing clinic. In response to our community needs assessment, we anticipate this clinic growing quickly with patients, given the lack of uninsured access to health care in our community. Currently, the Christian Free Clinic is funded by charitable donations from local organizations, however, the amount of money received monthly, which is approximately $3,000.00 is nowhere near the amount of funds needed to support monthly operations of a clinic.

The clinic will also be marketed to local primary care physicians as a valuable educational resource for indigent or uninsured patients with chronic diabetic needs. It is recognized that physicians have limited time to spend on one-on-one education with their patients. This clinic will help fill that void by being a referral source for diabetic education, in addition to managing other chronic illnesses.

**Milestone 1**
P-1: Establish additional/expand existing/relocate primary care clinics.  
**Metric 1 [P-1.1]:** Relocate clinic to larger space on hospital campus.  
**Baseline:** Current clinic space is approximately 1,000 square feet  
**Goal:** Relocate clinic to a larger more sustainable office space on the hospital campus with approximately 1,500 square feet.  
**Data Source:** Documentation of relocation of clinic address and notice to patients.  
**Milestone 1 Estimated Incentive Payment $ 549,022**

**Milestone 2**
P-5: Train/hire additional primary care providers and staff and/or increase the number of primary care clinics for existing providers  
**Metric 1 (P-5.1):** Documentation of staff training and education.  
**Data Source:** Documentation of completion of all items described by the RHP plan for this measure. Hospital or other performing provider report, policy, contract or other documentation.  
**GRMC will use a service education log as its data source.**  
**Baseline:** There are currently no staff hired or trained to operate this clinic.  
**Goal:** Train medical assistant and front office receptionist staff specifically on diabetic patient tracking and management.  

**Milestone 3**
P-5: Train/hire additional primary care providers and staff and/or increase the number of primary care clinics for existing providers  
**Metric (P-5.1):** Documentation of staff training and education.  
**Data Source:** Documentation of completion of all items described by the RHP plan for this measure. Hospital or other performing provider report, policy, contract or other documentation.  
**Baseline:** There are currently no staff hired or trained to operate this clinic.  
**Goal:** Train medical assistant and front office receptionist staff specifically on diabetic patient tracking and management.

**Milestone 4**
P-4: Expand the hours of a primary care clinic, including evening and/or weekend hours  
**Metric (P-4.1):** Increase clinic hours from three days a week, to two extended evening hours per week a month.  
**Data Source:** Clinic documentation/Patient registry/office schedule  
**Baseline:** Office hours are three days a week 8-5pm  
**Goal:** Extend hours two days a week to 8pm  
**Milestone 4 Estimated Incentive Payment $600,694**

**Milestone 5**
P-4: Expand the hours of a primary care clinic, including evening and/or weekend hours  
**Metric (P-4.1):** Increase clinic hours from three days a week, to two extended evening hours per week a month.  
**Data Source:** Clinic documentation/Patient registry/office schedule

**Milestone 7**
I-12 Increase primary care clinic volume of visits and evidence of improved access for patients seeking services.  
**Metric 1 [I-12.1]:** Documentation of increased number of visits. Demonstrate improvement over prior reporting period.  
**Data Source:** Patient registry/Clinic documentation/schedule  
**Baseline:** 120 visits per month  
**Goal:** Increase patient visits 200+% over baseline (240 visits per month)  
**Milestone 8 Estimated Incentive Payment $992,451**
**Metric:** (P-5.1): Documentation of increased number of providers and staff and/or clinic sites  
**Data Source:** Documentation of completion of all items described by the RHP plan for this measure. Hospital or other performing provider report, policy, contract or other documentation. GRMC will use a personnel log and/or in-service education log as its data source.  
**Baseline:** There are currently no employees hired to operate this clinic, only four volunteer physicians and one non-clinical volunteer.  
**Goal:** Hire & train a physician extender, medical assistant/ receptionist and front office receptionist.

Milestone 2 Estimated Incentive Payment: $549,021

**Milestone 3**  
**Incentive Payment:** $399,302

**Milestone 4**  
P-4: Expand the hours of a primary care clinic, including evening and/or weekend hours  
**Metric:** (P-4.1.): Increase number of hours at primary clinic over baseline.  
**Data Source:** Clinic documentation  
**Baseline:** one evening per week.  
**Goal:** Clinic operating three days per week from 8-5pm  
**Milestone 4 Estimated Incentive Payment** $399,302

**Milestone 5**  
I-12 Increase primary care clinic volume of visits and evidence of improved access for patients seeking services  
**Metric 1** [I-12.1]: Documentation of increased number of visits. Demonstrate improvement over prior reporting period.  
**Data Source:** Patient registry  
**Baseline:**  
**Goal:** Increase the number of visits by 150+% over baseline (120 visit per month)  
**Milestone 7 Estimated Incentive Payment** $600,694

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $4,489,788**
Identifying Project and Provider Information:

Title: 1.1.2 - Expand existing primary care capacity: a) expand primary care clinic space; b) expand primary care clinic hours; and c) expand primary care clinic staffing.
Unique RHP ID#: 133260309.1.1 – PASS 1
Performing Provider: Medina Healthcare System (Medina Regional Hospital)
Performing Provider TPI: 212140201

Project Summary:

Provider Description: Medina Healthcare System is comprised of Medina Regional Hospital (“MRH”) and three Rural Health Clinics. MRH is a 25 bed critical access hospital and is the sole hospital provider in Medina County with an approximate population of 47,000 and square mileage of 1,335. The hospital is located in the City of Hondo, which is a 10 square mile area, and approximate population of 9,000.

Intervention(s): This project will add needed staff (physicians and/or mid-level providers), clinic staff, and square footage to increase clinic visits and expand clinic hours. This project is therefore an expansion of our existing clinics.

Need for the project: As the only rural health clinics in the County, the facilities are overcrowded with almost 48,000 visits annually. Patients walk out due to long waits and cancel appointments. With very little weekend access, patients often seek medical attention through the busy and costly emergency department. These issues are due to inadequate access to primary care.

Target population: The target population is those patients in the County that need medical (primary) care access to physicians/mid-level providers (not only during 8-5 hours), but also after hours and on weekends. Approximately 32% of our clinic patients are Medicaid or indigent. Many more are by definition charity patients.

Category 1 or 2 expected patient benefits: This project seeks to expand clinic hours/staff and space available to improve access to care. By DY(4) and (5), the project seeks to increase clinic visits by 3% (1,435 patients) and 5% (2,390 patients) respectively. In addition, the unique number of patients will increase by 3% (450 patients) and 5% (750 patients) from the baseline number. Currently, primary care physicians have over 47,000 combined visits annually. Thirty-two percent of these patients are Medicaid or indigent.

Category 3 outcomes:
1. 3.IT-1.12 seeks to increase the percent of qualified patients who receive an eye exam (retinal or dilated) currently by (TBD) % by DY5.
2. 3.IT-1.13 seeks to increase diabetic foot exams in qualified patients by (TBD)% in DY5.
3. 3.IT-1.14 our goal is to increase the number of diabetic patients who had a nephropathy screening test by (TBD) % in DY5.
**Project Description:**

Medina Regional Hospital proposes to expand primary care capacity to improve accessibility to citizens of the County and surrounding areas.

DSRIP Project 133260309.1.1, “Expanding Primary Care Capacity” is essential to providing accessible healthcare to citizens of Medina County, Texas. Access to comprehensive, quality services is important for the achievement of health equity and for increasing the quality of life. This goal requires: gaining entry into the system, accessing a location where services are provided, and finding a trusted healthcare provider. The goal of “expanding capacity” would allow patients to access the right care in the right place at the right time. This goal will be accomplished by adding healthcare providers and increasing the hours of Medina Regional Hospital (MRH) health clinics, as well as some expansion of space. Achieving this goal would allow patients access to care outside normal business hours reducing trips to Bexar County or improper utilization of emergency departments. This utilization of “after hours” emergency sites results in less coordinated, as well as more costly care.

**Goals and Relationship to Regional Goals:**

The goal of this project is to expand primary care capacity in the region by seeking to keep patients healthier, and thereby lessening the burden of regional emergency departments. By increasing access, patients can utilize the appropriate care destination both in Medina County and in RHP6 in general.

**Project Goals:**

The project/option selected is: Expand Existing Primary Care Capacity with the corresponding components of:

a) Expand Primary Clinic Space;
b) Expand Primary Clinic Hours; and
c) Expand Primary Clinic Staffing

This project meets the following regional goals:

- Transform healthcare by providing the right care at the right location and in a timely manner, thereby reducing costly care, unnecessary hospitalization, and builds on the strength of the RHP.
- Develops a regional approach to healthcare delivery that improves existing programs in our hospital and the region.
  
  This goal is responsive to patient needs and should improve overall patient satisfaction.

**Challenges:**

As Medina County is a designated “health professional shortage area”, recruitment and retention of physicians and mid-levels (Physician Assistants and Nurse Practitioners) are major challenges in meeting the goal described above. Medina Healthcare System (MHS) plans to increase recruitment efforts and employ outside agencies to meet these challenges. A staffing plan will be implemented to ensure the extended hours of the clinic become a reality. Efficient scheduling remains an obstacle to care access predominantly due to the lack of an electronic medical record system and an outdated scheduling process. MRH has purchased an electronic system and plans are underway for a “go-live” date.
5-Year Expected outcome for Provider and Patients:
Medina Regional Hospital expects to see improvements in the number of visits and unique patients seeking care in our rural health clinics. Expected outcomes will relate to the project goals described above.

Starting Point/Baseline:
In the fiscal year ending on September 30, 2012, the number of patient visits in rural health clinics of MHS, equaled 47,850. In September 2012, care was delivered utilizing one physician assistant, one nurse practitioner, 24 clinic staff members, and six Family Practice physicians. Three full-time schedulers were employed for all three clinics. Patient record keeping and scheduling utilize a slow, cumbersome process, and no electronic health record is in place.

Rationale:
Regional Health Partnership (RHP) 6 reports a high uninsured rate as well as reportable poor health outcomes. This RHP is composed of 54% Hispanic and 37% Anglo population. Spanish is the predominant language in many homes. 12% are 65 years of age or older; many with limited mobility/transportation issues. The per capita income is less than the state average. In 2009, 16% of the population lived below the poverty line. Medina County averaged 11%-20%. In 2009, 471,000 residents lacked health insurance, particularly in rural areas such as Medina County. Many residents are employed by small businesses or are self-employed. This lack of insurance is another barrier to access to “primary care” services. Thirty-three providers in RHP 6 are designated as Rural Health Clinics. Medina Regional Hospital is designated as a Critical Access Hospital and manages three rural health clinics located in Hondo, Castroville and Devine.

The National Rural Health Association (NRHA) has identified several issues of particular interest to rural communities, the first of which is “access to health care services, particularly health disparities and physician shortages.” Rural counties in RHP 6 comprise 61% of the geographical area. This highlights the importance of safety net providers and explains the importance of increasing access to primary care, both in the RHP and in Medina County. The citizens in these counties tend to be older, less educated, with lower per capita income.

Continued population growth, both in the RHP and Medina County, will exacerbate the current challenge of providing primary care services. Future decisions (Medicaid expansion, health insurance, exchanges, etc.) could have a significant impact on the health status of residents in Medina County. This opportunity to implement the transformative project of increasing access to primary care (through the 1115 Waiver funding) will assist MRH in addressing the needs of its community.

In Medina County, patients often seek care for primary care services in urgent or emergent care settings. This can result in a less coordinated and more expensive approach to healthcare. Lack of appropriate follow-up is yet another downside to this type of care. When primary care clinics are closed (after-hours, weekends, holidays) or scheduling is difficult, residents seek treatment in the emergency department, or worse, seek no treatment at all. Particularly with the elderly and indigent populations, transportation to other counties (such as Bexar County) is not a viable option. Conditions can exacerbate during these time periods leading to an increase in possibly preventable readmissions. This can also be complicated by the inability to receive appointments.
in a timely manner.
By enhancing clinic hours, expanding appointment times, and generally improving access to

care, patients should align themselves with the primary care system in Medina County resulting

in better outcomes, improved coordination of care, and reduced costs.

The prevalence of other chronic diseases, such as diabetes, cancer and cardiovascular disease, is

above state and national levels. 60% of the deaths in 2008 in RHP 6 were due to these potentially

preventable causes. Access to providers, extended hours and more efficient scheduling could
certainly assist in preventing these deaths. The rural health clinics service over 47,000 visits,

with patients from birth to death. Access to a primary care provider is essential to this county

and for patients of all ages.

According to the 2011 physician needs assessment, Medina County was short six Family

Practice physicians. According to the County Health Rankings and Roadmaps, Medina County
showed 1,701 residents per Family Practice practitioner. This is well below the national
benchmark of 631:1. Texas ranks 45th in the nation in number of physicians per capita. The
Region’s growing population, increased life spans and growing prevalence of chronic diseases,
contribute to an accelerated need for primary care providers. For children, access to primary
care is extremely important. The FY 2010 Texas Medicaid Managed Care STAR Program
Quality of Care Report stated that less than 80% of children between the ages of three to five had
a well-child visit. Adult obesity was 30% compared to the national average of 25% and diabetic
screening was 79% compared to 89%.

Low birth weight was 7.9% compared to 6% nationally, and the teen birth rate was 55 (compared
to 22).

The project chosen certainly addresses the RHP and the county needs. To fulfill that project,
process and outcome measures were chosen that specifically lead us to the desired outcomes.

The process milestones selected were:

1. P-4 – Expand the hours of a primary care clinic, including evening and/or weekend hours, and
   P-4.1 will be the metric increasing hours over the baseline. The current hours for the rural
   health clinics as of FYE 9/30/12 are: 9am-5pm (Monday-Friday); Saturday (Hondo) 9am-
   11am.

2. P-5 – Train, hire additional primary care providers and staff as evidenced by P-5.1
   Documentation of increased numbers of providers and staff in Devine, Hondo and/or
   Castroville.

The improvement target selected is I-12 with the milestone being the increase in clinic visits as
evidenced by improved access.

I-12.1 – Will be the documentation of increased visits
I-12.2 – Documentation of the number of unique patients or size of patient panels
Clinic space will also be enhanced/expanded to meet the growing volume of patients.

One specific chronic disease target will be diabetes. The diabetes rate in Bexar County is 10%
and more than double for African Americans and Hispanics (13%) as compared to Whites (6%). The population of Texas will continue to grow and a portion of this growth (18%) will be from international migration from Mexico. According to national examination services, Hispanics are almost twice as likely as non-Hispanic Whites to develop diabetes.

According to the Agency on Healthcare Research, Texas scored “weak” on preventative measures and “weak” on diabetes measures. In fact, in RHP 6, diabetes was listed as one of the top causes of death. Disease management, screening and wellness programs are crucial to reducing morbidity and mortality due to diabetes. By improving access to care and allowing for increased visits, thereby increasing screening exams, diabetes can be better managed in Medina County. Many diabetic complications can be prevented if detected and addressed early. Control of diabetes can extend and improve the quality of lives of thousands of patients in Medina County.

**Project Components:**
To expand primary care access we propose to meet all required project components.

a) Expand primary care clinic space. We plan to increase existing space to allow for the increase in patient volume. An expansion plan will be developed addressing space priorities.

b) Expand primary care capacity hours. We plan to increase hours by offering services on weekends and later in the evening. This should allow patients more flexibility in scheduling as well as “drop-in” hours. Extended hours should also lower the hospital ED utilization.

c) Expand primary care capacity staffing. We plan to hire an additional provider (mid-level, physician or both) as well as clinic staff to improve throughput, scheduling, and patient satisfaction.

**Unique community need identification numbers the project addresses:**
Screening is obviously an important factor in improving health outcomes of both RHP 6 and in Medina County. A summary of RHP 6 needs includes one most relevant to Medina County and that is:

- CN.3- Many residents lack access to medical and dental care due to high rates of uninsured and healthcare provider shortages. As a provider with almost 50,000 visits annually, increasing access to primary care will enhance our existing primary care delivery processes.

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This project significantly enhances the care currently being delivered. When the clinics are closed, patients seek care mainly in the only emergency room in the county, or make the long trip into Bexar County, or seek no care at all.

All these circumstances lead to increased costs and fractionated care in both the County and RHP 6. Increasing access to providers, expanding the hours/space of the clinics, will certainly lead to better healthcare for children, adults, and the elderly in Medina County.
### Related Category 3 Outcome Measure(s):

**Related Category 3 Outcome Measures**

Three non-stand-alone measures were chosen from Category 3 to include:

**Outcome Domain – 1 (Primary Care and Chronic Disease Management)**
- IT-1.12 Diabetes Care: Retinal Eye Exam
- IT-1.13 Diabetes Foot Care Exam
- IT-1.14 Diabetic Care: Microalbumin/Neuropathy

**Reasons/rationale for selecting the outcome measures:**
These were chosen because diabetes is one of the most common and costly diseases in both RHP 6 and in Medina County. Half of all residents with diabetes go undiagnosed, making screening a vital part of primary care in the area. Complications cost millions of dollars and undiagnosed diabetes can lead to amputations, blindness, and kidney failure. In the *County Health Rankings and Roadmaps*, Medina County scores below both Texas and national benchmarks in diabetic screening. Adult obesity ranks high at 30%, as well as a 26% score on physical activity.

Given the high prevalence of diabetes in the RHP and the County, fueled by a high obesity rate, access to fast foods, a high rate of uninsured/underinsured, low educational levels and the percentage of residents living below the poverty line (16%), screening for complications and prevalence of diabetes is of vital importance to the healthcare needs of Medina County.

The rural health clinics in Medina County, with over 47,000 visits annually, serve the primary healthcare needs of many of these residents. Improving access to primary care will provide even more citizens the screening exam needed to live a healthier lifestyle, and at a reduced cost.

**Note:** Medina Regional Hospital purchased an EHR system in 2012 and plans to go-live in 2013, but this is not directly related to this project.

### Relationship to other Projects:

1.1.2 – Expanding primary care capacity is interrelated to numerous other 1115 Waiver Projects in several categories.

2.2 - Expanding the chronic care management model aims to reduce unnecessary acute and emergency care utilization by effectively managing chronic conditions (i.e. diabetes). Elements include the ability to identify these conditions earlier. Expanding primary care access and diagnosing diabetes earlier, go hand-in-hand.

2.3 – Redesign Primary Care – As patient volumes increase, physicians struggle to ensure their patients have prompt access to care and receive adequate screenings for chronic conditions. Receiving appointments timely and understanding service availability, is the rationale for this project option which indirectly in line with 1.1.2 expanding primary care capacity. Increasing providers and hours certainly leads to improved primary care 2.3.

2.4 – Redesign to improve Patient Experience is also closely related to 1.1.2. Improved access to
care and more flexible scheduling can only result in an improved patient care experience. With an improved experience, patients should “keep appointments” and can be followed more closely.

1.1.2 (Increase training of Primary Care Workforce) is obviously related to expanding primary care capacity. Expanding the primary care workforce will increase capacity and help create a more organized structure of providers and space. The expansion will lead to earlier diagnosis and treatment of chronic diseases and decrease healthcare costs overall. In 2010, Texas ranked 47 in numbers of primary care physicians per 100,000 in population. Improving this number is key to expanding capacity.

1.3 – Implement a Chronic Disease Management Registry. Although not a direct link, the ability to track screening results of patients with diabetes by improving primary care access has the similar goal of “prompting” physicians and teams to conduct assessments and deliver specific recommended cure. For example, P-8 would create protocols for reminders for targeted diseases (such as screening exams for diabetes).

1.10 – Enhance Performance Improvement and Reporting Capacity. Performance improvement activities will be woven into expanding primary care capacity and Category 3 outcomes of screenings for diabetic patient conditions. “Performance improvement is a large component of success of all of the project areas across the categories.” Education and training will be provided to physicians and staff in process improvement strategies.

### Relationship to Other Performing Providers’ Projects in the RHP:

Other performers selecting this project include:

Methodist Hospital System
Frio Regional Hospital
Southwest General Hospital
Guadalupe Regional Medical Center
University Hospital
University of Texas Health Science Center (San Antonio)
Peterson Regional Medical Center
Baptist Medical Center
Val Verde Regional Medical Center
Children’s Hospital of San Antonio

Many of these facilities are geographically positioned with overlapping patients. Improving access will assist all these patients and simultaneously reduce ED visits.

### Plan for Learning Collaborative:

As the anchor for RHP 6, University Health System will promote and facilitate learning collaboratives. Medina Regional Hospital will participate with many of the above providers performing similar projects to share ideas, best practices, challenges and success stories. Working groups will be formed to establish the goals, develop a calendar for meetings, and share ideas. New solutions can be tested.
**Project Valuation:**

This project touches almost all citizens in Medina County, and in fact, compliments other providers in the RHP. By improving access to care, costly preventable admissions and over-utilization of emergency departments will be decreased in Medina as well as neighboring counties such as Bexar and Uvalde. Cost avoidance is obviously a major justification for this project. Barriers to accessing health services lead to delays in receiving appropriate care, inability to receive preventative services, and hospitalizations that could have been prevented. In terms of cost, providers including physicians, mid-levels and staff will need to be hired and trained. Processes will have to be developed and implemented. As the only hospital in Medina County, access to care is both beneficial and a priority. Over 47,000 visits to the clinics were recorded last year. As the demand for healthcare increases (through migration, population growth, baby boomer aging), demand will rise even farther.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $2,542,948**
Identifying Project and Provider Information:
Title: 1.10.1 Enhance improvement capacity within people – Medina Healthcare System
Unique RHP ID#: 133260309.1.2 – PASS 2
Performing Provider: Medina Healthcare System (Medina Regional Hospital)
Performing Provider TPI: 212140201

Project Summary:
Provider Description: Medina Healthcare System is comprised of Medina Regional Hospital (“MRH”) and three Rural Health Clinics. MRH is a 25 bed critical access hospital and is the sole hospital provider in Medina County with an approximate population of 47,000 and square mileage of 1,335. The hospital is located in the City of Hondo, which is a 10 square mile area, and approximate population of 9,000.

Intervention(s): This project will lead to the implementation of process improvement methodologies that will improve patient safety, quality, and efficiency. Resources will be put in place to conduct, report, drive and measure quality improvement; Specifically an office and director will be established/hired and a formal process of education will be implemented.

Need for the project: Currently, the hospital has no director or office for Process Improvement or Quality. No formal methodology is being utilized and little data reporting is taking place, which complicates the ability to improve upon patient safety initiatives or report mandated/meaningful data. Although it is an expansion of our current process, this project will be a huge undertaking for this facility.

Target population: The target population is those patients served in our rural health clinics and hospital. Approximately 32% of our clinic patients are Medicaid or indigent, and will benefit from this project. Many more by definition are considered charity patients. The hospital inpatient/outpatient percent of Medicaid/indigent approximates 20%.

Category 1 or 2 expected patient benefits: The project seeks to increase the number of reports generated to three in DY4 and to submit three quality dashboards by DY5. Additionally, we seek to increase the number of performance activities (designed and implemented) to three in DY4 and demonstrate improvement in two selected quality measures by DY5. We will also utilize this Category 1 project to drive improvements in three Category 3 areas.

All employees (approximately 200) will be affected and educated during this project. Additionally, the primary care physicians will be educated and benefited by this project. With advanced process improvement training, over 47,000 clinic patients will benefit as well as 1100 inpatient hospital patients (Approximately 32% of clinic patients are Medicaid or indigent.).

Category 3 outcomes:
1. 3.IT-12.1 seeks to increase the number of women aged 40-69 that have received an annual mammogram by (TBD) % in DY4 and (TBD) % over baseline in DY5.

2. 3.IT-12.2 seeks to increase the number of women aged 21-64 that have received a PAP measurement (in the measurement year or two prior years) by (TBD) % over baseline in DY4 and (TBD) % over baseline in DY5.
3. 3.IT-12.4 seeks to increase the number of adults aged 65 and older that have received a pneumonia vaccine by (TBD) % in DY4 and (TBD) % over baseline in DY5.

<tr>
<td>Medina Regional Hospital proposes to expand quality improvement capacity through people, processes and technology so that the resources are in place to conduct report, drive and measure quality improvement.</td>
</tr>
</tbody>
</table>

DSRIP Project 212140201.1.10, “Enhance Performance Improvement and Reporting Capacity” will lead to the implementation of process improvement methodologies that will improve patient safety, quality and efficiency. A new operational mindset will be instituted to lead staff to identify inefficiencies in the healthcare delivery system and to work toward the elimination of these inefficiencies.

Process improvement in healthcare is imperative in today’s rapidly changing environment. These improvements assure that our systems are operating at their optimum. The goals of healthcare process improvement are to enhance the effectiveness of systems to alleviate waste/cost and ultimately improve the quality of the patient experience, care and outcomes. Improvement in numerous areas will allow us to reduce duplication of efforts and minimize the waste of resources. Changing the management of critical processes can generate a 20-50% improvement in those processes impacting patient and employee satisfaction, as well as the bottom line. With the IOM’s “to err is human” and “crossing the quality chasm”, a widespread incidence of medical errors in U.S. hospitals was reported. The IOM report estimated that medication errors alone caused more than 7,000 deaths annually. Additionally, “to err is human” revealed that between 44,000 and 98,000 Americans die each year due to medical errors, and total costs of these errors are estimated to be between $17 billion and $29 billion dollars, with healthcare costs comprising over 50%. According to Health Aff. (2006), in 2003, Medicare paid hospitals an additional $300 million per year for five types of adverse events. Healthcare professionals also pay with a loss of morale and increased turnover.

Since then, much progress has been made in developing indicators and risk adjustment mechanisms to compare and improve quality across systems. Hospitals that perform well on process measures have better outcomes, employee and patient satisfaction, and reduced costs.

**Goals and Relationship to Regional Goals:**
The goal of this project is to expand quality improvement capacity through people, processes and technology so that the resources are in place to conduct, report, drive and measure quality improvement.

**Project Goals:**
The project/option selected is: Enhance Performance Improvement and Reporting Capacity with the corresponding components of:

</table>
impact the work environment, patient care and satisfaction, efficiency and other issues aligned with continuous process improvement.

This project meets the following regional goals:

- One of the key goals of the Waiver and RHP6 is to improve and prepare the healthcare infrastructure’s newly insured population. This will require effective management, enhanced technology and improved processes to promote quality care and to reduce the costs. RHP6 represents a vast area with many rural communities where poor health outcomes are common. Limited access to primary and specialty care exacerbates these problems. Healthcare facilities in RHP6 must become efficient in delivering care to an increasing population. The region has a high emergency room utilization, low access to primary/specialty care, and 125,090 potentially preventable hospitalizations leading to charges of $1,700 per adult living in the region’s counties. Performance improvement is key to improvement in all the categories named above, plus all the other projects in the partnership. It meets the triple aim of assuring patients receive high quality and patient centered care, in the most cost effective ways.

- This project will assist in developing a regional approach to healthcare delivery that enhances or replaces an existing process in our hospital system and RHP. The goal is responsive to patient needs and should improve overall patient satisfaction.

Challenges:
The primary challenge for this project will be the recruitment and retention of a qualified process improvement coordinator to engage the stakeholders. As a health provider shortage area, recruiting a well-trained, passionate Director to lead process improvement will be difficult. Obtaining management and staff buy-in to a formal change process may also prove to be daunting, as well as rolling out process methodologies throughout the medical and hospital staff.

5-Year Expected outcome for Provider and Patients:
Medina Regional Hospital expects to have a Performance Improvement office with a qualified director leading the change for a formalized quality performance program. Our goal is to have a substantial workforce that is trained and using various performance improvement tools in approaching work and cost efficiencies while reducing variations in processes.

Starting Point/Baseline:
Currently no position for Director of Process Improvement/Quality exists at Medina Regional Hospital. No formal methodology is being utilized at this time and little date reporting/charting is taking place. Therefore, the baseline number of employees in the process improvement department is zero, and dedicated space is also zero.
**Rationale:**

Enhancing performance improvement and reporting capacity will lead to the implementation of process improvement methodologies that will improve patient safety, quality and efficiency. A new operational mindset will be instituted to lead staff to identify inefficiencies in the healthcare delivery system and to work toward the elimination of these inefficiencies.

The project chosen certainly addresses the RHP and the county needs. To fulfill that project, process and outcome measures were chosen that specifically lead us to the desired outcomes. The process milestones selected were:

1. **P-1** – Establish a performance improvement office to collect, analyze, and manage real-time data and to monitor the improvement trajectory and improvement activities across the Performing Provider’s delivery system.
   - **P-1.1** Metric documentation of the establishment of performance improvement office.
   - **P-1.2** Documentation that the performance improvement office is engaged in collecting, analyzing, and managing real-time data.

2. **P-2** – Establish a program for trained experts on process improvements to mentor and train other staff, including front-line staff, for safety and quality care improvement. All staff trained in this program should be required to lead an improvement project in their department within six months of completing their training.
   - **P-2.1** Train-the-trainer program established.
   - **P-2.2** Improvement projects led by staff trained through the train-the-trainer program.

3. **P-9** - Participation in face-to-face learning/meetings/seminars at least twice a year with other providers and the RHP to promote collaborative learning around similar and shared projects.
   - **P-9.1** Participate in semi-annual meetings or seminars

The improvement targets selected are:

**I-7** Milestone: Implement quality improvement data systems, collection, and reporting capabilities.
- **I-7.1** Metric: Increase the number of reports generated through these quality improvement data systems.
- **I-7.2** Metric: Demonstrate how quality reports are used to drive rapid-cycle performance improvement.

**I-8** Milestone: Create a quality dashboard or scoreboard to be shared with organizational leadership and at all levels of the organization on a regular basis that includes outcome measures and patient satisfaction measures.
- **I-8.1** Metric: Submission of quality dashboard or scorecard.

**I-9** Milestone: Demonstrated improvement in x number of selected quality measures.
- **I-9.1** Metric: Improvement in selected quality measures.
**Project Components:**
To enhance improvement capacity within people we propose to meet all the required components.

d) Provide training and education to clinical and administrative staff on process improvement strategies, methodologies and culture.
e) Develop an employee suggestion system that allows for the identification of issues that impact the work environment, patient care and satisfaction efficiency and other issues aligned with continuous process improvement.
f) Continuous quality improvement is reflected in Milestone 4 [I-7], Metrics I-7.1 and I-7.2 (implementing quality improvement data systems, collection, and reporting capabilities). CQI is also reflected in [I-7.2] utilizing quality reports to drive rapid cycle performance improvement. Additionally, Milestone 6 [I-9] projects demonstrated improvement in two selected quality measures.

**Unique community need identification numbers the project addresses:**
Performance improvement is obviously an important factor in improving health outcomes of both RHP 6 and in Medina County. A summary of RHP 6 needs includes three which are most relevant to Medina County and they are:

- CN.1- Texas ranks last in the nation on health care quality. RHP6 is challenged to deliver improved quality and patient satisfaction.
- CN.2- A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients.
- CN.6-High rates of communicable diseases and vaccine preventable diseases in the community.

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
Currently a formal process or methodology for process improvement is not being utilized. This formalized methodology, led by a qualified Quality Director, represents a significant enhancement to the evaluation of resources. Process improvement permeates every aspect of each initiative in RHP6.

**Related Category 3 Outcome Measure(s):**

<table>
<thead>
<tr>
<th>Outcome Domain – 12 (Primary Care and Primary Prevention)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IT-12.1 Breast Cancer Screening</td>
</tr>
<tr>
<td>• Number of women aged 40 to 69 that have received an annual mammogram during the reporting period. Denominator: Number of women aged 40 to 69 in the patient or target population. Women who have had a bilateral mastectomy are excluded.</td>
</tr>
<tr>
<td>IT-12.2 Cervical Cancer Screening</td>
</tr>
</tbody>
</table>
Number of women aged 21 to 64 that have received a PAP in the measurement year or two prior years. Denominator: Women aged 21 to 64 in the patient or target population. Women who have had a complete hysterectomy with no residual cervix are excluded.

IT-12.4 Pneumonia Vaccination Status for Older Adults
- Numerator: Number of adults aged 65 and older that have ever received a pneumonia vaccine.
- Denominator: Number of adults aged 64 and older in the patient or target population.

Reasons/rationale for selecting the outcome measures:
These were chosen because primary screening as well as preventative vaccinations contribute to early detection and prevention, increasing health outcomes of individuals.

Mammography screening (52%) in Medina County is well below the national benchmark of 74%. According to the Agency for Healthcare Research and Quality’s 2011 Report, Texas scored WEAK in preventative measures and AVERAGE on cancer measures. Cancer is a leading cause of death in RHP6. Medina Regional Hospital will utilize the Category 1 project (Process Improvement) to improve both mammography and cervical cancer screening, as well as pneumonia vaccinations in Medina County.

Education and training on process improvement measures to front line staff, directors, clinical and non-clinical staff, and the establishment of the employee suggestion process, will position Medina Regional Hospital to evaluate current plans and discharge tools to improve preventive measures such as our I-T targets.

Relationship to other Projects:
This project is a direct link to 1.1.2, “Expanding Primary Care Staffing”. Process improvement is needed to enhance recruitment/retention efforts. Additionally, an enhanced process improvement methodology will be needed to improve efficiencies in the clinics to improve patient flow and all projects to improve efficiencies and reduce waste will be integrated to this project. This project supports the 1115 Waiver and Triple Aim Goals to improve outcomes while containing cost growth. The tools selected will focus on reducing undesirable variations, which will support Medina Regional Hospital’s and RHP 6 goals.

Relationship to Other Performing Providers’ Projects in the RHP:
The Baptist Health System and University Health Science Center have also selected “expanding quality improvement capacity” as DSRIP projects. This will facilitate learning collaboratives with other providers in RHP6. Selection Pros/Cons of methodologies can be discussed as well as best practices.

Plan for Learning Collaborative:
As the anchor for RHP 6, University Health System will promote and facilitate learning collaboratives. Medina Regional Hospital will participate with many of the above providers performing similar projects to share ideas, best practices, challenges and success stories. Working groups will be formed to establish the goals, develop a calendar for meetings, and share ideas. New solutions can be tested.
<table>
<thead>
<tr>
<th><strong>Project Valuation:</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>This project touches all aspects of the hospital’s delivery systems. Cost avoidance is a major component of this valuation due to the fact that by improving systems and increasing efficiencies, outcomes can be affected: reduction in mortality, reduction in medical errors, reduction in medication errors, etc. With a formalized department, reporting/benchmarking and process improvements should lead to a happier and healthier community. The project therefore adds much strength to the hospital through: 1) cost avoidance; 2) improvement in patient satisfaction; and 3) hospital efficiencies. As the demand for healthcare increases (through migration, population growth, aging baby boomers, etc.), demand will use even further, necessitating the need for more efficiencies and a streamlined resource allocation process.</td>
</tr>
</tbody>
</table>

The implementation of a formal process improvement methodology will assist in addressing a substantial need in the community for increased efficiency, and improvement in the quality of care.

### Project Summary:

**Provider Description:** Methodist Hospital, 45-0388, includes the campuses of six acute care hospitals: Methodist Hospital, Methodist Children’s Hospital, Methodist Specialty and Transplant Hospital, Northeast Methodist Hospital, Metropolitan Methodist Hospital, and Methodist Texan Hospital. For more than 49 years Methodist has provided high quality care to patients from San Antonio and throughout South Texas.

**Intervention(s):** Methodist Hospital will deploy telehealth services that will provide instant Telehealth consultations with trained specialists in selected services affiliated with Methodist Hospital. This will allow patients experiencing barriers to specialty care to receive initial care in their home facility. The specialist will evaluate the patient via Telehealth consultation and decide which interventions will benefit the patient. This will allow all members of the healthcare team to monitor the patient’s status, treatment plan, and disease management.

**Need for the project:** The goal of this program is to bring the best of acute diagnosis and treatment recommendations to remote communities, which often do not have specialists and the resources to provide the advanced medical treatments. Approximately 18% of patients in rural community hospitals are transferred to San Antonio for specialty care that could be handled by rural hospitals with availability to specialists.

**Target population:** Target populations are patients that present to Emergency Departments at facilities without specialty physician coverage. Approximately 30% of patients are either Medicaid and/or indigent patients and are expected to benefit from this project.

**Category 1 or 2 expected patient benefits:** This project will increase Telehealth visits to 150 by DY5. This process will significantly increase the quality of care to the patients by having the specialist see and communicate with the patient in order to best assess their ability for local care or the need to start therapy and transport to a regional facility. Approximately 50 telemedicine visits are estimated during the baseline period in DY 3. MHS has estimated that the telemedicine visits will be 100 for DY 4 and 150 for DY 5. Methodist Hospital estimates that approximately 30% of these patient are indigent and Medicaid patients.

**Category 3 outcomes:** Improve patient satisfaction by 2% in DY4 and 4% in DY5. Percentage increases are in line with the community estimated access rate.

### Project Description:

Methodist Healthcare System will operate a telemedicine network to enhance care for patients in a San Antonio, Texas and surrounding area. We expect call to consultation times to decrease and quality of care, due to a virtual consultation, to increase. This program will also align clinical protocols between facilities to enhance care of patients. Developing a telemedicine network has proved difficult in the past due to significant costs, both with equipment and with physician specialty coverage. Additionally, only recently has the technology improved enough that it is
now reasonable to expect it to be able to provide consistent and reliable connection and the ability for a specialist to have a clinical interaction with a patient.

This telemedicine network will allow facilities to network with our hospital system for specialty coverage that is lacking or non-existent. This has the potential to provide significant benefit to families and patients.

The five year outcome is expected to increase patient access to specialists in order to improve patient health.

This project is aligned with the following Region 6 goals:

- Triple Aim: assuring patients receive high-quality and patient-centered care, in the most cost effective ways
- Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our counties
- Improve outcomes while containing cost growth

No other federal funds will be utilized for the funding of this project.

**Starting Point/Baseline:**

This project will be assessed to determine most appropriate community need in DY2. Once assessed, the Telemedicine program will be implemented in DY3. The baseline will be determined in year of implementation. The baseline will be telemedicine visits compared to total visits.

**Rationale:**

There is currently a shortage of specialists and subspecialists in nearly every community. Subspecialists are in very short supply in Bexar and the surrounding counties as well. This project brings a specialist to the patient’s bedside when needed. Patients will be better served by a virtual consultation in which the specialist is able to see and speak to the patient, the family, and the attending doctor and make timely decisions on treatment and transfer. This program should allow more patients to stay in their local facility while facilitating the transfer and treatment of high acuity patients to a facility with a higher level of care.

**Core Project Components:**

e. Provide patient consultations by medical and surgical specialists as well as other types of health professionals using telecommunications.

f. Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned”, opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

This project address the Community Needs Assessment for these items:

CN.1 - Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver
improved quality and patient satisfaction.
CN.2 - A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions. Leading causes of death in RHP 6 include cardiovascular disease, cancer, and diabetes.
CN.3 - Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages.

<td>The telemedicine program’s results and processes will be shared with all participating facilities. Additionally, protocols will be aligned between facilities and our San Antonio hospitals. Feedback on processes, treatments, and metrics will be shared with all partnering facilities.</td>
</tr>
</tbody>
</table>
**Project Valuation:**

Methodist’s project valuation used a method which ranked the importance of each project based on several key factors. First, Methodist considered the extent the project helps further the goals of the Waiver, which are to (a) enhance access to health care, (b) increase the quality of care, and (c) improve the cost-effectiveness of care provided in the community. Next, Methodist considered the degree of need for the project in the community as addressed and identified in the Community Needs Assessment. The size of the required investment was also considered, which included considerations of personnel, equipment, time and complexity as well as the cost of the time, effort, and clinical resources involved in implementing the project. Finally, Methodist reflected on the scope of the project: the number of patients that would be affected, including the type of patients; the number of patient visits or encounters; how many providers or staff members would be added; the costs that would be avoided as a result of the project; and the ripple effect the project would have on all members of the healthcare system. These factors were weighed against the amount of funding available. We believe this approach is the best methodology available to assess the impact of the project; the investment of the performing provider, and the overall value to the community, to the extent community resources are available to help fund DSRIP projects. Final project valuation and funding distribution across categories was then determined based on the valuation provisions in the Program Funding and Mechanics Protocol.

In valuing the project, Methodist took into account the extent to which a telemedicine program would potentially meet the goals of the Waiver (improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project. The telemedicine project is projected to go live in DY 3. This will provide significant benefit in avoiding unnecessary medical transportation costs, family hardship, and enhancing the remote facilities ability to care for patients locally. Additionally, with the live consultation of a specialist, we will be able to administer therapy appropriately and arrange for a higher level of care when necessary.

Identifying Project and Provider Information:

Title: 1.9.2 Improve access to specialty care
Unique RHP ID#: 094154402.1.2 - PASS 1
Performing Provider: Methodist Hospital
Performing Provider TPI: 094154402

Project Summary:

Provider Description: Methodist Hospital, 45-0388, includes the campuses of six acute care hospitals: Methodist Hospital, Methodist Children’s Hospital, Methodist Specialty and Transplant Hospital, Northeast Methodist Hospital, Metropolitan Methodist Hospital, and Methodist Texan Hospital. For more than 49 years Methodist has provided high quality care to patients from San Antonio and throughout South Texas.

Intervention(s): Project is to expand specialty care capacity by locating a Freestanding ED in Westside of San Antonio in a community area of need. Because of the population size of Bexar County (1.8 million) and the CBSA (2.5 million) and this projected growth, just about every geographic area of San Antonio is currently and will continue to be underserved by primary care providers and emergency health care services. There is a void of emergent health care services related to continuing and significant population growth, as well as ongoing traffic difficulties from the Westside into the South Texas Medical Center. Through 2016 the high risk population growth (65+) will top 39.9% versus Bexar County’s overall growth in this age cohort of 24.9%. Furthermore, San Antonio’s Westside population in every age cohort is growing faster than any other area of San Antonio. It is because of this growth, especially in the high risk age cohorts, that there is consideration for the development of a freestanding emergency center to be located in a high traffic area, and with easy access to all parts of the Westside.

Need for the project: San Antonio is experiencing the largest population growth in virtually every geographic area when compared to Texas and other US cities of similar size. Emergency care services that mimic the same type of emergent services found in a hospital is vitally important to these high growth areas because of current need, future growth and travel difficulties. When looking a population growth projections for 2013 - 2018, the Northeast side will grow by 9% (Texas will grow by 7.9% and Bexar County will grow by 8.5%), Northwest: 10.8%, North Central: 10.5%, Downtown: 4.2%. Even in the slower growing southern geographic areas (Southeast and Southwest San Antonio), the population growth will just about match the overall growth of Bexar County. Furthermore, the high risk health population (65+) will grow by double digits in every area of San Antonio. In the San Antonio MSA the current population is 2.17 million and is expected to grow to over 2.56 million by 2021 (18%).

Target population: The target population is our patients that need emergency services in areas demonstrating community need. Approximately 26% of patients are either Medicaid and/or indigent patients, and are expected to benefit from this project. These patients will be served equally as any other patient presenting to this emergency center.

Category 1 or 2 expected patient benefits: The project seeks to provide increase emergency room visits in an area of community need by 2,053 visits in DY 3, 4,721 visits in DY 4, and 5,132 visits in DY5.

Category 3 outcomes: 3.IT-6.1 - Our goal is to increase number of patient surveys by 4% by
DY % and reach top 50th percentage of patient satisfaction.

**Project Description:**

Project is to expand specialty care capacity by locating a Freestanding ED in Westside of San Antonio. San Antonio is experiencing significant population growth in almost every geographic sector. Because of the population size of Bexar County (1.8 million) and the MSA (2.17 million) and this projected growth, just about every geographic area of San Antonio is currently and will continue to be underserved by primary care providers and emergency health care services. Furthermore, the delays in travel to local providers in the Medical Center (where the bulk of healthcare services are delivered to this population) are more pronounced because of our current population and the continued growth that will be experienced over time. On the Westside of San Antonio there is a void of emergent health care services related to continuing and significant population growth, as well as ongoing traffic difficulties from the Westside into the South Texas Medical Center. Through 2016 the high risk population growth (65+) will top 39.9% versus Bexar County’s overall growth in this age cohort of 24.9%. Furthermore, San Antonio’s Westside population in every age cohort is growing faster than any other area of San Antonio. It is because of this growth, especially in the high risk age cohorts, that there is consideration for the development of a freestanding emergency center to be located in a high traffic area, and with easy access to all parts of the Westside.

One challenge that Methodist Hospital will be facing is the shortage of physicians. According to the AMA, Texas has a significant shortage of physicians and with Medicare and Medicaid reimbursement cuts; physicians are more likely not to service those types of patients. There is also the challenge of recruiting nurses with a Texas nursing shortage. With state funding cuts for nursing education, the shortage for nurses are at 22,000 full-time nurses, and this amount expected to increase to 70,000 by 2020. Another challenge and goal is to help these patients get engaged in their own healthcare to ensure a good outcome.

While these challenges may seem daunting, Methodist has a very aggressive physician recruitment program that addresses these recruitment challenges. For instance, in 2012 Methodist credentialed 424 new physicians and recruited from outside of San Antonio an additional 38 physicians to the market. The same can be said about the current Methodist nurse recruitment program. In 2012, Methodist hired 893 additional nurses, and employs a fulltime nurse recruitment staff to assist in this activity. Methodist also has a long history of wellness and prevention activities targeted to the community at large, as well as area employers. A significant number of our community benefit activities are directed toward assisting participants in understanding and continually engaging in improving personal health. As an example, in 2012 Methodist offered 2,621 complimentary communities wellness and prevention events, with a high percentage of these activities targeting those most disenfranchised in our community.

Core project components:

A freestanding emergency facility located on the Westside of San Antonio will be open 24/7/365
and staffed with appropriate clinicians, including board certified emergency physicians. Referrals into this center will be mostly walk-in, as the center will be easy to access because of its location at a major high traffic crossroad in the area. This project will mimic a typical emergency center found in any acute care hospital, and will implement the same clinical and quality treatment and improvement protocols as would be expected in any hospital setting. Furthermore, this center will be open to the entire population regardless of their ability to pay for services, as indicated by Mission of the Methodist Healthcare System - Serving Humanity to Honor God.

Methodist understands that continuous quality improvement is at the heart of this project. Therefore, in the implementation of this project, Methodist will endeavor for continuous quality improvement by monitoring the patient volumes and patient utilization to ensure that progress is being made towards meeting the project milestones. Additionally, Methodist will ensure that all methodologies used will meet or exceed any applicable nationally recognized protocol or quality benchmarks.

The target population is our patients that need emergency services in areas demonstrating community need. Approximately 26% of patients are either Medicaid and/or indigent patients, and are expected to benefit from this project. These patients will be served equally as any other patient presenting to this emergency center.

This project is aligned with the following Region 6 goals (Triple Aim):

- Assuring patients receive high-quality and patient-centered care, in the most cost effective ways
- Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our counties
- Further develop and maintain a coordinated care delivery system

Starting Point/Baseline:
Baseline will be determined in DY3 for ED visits.

Rationale:
San Antonio is experiencing the largest population growth in virtually every geographic area when compared to Texas and other US cities of similar size. Emergency care services that mimic the same type of emergent services found in a hospital are vitally important to these high growth areas because of current need and future growth. Convenience, quality of care, quicker service, and a full compliment of emergent care diagnostics are the goals and metrics of this project. Furthermore, third-party research indicates just about every geographic area in San Antonio is currently underserved for this type of service, and will continue to be if new emergency care services are not developed (the continued growth of ER visits from every part of San Antonio and to every hospital is witness to the need to increase ED and primary care infrastructure capacity - but closer to the neighborhoods and in a less costly construction
environment).

Project components included in the Freestanding ED:

   a) Increase service availability with extended hours – operating hours are 24 hours/365 days a year

   b) Increase number of specialty clinic locations- increase clinic location in Westside of San Antonio

   c) Implement transparent, standardized referrals across the system - MHS will promote the location, services and hours of operation throughout the service area (consumers and physicians) to increase referrals (walk-ins) to the center.

   d) Conduct quality improvement for project - This project will mimic a typical emergency center found in any acute care hospital, and will implement the same clinical and quality treatment and improvement protocols as would be expected in any hospital setting.

This project address the Community Needs Assessment for these items:

CN.1 - Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.

CN.3 - Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages.

**Related Category 3 Outcome Measure(s):**

<table>
<thead>
<tr>
<th>IT-6.1 Patient Satisfaction – Unique RHP Outcome ID: 094154402.3.2</th>
</tr>
</thead>
</table>

Rationale/Evidence: The intent of the HCAHPS initiative is to provide a standardized survey instrument and data collection methodology for measuring patients' perspectives on hospital care. The surveys are designed to produce comparable data on the patient's perspective on care that allows objective and meaningful comparisons between institutions on domains that are important to consumers. Public reporting of the survey results is designed to create incentives for institutions to improve their quality of care. Public reporting will serve to enhance public accountability in health care by increasing the transparency of the quality of institutional care provided in return for the public investment.

Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.

**Relationship to other Projects:**

The Expand Specialty Care Capacity- Freestanding ED will support MHS Project 094154402.1.1- Introduce, Expand, or Enhance Telemedicine/Telehealth. Telemedicine can be made available for consults in the ED where specialty coverage is not available.
**Relationship to Other Performing Providers’ Projects in the RHP:**
Baptist Health Services and CHRISTUS Santa Rosa have begun expanding services in the Westside of San Antonio.

**Plan for Learning Collaborative:**
Following completion of the RHP plan, University Health System (anchor) will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include goals, regular meetings, site visits, conference calls, communication plan development, organizing learning event, and adopt metrics to measure success.

**Project Valuation:**
Methodist’s project valuation used a method which ranked the importance of each project based on several key factors. First, Methodist considered the extent the project helps further the goals of the Waiver, which are to (a) enhance access to health care, (b) increase the quality of care, and (c) improve the cost-effectiveness of care provided in the community. Next, Methodist considered the degree of need for the project in the community as addressed and identified in the Community Needs Assessment. The size of the required investment was also considered, which included considerations of personnel, equipment, time and complexity as well as the cost of the time, effort, and clinical resources involved in implementing the project. Finally, Methodist reflected on the scope of the project: the number of patients that would be affected, including the type of patients; the number of patient visits or encounters; how many providers or staff members would be added; the costs that would be avoided as a result of the project; and the ripple effect the project would have on all members of the healthcare system. These factors were weighed against the amount of funding available. We believe this approach is the best methodology available to assess the impact of the project; the investment of the performing provider, and the overall value to the community, to the extent community resources are available to help fund DSRIP projects. Final project valuation and funding distribution across categories was then determined based on the valuation provisions in the Program Funding and Mechanics Protocol.

The freestanding emergency room will significantly improve access to the highest quality emergency medical treatment to patients that live in areas not geographically located close to an existing acute care hospital, or challenged by increasing traffic issues. This directly addresses the goals by improving the coordinated care delivery system and will address a community need by providing access to emergency services closer to the homes of patients that do not currently have an acute care hospital near their home. Methodist took these factors into account when determining the incentive value of this project.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $10,486,883
### Identifying Project Information:

| Project Name: 1.10.2 Enhance Improvement Capacity through Technology |
|-----------------|----------------------------------------------------------|
| Unique RHP ID#: 127294003.1.1 – PASS 2 |
| Provider Name: Peterson Regional Medical Center (PRMC) |
| TPI: 127294003 |

### Project Summary:

**Provider Description:** Peterson Regional Medical Center (PRMC) is the only healthcare organization within Kerr County and is located in the town of Kerrville. The population for Kerrville (2011) was listed as 22,423 and the population for Kerr County (2011) was 49,783. Kerr County is a total of 1,108 sq miles (45 persons/sq mile) with only 20.3 (1,100.7 persons/sq mile) of that belonging to Kerrville. PRMC provides healthcare and medical resources to nine surrounding counties with a total population of 187,293. Kerr County has been listed as a Healthcare Provider shortage area; this however is magnified by the fact that the majority of surrounding counties is also listed as shortage areas, and/or is unable to provide any healthcare services at all. It was found in our Community Health Needs Assessment held in October of this year that 28% of Kerr County’s population is unfunded, which is much higher than the national average of unfunded population which was found to be 16% and the national benchmark 11%. The cost of care for these groups is on the rise; it is crucial that changing our practice to provide efficient, cost effective, high quality care is placed at the top of our priority list. Of PRMC’s total diabetic population visits, Medicaid/Indigent/Self-pay comprised 11%.

**Intervention(s):** This project will allow PRMC to arrange a decision support analyst position to write reports from our current data repository as well as manage software modules. The decision support analyst will utilize tools, technology, and applications to access clinical, financial, and quality information on a timely basis. The development of an enterprise data repository makes information available to support the hospitals strategic planning, process improvement management, and decision-making activities. This program will allow healthcare providers to acquire knowledge based on real time data from dashboards created permitting them to actively participate in the assessment of healthcare quality at our organization. PRMC plans to use this data being collected and reported to key organizational leaders to assess our current processes and implement new and improved process improvement teams. Evidence-based models will be used implementing these process improvement projects such as Lean, Six Sigma, or Malcolm Baldrige.

**Need for the project:** Studies by the National Institutes of Standards and Technology have found that organizations adopting quality management practices experience an overall improvement in employee relations, higher productivity, greater customer satisfaction, increased market share, and improved profitability. Current organizational leaders are uneducated on the use of data collected and reported, this program will allow for key leaders to be educated and trained on uses of data to improve the care we provide to our patients. This project is also needed to assist us in obtaining the information and data collection we need for our Pass 1 project that we are currently unable to retract from our repository. Rates of diabetes are in our community are increasing rapidly; future organizational operations will be unable to withstand the pressure of treating the flood of obesity-related diseases, newly insured population, and other financial tribulations at this rate. Consequently, while we search for better and more efficient ways of treating diabetes and helping people manage the disease in the outpatient setting so that costly procedures can be prevented, we must find more ways to education people during their hospitalization to make healthy lifestyle choices after they are discharge using parts of the data we plan to collect in our process improvement efforts. The high cost of diabetes complications- their long term effect on the...
individuals quality of life, the high treatment costs, the fact that they are largely preventable, and the possibility for a sizable return on investment are all reason we feel this project is important to our organization and our community.

**Target population:** The target population that will be focused on is our community’s diabetic and un/under-funded populations. Kerr County went from being ranked 196th (out of 254 Texas Counties) in 2011 to 246th in 2012 in the diabetes category. If that alone wasn’t ample enough of a reason to target this population in our community, the reality of how many of our community residents are unfunded/underfunded compounds the complexity of being able to care for these patients with any kind of magnitude or degree of quality value extremely difficult.

**Category 1 or 2 expected patient benefits:** This project seeks to increase the number of reports generated through quality improvement data systems by producing the following reports for PRMC’s diabetic patient population: scheduled follow-up appointments post hospitalization, pharmacist coaching to patient/family prior to discharge, number of encounters with the Discharge Advocate, Emergency Room encounters, follow-up phone calls conducted post acute care discharge, scheduled outpatient diabetic education visits with diabetic educator and 30 day readmission rates. These reports will allow PRMC to focus on areas of needed improvement to drive improved quality of care and reduce healthcare cost within targeted diabetic population group in DY4. In DY5, a quality dashboard will be created and presented throughout the organization, demonstration to key leadership on the use of the dashboard to drive rapid-cycle performance improvement efforts.

**Category 3 outcomes:** OD-9 Right Care, Right Setting IT-9.2 Reduce Emergency Department visits for target condition-Diabetes will be executed in DY4 and DY5. 19% of total diabetic population visits at PRMC were seen in our ED in calendar year 2012. DY4 improvement target is to reduce ED visits as a percentage of total diabetic population visits by 5%. DY5 improvement target is to reduce ED visits as a percentage of total diabetic population visits by 5% for a total of 10%. To reach these goals actionable data will need to be obtained to verify PRMC’s Pass I project is operational. Currently PRMC does not have the resources or personnel to accomplish these data collection requirements.

**Project Description:**

**Peterson Regional Medical Center proposes to implement a process using technology to provide actionable data. Organization wide training on the use of that data to drive efficiency, improved quality measure monitoring, increase patient safety, and enhance patient-centered care activities throughout the entire system.**

Peterson Regional Medical Center (PRMC) currently lacks the availability of adequate data extraction and reporting skills to facilitate effective decision making for quality and safety improvement initiatives. This project will allow arrangement of a decision support analyst position to write reports from our current data repository as well as manage software modules. The decision support analyst will utilize tools, technology, and applications to access clinical, financial, and quality information on a timely basis. The development of an enterprise data repository makes information available to support the hospital's strategic planning, process improvement management, and decision-making activities.

Meaningful data can help to proactively address issues, measure progress and capitalize on quality improvement opportunities. It is essential that healthcare providers acquire the knowledge to actively participate in the assessment of healthcare quality. Decision support analysts assist departmental leaders in determining the information necessary to satisfy specific business and
customer demands. PRMC currently contracts with outside sources paying them to write customized reports and to develop data views and dashboards little and/or fragmented action takes place from the results reported due to a lack of education on how to use the information to make process improvements. Over the past year, PRMC has paid in excess of $50,000 to have reports developed. We have many other needs for additional development and education that we feel at this time we cannot afford to have done on a contract basis. Recruiting an experienced decision support analyst will allow PRMC to measure quantitative data against benchmarked standards in order to clarify and verify organizational focus on and progress towards PRMC’s strategic goals.

Studies by the National Institutes of Standards and Technology (NIST) have found organizations adopting quality management practices experience an overall improvement in employee relations, higher productivity, greater customer satisfaction, increased market share, and improved profitability. In combination with implementing a data support analyst, PRMC will adopt components of evidence based improvement methodologies such as Lean, Baldrige, and Six Sigma.

Once data collection efforts are available, specialized training to key organizational leaders will enhance our ability to effectively utilize info to make necessary system process improvements. Training will include evidence based process improvement methodologies such as Lean, Six Sigma, and Baldrige. Leaders will then demonstrate use of data and process improvement methodologies to positively impact outcomes. Outcomes to be impacted include: increased patient care quality and safety, health care cost reeducation, decreased waste, efficiency, and improvement of patient-centered activities. A system will be developed to allow employee input regarding potential or actual identified issues; and a dashboard program will be hardwired within our infrastructure providing real-time data accessibility to all employees throughout the organization.

Goals and Relationship to Regional Goals:
The goal of this project is to improve the organization’s ability to positively affect previously mentioned outcomes through better use of data and evidence based improvement methodologies. It is critical this project support not simply what is good for the company, but also what is good for its employees, stakeholders, suppliers, partners, collaborators, customers, and community as a whole.

Project Goals:
- Create strategic organizational goals that are focused and patient centered and to increase the availability of data to support data driven decision making
- Recruitment of an experienced decision support analyst
- Training for key organization leaders and employees on process improvement methods based on data collected
- Effective and timely use of data driven process improvement tools and activities
- Quality dashboard that allows information to be easily shared with organizational leadership at all levels
- Budgets, policies, practices and processes evaluated modified and improved based on valid data and evidence based improvement methodologies
- Reduce waste and variation in care processes to drive improvement in quality measures and patient care

Rates of diabetes are increasing throughout our community rapidly; future organizational
will not be able to withstand the pressure of treating the flood of obesity-related diseases. Consequently, while we search for better and more efficient ways of treating diabetes and helping people manage the disease in the outpatient setting so that costly procedures can be prevented, we must find more ways to educate people during their hospitalization to make healthy lifestyle choices after they are discharged using parts of the data we plan to collect in our process improvement efforts.

This project meets the following Regional Goals:

- Triple Aim: assuring patients receive high-quality and patient-centered care, in the most cost effective ways
- Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our counties; Improve outcomes while containing cost growth
- Further develop and maintain a coordinated care delivery system
- Improve and prepare the health care infrastructure to serve a newly insured population
- Health care information technology to improve communication and health care

Challenges:
Quantifying healthcare quality is complex and a challenging process, which exceeds PRMC’s current human resource capabilities. Currently, fragmentation of data flow occurs because of multiple collections of data silos. Other challenges PRMC faces are:

- Limited availability of timely data to guide improvement efforts
- Questionable validity of current data collection
- Duplicated data collection and improvement efforts across the organization
- Limited knowledge on effective use of data to prioritize measure and improve clinical, financial, and administrative processes
- Inability to devote current human resources to data collection and employee training efforts
- No current evidence based methodology process used effectively throughout the organization
- Information is not commonly shared with organizational leadership at all levels

We suspect that there are extensive gaps between the care that patients receive and what the medical community has determined to be the most effective care. Despite unrivaled technological innovation, it is difficult to ensure that all patient care being delivered meets the accepted standards of quality. Gaps in quality are responsible for wasteful, ineffective care, preventable medical complications, avoidable hospitalizations, decreased quality of life, disability, and premature death. As a result, there is a key need for better integration and sharing of data within and across our healthcare system and even within our entire community.

To address these challenges PRMC seeks to recruit an experienced decision support analysts and evidence based process improvement methodologies. Implementation of this project will provide leaders and frontline healthcare providers the resources to collecting and reporting health data which will help them to better characterize the nature of health or process problems in our organization and our community and develop actionable plans based on the findings. To ensure data is accurately and consistently collected and understood, PRMC will provide key leaders and employees from all levels throughout the organization, improvement methodology coaching.

5-Year Expected Outcome for Provider and Patients:
PRMC expects to see improvements in safety, quality of care, healthcare outcomes, and reduced healthcare cost based on reliable, timely, and actionable data collection findings.
Employees will be trained to use process improvement tools (ex: Lean, Six Sigma, PDSA or Rapid Cycle Improvement) teaching them how to read, evaluate and implement change or improvement based on the use of valid data collection mechanisms. A quality dashboard will be developed to disseminate information across levels within the organization. Standardizing specific components of data collection and using improvement methodology tools will create efficiency, drive patient centered care, narrow the focus of needs identified which results in improved quality, safety, and patient centered care leading to an overall healthcare cost reduction.

**Starting Point/Baseline:**

Currently PRMC data availability is fragmented with limited ability to extract, aggregate and disseminate data. Leadership and other staff members have little training in evidence-based processes such as Lean, Six Sigma or Rapid Cycle Improvement. A decision support analyst position does not exist at PRMC at this time. We currently utilize two outside resources, one for reports and the other to create dashboard views. In the past year, we have had a minimum of 40 reports written for our organization with costs exceeding $50,000. PRMCs baseline diabetic population in calendar year 2012 is a total of 3,719 patients with 12% or 1,226 visits having an inpatient stay.

**Rationale:**

Option 1.10.2 was chosen to correct current fragmented process improvement efforts and inefficient data collection systems. Excessive healthcare cost and errors can occur because of system and process failures. In an effort to improve operational effectiveness and create a culture of continuous improvement PRMC feels a combined approach of designing a reliable data collection process along with adopting process improvement techniques will address current inefficiencies, ineffective care, and preventable errors. Thus, allowing key process improvement personnel to influence quality improvements efforts and activities throughout the organization. When data is gathered, tracked, and analyzed in a more credible way, it becomes possible to measure progress and success or lack thereof. This project will assist in fostering a culture of change by developing an understanding of identified problems through data collection and caring out improvement opportunities by involving key stakeholders, testing change, and continuous evaluation to sustain change.

As mentioned before our target group that will be focused on first is our community’s diabetic population. The high cost of diabetes complications—their long term effect on individual quality of life, the high treatment costs, the fact that they are largely preventable, and the possibility for a sizable return on investment—provide inherent incentives for PRMC to assess the diabetes care in our organization and identify opportunities for quality improvement. Performance improvement and reporting capacity is a large component in determining the success of our Pass 1 project. The Pass 1 project has identified a need for data collection on our target population, which is not readily available today and would be expensive for us to acquire through contracted agencies. All data collection efforts and report writing is outsourced and is often returned in difficult to read formats or not including all data measurements requested within one single report. This makes it incredibly difficult in making anything from the report useful in process improvement efforts.

Both the NHQI and IOM’s *Crossing the Quality Chasm* report highlight the importance of improving care for chronic diseases. Diabetes in particular is recognized as one chronic disease for which quality improvement efforts could make great strides. Diabetes has widely respected national guidelines for what constitutes quality care and well-developed national measures of
quality. Despite this fact, the gap between evidence-based treatment and actual practice and outcomes continues to be wide. There continues to be a large number of complications from diabetes that research demonstrates could have been prevented with high quality care. We anticipate this resulting in better patient care and improved patient outcomes. This project option will provide the data collection mechanism to address the current cumbersome and complicated process of collecting baseline-starting points for the Pass 1 Option 2.12.1 project.

**Project Components:**

Through enhanced performance improvement and reporting capacity through technology, PRMC will meet the following required project components:

- **Provide training and education to clinical and administrative staff on process improvement strategies, methodologies, and culture** - Employment or expansion of an existing position will be evaluated to implement the role of a decision support analyst. The decision support analyst will collaborate with key stakeholders within our organization to review components of process improvement methods or tools such as PDSA, Six Sigma, and FMEA to be considered for use within our organization. Once these methods and tools for improvement have been chosen, in-depth education will be provided to key influential leaders from throughout the organization. These key players will then lead the way by allocating their efforts in educating the remainder of the workforce team.

- **Develop an employee suggestion system that allows for the identification of issues that impact the work environment, patient care and satisfaction, efficiency and other issues aligned with continuous process improvement** – PRMC currently uses a mechanism similar for employees to use for such reporting called, Bright Idea. They are able to submit a Bright Idea from the Intranet home page, once it has been submitted it is sent to the Quality Improvement Department for review. This application is old and out dated; therefore, the process and application will be reviewed, updated, and improved as necessary to meet the need of our employees and the goals of this project.

- **Design data collection systems to collect real-time data that is used to drive continuous quality improvement.** A dashboard system will be developed allowing centralized accessibility to data collection systems. A central data repository will improve visibility of current data collection activity and reduce duplicated data collection efforts.

The unique community need identification numbers the project addresses:

CN.1 – Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction

CN.2 – A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions. Leading causes of death in RHP 6 include cardiovascular disease, cancer, and diabetes

How the project represents a new initiative or enhances an existing delivery system reform initiative:

A new initiative for implementing the position of a decision support analyst will be evaluated. This project will enhance and streamline current quality improvement efforts. This project will provide the capability to collect needed data in the Pass I initiative.

**Related Category 3 Outcome Measure(s):**

**OD-9 Right Care, Right Setting**
“The U.S. healthcare system wastes $700 billion annually on the kinds of systemic inefficiencies that would make a quality management guru cringe,” says Robert Kelly, Vice President of Healthcare Analytics at Thomson Reuters. This project will provide the ability to capture data needed for setting baseline measurements for our pass 1 project and other identified system failures in the future. Without validated reliable data and proven methodology, tools to learn how to turn data into valuable information our organization will remain stagnant. OD-9 Right Care, Right Setting and IT 9.2 (standalone) was chosen as the projects outcome domain based on 19% of overall diabetic population visits were Emergency Department setting. One goal of collecting meaningful data is to identify the frequency and cost of care of emergency department visits in PRMC’s diabetic population group. Once proper reports are generated we can identify trends which contributed to diabetic patients not seeking the right care in the right setting.

Because diabetes can result in expensive long-term complications, investing in diabetes control initiatives can improve health outcomes and reduce health care costs. Quality healthcare can be defined as the right care delivered in the right setting to the right person at the right time. Patients who do not understand the importance of the underlying premise that primary care will provide them with continuity and oversight of their overall health will look for the most convenient path to care, such as going to Emergency Rooms, and never realize the its consequences. Right care in the right setting offers continuity of care which improved treatment adherence, allows early detection of problematic health issues and reduces the risk of these becoming health emergencies.

Relationship to other Projects:

For Pass 2 PRMC was only required to do one project. However, our Pass 1 project’s success will be determined on process improvements and reporting from the outcomes of this Pass 2 project. The pass 1 project has identified a need for data, which is not readily available today. Once data is available, training will enhance our ability to effectively utilize information to make system process improvements resulting in improved patient outcomes.

Relationship to Other Performing Providers’ Projects in the RHP:

Relationship to other Performing Provider Projects is unable to be determined at this time.

Plan for Learning Collaborative:

University Health System, as the RHP 6 anchor, will promote and facilitate learning collaborative. Following completion of the RHP Plan, University Health System will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include the following: Identify participants; Establish Learning Collaborative goals; Develop a calendar of regular meetings, site visits, and/or conference calls; Develop a plan to communicate ideas, data, and successes across the region and state; Organize a learning event and invite experts and other Performing Providers from outside the region to share knowledge and best practices; Adopt metrics to measure success.

Project Valuation:

Peterson values each project based on the specific needs of the community, projected impact on community health outcomes, level of advancement to the healthcare delivery system, and the time, effort and clinical resources necessary to implement each portion of this project.
Evidence from research indicates that quality improvement is critical to achieving better health outcomes and closing the gaps between what we know and what we do in health care. In addition, there is growing evidence that investments in diabetes quality improvement can yield a significant return on investment both in terms of cost savings and improved quality of life for people with diabetes.

Peterson Regional Medical Center is licensed for 125 acute care beds. The diabetic population in calendar year 2012 consisted of 3719 patients. 11% of the visits were provided for the Medicaid/Indigent/Self-pay subpopulation. Cost avoidance is being limited by data availability and budget constraints on use of external resources. PRMC lacks the availability of appropriately trained personal to write quality improvement reports from data collected from within our organization. The true value is establishing the capability that will last throughout the organization’s history. The implementation cost of this project is estimated to be $436,636. This project will address the community health care needs by providing the tools to reach Pass 1 data and process improvement goals. In calendar year 2012 PRMC’s baseline diabetic population group had a total of 3,719 patients with 1,226 inpatient admissions for a total of $28.8 million in charges. PRMC’s Pass 1 initiative estimates an average annual community healthcare savings of $2.9 million by reducing the rate of inpatient admissions (as a percentage of the total diabetic population) by 10%. Without process improvement methodologies, the capability to enhance reporting ability and integrity failure to meet improvement outcomes is imminent. Components of evidence based improvement methodologies combined with real-time data availability increase the likelihood of desired outcomes.

"The ultimate measure by which to judge the quality of a medical effort is whether it helps patients (and their families) as they see it. Anything done in health care that does not help a patient or family is, by definition, waste, whether or not the professions and their associations traditionally hallow it" (Don Berwick, 1997).

|-------------------------|-------------------------|-------------------------|-------------------------|

**Milestone 1**

**P-5**: Enhance or expand the organizational infrastructure and resources to store, analyze and share the patient experience data and/or quality measures data, as well as utilize them for quality improvement.

**Metric 1 [P-5.1]**: Increased collection of patient experience and/or quality measures data

*Baseline:* Currently no diabetic population specific reporting is available.

*Goal:* Define specific metrics, data collection requirements and reporting format for the following reports: scheduled follow-up appointments post hospitalization,

**Metric 2 [P-6]:** Hire/train quality improvement staff in well-proven quality and efficiency improvement principles, tools and processes, such as rapid cycle improvement and/or data and analytics staff for reporting purposes (e.g., to measure improvement and trends).

*Baseline:* 0

*Goal:* Fifty staff members trained in basics and five trained in advanced quality and efficiency principles

*Data Source:* HR and Training Programs

**Metric 2 [P-6.2]:** Increase number of data analysts hired who are responsible for collecting and analyzing real-time data to measure improvement and trends and to drive rapid-cycle

**Milestone 2**

**P-6**: Hire/train quality improvement staff in well-proven quality and efficiency improvement principles, tools and processes, such as rapid cycle improvement and/or data and analytics staff for reporting purposes (e.g., to measure improvement and trends).

**Metric 1 [P-6.1]:** Increase Number of staff trained in quality and efficiency improvement principles

*Baseline:* Number of staff trained

*Goal:* Fifty staff members trained in basics and five trained in advanced quality and efficiency principles

**Data Source:** HR and Training Programs

**Metric 2 [P-6.2]:** Increase number of data analysts hired who are responsible for collecting and analyzing real-time data to measure improvement and trends and to drive rapid-cycle

**Milestone 3**

**I-7**: Implement quality improvement data systems, collection, and reporting capabilities.

**Metric 1 [I-7.1]:** Increase the number of reports generated through these quality improvement data systems

*Goal:* Generate monthly quality reports as defined in Milestone 1

*Data Source:* EMR

**Metric 2 [I-7.2]:** Demonstrate how quality reports are used to drive rapid-cycle performance improvement.

Number of performance activities that were designed and implemented based on the data in the reports.

*Goal:* One per month

**Milestone 4**

**I-8**: Create a quality dashboard or scoreboard to be shared with organizational leadership and at all levels of the organization on a regular basis that includes outcome measures and patient satisfaction measures.

**Metric 1 [I-8.1]:** Submission of quality dashboard or scoreboard

*Goal:* One

*Data Source:* Quality Improvement Data Systems

**Metric 2 [I-8.2]:** Demonstration of how quality dashboard is used to drive rapid-cycle performance improvement.

Number of performance activities that were designed and implemented based on the data in the reports.

*Goal:* Utilize dashboard data to drive identified process improvement projects

*Data Source:* Documentation from quality improvement office

Identifying Project and Provider Information:
Title: 1.9.2 Improve Access to Specialty Care: Improve Outcomes for Diabetic Pregnancies
Unique RHP ID#: 136491104.1.1 – PASS 1
Provider Name: Southwest General Hospital
TPI: 136491104

Project Summary:

Provider Description:
Southwest General Hospital is a 327-bed, acute care hospital in San Antonio, Texas serving residents of South San Antonio and surrounding areas. RHP 6 encompasses 20 counties and covers 24,734 square miles, comprising about 9.5% of the total land area of Texas.

Intervention(s):
Southwest General Hospital proposes to develop and implement a Gestational Diabetes program to educate and monitor patients throughout their pregnancy, therefore improving fetal outcomes. The project will provide specialty care services and providers to better accommodate the high demand for peri-natal services and thus have increased access to services. The project will include a structured program that involves both Obstetricians and Maternal Fetal Medicine physicians, perinatal nurses, and a diabetic educator. The program will include a process to ensure transparent, standardized referrals across the continuum of care.

Need for the project:

- RHP 6 pregnant women currently have limited access to resources to care for at risk or diagnosed with gestational diabetes. The program will seek to enhance ease and availability of care resources.
- Bexar County, which has the highest number of births in the state of Texas, has a higher adolescent (ages 13-17 years) pregnancy rate than Texas, with an average of 30.6 per 1000 women compared to 26.1 for the state. This project will assist with meeting a serious healthcare gap in RHP 6.
- Women of Hispanic origin have a 5-8% chance of developing gestational diabetes compared to a 1.5-2% risk in non-Hispanic white women. Approximately 54% of the population in RHP 6 is of Hispanic origin. This differs from the state as a whole, which is 46% Anglo and 38% Hispanic. With proper diet, medication and monitoring, complications from gestational diabetes can be controlled. A strong referral network will support achieving this program goal.
- Of the 36,000 live births in RHP 6 in 2008, only 59% of mothers received prenatal care within the first trimester, leading to the assumption, access to medical care remains difficult regardless of clinic resources.
- The high percentage rate of stillbirths, premature deliveries and low birth weight babies, preterm labor, and birth trauma related to diabetes in pregnancy presents a need for these services.
- The Gestational Diabetes Program will assist with improving the health care delivery infrastructure to better serve the Medicaid and uninsured residents of South San Antonio and surrounding areas. At Southwest General Hospital currently, 89.4% of obstetrical patients are Medicaid and uninsured mothers and babies.
- The program will build on an existing Maternal Fetal Medicine program which is comprised of Obstetricians, Maternal Fetal Medicine Physicians, Diabetes Educators, and Perinatal Nurse Practitioners. Outreach efforts will serve to identify and reach key rural areas currently experiencing difficulty with access to care.

**Target population:**

The target population will be pregnant teens and women at risk for or diagnosed with gestational diabetes in RHP 6. Currently, Southwest is seeing approximately 620 mothers annually for care related to Gestational Diabetes.

The focus will be on the first trimester of pregnancy with an added focus on Hispanic adolescents and women.

**Category 1 or 2 expected patient benefits:**

- To provide a specialty gestational diabetes outreach center with an established associated maternal fetal medicine program.
- To decrease the percentage of low birth weight babies resulting from undiagnosed or untreated gestational diabetes.
- To increase the total volume of patients seen at the specialty clinic by 6% from baseline DY 3 to DY4.

**Category 3 outcomes:**

Our goal is to reduce the number of babies weighing less than 2500 grams at birth by 5% in year 4 and by 7% in year 5 by screening, early identification, intervention, treatment and provision of preventive care for the pregnant women with gestational diabetes.

**Project Description:**

Southwest General Hospital proposes to develop and implement a Gestational Diabetes program to educate and monitor patients throughout the pregnancy, therefore improving patient outcomes.

The project for Southwest General Hospital is designed to increase the capacity to provide specialty care services and the availability of targeted specialty providers to better accommodate the high demand for services and thus have increased access to services. Southwest General Hospital will develop and implement a Gestational Diabetes program to educate and monitor patients, therefore, improving fetal outcomes. We propose providing a structured program that involves referrals to both Obstetricians and Maternal Fetal Medicine physicians, perinatal nurses, and a diabetic educator.

Through the goal of improving access to specialty care, the project will impact the following:

- Clinic hours will be established to meet needs through flexibility of hours (early am and evening) as well as routine hour visits
- Gestational diabetes clinics will be established in one additional area of RHP 6 with highest pregnancy rate
- Quality improvement efforts will focus on use of rapid cycle improvement methodologies
Goals and Relationship to Regional Goals:
The goal of this project is to increase the capacity to provide specialty care services and the availability of targeted specialty providers to better accommodate the high demand for services and thus have increased access to services. A structured education program and ongoing patient monitoring will have as a goal the improvement in clinical outcomes for women with Gestational Diabetes.

Project Goals:
- Provide a Gestational Diabetes Program for the RHP 6 region
- Increase access to care for RHP 6 pregnant women at risk for or diagnosed with gestational diabetes
- Decrease the percentage rate of stillbirths, premature delivery and low birth weight babies, preterm labor, and birth trauma related to diabetes in pregnancy

This program meets the following regional goals:
- The Gestational Diabetes Program will contribute to assuring patients receive high-quality, patient centered care with the goal of improved outcomes for mother and baby
- The Gestational Diabetes Program will assist with improving the health care delivery infrastructure to better serve the Medicaid and uninsured residents of South San Antonio and surrounding areas. At Southwest General Hospital currently, 89.4% of obstetrical patients are Medicaid and uninsured mothers and babies.
- The program will build on an existing Maternal Fetal Medicine program which is comprised of Obstetricians, Maternal Fetal Medicine Physicians, Diabetes Educators, and Perinatal Nurse Practitioners. Outreach efforts will serve to identify and reach key rural areas currently experiencing difficulty with access to care. The Birthplace at Southwest General Hospital has provided care to women, including teens, with gestational diabetes with excellent outcomes. We have the ability and knowledge to provide outlying communities with the resources needed to manage patients with Gestational Diabetes. The establishment of standardized referral and work up guidelines is critical to program success.

Challenges/Issues Faced By Provider:
- Of the 36,000 live births in RHP 6 in 2008, only 59% of mothers received prenatal care within the first trimester, leading to the assumption, access to medical care remains difficult regardless of clinic resources
- Difficulties with the Medicaid authorization processes may lead to physicians to drop many Medicaid patients

5-year Expected Outcome:
Through an increase in access, the Birthplace at Southwest General Hospital will improve clinical outcomes for pregnant women with Gestational Diabetes, therefore, anticipate decreasing
the rate of stillbirths, premature delivery and low birth weight babies, macrosomia, preterm labor, and birth trauma related to diabetes in pregnancy.

1 RHP 6 Community Needs Assessment, September 2012.

**Starting Point/Baseline:**

The baseline for the program will serve as the foundation to further develop and grow the Maternal Fetal Medicine Program at Southwest General Hospital to care for local and outlying regions of RHP 6 with a high quality gestational diabetes specialty care service line. The baseline number of participants as well as the number of providers begins as 0 for both in DY2.

The Birthplace at Southwest General Hospital has provided care to women, including teens, with gestational diabetes with excellent outcomes. We have the ability and knowledge to provide outlying communities with the resources needed to manage patients with Gestational Diabetes.

Baseline number of available appointment for Gestational Diabetes patients is at capacity in existing care delivery model and is limited by space and time. The ability to establish outreach clinics served by specialty consultants in key need areas will provide improved access to mothers requiring screening, care, and management of diabetes, as required. The establishment of these clinics will also reduce waiting time for routine appointments and foster improved participation and compliance with treatment plans for diabetes and pregnancy management. Currently, Southwest is seeing 620 mothers annually for care related to Gestational Diabetes.

**Rationale:**

Of the 36,000 live births in RHP 6 in 2008, only 59% of mothers received prenatal care within the first trimester, leading to the assumption, access to medical care remains difficult regardless of clinic resources. It is estimated that between 2.5 percent and 4 percent of women in the United States will develop gestational diabetes during pregnancy. Gestational diabetes place these women at a greater risk for pregnancy complications including preeclampsia, prematurity, macrosomia (birth weight greater than 9lbs 15ounces), neonate respiratory difficulties, neonate hypoglycemia, birth injury and stillbirth. According to the Texas Department of Human Services, in 2007, 50.3% of the premature births were from Hispanic mothers. Women of Hispanic origin have a 5-8% chance of developing gestational diabetes compared to a 1.5-2% risk in non-Hispanic white women. Approximately 54% of the population in RHP 6 is of Hispanic origin. This differs from the state as a whole, which is 46% Anglo and 38% Hispanic. With proper diet, medication and monitoring, complications from gestational diabetes can be controlled.

According to the Regional Healthcare Partnership 6 Community Needs Assessment (September 2012), Diabetes is one of the major causes of premature death in the U.S. and disproportionately affects some racial and ethnic populations. The percentages of low birth weight babies and diabetes among adults are similar for the region and Texas, with an average between 8% and 10%. Bexar County, which has the highest number of births, has a higher adolescent (ages 13-17 years) pregnancy rate than Texas, with an average of 30.6 per 1000 women compared to 26.1 for the state. This project will assist with meeting a serious healthcare gap in RHP 6.

The Birthplace at Southwest General Hospital has provided care to women, including teens, with
gestational diabetes with excellent outcomes. We have the ability and knowledge to provide outlying communities with the skills, knowledge, and clinically competent resources necessary to manage patients with Gestational Diabetes and for patients to manage self through outreach services in collaboration with rural healthcare teams. All pregnant women should be screened for gestational diabetes because of its serious risks; however, a recent study has found that only 68 percent of all pregnant women were screened\textsuperscript{6}. With proper diet, medication, and monitoring, complications from gestational diabetes can be controlled.

Unique community need identification number the project addresses:

- CN.5 -Lack of interconceptional and prenatal care for women and preventative pediatric care results in poor maternal and child health outcomes

As stated previously, Southwest General has provided a Maternal Fetal Medicine program for the last 12 months. The expansion of the program to RHP 6 areas of acute need will be a new initiative requiring space as well as human and material resources. The ability to model the existing program is an asset in development and implementation of the project.

\textsuperscript{2}RHP 6 Community Needs Assessment, September 2012.  
\textsuperscript{5}RHP 6 Community Needs Assessment, September 2012.  
\textsuperscript{6}RHP 6 Community Needs Assessment, September 2012.

Related Category 3 Outcome Measure(s):

OD-8 Perinatal Outcome:

- IT- 8.2 Percentage of Low Birth-weight births

Of the 36,000 live births in RHP 6 in 2008, only 59% of mothers received prenatal care within the first trimester, leading to the assumption, access to medical care remains difficult regardless of clinic resources\textsuperscript{2}. The potential for gestational diabetes going unidentified is extremely high in the region. The screening, identification, education and provision of prenatal care are critical to impact the above outcome measures.

According to the Texas Department of Human Services, in 2007, 50.3% of the premature births were from Hispanic mothers. Women of Hispanic origin have a 5-8% chance of developing gestational diabetes compared to a 1.5-2% risk in non-Hispanic white women. Approximately 54% of the population in RHP 6 is of Hispanic origin\textsuperscript{6}. This differs from the state as a whole, which is 46% Anglo and 38% Hispanic\textsuperscript{5}. With proper diet, medication and monitoring, complications from gestational diabetes can be controlled. The monitoring of the above metric will serve to evaluate the outcomes associated with education related to proper diet, medication management, and complication prevention provided through a gestational diabetes program focused on screening and identification of actual and potential residents in RHP 6 with gestational diabetes.

The monitoring initiative is new to Southwest General Hospital; however, the outcome measure
of low birth weight is critical to evaluation of the program outcomes as well as evaluation of the entire population served by the facility. The monitoring and evaluation outcomes will serve to further develop the diabetes program and will serve as the basis for identification of additional clinical care programs.

### Relationship to other Projects:

The development of a Gestational Diabetes program service line would inter-relate to the following projects:

- 1.9: Diabetes service line expansion to address the specialty problem of gestational diabetes;
- 2.6: Implementation of evidence-based health promotion and disease prevention program for gestational diabetes;
- 2.12: The implementation of a comprehensive care transition program for Post Partum follow-up and disease follow-up and monitoring.

The project aligns with Category 4 Population focused measures which are the following: RD-1 Potentially Preventable Admissions related to Diabetes. Diabetic short term complications of patients cared for in program and post delivery require admission for short term diabetic complications. Through the identification of barriers and facilitators of post partum follow up in women with recent gestational diabetes, the incidences requiring admission are hypothesized to be minimal post participation in SWGH proposed program.

### Relationship to Other Performing Providers’ Projects in the RHP:

Potential members of learning collaborative based on early review and identification of projects. Further detail required to assess comparability and potential for collaboration.

1. CHRISTUS Santa Rosa Hospital – Implement Evidence based Health Promotion Programs; and Expand Specialty Care Capacity
2. University Hospital; Baptist Medical Center; CHRISTUS Hospital of San Antonio; Methodist Hospital; Dimmitt County Memorial Hospital; Val Verde Regional Medical Center; and Connally Memorial Medical Center – Expand Specialty Care Capacity

### Plan for Learning Collaborative:

At this time, without further background information and detail on projects for RHP 6, a plan for participation in a RHP-wide learning collaborative with other similar projects is not possible. The potential for collaboration with above identified projects and providers is critical to best practice identification and performance improvement projects.
### Project Valuation:

- **Achieve Waiver Goals:**
  
  “Initiatives under the DSRIP program are designed to provide incentive payments to hospitals and other providers for investments in delivery system reforms that increase access to health care, improve the quality of care, and enhance the health of patients and families they serve”. Southwest General will develop the gestational diabetes program, provide qualified members of the Healthcare team, to include Obstetricians and Maternal Fetal Medicine providers, to support patient education and care, and allocate space, equipment, and resources to recruit program participants.

- **Addresses Community Needs:**
  
  As previously outlined the community and the RHP as a whole are critically challenged to provide timely prenatal care and reduce the incidence of gestational diabetes. Of the 36,000 live births in RHP 6 in 2008, only 59% of mothers received prenatal care within the first trimester, leading to the assumption, access to medical care remains difficult regardless of clinic resources⁷. The potential for gestational diabetes going unidentified is extremely high in the region. The screening, identification, education and provision of prenatal care are critical to impact the above outcome measures.

  ⁷RHP 6 Community Needs Assessment, September 2012.

- **Project Scope:**

  Southwest General Hospital has a known reputation on the Southside of San Antonio related to obstetrical care. In late 2011, the organization launched a maternal fetal medicine program which has enhanced the ability to reach outlying regions and establish a program to identify and manage gestational diabetes in a manner which demonstrates practices based on evidence and supported by clinical outcomes. The expansion of the program to outlying communities will further enhance care but also extend high quality preventive care and education for the region. The program framework is developed and requires the expansion and planning to serve and identify a larger patient base and establish outreach programs to impact care for the patient population.

- **Project Investment:**

  Many of the resources required to support the physician component of the proposed project is in place. The major investment centers on midlevel care provider recruitment and salaries. Additionally, support staff, space, additional equipment needs, travel, marketing, and educational materials will require hospital dollars to support program implementation and sustainability.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $1,743,608
Identifying Project and Provider Information:
Title: 1.1.1 Establish more primary care clinics: University Hospital
Unique RHP ID#: 136141205.1.1 – PASS 1
Performing Provider: University Hospital
Performing Provider TPI: 136141205

Project Summary
Provider Description: University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access to primary, specialty and preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County.

Intervention(s): The Health System will partner with Federally Qualified Health Centers to increase access to women’s health services for residents of Bexar County, Texas by establishing clinical sites and increasing number of primary care visits to enhance access to early preventive care. Combined, these practices can encourage and empower individuals to make healthy decisions that can lead to improved health outcomes in the area of maternal, infant and child health.

Need for the project: Rapid population growth alongside concentrations of low-income, under and uninsured residents underscore the importance of improving access to preventive health services that respond to the health service needs of the population. Focusing on maternal, child and infant health is considered an important opportunity to identify existing health conditions in women such as diabetes, hypertension, poor nutrition and to prevent future health problems for women and their children. Factors that can impact maternal and child health include living in poverty, limited access to prenatal care, nutrition and age. The rate of uninsured in Bexar County is 23% further highlighting the need for increased access.

Target population: The target population includes Medicaid-funded (19%) and uninsured (43%) individuals who represent 62% of the patient population served by the Health System. In addition focus will be placed on residents located in rapidly growing areas of Bexar County and in particular the central Northern sector of the county where almost four out ten individuals have no usual source of medical care or have not received a medical checkup in the past year. This area also has a number of a high number of low income, uninsured, minority residents who suffer from multiple chronic conditions

Category 1 or 2 expected patient benefits: The anticipated 5 year goal is to increase primary care encounters by 20% over baseline (or 7,524 encounters) by enhancing access to preventive health care targeting improved birth outcomes in both mother and child.

Category 3 outcomes: IT-8.1 Timeliness of Prenatal/Postnatal Care; IT-8.5 Frequency of Ongoing Prenatal Care; IT-8.2 Percentage of low birth weight births (CHIPRA/NQF #1382)

- **DY4** –
  - Increase Timeliness of Prenatal/Postnatal Care by TBD% from baseline.
• Increase Frequency of Ongoing Prenatal Care by TBD% from baseline.
• Decrease Percentage of Low Birth-weight births by TBD% from baseline
  • DY5 –
    • Increase Timeliness of Prenatal/Postnatal Care by TBD% from baseline.
    • Increase Frequency of Ongoing Prenatal Care by TBD% from baseline.
    • Decrease Percentage of Low Birth-weight births by TBD% from baseline

Project Description:

University Health System will partner with Federally Qualified Health Centers (FQHCs) to increase access to women’s health services for residents of Bexar County, Texas by establishing clinical sites and increasing number of primary care visits to enhance access to early preventive care. Combined, these practices can encourage and empower individuals to make healthy decisions that can lead to improved health outcomes in the area of maternal, infant and child health. In Bexar County, as elsewhere, low income, uninsured, minority populations have multiple chronic conditions. Without regular primary care, chronic conditions are likely to become acute episodes, putting patients at risk for disability and premature death. Extended delays in appointment scheduling and long wait times have a significant negative impact on patient and provider satisfaction and quality of care, and discourage people from using health care proactively. Recruitment of providers to serve a medically compromised population will also be challenging. The 5 year goal is to expand delivery of women’s preventive service and thereby create access to primary care services for high risk populations translating into additional 7,524 patient encounters. Establishing a new clinic location that provides much needed women’s preventive health services addresses many of the challenges faced by patients including delays in scheduling appointments, long wait times and overall access to healthcare.

The project addresses the following regional goals:
  • Further develop and maintain a coordinated care delivery system

Starting Point/Baseline:

As of September 30, 2012, there are 0 patient encounters at this new location for base year.

Rationale:

In the United States, safety-net hospital systems remain essential to providing access to health services for over 50 million uninsured Americans as well as other underserved populations. In the era of healthcare reform, safety-net hospitals will remain critical to responding to the mandate of providing medical care that is accessible, integrated, and patient-centered. In addition, the evidence makes clear that carefully tailored health services interventions can lead to the establishment of a usual source of care, improve adherence to clinical care and treatment, and strengthen evidence-based clinical preventive service delivery to economically vulnerable, uninsured or underinsured populations.

In Bexar County, Texas, rapid population growth alongside concentrations of low-income, under and uninsured residents underscores the importance of improving access to preventive health services that respond to the health service needs of the population. Focusing on maternal, child and infant health is considered an important opportunity to identify existing health conditions in
women such as diabetes, hypertension, poor nutrition and to prevent future health problems for women and their children. Factors that can impact maternal and child health include living in poverty, limited access to prenatal care, nutrition and age. The rate of uninsured in Bexar County is 23% further highlighting the need for increased access.

To combat these disparities and increase healthcare access, University Health System; the major safety-net hospital for South Central Texas proposes to expand its patient-centered medical home. This is considered an integrated model of health service delivery that focuses on providing high quality, affordable, accessible care alongside a clinical practice that is efficient, evidence-based and utilizes inter-operable information systems to address primary, urgent and specialty care needs.

This project addresses CN.3. Specifically, the local identified need of increased access to medical health services due to high rates of uninsured and a shortage of health care providers is being addressed. This program strengthens healthcare linkages with local community partners enhances access to health care services by expanding clinical services and increasing the number of healthcare providers. No additional federal funds will be utilized for this project due to partnership with FQHC. This will be a partnership of co-location with a lease agreement involved.

The primary project component is to improve geographical coverage and access to clinical sites and increase number of primary care visits to enhance access to early preventive care with particular focus placed on addressing maternal and child health. This evidence-based model of care shifts focus from clinical service provision to the patient, their families, and their community. Establishing a long-term, trusting relationship assures patients receive the right care, including recommended clinical preventive services, at the right time, in the right setting.

Implementation of this program will ensure patients have access to continuity of primary and preventive care services. Strategies include redesigning our clinical workflow to reduce wait times, assure timely scheduling of appointments, deliver clear communication and messaging between patients and health care teams, provide data systems to support population health management, establish effective case management and care coordination, and support patient self-care, development, and accountability, and develop performance reporting and improvement plans using LEAN concepts to reduce waste.

Measures of performance will include both process and outcomes measures that assess progress towards implementation milestones. These include: 1) measures of clinical expansion (establishment of patient-centered medical home site), 2) integration and access (expanded services that address target population needs), and 3) quality of care and cost-effectiveness. In summary, establishing this patient-centered, clinical preventive model of care strengthens the our mission and responds to national health aims of delivering high quality care, improving population health and reducing healthcare costs.

Related Category 3 Outcome Measure(s):

- Timeliness of prenatal/postnatal care (IT-8.1)
- Frequency of ongoing prenatal care (IT-8.5)
Outcome Domain: 8-Perinatal Outcomes

Specific outcomes selected for this project were based on evidence of effectiveness regarding the importance of initiating early of prenatal Care (PNC) and helping to reduce late prenatal care entry during pregnancy which has been shown to significantly reduce the potentially deleterious effects of both normal and high-risk pregnancy outcomes including: 1) premature birth, 2) low birth weight, 3) maternal hypertension and 4) gestational diabetes (Alexander and Korenbrot, 1995; Tossounian, Schoendorf and Kiely, 1997; Alexander and Kotelchuck, 2001; Atrash et al., 2006). In addition, the delivery of postnatal care primarily through preventive screening conducted at specific developmental milestones can help reduce maternal death or disability as a result of undiagnosed conditions (Healthy People 2020).

IT-8.1 Timeliness of Prenatal/Postnatal Care 262 (CHIPRA Core Measure/NQF #1517) (Nonstandalone measure)

a. Numerator: Deliveries of live births for which women receive the following facets of prenatal and postpartum care:
   Rate 1: Received a prenatal care visit as a member of the organization in the first trimester or within 42 days of enrollment in the organization.
   Rate 2: Had a postpartum visit for a pelvic exam or postpartum care on or between 21 and 56 days after delivery.

b. Denominator: Deliveries of live births between November 6 of the year prior to the measurement year and November 5 of the measurement year

c. Data source: EHR, claims

d. Rationale/Evidence: The percentage of deliveries of live births between November 6 of the year prior to the measurement year and November 5 of the measurement year. For these women, the measure assesses the following facets of prenatal and postpartum care.

• Rate 1: Timeliness of Prenatal Care. The percentage of deliveries that received a prenatal care visit as a member of the organization in the first trimester or within 42 days of enrollment in the organization.

• Rate 2: Postpartum Care. The percentage of deliveries that had a postpartum visit on or between 21 and 56 days after delivery.

IT-8.5 Frequency of ongoing prenatal care (AHRQ266/CHIRPA267) (Non-stand alone measure)

a. Numerator: Women in the denominator sample who had an unduplicated count of less than 21%, 21-40%, 41-60%, 61-80%, or more than 81% of expected visits, adjusted for the month of pregnancy at enrollment and gestational age.

b. Denominator: Women who delivered a live birth during the measurement yr.

c. Data source: EHR, Claims

d. Rationale/Evidence: This measure looks at the use of prenatal care services. It tracks
Medicaid-enrolled women who had live births during the past year to determine the percentage of recommended prenatal visits they had. Complications can arise at any time during pregnancy. For that reason, continued monitoring throughout pregnancy is necessary. Frequency and adequacy of ongoing prenatal visits are important factors in minimizing pregnancy problems. The American College of Obstetricians and Gynecologists recommends that prenatal care begin as early as possible in the first trimester of pregnancy. Visits should follow a schedule:

- Every 4 weeks for the first 28 weeks of pregnancy
- Every 2 to 3 weeks for the next 7 weeks
- Weekly thereafter until delivery

**IT-8.2 Percentage of low birth weight (CHIPRA/NQF#1382)**

a. Numerator: The number of babies born weighing <2,500 grams at birth)
b. Denominator: All births
c. Data Source: EMR, Claims
d. Rationale/Evidence: Women who receive prenatal care are more likely to have 1) access to screening and diagnostic tests that can help identify problems early; 2) services to manage developing and existing problems; and 3) education, counseling, and referrals to reduce risky behaviors like substance use and poor nutrition (Healthy People, 2020, March of Dimes, 2010). National studies demonstrate that almost 1 out of 4 women still do not receive the full benefits of prenatal care (PNC). For example, between 1980 and 2001, the proportion of women who received PNC in the first trimester increased only moderately from 76% to 83% while a more recent investigation found that in 2003 and 2004 the percentage of women who reported receiving PNC (84%) remain unchanged (Martin et al., 2002). Studies also demonstrate an association between late entry into PNC and impact on birth outcomes including low birth weight, preterm birth and infant mortality. In 2006, as in previous years, non-Hispanic black and Hispanic women were more than twice as likely as non-Hispanic white women to receive care late (beginning in the 3rd trimester) or to receive no care at all (March of Dimes, 2010).

**Relationship to other Projects:**

This Project is related to:

**Category 2:**

136141205.1.5: Expand specialty care; Behavioral health services
Mental health conditions are prevalent among women of reproductive age and a substantial proportion goes untreated. Expanding Behavioral health services allows increase access through both women’s health and primary care provider referrals.

92414401.2.2 Enhance/Expand Medical Homes
Increasing access to primary care and women’s services supports the medical home by providing access to specialty and preventive services offered in one location, in close proximity to patient homes and communities.

131641205.2.2 Redesign to Improve Patient Experience
Providing the ability to access healthcare in a timely manner and in locations where services are needed will lead to better patient experience. This can also be replicated with local and regional partners.

131641205.2.3 Apply process improvement methodology to improve quality and efficiencies:
LEAN methodologies will be used to develop and implement improved clinical workflows, provider tools and training for staff in process improvement, and efficient, quality care delivery
Category 4:
Related Category 4 measures include potentially preventable admissions measures in RD-1, 30 day readmissions in RD-2, Patient Satisfaction in RD-4.1 and RD-4.2.

Relationship to Other Performing Providers’ Projects in the RHP:
92414401.1.1 Expand training of the primary care workforce
Training future providers in primary care will assist with filling the need to create more access for patients and having newly trained providers to staff additional clinical sites

Plan for Learning Collaborative:
This project lends itself to participation in a learning collaborative as other Performing Providers in RHP6 seek to develop primary care services in other parts of the region for similar patient populations. Processes and techniques developed and implemented during this project will be documented by the project team. Successes as well as lessons learned will be shared with regional collaborators who are also working to improve primary care access.

Project Valuation:
The project achieves the waiver goal and meets community needs by expanding primary care in a predominantly Hispanic, underserved area of Bexar County. This program strengthens healthcare linkages with local community partners and enhances access to health care services to a target population who struggle with poverty, receive acute or emergency healthcare services only, and do not have usual providers.

Review of maternal indicators by funding type for 2010 shows Medicaid births have multiple risk factors associated with preterm or low birth weight deliveries. Total births in 2010 were 25,680 for Bexar County; 48% were Medicaid births, 34% Private insurance, and 18% self pay. Medicaid births had the highest proportion of single mothers (70%), Hispanic mothers (77%) and teen mothers (<18years) 8%, as well as low birth weight babies (<2500 g) (10%), premature babies (13%), and no prenatal care during the first trimester 31%. All these factors are significantly associated with higher risk births.

In addition, many in the target population have chronic disease; with no primary care access these condition will become far more complicated and costly to treat. Access to a primary care medical home been has shown to improve health, improve health care, and lower care costs.

### Year 2 (10/1/2012 – 9/30/2013)

**Milestone 1**
- **P.1 Establish additional primary care clinics**

**Metric 1 [P:1.1]**: Number of additional clinics
- Baseline: 0 primary care clinics in collaboration with local FQHC
- Goal: to have 1 clinical site
- Data Source: Provider schedule IDX at new location
- Milestone 1 Estimated Incentive Payment: $4,479,877
- Year 2 Estimated Milestone Bundle Amount: $4,479,877

**Milestone 2**
- **I:12 Increase primary care clinic/women’s health services volume of visits and evidence of improved access for patients seeking services**

**Metric 1:[I:12.1]**:
- Baseline: 0 primary care encounters September 2012 baseline year.
- Goal: to have 2,200 additional primary care/women’s health services encounters at new clinical site over baseline Year 2
- Data Source: IDX, sunrise and OP activity report
- Milestone 2 Estimated Incentive Payment: $4,887,305
- Year 3 Estimated Milestone Bundle Amount: $4,887,305

### Year 3 (10/1/2013 – 9/30/2014)

**Milestone 3**
- **I:12 Increase primary care clinic/women’s health services volume of visits and evidence of improved access for patients seeking services**

**Metric 1:[I:12.1]**:
- Goal: to have a total of 2,420 primary care/women’s health services encounters at new clinical site. This is a 10% increase over Year 3 (220).
- Data Source: IDX, sunrise and OP activity report
- Milestone 3 Estimated Incentive Payment: $4,901,513
- Year 4 Estimated Milestone Bundle Amount: $4,901,513

### Year 4 (10/1/2014 – 9/30/2015)

**Milestone 4**
- **I:12 Increase primary care clinic/women’s health services volume of visits and evidence of improved access for patients seeking services**

**Metric 1:[I:12.1]**:
- Goal: to have a total of 2,904 primary care/women’s health services encounters at new clinical site. This is a 20% increase over Year 4 (484).
- Data Source: IDX, sunrise and OP activity report
- Milestone 4 Estimated Incentive Payment: $4,049,076
- Year 5 Estimated Milestone Bundle Amount: $4,049,076
TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $18,317,771
### Identifying Project and Provider Information:

| Title: 1.1.2 Expand existing primary care capacity: University Hospital expanding capacity |
| Unique RHP ID#: 136141205.1.2 – PASS 1 |
| Performing Provider: University Hospital |
| Performing Provider TPI: 136141205 |

### Project Summary:

**Provider Description:** University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access, through Community Medicine Associates (CMA) to primary, specialty the preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County.

**Intervention(s):** The Health System will increase access to primary care for residents of Bexar County, Texas by enlarging primary care clinic space, expanding hours of operations at primary care clinic sites and adding more clinical staff.

**Need for the project:** The demand for primary care visits in the Health System’s service area has been growing at a rapid rate. The majority of low-income, under and uninsured residents are concentrated in sectors where access to primary care and social services are limited. The rate of uninsured in Bexar County is 23% highlighting the need for increased access.

**Target population:** Medicaid-funded (19%) and uninsured (43%) individuals represent 62% of the patient population served by the Health System.

**Category 1 or 2 expected patient benefits:** The Health System will improve access for primary care services by demonstrating an increase in volume of services provided in DY2 through DY5. For the baseline year beginning October 1st, 2011 and ending September 30th, 2012, there were 244,382 CMA adult primary care encounters. The secondary goals are to enhance care coordination and reduce emergency room visits, hospital admissions and hospital re-admissions.

- **DY2** – Increase CMA primary care encounters by 2% over baseline; 249,270 expected adult primary care encounters.
- **DY3** – Increase CMA primary care encounters by 4% over baseline; 254,157 expected adult primary care encounters.
- **DY4** – Increase CMA primary care encounters by 6% over baseline; 259,045 expected adult primary care encounters.
- **DY5** – Increase CMA primary care encounters by 8% over baseline; 263,933 expected adult primary care encounters.

**Category 3 outcomes:** IT-9.2 – The goal is to reduce emergency center visits.

- **DY 4** – Reduce emergency center visits for patients with COPD, behavioral health diagnoses, uncontrolled diabetes, and asthma by TBD % from baseline.
- **DY 5** – Reduce emergency center visits for patients with COPD, behavioral health
diagnoses, uncontrolled diabetes, and asthma by TBD % from baseline.

**Project Description:**
Our goal is to increase access to quality primary care in Bexar County. We will accomplish by expanding existing primary care clinic space, expanding hours of operations at primary care clinic sites and expanding the primary care clinic staffing. In Bexar County, as elsewhere, low income, uninsured, and minority populations have multiple chronic conditions. Without regular primary care, chronic conditions are likely to become acute episodes, putting patients at risk for disability and premature death. Extended delays in appointment scheduling and long waiting times have a significant negative impact on patient and provider satisfaction and quality of care, and discourage people from using health care proactively. Recruitment of providers to serve a medically compromised population will also be difficult.

The Health System will monitor, evaluate, and adjust the project based on quality improvement activities throughout the development and implementation phases, offering “lessons learned” to our partners in RHP6 through the appropriate Learning Collaborative to be established.

**Relationship to Regional Goals**
This project will further achievement of the regional goals of the Triple Aim; improved health care infrastructure to better serve Medicaid and currently uninsured residents in RHP 6; reduce health disparities; further develop and maintain a coordinated care delivery system; and improve outcomes while containing cost growth.

**5 Year Expected Outcome for Provider and Patients:**
University Hospital expects to see improvements in clinical outcomes and in reduced utilization of the ER for patients served in this model. The anticipated 5 years goal is to increase primary care access and enhance coordination of care to reduce emergency room visits, hospital admissions and hospital re-admissions.

**Starting Point/Baseline:**
As of baseline year end September 30th, 2012, CMA provided 244,382 adult primary care encounters.
Primary care encounters include: CMA primary care network (Main clinical home, PHC, all locations that provide primary and preventive services)

**Rationale:**
The demand for primary care visits in University Hospital’s primary service area has been growing at a rapid rate. Primary care capacity, resources, infrastructure, and technology are severely limited. Our goal is to increase primary care encounters throughout University Hospital/Community Medicine Associates (CMA) primary care network. In order to provide more preventive, primary, and chronic care in the primary care setting, it is critical to expand primary care capacity. According to the 2010 Healthcare Collaborative reports, the current population of Bexar County increased by 15% between 2000 and 2008 (1.59 million). Racial/ethnic diversity varies greatly within sectors of Bexar County. In 2000, over 80% of the population in South and West Bexar County were Hispanic, while fewer than 30% of North Central and Northeast Bexar County were Hispanic. The proportion of African Americans varies
from under 1% in South Bexar to over 15% in Southeast Bexar. Educational attainment is not distributed equally across Bexar County sub-sectors. Nearly one-third to a half of the population in the South (45.5%), West (42.2%), and Southeast (35.7%) do not have a high school diploma, compared to 6.9% of the population in North Central.

This project addresses CN.3 – Lack of access to medical and dental care due to lack of insurance and provider shortages.

Currently, the demand for primary care services within University Health System exceeds the supply. New initiatives for providing primary care access to the underserved of Bexar county is critical. Our new initiatives will seek to renovate specific clinic locations to provide additional capacity, extend hours of operations to include nights and weekends and hire additional providers to expand patient panel sizes.

**Related Category 3 Outcome Measure(s):**

**IT-9.2 ED appropriate utilization (Standalone measure)**
- Reduce all ED visits (including ACSC)
- Reduce pediatric Emergency Department visits (CHIPRA Core Measure)
- Reduce Emergency Department visits for target conditions:
  - Chronic Obstructive Pulmonary Disease
  - Behavioral Health
  - Diabetes
  - Asthma

Reason/rationale for selecting the outcome measure:

High emergency room (ER) utilization is a considerable concern for the increasing cost of health care. Frequent and inappropriate use of hospital ERs is extremely costly and care could be provided in a less expensive setting. Patients, when possible, should be treated by their primary care provider for non-emergency conditions in order to promote consistent, quality care. The targeted population will be the CareLink members assigned to University Health System patient centered medical homes. CareLink is a financial assistance program for uninsured residents of Bexar County. The program was created in 1997 to help address the needs of Bexar County residents without health care coverage who were not eligible for Medicaid or other public or private funding. While CareLink is not an insurance product per se, it has many similar advantages in terms of promoting access to preventive health services, encouraging a long lasting relationship with a primary care provider, and instilling a sense of shared responsibility between member and staff for the member’s health. As of December 31, 2011, there were 54,256 members enrolled in CareLink.

**Relationship to other Projects:**

This Project is related to:
136141205.1.3 Implement a Chronic Disease Management Registry
This project will help monitor current and future patient population in University Health System medical homes to improve healthcare outcomes.
136141205.1.4 Introduce, Expand, or Enhance Telemedicine/Telehealth
Telemedicine can be utilized to expand services and access to new clinical sites.
136141205.1.5 Expand specialty care; Behavioral health services
Mental health conditions are prevalent among the population University Health System serves. Expanding Behavioral health services will give the providers access to refer patients in need of these services at new primary care sites.

92414401.2.2 Enhance/Expand Medical Homes
Increasing access to primary care will give patient access to other specialty and preventive services offered in the medical homes

136141205.2.2 Redesign to Improve Patient Experience
Providing the ability to access healthcare in a timely manner and in locations where services are needed will to a better patient experience.

136141205.2.3 Apply process improvement methodology to improve quality and efficiencies: LEAN methodologies will assist all projects in developing tools and training for the staff as it relates to process improvements in the quality and efficiencies in the care provided to the community.

136141205.2.4 Establish/Expand a Patient Care Navigation Program
This project will link much needed care coordination, social support and culturally competent care to vulnerable patient populations at risk for admissions and re-admissions.

136141205.2.5 Use of Palliative Care Programs
Patients in the medical homes with chronic end of life conditions will have an avenue that addresses patient populations who are at risk for suffering, frequent emergency room visits, admissions and death.

Related Category 4 measures include potentially preventable admissions measures in RD-1, 30 day readmissions in RD-2, Patient Satisfaction in RD-4.1 and RD-4.2.

Relationship to Other Performing Providers’ Projects in the RHP:

92414401.1.1 Expand training of the primary care workforce
Training future providers in primary care will assist with filling the need to create more access for patients and having newly trained providers to staff additional clinical sites

Plan for Learning Collaborative:
This project lends itself to participation in learning collaboratives as other Performing Providers in RHP6 seek to develop and expand primary care services in other parts of the region for similar patient populations. Processes and techniques developed and implemented during this project will be documented by the project team. Successes as well as lessons learned will be shared with regional collaborators who are also working to improve primary care access.

Project Valuation:
The project achieves the waiver goal and meets community needs by expanding primary care in a predominantly Hispanic, underserved area of Bexar County. The demand for primary care has been growing at a rapid rate in Bexar County, and necessitates expanding resources to meet the needs of the population. By expanding clinic space, increasing the number of primary care providers, and expanding clinic hours, this program strengthens healthcare linkages with local community partners and enhances access to health care services to a target population. This population struggles with poverty, utilize acute or emergency healthcare services, and do not have usual providers. In addition, many in the target population have chronic diseases; with no primary care access these condition will become far more complicated and costly to treat. Access to a primary care medical home been has shown to improve health, improve health care, and lower care costs.

### Project Summary:

Provider Description: University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access to primary, specialty the preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County.

Intervention(s): This project will improve patient care quality by developing and utilizing a master chronic disease management registry that will allow providers to more efficiently monitor a patient's disease status, adherence to treatment plans, medication management as well as tailor delivery of appropriate clinical/care coordination interventions.

Need for the project: The design and utilization of chronic disease registries are considered the first step in providing a population-based approach to fully evaluate quality of care delivered, coverage of clinical preventive services and their impact on condition-specific outcomes for patients with chronic health conditions.

Target population: The target population will include all patients with chronic conditions with a specific focus on adults and children with asthma and COPD. These individuals cost the system about $20 million/year in EC and inpatient visit cost.

Category 1 or 2 expected patient benefits: The project seeks to enroll patients from the largest pediatric sites and pulmonologist/allergy specialist sites into the registry. Registry functionality will be available to the three designated specialties by the end of DY3. Patients will be enrolled during DY4, with a goal of approximately 70% of patients with a diagnosis of asthma in the three target clinic sites enrolled by the end of DY5.

Category 3 outcomes: 136141205.3.5 3.IT-9.2: ED appropriate utilization
- **DY4** – Reduce Emergency Department visits by 5% (300 visits/yr) for adult and pediatric asthma/COPD registry patients assigned to three target specialties.
- **DY5** – Reduce Emergency Department visits by 15% (1500 visits/yr) for adult and pediatric asthma/COPD registry patients assigned to three target clinics.

### Project Description:

This project proposes to develop and use a chronic disease management registry specifically targeting University Hospital’s Medicaid and uninsured patient population diagnosed with asthma/COPD. Providing excellent care to the residents of Bexar County requires reliable, transparent, time-sensitive data. The goal of University Hospital’s Population Health
Infrastructure Initiative (PHII) is to establish a meaningful platform for medical providers to review clinical information with their medical teams and produce better patient outcomes in both inpatient and outpatient settings.

According to the Bexar County Health Collaborative 2010 Health Assessment, prevalence data for asthma in Bexar County reveal an average (13%) comparable to the state’s (12%) and the nation’s (14%). Disparities, however, are found by gender, ethnicity, and locale: Females, African-Americans, and residents of the west and northeast parts of the county are more likely to have asthma. The highest prevalence (16%) among the variables studied is found in residents of the Westside. Implementation and enhanced utilization of Health Information Exchange (HIE) and the Health System’s data warehouse will provide opportunity for accurate, secure patient health care information to be readily accessible to the appropriate providers with the ability of reports being generated for like population through analytic software, enhancing information for clinician decision with respect to patient care.

The Texas Health and Human Services Commission (HHSC) published various reports related to potentially preventable hospitalizations and readmissions. Between 2005 and 2010, HHSC found that RHP 6 had 125,090 potentially preventable hospitalizations, about 8.5% of the entire state. The nine conditions studied included asthma. The hospitalizations are considered “potentially preventable” because “if the individual had access to and cooperated with appropriate outpatient health care, the hospitalization would likely not have occurred.” These hospitalizations amounted to $2.9 billion in hospital charges, roughly $1,700 per adult living in the region’s 20 counties. Specifically, at UHS, when applying national benchmarks to cost, patients with asthma or COPD who were admitted to EC or Inpatient Unit cost the system $19,810,000 last year alone. By tracking key patient information, a disease registry for asthma can help physicians and other members of a patient’s health care team to identify and reach out to patients who may have gaps in their care to prevent complications, which often lead to more costly interventions. Implementation of the registry could save 30% -50%/year of EC/Observation and Inpatient cost of compliant patients.

Goals and Relationship to Regional Goals
This project specifically addresses the regional waiver goals of improving the health care infrastructure to better serve Medicaid and currently uninsured residents in RHP 6, reduce health disparities, and further develop and maintain a coordinated care delivery system.

Project Goals:
- Develop a plan to implement/complete the registry to track and assist adult and pediatric patients with asthma/COPD to reduce ED visits.
- Develop and implement a cross-functional team to evaluate registry program.
- Demonstrate registry automated reporting ability to track and report on patient demographics, diagnoses, patients in need of services or not a goal, and preventive care status.
- Implement/ expand a functional disease management registry.
- Increase the percentage of patients enrolled in the registry
- Train provider and provider staff to understand and utilize interactive Registries

Challenges:
Challenges to developing a chronic disease management registry for asthma during this wider process include locating appropriately trained and experienced personnel, implementing
new applications, training current staff and executing change management for multiple applications being inserted into the current environment. The end result of the PHII’s asthma/COPD registry project will be a centralized system for data validation, reporting, and analysis.

The PHII will require considerable resources for analysis, design, and implementation into Health System facilities. The Health System will undergo application infrastructure development to efficiently align current applications with new resources to validate synergy of all applications. After development, implementation will ensue at all University Health System sites including the ambulatory network. Training will proceed during and post implementation of applications. Testing applications will follow implementation and precede pilot and go-live stages.

The program will establish a platform for providers, medical staff, administrative executives, service-line personnel to view the same accurate information synthesized through various standardized reports to improve decision-making. The Health System will monitor, evaluate, and adjust the project based on quality improvement activities throughout the development and implementation phases, offering “lessons learned” to our partners in RHP6 through the appropriate Learning Collaboratives to be established.

5-Year Expected Outcome for Provider and Patients:
University Hospital expects to have a fully functional disease-specific registry tailored to meeting the health services needs of its economically underserved population. Further, the registry will assist the health care team in managing patients with asthma/COPD by a) prompting physicians and their teams to conduct appropriate assessments and deliver condition-specific care; b) identifying patients who have missed appointments, are overdue for care, or are not meeting care management goals; c) providing reports about how well individual care teams and the Health System are doing in delivering recommended care to their asthma/COPD patients; and d) stratifying patients into risk categories to target interventions toward patients with the highest needs.

Ultimately, by the end of DY5, data on emergency department use by adult and pediatric asthma/COPD patients will be reduced, reflecting the contributions of the registry to the overall outcome goal, Right Care, Right Setting (OD-9). We anticipate a 30% reduction in EC and inpatient visits. In addition, for health care executives in operations and finance, this initiative will provide transparency of information for enhanced decision-making at executive and service-line levels, which will lead directly to cost-saving opportunities and more efficient processes.

Rationale:
Timely, accurate information is critical to improving health care outcomes. The Population Health Infrastructure Initiative not only establishes the functionalities of a chronic disease management registry, it enhances the data processes relative to a registry, making it a central hub of accurate health system data and information.

Project Components: For the medical care teams on this project, the registry’s asthma/COPD module will enable them to
a) enter patient data into a unique chronic disease registry;
b) actively manage patients using registry data to proactively contact, educate, and track patients by disease status, risk status, self-management status, and community and family
need;
c) use registry reports to develop and implement a QI plan targeted to asthma/COPD management; and
d) conduct quality improvement activities such as rapid cycle improvement, among others.

Milestones and metrics as presented in the following table take the creation of the registry from developing the cross-functional team to evaluate and document the registry’s capability to address the Medicaid and currently uninsured adult and pediatric asthma/COPD patient population, as well as future community needs, through establishing the data elements required for the registry, to implementing the reporting and notification functions necessary to manage individual patients’ care.

This project uniquely targets CN.2 - Address the high prevalence of chronic disease and related health disparities in the community through greater prevention efforts that focus on addressing chronic disease.

Historically, data warehouses have been extremely inflexible and difficult to manage, particularly with regard to sharing data among providers or tracking individual patients. University Hospital’s implementation of its Electronic Medical Record (EMR), with funding assistance from HITECH, positions the organization to enhance and expand the Population Health Infrastructure Initiative (PHII) to establish a meaningful platform for medical providers to review clinical information with their medical teams and produce better patient outcomes in both inpatient and outpatient settings. This platform also provides business intelligence tools to identify opportunities for cost savings and reduce waste. Given the health care disparities among and within the RHP 6 counties, including the prevalence of asthma due to poverty and environmental conditions, the opportunity to gather and share data across performing providers in the region will advance access, reduce disparities, and enhance management of chronic conditions.

### Related Category 3 Outcome Measure(s):

**OD-9 – Right Care, Right Setting:**
**IT-9.2  ED Appropriate Utilization (Stand Alone Measure)**
- Reduce Emergency Department visits for target conditions
  - Congestive Heart Failure
  - Diabetes
  - End Stage Renal Disease
  - Cardiovascular Disease /Hypertension
  - Behavioral Health/Substance Abuse
  - Chronic Obstructive Pulmonary Disease
  - Asthma

**Reasons/Rationale for selecting the outcome measures:**
Local, state, and national data for Medicaid recipients and the uninsured are unequivocal in showing the lack access to care and subsequent coordination of care for these populations. RHP 6 presents a challenge in this regard as funding sources for performing providers is uneven at best and the disparities in resources are very apparent to patients and provider, alike. The asthma/COPD registry project proposed here will be a powerful tool in the hands of physicians and their health care teams to let them see a truer picture of a patient’s status in terms of medication compliance, appointments kept, latest lab values, among other variables. Studies
into ED use almost always contain a heavy behavioral component, and broad efforts to educate patient populations and to steer them away from EDs have had no effect. An asthma/COPD registry will prompt the provider to engage in face-to-face education and inquiry into an individual’s ED utilization behavior to manage his/her chronic condition. Given the health care disparities among and within the RHP 6 counties, including the prevalence of asthma due to poverty and environmental conditions, the opportunity to gather and share data across performing providers in the region will advance access, enhance management of the chronic condition, and contribute to a reduction in ED utilization.

**Relationship to other Projects:**

The overall Population Health Infrastructure Initiative supports all Health System DSRIP projects through enhanced data collection, centralized reporting, and production of data into accurate information for health care professionals to employ in the areas of telemedicine /telehealth and chronic disease care management.

Category 1: (Project ID: 136141205.1.4) Introduce, Expand or Enhance Telemedicine /Telehealth

Category 2 (Project ID: 92414401.2.1) Apply Evidence-Based Care Management Model to Patients Identified as Having High Risk Health Care Needs

**RD-5. Emergency Department**

Admit decision time to ED departure time for admitted patients (NQF 0497)

a. Decision Time to transfer an emergency patient to another facility (not Transport Time), i.e. decision to make the first call from arrival in transferring ED until

**Relationship to Other Performing Providers’ Projects in the RHP:**

1.3 – Implement a Chronic Disease Management Registry/UTHSCSA: UTHSCSA is the Health System’s partner in delivering care to the county’s Medicaid and currently uninsured populations. We will collaborate on their project to the extent our two overlap, share lessons learned and best practices about registries in general, and support a learning collaborative should one be formed on this topic.

92414401.1.1 - Expand training of primary workforce. All new primary care providers and care manager staff will be trained on the use of the chronic disease registry, and establish a platform for new providers to view the same accurate information synthesized through various standardized reports to improve decision-making, and patient care.

**Plan for Learning Collaborative:**

This project naturally lends itself to participation in learning collaboratives as other Performing Providers seek to establish their own registries or seek to reduce ED utilization in other parts of the region.

**Project Valuation:**

1. This project achieves the Waiver goals by a) improving the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further developing and maintaining a coordinated care delivery system; c) contributing to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and serving as a powerful tool to help providers improve outcomes and reduce ED utilization (containing cost growth).

2. This project addresses community needs by improving access to care for populations with a high prevalence of chronic conditions and reducing disparities in care by providing the...
business intelligence tools to improve programmatic decision-making by locale, ethnicity, gender, or other variables. A significant impact on utilization costs stands to be gained. As noted earlier, asthma was identified by the Texas HHSC as a condition for which potentially preventable hospitalizations and readmissions were observed.

3. When fully implemented – beyond DY5 – which includes developing registries for other highly prevalent chronic conditions, such as diabetes and CHF, as well as eventually sharing the technology among the region’s Performing Providers, the large scope of the project will impact outreach efforts to both physicians and their Medicaid and uninsured patients; will improve proper utilization in the form of increased routine and follow-up patient visits and encounters; will attract and retain physicians in the Health System through; and will promote savings through appropriate ED utilization.

4. This project requires a very large investment as it fits with and enhances federal HIE activities already under way. The hardware, software applications, human resources and time to implement are of the highest organizational priority for the Health System. This particular project targets asthma/COPD, but the scope of utilization for other chronic diseases and in other health care settings is potentially huge.

5. Providers will work with registries to make system of care more efficient and provider time more effective

6. Registry can dramatically improve emergency department providers and primary care provider communication. This improved interaction can ensure a clear message to the patient and more consistent treatment plans

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $19,281,864
**Identifying Project and Provider Information:**

| Title: 1.7.1 – Implement telemedicine program to provide or expand specialist referral services in an area identified as needed to the region: University Hospital Telemedicine Program |
| Unique RHP ID#: 136141205.1.4 – PASS 1 |
| Performing Provider: University Hospital |
| Performing Provider TPI: 136141205 |

**Project Summary:**

**Provider Description:** University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access to primary, specialty the preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County.

**Intervention(s):** This project will employ telemedicine services to improve access to specialty care for patients experiencing barriers to such care. With enhanced access and improved care coordination, the telemedicine visits will allow specialists and other members of the health care team to more efficiently monitor a patient's disease status, adherence to treatment plans, and medication management.

**Need for the project:** Telemedicine technology has become increasingly available to clinical practitioners and holds the promise of providing electronic health care services to increase patient access to care. Vulnerable populations that include economically underserved, minority, and uninsured individuals are less likely to either seek or have access to timely clinical interventions and treatment, resulting in emergency room visits and hospital admissions. In Bexar County, as elsewhere in RHP 6, there is a disproportionate population of low-income, uninsured, and minority individuals, who experience chronic conditions. Without regular primary care and timely access to specialists, these chronic conditions are likely to become acute episodes, resulting in preventable hospital admissions.

**Target population:** The target population will include all patients with chronic conditions with a specific focus on adults with diabetes. Medicaid-funded (19%) and uninsured (43%) persons represent 62% of the patient population served by the Health System. According to data provided by the Texas Department of State Health Services, there were 8,863 adult hospitalizations for diabetes long-term complications in Bexar county from 2006 – 2010. University Hospital ranked second in number of admissions.

**Category 1 or 2 expected patient benefits:** In DY4, 10% of adult patients with diabetes referred to specialists from three designated clinics will have received telemedicine visits. By the end of DY5, adult patients with diabetes will be receiving specialty telemedicine visits from five designated clinics and clinics will be performing at least 10 telemedicine visits per month.

**Category 3 outcomes:** 136141205.3.6 3.IT-2.8: Reduce Diabetes Long-term Complications Admission Rate –PQI3
• **DY4** – Reduce Diabetes Long-term Complications Admission Rate by TBD% for adult diabetes patients.
• **DY5** – Reduce Diabetes Long-term Complications Admission Rate by TBD% for adult diabetes patients.

**Project Description:**

University Hospital proposes to employ telemedicine services to the Medicaid and uninsured adult diabetic patient populations in the ambulatory setting.

The Health System’s goal is to increase our ability to provide both primary care and specialty care services to communities currently underserved, with a focus on providing appropriate care, at the right time, in convenient locations. The five-year target goal is to substantially improve primary medical care capacity for Bexar County and the region by employing telemedicine/telehealth technology. This project proposes to employ telemedicine in service to the Health System’s adult diabetic patient population. We want to increase the overall use of telemedicine for consults for specialty areas in the Health System’s Medicaid and uninsured patient populations, such as endocrinology, cardiology, stroke care, and emergency medicine. In Bexar County as elsewhere, there is a disproportionate population of low-income, uninsured, and minority individuals, who often have chronic conditions. Without regular primary care, these chronic conditions are likely to become acute episodes, putting patients at risk for disability and premature death. Extended delays in appointment scheduling and long wait times have a negative impact on patient satisfaction and quality of care, which ultimately discourages this population from using health care proactively. The Texas Health and Human Services Commission (HHSC) has published various reports related to potentially preventable hospitalizations and readmissions. Between 2005 and 2010, HHSC found that RHP 6 had 125,090 potentially preventable hospitalizations, about 8.5% of the entire state. The nine conditions studied included diabetes. The hospitalizations are considered “potentially preventable” because “if the individual had access to and cooperated with appropriate outpatient health care, the hospitalization would likely not have occurred.” These hospitalizations amounted to $2.9 billion in hospital charges, roughly $1,700 per adult living in the region’s 20 counties. With expanded capacity to provide care through telemedicine, more patients will have access to care, particularly specialty care, which will increase opportunities to prevent disease and avoid hospitalizations, emergency room visits, and re-admissions. In the course of five years, we anticipate a ripple effect of quality of care for the patient and providers, as well as cost savings throughout our health system.

**Project Goal**

The first year’s goal is the acquisition, development, and evaluation of telemodalities, to include robots, teleconferencing software, and telepresence hardware. Multiple pilots in varied settings will allow us to evaluate these technologies. The pilot facilities will employ this equipment to care for the underserved population by providing patients the ability to conference with a provider at a remote, central location. This will enable one provider to service several low-volume clinics in locations throughout Bexar County. An infrastructure environment will be established to support the telemodalities. Nurse and Physician Champions will be established to identify the best candidates for these pilot projects. Maintaining convenient, local, virtual clinics will allow us to extend our reach and provide care to members of the community that might
otherwise not be served, or served at a much higher cost and acuity of care. Expansion of this project to all the Health System’s “hub” clinics, specialty clinics, and eventually, the surrounding counties in partnership with rural hospitals, is the long-term goal for this project beyond the five year plan.

**Relationship to Regional Goals**

This project will further achievement of the regional goals of the Triple Aim; improved health care infrastructure to better serve Medicaid and currently uninsured residents in RHP 6; reduce health disparities; further develop and maintain a coordinated care delivery system; and improve outcomes while containing cost growth. Specifically, this project will implement a telemedicine program to provide or expand primary care and specialist referral services initially to the health system’s Medicaid and uninsured patients and eventually, to areas identified as needed to the region. The Health System will monitor, evaluate, and adjust the project based on quality improvement activities throughout the development and implementation phases, offering “lessons learned” to our partners in RHP6 through the appropriate Learning Collaboratives to be established.

**Starting Point/Baseline:**

Currently, a telemedicine program does not exist at the Health System’s primary care locations. Therefore, the baseline for the number of participants, as well as number of consults achieved through telemedicine, begins at 0 for DY2.

**Rationale:**

One of the greatest challenges facing the U.S. health care system is to provide quality care to the large segment of the population, which does not have access to specialty physicians because of factors such as geographic limitations or socioeconomic conditions. The use of technology to deliver health care from a distance, or telemedicine, has been demonstrated as an effective way of overcoming certain barriers to care, particularly for communities located in rural and remote areas. In addition, telemedicine can ease the gaps in providing crucial care for those who are underserved, principally because of a shortage of sub-specialty providers. The use of telecommunications technologies and connectivity has impacted real-world patients, particularly for those in remote communities. This work has translated into observable outcomes such as improved access to specialists; increased patient satisfaction with care; improved clinical outcomes; reduction in emergency room utilization; and cost savings. Nowhere are these benefits more evident than in Texas. Moreover, public and private funding to subsidize care in the state remains inadequate, despite growing community needs associated with increases in the uninsured and aging populations. Consequently, many people are left to seek care in emergency rooms, often as a last resort, in an unmanaged and episodic manner. The costs of such care are borne by care-giving institutions, local governments, and, ultimately, taxpayers, many of whom are already burdened with the costs of meeting health-related costs of their own. This project will address the core components of 1.7.1 by employing telemedicine technology in three of the Health System’s clinics to a) provide patient consultations by medical and surgical specialists, as well as other types of health professional using telecommunications and b) conduct quality improvement for the project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned,”
opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations. Implementing and expanding telemedicine/telehealth capabilities will allow providers, both in primary care and specialty care, to deliver excellent medical care to our target patient populations throughout RHP 6. Telemedicine/telehealth allows providers to reach into rural areas to provide virtual face-to-face care, while reducing costs and improving patient satisfaction. Milestones and metrics as presented in the following table begin with a needs assessment and identification of specialties to be provided within the project based on regional and community need, while evaluating the technology for upgrades and improvements, followed by implementation in three Health System clinics to address the Medicaid and currently uninsured adult diabetic patient population. Ultimately, by the end of DY5, data on admission rates will show reduced utilization, reflecting the contributions of telemedicine to the overall outcome goal, Potentially Preventable Admissions (OD-2). The RHP Planning Protocol very specifically states HHSC’s goals for employing telemedicine/telehealth: “Specifically, we hope to achieve the following goals for the state’s Medicaid population: increase patients’ timely access to specialty care and reduce geographic barriers; improve efficiency in the referral process by letting specialists divert unnecessary referrals and decreasing the wait time for urgent referrals.” This project is intended to assist the state in these goals.

This project addresses

- **CN.2** – Address the high prevalence of chronic disease and related health disparities in the community through greater prevention efforts that focus on addressing chronic disease and
- **CN.3** – Address the lack of medical and dental health services in the community due to high rates of uninsurance and provider shortages

As noted above, diabetes was identified by the Texas HHSC as a condition for which potentially preventable hospitalizations and readmissions were observed.

University Hospital is already a partner in employing telemedicine in the Bexar County Adult Detention Center, reaching a population that is both literally and figuratively difficult to reach. The experience gives us confidence that expanding this capability to our current clinic patient population and in partnership with the other performing providers in RHP6 will vastly improve management of diabetes and eventually, other chronic conditions, such as CHF, as well as expand access to primary and preventive care. No other sources of federal funding are used for this project.

**Related Category 3 Outcome Measure(s):**

- **OD-2 – Potentially Preventable Admissions**
- **IT-2.8 – Diabetes Long Term complications Admission Rate-PQI3 (Standalone measure)**

**Reasons/rationale for selecting the outcome measure:**

Local, state, and national data for Medicaid recipients and the uninsured are unequivocal in showing the lack of access to care and subsequent coordination of care for these populations. RHP 6 presents a challenge in this regard as funding sources for performing providers is uneven at best and the disparities in primary care and specialty resources are very apparent. The telemedicine project proposed here will help address these issues by providing quality health
care in a cost-effective manner. Engaging a patient face-to-face through technology offers the opportunity for education and inquiry into an individual’s management of his/her diabetes. Given the health care disparities among and within the RHP 6 counties, including the prevalence of diabetes, the opportunity to interact with hard-to-reach patients will advance access, enhance management of the chronic condition, and contribute to a reduction in hospital admissions.

**Relationship to other Projects:**

This project supports multiple projects and interventions of the Health System’s DSRIP program. Establishing a presence in telemedicine throughout the region will assist in the expansion of access to primary and specialty care. In addition to that, this project will provide a significant resource to managing our populations by linking this resource with care coordination and other service lines that can contribute to improved outcomes.

Related projects:
92414401.2.2 – Enhance/expand the medical homes
Telehealth will expand the medical home concept by offering services that would otherwise be unavailable. These services include, but are not limited to, telemedicine, tele-case management, and tele-patient education.

136141205.2.7 – Implement evidence-based disease prevention programs
Education offered individually or in group visits will be evidence-based.

136141205.2.2 – Redesign to improve patient experience
Research has proven that patient satisfaction will increase as a result of the implementation of a Care Management Model which is enhanced by telemedicine and telehealth. The expectation will also be improved provider satisfaction within our ambulatory clinics. A recent study completed with the Affinity Health System showed an increase in provider satisfaction and patient compliance.

136141205.2.4 – Establish/expand a patient care navigation program
Telemedicine/Telehealth can support care management model through patient access to navigation. This allows patient access throughout the health care continuum while simultaneously addressing chronic conditions identified by the patient’s provider.

Category 4 measures include potentially preventable admissions in RD-1 and patient-centered health care, including patient satisfaction and medication management in RD-4.

**Relationship to Other Performing Providers’ Projects in the RHP:**

1.7.1: Introduce, Expand, or Enhance Telemedicine/Telehealth

094154402.1.1 – Methodist Hospital (Pass 1)
085144601.1.15 – UTHSCSA (Pass 2):

UTHSCSA is the Health System’s partner in delivering care to the county’s Medicaid and currently uninsured populations. We will attempt to collaborate with the medical school and Methodist Hospital on their projects, share lessons learned and best practices about telemedicine, and support a learning collaborative should one be formed on this topic.
Plan for Learning Collaborative:

This project naturally lends itself to participation in learning collaboratives as other Performing Providers seek to employ telemedicine/telehealth to increase access to primary and specialty care, erase disparities in care, and reduce ED utilization in other parts of the region. We will attend meetings and share data related to the efficacy of this project.

Project Valuation:

1. This project achieves the Waiver goals by a) improving the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further developing and maintaining a coordinated care delivery system; c) contributing to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and serving as a powerful tool to help providers improve outcomes and reduce hospital admissions (containing cost growth).

2. This project addresses community needs by improving access to care for populations with a high prevalence of chronic conditions and reducing disparities in care by allowing access to primary, and particularly specialty, care providers which may be in short supply. A significant impact on health outcomes and utilization costs stands to be gained. As noted earlier, diabetes was identified by the Texas HHSC as a condition for which potentially preventable hospitalizations and readmissions were observed.

3. When fully implemented – beyond DY5 – which includes telemedicine initiatives for other highly prevalent chronic conditions, such as CHF, as well as eventually sharing the technology among the region’s Performing Providers, the larger scope of the project will impact outreach efforts to both physicians and their Medicaid and uninsured patients; will improve proper utilization in the form of increased routine and follow-up patient visits and encounters; will attract and retain physicians in the Health System; and will promote savings through appropriate ED utilization.

4. This project requires a very large investment as it fits with HITECH funding goals. The hardware, software applications, human resources, and time to implement are of the highest organizational priority for the Health System. This particular project targets diabetes, but the scope of utilization for other chronic diseases and in other health care settings is potentially huge.

Identifying Project and Provider Information:

Title: 1.9.2 Expand Access to Specialty Care (Behavioral Health)
Unique RHP ID#: 136141205.1.5 – PASS 1
Performing Provider: University Hospital
Performing Provider TPI: 136141205

Project Summary:

Provider Description: University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access to primary, specialty and preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County.

Intervention(s): This project will increase access to behavioral health specialty care by adding/increasing behavioral health providers at primary care clinics and having patients receive behavioral health services through integrated patient-centered medical home/neighborhood clinics (PCMH). The PCMH is an innovative, evidence-based program to improve primary care. Adding behavioral health capacity in this infrastructure will provide seamless referrals and increase access to specialty care.

Need for the project: According to the Bexar County Health Status Report Based on Behavioral Risk Factor Surveillance (BRFSS) Data Collected in 2008, 33% of survey respondents said their mental health was not good for one or more days over the past month and 18% reported five or more days of poor mental health. Depression, drug and alcohol use, and lack of access to mental health services were cited as the most frequent mental health issues. Some respondents shared that mental health care is difficult to acquire due to a lack of insurance coverage.

Respondents also mentioned that many Bexar residents do not access care at all because they do not know what mental health services are available. Lack of awareness of services and social stigma around mental health disorders were two major challenges in this area. Education campaigns were suggested as a way to inform Bexar residents about the available mental health services in the community.

Target population: The target population will be those who receive primary care services within University Health System primary care clinics, and who fall into either Quadrant I or III regarding behavioral health needs. Medicaid-funded (19%) and uninsured (43%) persons represent 62% of the patient population served by the Health System. (Ref. for Quadrant Model: National Council for Community Behavioral Healthcare, 2003). These patients will benefit from increased access to behavioral health services in the primary care setting.

Category 1 or 2 expected patient benefits: The Health System will improve access for behavioral health services by demonstrating an increase in volume of services provided in DY2 through DY5:

- **DY2** – Increase behavioral health patient encounters by 2% over baseline; 12,186 expected behavioral health encounters.
- **DY3** – Increase behavioral health patient encounters by 4% over baseline; 12,425
expected behavioral health encounters.

- **DY4** – Increase behavioral health patient encounters by 6% over baseline; 12,664 expected behavioral health encounters.
- **DY5** – Increase behavioral health patient encounters by 8% over baseline; 12,903 expected behavioral health encounters.

**Category 3 outcomes:** IT-1.18 – The goal is to increase access to follow up appointments post discharge for mental illness.

- **DY4** – Increase by TBD% over baseline the number of patients securing outpatient mental health appointments within 7 days and within 30 days post discharge.
- **DY5** – Increase by TBD% over baseline the number of patients securing outpatient mental health appointments within 7 days and within 30 days post discharge.

**Project Description:**

In the United States, safety-net hospitals remain essential to providing access to health services for over 50 million uninsured Americans as well as other underserved populations. The passage of the Affordable Care Act in 2010 marked an important legislative commitment to addressing rising health care costs and improved access to quality healthcare for all Americans. In the era of healthcare reform, safety-net hospitals will therefore remain critical to responding to the mandate of providing primary and specialty medical care that is accessible, integrated, and patient-centered.

University Hospital proposes to increase access to specialty care by expanding its provider base and having patients receive behavioral health services through its integrated patient-centered medical home (PCMH). The PCMH is an innovative, evidence-based program to improve primary care. Adding behavioral health capacity in this infrastructure will provide seamless referrals and increase access to specialty care.

This project will increase access to behavioral health within the University Health System medical homes which will be accomplished by adding behavioral health providers (which may include psychiatrists, psychiatric nurse practitioners, psychologists, behavioral therapists, and/or licensed chemical dependency counselors, as determined by demand) to these settings and thereby leading to increased accessibility. The target population will be those that receive primary care services within University Health System primary care clinics, and who fall into Quadrant I or III regarding behavioral health needs—typically those most likely to be appropriately cared for in primary care settings with co-located behavioral health practitioners. (Ref. for Quadrant Model: National Council for Community Behavioral Healthcare, 2003).

Texas currently ranks 50th in per capita state funding for behavioral health treatment, and persons in RHP 6 experience barriers to accessing behavioral health care. In addition, Bexar County ranks in the top 10 in Texas in terms of least funded Local Mental Health Authorities. Funding for clinical care is restricted to certain mental illness diagnoses, leaving a large segment of persons with a mental illness (including those most commonly seen in primary care settings) without access to appropriate care and treatment.

Community Medicine Associates (the University Health System owned provider group) is the primary care access point for University Health System patients, and there is currently a need for...
behavioral health specialty providers for the population served to enhance the medical home model and expand behavioral health care to additional sites.

Goals and Relationship to Regional Goals
Project goals are to expand access to behavioral healthcare within the primary care setting and thereby address the regional goals of filling gaps in access to behavioral health for economically underserved populations.

Project Goals:
- Increase the number of behavioral health providers.
- Increase the percentage of patient-centered behavioral health specialty visits
- Improve accessibility to appointments post-hospital discharge in target population.

Challenges
A primary challenge will be recruiting and retaining psychiatric providers since Texas currently has a workforce shortage of psychiatrists. For example, based on the national ratio of 13.9 psychiatrists/100,000 population, San Antonio needs an additional 49 psychiatrists to provide care. If based on the University of Texas Medical Branch recommendations of 25.9 psychiatrists/100,000 population, San Antonio needs an additional 294 psychiatrists. (Ref: Methodist Health Care Ministries Mental Health Services Project, San Antonio, July 2010). Recruiting and retention challenges will be overcome by designation of Health Provider Shortage Areas (HPSAs) as designated by HRSA of some primary care clinic sites as underserved areas as relates to behavioral healthcare which then allow Medicare designated bonus payments.

5-Year Expected Outcome for Provider and Patient
University Health System expects to have improved access to specialty care alongside an expanded provider base and a percentage increase in patients receiving behavioral health services through its integrated patient-centered medical home. The result of these efforts will be both an improvement in follow-up post hospitalization for a mental illness diagnosis and reduce emergency room visitation for preventable conditions.

Starting Point/Baseline:
Currently there is one FTE psychiatrist, one FTE psychiatric nurse practitioner, and five FTE therapists who provide specialty behavioral health services at one clinical location. During the baseline year ending September 30th, 2012 (DY1), the University Health System’s owned primary care clinic sites had 11,947 behavioral health provider encounters.

Rationale:
Currently, the demand for behavioral health treatment of patients with behavioral health needs primarily in the areas of the city that have been identified as economically underserved (low behavioral health co-morbid with low to high physical health needs) within the community has outstripped available outpatient resources. For example hospitalization data for mental illness is more pronounced in the southern and western sectors of the County and is considered a direct result of having limited clinical care and treatment resources.
Further, state funding for mental health treatment is restricted to certain mental health diagnoses, thus excluding a large percentage of persons with other mental illnesses, e.g., anxiety disorders, mild to moderate depressive disorders, attention-deficit/hyperactivity disorder, bereavement, adjustment reactions, etc. Focusing on Quadrant I and III includes those diagnoses most likely to be encountered in the primary care setting.

Population forecasts for the Bexar County primary service area predict an increase by 9% in the demand for behavioral health services by 2019, including the need for pharmacologic management. (Ref: Methodist Health Care Ministries Mental Health Services Project, San Antonio, July 2010).

The cost benefit of providing integrated care for treating common mental health disorders is similar to the benefit achieved in treating other chronic conditions (Ref: Connecting Body and Mind: A Resource Guide to Integrated Health Care in Texas and the United States, Hogg Foundation for Mental Health). This project is selected to enhance integration of behavioral health care for those patients served by University Health System’s patient-centered medical home. It addresses the need for specialty behavioral health services for those patients who cannot access services because of diagnostic restrictions, lack of funding, or lack of access to behavioral health providers accepting Medicaid and/or Medicare.

Patients, particularly those in ethnic minority groups, often do not adhere to their primary care provider’s referral to specialty mental health care. (Ref: Takeuchi DT & Cheung MK: Coercive and Voluntary Referrals: How Ethnic Minority Adults Get Into Mental Health Treatment. Ethnicity and Health, 3, 149 – 153.)

Additionally, in Texas, RHP 6, and San Antonio/Bexar County, primary care providers are often unable to locate mental health providers and/or psychiatrists to refer patients leading to disparate care and further exacerbating the health inequalities among these vulnerable populations. Screening for mental health disorders leads to improved patient outcomes only when appropriate care follows detection. (Ref: Connecting Body and Mind: A Resource Guide to Integrated Health Care in Texas and the United States, Hogg Foundation for Mental Health).

Patients with mental illness at times require assessment by a behavioral health provider in order to unburden primary care providers of disease acuity requiring specialty consultation, to improve the comfort level of primary care providers in managing co-morbid behavioral health conditions, and to improve the overall quality of life of patients by addressing the patient’s needs holistically and in a manner that is coordinated.

This project addresses community health need CN.4 – Address the shortage of high quality integrated mental and behavioral health services in the community.

In terms of system redesign, this project represents an initiative to integrate behavioral health treatment for patients served by University Health System’s patient-centered medical home by providing care in the right setting and at the right time for patients who historically have been unable to access outpatient behavioral health care, by providing earlier detection and treatment and potential cost avoidance of unnecessary hospitalizations and/or ER visits due to preventable conditions that include appropriate and timely treatment mental illness, coordinated outpatient post-discharge follow-up.
This project addresses the following Core Components:

a) Increase service availability with extended hours: University Health System anticipates expanding clinic hours during the project, after determining when and where the additional hours would be beneficial.

b) Increase number of specialty clinic locations: University Health System anticipates adding behavioral health care at additional community clinic sites in DY2, which is reflected in milestone 1.

c) Implement transparent, standardized referrals across the system: University Health System has already implemented this component and does not need to further address at this time.

d) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations. University Health System anticipates addressing access to services by those patients falling out of the target population or addressing care transition with high risk for hospitalization patients. University Health System also anticipates engaging in face-to-face biannual meetings with other providers and the RHP to

Related Category 3 Outcome Measure(s):

IT-1.18 Follow-Up After Hospitalization for Mental Illness- NQF 0576236 (Standalone measure)

a. Numerator:
   Rate 1: An outpatient visit, intensive outpatient encounter or partial hospitalization with a mental health practitioner within 30 days after discharge. Include outpatient visits, intensive outpatient encounters or partial hospitalizations that occur on the date of discharge.

   Rate 2: An outpatient visit, intensive outpatient encounter or partial hospitalization with a mental health practitioner within 7 days after discharge. Include outpatient visits, intensive outpatient encounters or partial hospitalizations that occur on the date of discharge.

b. Denominator: Members 6 years and older as of the date of discharge who were discharged alive from an acute inpatient setting (including acute care psychiatric facilities) with a principal mental health diagnosis on or between January 1 and December 1 of the measurement year. The denominator for this measure is based on discharges, not members. Include all discharges for members who have more than one discharge on or between January 1 and December 1 of the measurement year.

Mental health readmission or direct transfer: If the discharge is followed by readmission or direct transfer to an acute facility for a mental health principal diagnosis (within the 30-day follow-up period, count only the readmission discharge or the discharge from the facility to which the member was transferred. Although re-hospitalization might not be for a selected mental health disorder, it is probably for a related condition.
c. Data Source: EHR, Claims

d. Rationale/Evidence: This measure assesses the percentage of discharges for members 6 years of age and older who were hospitalized for treatment of selected mental health disorders and who had an outpatient visit, an intensive outpatient encounter or partial hospitalization with a mental health practitioner. Two rates are reported.

Rate 1. The percentage of members who received follow-up within 30 days of discharge
Rate 2. The percentage of members who received follow-up within 7 days of discharge.

Reasons/Rationale for selecting the outcome measures:
The selection of this outcome measure underscores the importance of addressing the triple aim in healthcare which includes improving quality of care, improving population health in a cost-effective manner. Additional milestones and metrics were selected to reflect an increase in behavioral health providers and their integration within additional primary care sites.

**Relationship to other Projects:**
The project focuses on behavioral health expansion and integration into the medical home also fully supports related DSRIP projects that target disease management, expansion of primary care capacity and redesign of patient experience.

(Project ID: 136141205.1.2) Expand Primary Care Capacity: Expanding and integrating behavioral health care within the medical home will improve the training of the primary care workforce through side-by-side modeling and case discussion.

(Project ID: 136141205.1.3) Implement a Chronic Disease Management Registry: Management of certain chronic behavioral health disorders within medical homes will be supported by the disease management registry so that identification of gaps in care and enhance behavioral health service line planning.

(Project ID: 136141205.1.7) Enhance/Expand Medical Homes: Expansion and integration of behavioral health providers within the medical home allows for the provision of care with the patient at the right time and in the right setting and for managing co-morbid mental health and physical conditions in a coordinated, holistic way.

(Project ID: 92414401.2.1) Expand Chronic Care Management Models: Interventions aimed at managing certain chronic mental health disorders commonly seen in primary care settings, are aimed at improving health outcomes and quality of care, potentially helping to reduce unnecessary hospitalizations and ER visits.

(Project ID: 136141205.2.2) Redesign to Improve Patient Experience: By providing increased access to specialized mental health care within the medical home in a coordinated way, patient-centered care is enhanced by improving timely access to specialists and improving the patient’s overall health and functional status.

(Project ID: 136141205.2.4) Establish/Expand a Patient Care Navigation Program: Expanding behavioral health care in the medical home will enhance the opportunity for care navigation to
appropriate care in the right setting to patients vulnerable to admission and readmission to inpatient settings.

(Project ID: 136141205.2.1) Implement/Expand Care Transitions Programs: Access to outpatient appointments for those discharged from the hospital will improve care transition by providing care a continuum of care within University Health System.

Category 4
RD-1. Potentially Preventable Admissions: Expansion of and access to outpatient behavioral health services for those patients served in University Health System medical homes who have co-morbid physical illnesses in one of the potentially preventable admission diagnoses will help alleviate the contribution of untreated behavioral health diagnoses to instability of the physical diagnosis leading to admission.

RD-2. 30-Day Readmissions: Expansion of and access to outpatient behavioral health services for those patients served in University Health System medical homes with certain behavioral health diagnosis will help prevent 30-day readmissions.

Relationship to Other Performing Providers’ Projects in the RHP:
92414401.1.1 Expand training of the primary care workforce
Training future providers in primary will assist with filling the need to create more access for patients and having newly trained providers to staff additional clinical sites

Plan for Learning Collaborative:
This project lends itself to participation in learning collaboratives as other Performing Providers in RHP6 seek to develop or enhance behavioral health services in other parts of the region for similar patient populations. Processes and techniques developed and implemented during this project will be documented by the project team. Successes as well as lessons learned will be shared with regional collaborators who are also working to improve primary care access.

Project Valuation:
Project valuation for enhancing access to behavioral health services directly responds to waiver goals including the triple aim and improving the health delivery infrastructure to better serve the Medicaid and uninsured residents of the community and region. This includes providing care in the right setting at the right time and enhancing the ability to treat mental health disorders earlier in the course of illness, both of which may contribute to avoidance of unnecessary admissions and ER visits that might be due to untreated mental illness. The project also addresses community need by responding to gaps in delivery of behavioral health services. The Bexar County Mental Health Consortium, a broad representation of mental health agency stakeholders, has identified access to outpatient mental health care as a major need in the community, including enhancing availability of these services within the medical home. Additionally, treatment of chronic mental illnesses shows improved outcomes just as those seen with treatment of chronic physical illnesses, and coordinated care of co-morbid behavioral and physical illness diagnoses in an integrated fashion tends to improve outcomes of both. The project is considered large in scope as it looks to increase outreach to the targeted population and thereby increase the number of patients with behavioral health needs thereby reducing cost and avoidable
hospitalizations. Relative to other projects, the proposed efforts are large in scale and will require investment in human resources, technology and organizational priorities that strengthen the opportunity to deliver integrated and accessible care to the target population.

Identifying Project and Provider Information:
Title: 1.3 Expand school–based/mobile health clinics
Unique RHP ID#: 136141205
Performing Provider: University Hospital
Performing Provider TPI: 136141205

Project Summary:
Provider Description: University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access to primary, specialty the preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County.

Intervention(s): The Health System will expand primary care access through development and implementation of a school-based health center/mobile clinic based program to link children and adolescents of Bexar County, Texas with clinical preventive care. This project will expand primary care access by developing and implementing school-based health centers alongside mobile screenings in order to more effectively link students with clinical preventive care services. This will occur by establishing school-based health centers at or near a school campus, and/or having a mobile health clinic visit the school and/or provide these services by having students transported to a regional medical home located with the Health System ambulatory network of care to receive preventive screenings and immunizations.

Need for the project: Studies find that economically vulnerable populations including minority children are much less likely to have access to timely and appropriate health care. The rate of uninsured in Bexar County is 23% highlighting the need for increased access. In addition, access to timely clinical preventive screenings can prevent and detect illnesses and diseases in their earlier, more treatable stages, which can lead to reduced risk of illness, disability, early death, and medical care costs.

Target population: Economically vulnerable children and adolescents in need of evidence-based clinical preventive screening and primary care access that reside within the Health System service area.

Category 1 or 2 expected patient benefits: The anticipated 5 year goal is to establish three fully-operational school-based/mobile heath clinics programs to expand delivery of preventive care to underserved populations. The secondary goal is to support coordination of services that improve timely access to related United States Preventive Services Task Force (USPTF) preventive screenings that include obesity in children, adolescents, visual and hearing, lead levels and behavioral health that has demonstrated to reduce risk of illness, disability, early death, medical care costs.

Category 3 outcomes:
- IT-12.5 Other USPSTF-endorsed screening outcome measures (screening for obesity in
children and adolescents)

- IT-12.5 Other USPSTF-endorsed screening outcome measures (screening of adolescents 12-18 years of age) for major depressive disorder (MDD)

- IT-12.5 Other USPSTF-endorsed screening outcome measures (immunizations, adolescents 13-18 years of the Meningococcal Conjugate Vaccine (MCV-1) using American Academy of Family Physicians (AAFP) recommendations unless contraindicated

**DY4** –
- TBD Percent improvement over baseline of number of children and adolescents screened for obesity
- TBD Percent improvement over baseline of number of adolescents screened for major depressive disorder (MDD)
- TBD Percent improvement over baseline of number of adolescents 13-18 that receive the Meningococcal Conjugate Vaccine (MCV-1)

**DY5** –
- TBD Percent improvement over baseline of number of children and adolescents screened for obesity
- TBD Percent improvement over baseline of number of adolescents screened for major depressive disorder (MDD)
- TBD Percent improvement over baseline of number of adolescents 13-18 that receive the Meningococcal Conjugate Vaccine (MCV-1)

**Project Description:**

The project’s goal of implementing evidence-based strategies that expand primary care access firmly coincide with national and regional goals that include the National Prevention Strategy’s efforts to link populations with clinical preventive care. These goals aim to improve delivery of high quality evidence-based clinical preventive services to special populations that consist of screening and immunizations that can prevent diseases and reduce mortality associated with chronic disease and can encourage healthy behavior from a very young age.

Delivery of evidence-based clinical, community preventive services (i.e., immunizations, screenings), and the integration of these activities within a school-based setting are central to improving and enhancing the health status of children and adolescents of Bexar County, Texas. Establishment of a school-based clinic can support implementation of community-based preventive services and enhance linkages with clinical care as well as reduce barriers to accessing clinical and community preventive services, especially among populations at greatest risk.

Community Medicine Associates, the provider network for University Hospital, will partner with the University of Texas Health Science Center at San Antonio and local school districts to establish a model of care that is accessible, coordinated, comprehensive and patient-centered for
students. The primary emphasis will be placed on expanding health care services within major urban school districts such as the San Antonio Independent School District which has a current enrollment of 54,000 students of which more than eight out ten (86%) are economically disadvantaged. This will occur by leveraging resources with community-based educational service providers (i.e., Headstart, San Antonio ISD, Edgewood ISD among others) alongside accessibility to a mobile health and wellness unit that will provide timely access to school-based immunization and screening services. Provision of clinical preventive services will be made possible via a mobile health and wellness program alongside the establishment of a free standing school-based health clinic in areas that encompass both a large student population and that remains medically underserved. Clinical preventive menu of screening and related health services will include: physicals, primary care, immunizations, Texas Health Steps, health education, minor illness, and referrals to specialty.

Relationship to Regional Goals:
This project will further the achievement of the regional goals of the Triple Aim; improved health care infrastructure to better serve Medicaid and currently uninsured residents in RHP 6; reduce health disparities; further develop and maintain a coordinated care delivery system; and improve outcomes while containing cost growth. Specifically, this project will expand a mobile health clinic within major urban school districts. Creating a clinical linkage and establishing a usual source of care through a school-based/mobile health program center can strengthen adherence to preventive care and healthy decision-making thus translating into lives saved and cost-savings to both the healthcare delivery system and the local community.

The Health System will monitor, evaluate, and adjust the project based on quality improvement activities throughout the development and implementation phases, offering “lessons learned” to our partners in RHP6 through the establishment of an appropriate Learning Collaborative.

Five year expected outcomes for provider and patient: University Hospital expects to have a series of fully established school-based/mobile health centers tailored to meeting the health services needs of children and adolescents and their caregivers enrolled in major urban school districts within Bexar County, Texas. Further, implementation and expansion of these school-based clinics primarily leveraged through the existing network of University Health System preventive health clinics will directly maximize the opportunity to improve delivery of high quality evidence-based clinical preventive services to special populations. These will consist of screenings and immunizations that can prevent disease and reduce mortality associated with chronic conditions and that encourage healthy behavior from a very young age.

Ultimately, by the end of DY5, data will demonstrate the proportion of the target population that received age and sex appropriate clinical preventive care including screening for obesity in children and adolescents, screening for major depressive disorders in adolescents and delivery of the meningococcal conjugate vaccine to adolescents are defined as the primary health outcomes of interest (Primary Care and Primary Prevention OD-12). This will occur by ensuring that process and improvement milestones are met throughout the life of the project.
Starting Point/Baseline:
Based on the current community outreach model the starting point/baseline is 0

Rationale:
Adherence to clinical preventive services, such as routine disease screening and scheduled immunizations, are key to reducing death and disability is in line with national health goals. There is clear evidence that clinical preventive services can both prevent and detect illnesses and disease that range from the flu to cancer that if caught in their earlier, more treatable stages, can significantly reducing the risk of illness, disability, early death, and health care costs. For example, on average, 42,000 deaths per year are prevented among children who receive recommended childhood vaccines. Yet, despite this evidence and such services are now covered by Medicare, Medicaid, and many private insurance plans under the Affordable Care Act (ACA), large segments of the U.S. population which translate into millions of children, adolescents, and adults go without clinical preventive services that could protect them from developing a number of serious diseases or help them treat certain health conditions before they worsen.

This project specifically addresses community need three (CN.3):

CN.3 – Address the lack of medical and dental health services in the community due to high rates of uninsurance and provider shortages. The current project is a system redesign that enhances the current delivery of care model by leveraging the network of University Health System Preventive Health Clinics in the community. Specifically, these preventive health clinics will help to establish a usual source of care in the population through integration and maintenance that is accessible, coordinated, comprehensive and patient-centered for children and adolescents that attend school within the district. These efforts will therefore serve to reduce health inequities that address the triple aim of providing high quality care, improving population health and reducing the per capita cost of health care; University Hospital will engage in population-based interventions that are coordinated, comprehensive and multi-component to more effectively address the health needs of the 1.7 million residents of this major urban Texas region. With particular emphasis placed on the adolescent population, this will occur by implementing evidence-based strategies that encourage healthy lifestyles through delivery of clinical preventive services. Such efforts will also coincide with Healthy People 2020, The National Prevention Council’s National Prevention Strategy to engage and empower individuals, promote healthy and safe communities and align with clinical and community preventive services to reduce disparities in health.

Related Category 3 Outcome Measure(s):

OD – 12 Primary Care and Primary Prevention:

IT-12.5 Other USPTF-endorsed screening outcome measures (Screening for obesity in children and adolescents)

Rational/Evidence: Since the 1970s, childhood and adolescent obesity has increased three to six-fold. Approximately 12% to 18% of 2- to 19-year-old children and adolescents are obese (defined as having an age- and gender-specific BMI at ≥95th percentile). The USPSTF recommends that clinicians screen children aged 6 years and older for obesity and offer them or
refer them to comprehensive, intensive behavioral interventions to promote improvement in weight status. The USPSTF found that effective comprehensive weight-management programs incorporated counseling and other interventions that targeted diet and physical activity. Interventions also included behavioral management techniques to assist in behavior change. Interventions that focused on younger children incorporated parental involvement as a component.

Moderate- to high-intensity programs involved >25 hours of contact with the child and/or the family over a 6-month period and showed results including improved weight status, defined as an absolute and/or relative decrease in the BMI 12 months after the beginning of the intervention. Most participants were obese, and it is not known whether these results can be applied to children who are overweight but not obese. In addition, evidence was limited on the long-term sustainability of BMI changes achieved through behavioral interventions and on the trajectory of weight gain in children and adolescents. Interventions generally took place in referral settings, and the results can only be generalized to children who follow through on treatment. Low-intensity interventions, defined as ≤25 contact hours over a 6-month period, did not result in significant improvement in weight status.

**Numerator:** Number of children ages 6 years and older screened and referred to comprehensive behavioral interventions to promote weight status.

**Denominator:** Number of children ages 6 and older from the target population.

**Data Source:** EHR, Claims

**IT – 12.5 Other USPSTF-endorsed screening outcome measures** screening of adolescents (12-18 years of age) for major depressive disorder (MDD) when systems are in place to ensure accurate diagnosis, psychotherapy (cognitive-behavioral or interpersonal), and follow-up.

**Rationale/Evidence:** Depression among youth is a relatively common, disabling condition that is associated with serious long-term morbidities and risk of suicide. The majority of depressed youth, however, are undiagnosed and untreated, despite opportunities for identification in settings such as primary care. A synthesis of the evidence suggest that primary care screening tools may be accurate in identifying depressed adolescents, and treatment can improve depression outcomes. Specific treatment should be based on the individual's needs and mental health treatment guidelines (USPSTF, Systematic Review, 2009).

**Numerator:** Number of adolescents ages 12 to 18 years screened for major depressive disorder.

**Denominator:** Number of adolescents ages 12 to 18 from the target population.

**Data Source:** EHR, Claims

**IT – 12.5 Other USPSTF-endorsed screening outcome measures** Immunizations, Adolescents 13-18 years of the Meningococcal Conjugate Vaccine (MCV-1) using American Academy of Family Physicians (AAFP) recommendations unless contraindicated

**Rationale/Evidence:** Adherence to clinical preventive services, such as routine disease
screening and scheduled immunizations, are key to reducing death and disability is in line with national health goals. There is clear evidence that clinical preventive services can both prevent and detect illnesses and disease that range from the flu to cancer that if caught in their earlier, more treatable stages, can significantly reduce the risk of illness, disability, early death, and health care costs. For example, on average, 42,000 deaths per year are prevented among children who receive recommended childhood vaccines.

Numerator: Number of adolescents ages 13 to 18 years that receive the meningococcal conjugate vaccine (MCV-1).

Denominator: Number of adolescents ages 13 to 18 from the target population.

Data Source: EHR, Claims

**Relationship to other Projects:**

This project’s focus on enhancing a mobile clinic to allow school age children access to primary and preventive services ties to these Category 1 and Category 2 projects in our RHP:

**Category 1**

(Project ID: 136141205.1.1) **Expand Primary Care Capacity**: Expanding and integrating psychiatric care within the medical home will improve the training of the primary care workforce through side-by-side modeling and case discussion.

**Category 2**

(Project ID: 92414401.2.2) **Enhance/Expand Medical Homes**: Expansion and integration of psychiatric providers within the medical home allows for the provision of care with the patient at the right time and in the right setting and for managing co-morbid mental health and physical conditions in a coordinated, holistic way.

(Project ID: 136141205.2.2) **Redesign to Improve Patient Experience**: By providing increased access to specialized mental health care within the medical home in a coordinated way, patient-centered care is enhanced by improving timely access to specialists and improving the patient’s overall health and functional status.

Related Category 4 measures include RD-1. Potentially Preventable Admissions.

8. **Influenza Immunization**

   Influenza Immunization (CMS IQR/Joint Commission measure IMM-2)

**Relationship to Other Performing Providers’ Projects in the RHP:**

**Plan for Learning Collaborative:**

University Health System is very interested in sharing best practices, lessons learned, and other ideas to expand mobile clinics. We will participate in face-to-face meetings and/or conference calls to regularly share data related to the efficacy of various practices along with lessons learned as we implement this program.
### Project Valuation:

1. This project achieves the Waiver goals by a) improving the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further developing and maintaining a coordinated care delivery system; c) contributing to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and serving as a powerful tool to help providers improve outcomes and reduce ED utilization (containing cost growth).

2. This project addresses community needs by improving quality of healthcare delivery and patient experience, enhancing access to health services and expanding prevention efforts.

3. The large scope of the project that includes expansion across the 14 school districts in Bexar County, Texas is critical to ensuring a healthy population (children, adolescents, caregivers and the surrounding areas).

4. This project requires a very large investment in terms of personnel, technology and infrastructure to ensure a coordinated approach to clinical preventive care is taken across the various major urban school districts. The hardware, software applications, human resources and time elements required to implement this project are of the highest organizational priority for University Health System. This particular project targets the adolescent population, but the scope is also expansive in that it addresses both the current and future health needs of the population.

### Project Summary:

**Provider Description:** University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access to primary, specialty the preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County.

**Intervention(s):** This project will enhance awareness and establish an integrated interpretation service in order to ensure that health information is provided in a manner that is appropriate to a patient’s linguistic and cultural orientation. This will include enhancing awareness of and access to timely oral interpretation services for patients and family members, in order to improve communication and foster understanding between healthcare professionals and their patients/caregivers with limited English language proficiency.

**Need for the project:** Pronounced demographic shifts in the racial and ethnic make-up of the U.S. population illustrate the need for health systems to proactively find ways to deliver high quality care in a manner that is responsive to the cultural beliefs, language and behavior of an ever diverse patient population. According to the U.S. Census, 43% of Bexar County residents speak a language other than English (primarily Spanish) in the home, compared to 34% across the state. The ability of University Health System (UHS) to provide effective care to linguistically diverse populations will be dependent upon staff capacity (skills, knowledge and awareness) to demonstrate culturally competent care. In 2011, vendor-contracted interpreters were called to come to University Health System locations 1,327 times. Through the use of bi-lingual staff members, who have volunteered to interpret in their work areas and successfully completed a comprehensive interpretation course, UHS aims to significantly reduce the need for contracted interpreters for Spanish-speaking patients.

**Target population:** The target population will include the Medicaid funded and uninsured patients who comprise 62% of UHS patients. This will also include the broader UHS service catchment area of Bexar County and South Texas where large segments of the population are economically underserved, uninsured, with a primary language that is other than English.

**Category 1 or 2 expected patient benefits:** This project will conduct a gap analysis to assess gaps in language access and delivery of culturally competent care in DY 2. This will be followed by development and implementation of a 24/7 web-based video interpretation program and staffing capacity in DY 3 and DY 4 resulting in a total of 150 trained volunteer staff interpreters and an established standard document translation process by DY5. This will promote timely oral interpretation/ written translation services, improve exchange of health information and increase patient confidence in adherence to clinical care and treatment.
Category 3 outcomes: 136141205.3.19 IT-6.1 – 3.IT.6.1 Percent improvement over baseline of patient satisfaction scores

- **DY4** – Increase Patient Satisfaction Scores by TBD% over established baseline of patient satisfaction scores.

- **DY5** - Increase Patient Satisfaction Scores by TBD% over established baseline of patient satisfaction scores.

**Project Description:**
Pronounced demographic shifts in the racial and ethnic make-up of the U.S. population illustrate the need for health systems to proactively find ways to deliver high quality care in a manner that is responsive the cultural beliefs, language and behavior of an ever diverse patient population. According to the U.S. Census, 43% of Bexar County residents speak a language other than English (primarily Spanish) in the home, compared to 34% across the state. The ability of University Health System to provide safe, timely, effective and patient-centered care to linguistically diverse populations will be dependent upon staff capacity (skills, knowledge and awareness) to demonstrate cultural competent care, timely availability of qualified healthcare interpreters, and the ability to effectively translate health information between provider and patient in a manner that supports patient adherence to care and treatment.

University Health System therefore proposes to strengthen access to culturally competent patient-centered care through strategies that promote timely oral interpretation/translation services, improve the fluid exchange of health information between patients and healthcare professionals and promote opportunities for patient to adhere to prescribed clinical care and treatment regimens.

**Goals and Relationship to Regional Goals**
Project goals are to enhance awareness of translation services in order to ensure that health information is provided in a manner that is appropriate to a patient’s linguistic and cultural orientation. This will include enhancing awareness of and access to timely oral interpretation services for patients and family members, in order to improve communication and foster understanding between healthcare professionals and their patients/caregivers with limited English language proficiency.

This will also include incorporating strategies that improve the quality of written and oral translation services (English to Spanish) to ensure patients can receive important healthcare information in their preferred language, improve understanding and adherence to instructions, while reducing the cost of outsourcing document translation services. Specific project goals are in line with the project option’s core components (1.4.1, a-d), which therefore are as follows:

**Project Goals**
- Conduct an analysis to determine gaps in linguistic diversity, translation and culturally competent care.
- Train a cadre of volunteers reflective of the gap analysis and assessment to ensure that an appropriate level exists both in terms of capacity and competency.
• Develop a plan to establish a 24/7 web-based video interpretation program alongside recruitment of a manager to oversee this initiative.
• Expand the number of video conferencing terminals with access to healthcare interpretation technology.
• Hire and train certified translation staff to better enable translation of written documents alongside provision of web-based video interpretation services.
• Increase the number of interpreter encounters per month as a measure of improving language access to the patient population.
• Participate in face-to-face learning as a quality improvement process that promotes lessons learned, solutions, and opportunities with other providers in region.

In 2012, University Health System began the process of implementing an integrated interpreter education and competence assessment program. This 40-hour training program is for bilingual University Health System staff to provide healthcare interpretation services within their own clinical or administrative areas. The training includes: modes of interpretation, the role of the interpreter, code of ethics and confidentiality, medical terminology, and practice. Successful completion of the program requires regular class attendance, passing the final written exam, and a final demonstration of competence in an interpreting skills practice situation.

To date, University Health System has trained 108 interpreters through this program. 106 of these individuals serve as English/Spanish language interpreters. The remaining two are English/German interpreters.

Challenges
While this program marks a significant improvement over University Health System’s previous model of depending exclusively on costly contracted vendors to provide telephonic interpreters and onsite interpretation services at our locations, there continues to be challenges. These include:
1) Having a limited menu of language-specific interpretation services that are available through the in-house program. For example, there is significant and often emergency need for interpreters of languages of lesser diffusion, including Farsi, Arabic, Russian, Vietnamese and Karen
2) The limited capacity that exists for trained staff interpreters to support other units within the hospital, or at another University Health System location due to scheduling and primary job responsibilities and requirements.
3) Disparate distribution of interpreters by shift offers limited availability for after hours and weekend interpretation services
4) In situations in which pre-scheduling is not possible, such as emergencies, the time for a staff interpreter or an outside vendor to arrive onsite can often impact timeliness of care (arrival time can be greater than one hour).

5-Year Expected Outcome for Provider and Patient
University Health System expects to strengthen access to culturally competent patient-centered care through a fully established language interpretation program marked by an increase in training staff (150), implementation a 24/7 web-based interpretation technology and an established standard document translation process that promotes timely oral and written interpretation/translation services, improves exchange of health information between patients and
healthcare professionals and increases patient confidence in adherence to clinical care and treatment.

**Starting Point/Baseline:**
Currently, there are 108 certified medical interpreters at University Health System. The most recent available interpreter support services data report that in 2011 there were approximately 82,984 minutes of telephonic interpretation, 1,702 on-site contract interpretation encounters and 205 documents translated in Spanish.

**Rationale:**
In the United States, safety-net hospitals remain essential to providing access to health services for over 50 million uninsured Americans as well as other underserved populations. These populations are considered diverse both in terms of ethnicity, language and cultural background. Therefore expanding access to written and oral interpretation services firmly coincides with University Health System strategic imperative and national health care aims of providing high quality care, improving population health and providing that care in a cost-effective manner; University Health System will primarily focus on developing and implementing an, “infrastructure of culturally competent care.” This will include increasing the number of trained staff interpreters to 150 by the end of 2013 to provide greater in-house interpretation coverage. This will be enhanced by utilizing new and emerging web-based video technologies alongside development of a 24-hour Healthcare Interpreter Service within University Health System. The development of the in-house Healthcare Interpreter Service will occur in 2013, with the recruitment of a manager and the development of objectives and metrics for the program. In 2013, University Health System will evaluate available web-based video interpretation programs, with implementation to follow in 2014. By the end of 2014, University Health System’s Healthcare Interpreter Service will be to full capacity (4.5 FTEs) and operational thus providing 24/7 service.

There is also considerable need to improve the clarity and quality of instructions, letters, signs and other important health information and education documents. Assuring they are written at the appropriate grade level and are consistent with University Health System's commitment to patient centered care and cultural sensitivity is a high priority. University Health System will utilize the new Healthcare Interpreter Service team to reduce written translation expense and enhance the document translation process. The persons hired into these positions will be certified healthcare translators so, during those times when they are not interpreting, they can be translating documents from English to Spanish. The process will be standardized to assure all patient information requiring translation is first assessed by a communications professional for clarity, cultural sensitivity and appropriate grade level, and the translated documents are then evaluated by the volunteer bi-lingual University Health System Translation Committee for quality control purposes.

This project uniquely addresses community health need (CN.1) Improve quality of healthcare delivery and patient experience and (CN.2) address the high prevalence of chronic disease and related health disparities in the community through greater prevention efforts that focus on addressing chronic disease.

In terms of system redesign, this project represents an opportunity to develop effective methods
of translation and communication which are considered critical to delivering safe, timely and effective health care, and ensuring open communication between patients, families and healthcare team members. Communication is also directly linked to adherence to medication regimens, provider recommendations, and hospital discharge instructions. Communication that is respectful of a patient’s cultural orientation can result in better health outcomes and reduced readmission rates. Conversely, inadequate interpretation services and/or culturally or linguistically inappropriate health education materials can lead to patient dissatisfaction, poor comprehension and adherence, and uncoordinated low-quality care.

To attain the highest level of communication and cultural competence, healthcare providers must be aware of the impact of cultural factors on their patients’ health beliefs and behaviors, and have the tools and skills needed to communicate effectively and appropriately with a diverse population of patients. At the same time, patients must be empowered to be an active partner in this process.

</tr>
<tr>
<td>b Data Source: Patient survey</td>
</tr>
<tr>
<td>c Denominator: Number of patients who were administered the survey</td>
</tr>
</tbody>
</table>

**Reasons/Rational for Selecting the outcome measures:**
The patient satisfaction outcome measure was selected due to its consideration as a valid self-report rating by the patient in regards to the quality of care received during their most recent appointment. Further, the intent of the HCAHPS initiative is to provide a standardized survey instrument and data collection methodology for measuring patients' perspectives on hospital care. The surveys are designed to produce comparable data on the patient's perspective on care that allows objective and meaningful comparisons between institutions on domains that are important to consumers. Public reporting of the survey results is designed to create incentives for institutions to improve their quality of care. Public reporting will serve to enhance public accountability in health care by increasing the transparency of the quality of institutional care provided in return for the public investment.

With a service catchment area of 1.7 million residents, University Health System is the major safety-net hospital for Bexar County, Texas. Ensuring that timely, efficient, equitable, high quality care is delivered to the population will be strengthened by taking into account and measuring the patient perspective thus translating into better health for the community.

Further, effective communication impacts the patient’s perception of every dimension of care included in the CAHPS surveys. How they rate their experience in a hospital or outpatient
facility starts with understanding what their doctor, nurse or other healthcare worker said to them. How these professionals relate to their patients (e.g. demonstrating respect for a different culture) is critical to improving patient satisfaction scores and directly linked to patient adherence to treatment plans and medication regimens. Developing a culture in which competent healthcare interpreters are utilized in all situations in which the patient and provider speak different languages is an important way to reduce patient anxiety, foster understanding between the entire healthcare team (with the patient as its central member), and improve the patient experience. What is best for patients is the most important rationale for selecting this project and for measuring its success through CAHPS scores.

</tbody>
</table>
(Project ID: 136141205.2.4) **Establish/Expand a Patient Care Navigation Program:** Expanding delivery of culturally competent care in the medical home will enhance the opportunity for care navigation staff to provide appropriate care in the right setting to patients vulnerable to admission and readmission in inpatient settings.

**RD-4. Patient-centered Healthcare**  
1. **Patient Satisfaction**  
The reporting of the measures must be limited to the inpatient setting only. All of the HCAHPS’ questions included for the themes listed below are required to be included in RHP plans for PPs required to report for DY 2-5, or if HCAHPS not in place in DY 2, starting DY 3.  
a. Each HCAHPS theme includes a standard set of questions. The following HCAHPS’ themes will be reported on:  
   • Your care from doctors;  
   • Your care from nurses  
   • The hospital environment;  
   • When you left the hospital.  
b. Data Source: HCAHPS296

**Relationship to Other Performing Providers’ Projects in the RHP:**

**Plan for Learning Collaborative:**  
University Health System is already actively engaged with peer organizations in an interpretation services learning collaborative through the Teaching Hospitals of Texas. This demonstration project will further the work of this learning community and expand its ability to share ideas and challenges with providers across the state. University Health System looks forward to developing a plan to communicate lessons learned from this project across RHP 6 and organize learning events within the region to bring interpretation/translation communications experts in from outside the region to share knowledge and best practices around this important issue.

**Project Valuation:**  
This project, to improve communication and foster understanding between healthcare providers, patients and families, is directly tied to the Waiver’s Triple aim to assure patients receive high quality and patient-centered care, in the most cost effective ways.

Project valuation for strengthening access to culturally competent patient-centered care through strategies that promote timely oral interpretation/translation services, improve exchange of health information between patients and healthcare professionals and increase patient confidence in adherence to clinical care directly responds to waiver goals including the triple aim and improving the health delivery infrastructure to better serve the uninsured residents of the community and region. This includes providing care in the right setting at the right time and in a manner that enhancing the provider’s ability to address patient adherence to treatment, clinical preventive care and discharge instructions, both of which may contribute to avoidance of unnecessary admissions and ER visits that might be due to untreated mental illness.
The project also addresses community need by responding to efforts that improve quality of healthcare delivery and patient experience as well as reducing the high prevalence of chronic disease and related health disparities in the community.

This project is considered is appropriate in scope (Scale Rating: 4) with the potential to make a large impact as it looks to enhance an infrastructure that is coordinated and improves patient outcomes, as these objectives cannot be attained without effective interpersonal communication.

Relative to other projects, the proposed efforts is in scale and will require investment in human resources, technology and organizational priorities that strengthen the quality and value of care delivered to the target population.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $13,774,267**
### Project Summary:

**Provider Description:** University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access to primary, specialty, and preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County.

**Intervention(s):** Increase pediatric primary care (including pediatric urgent care) clinic visit volume and provide evidence of improved access for patients seeking services. Accomplish this intervention through hiring more pediatricians and mid-level providers to enhance access for pediatric patients.

**Need for the project:** Our goal is to increase access to quality pediatric care in Bexar County, Texas. This will be accomplished by expanding the existing health service model of care to more fully support delivery of pediatric health services including expanding hours of operations at primary care clinic sites and increasing number of pediatric clinicians to more fully support segments of the pediatric population in need of preventive care and treatment. Studies find that economically vulnerable populations including minority children are much less likely to have access to timely and appropriate health care.

**Target population:** The target population will include pediatric patients in either an indigent or Medicaid-qualifying status in Bexar County who are in need of accessible primary care in areas of the city convenient to where they live.

**Category 1 or 2 expected patient benefits:** We anticipate that this project will produce the following benefits for the targeted population:

- Provide more timely access to clinical preventive services and screening in order to prevent and detect disease
- Addresses community need three (CN.3), lack of medical and dental health services in the community due high rates of uninsurance and provider shortages
- Serve to reduce health inequities and address the triple aim of providing high quality care, improving population health and reducing the per capita cost of health care.

The University Health System will improve access for pediatric primary care and pediatric urgency care services by demonstrating an increase in volume of services provided in DY2 through DY5. For the baseline year beginning October 1st, 2011 and ending September 30th,
In 2012, there were 66,435 CMA pediatric primary care and pediatric acute care encounters.

- **DY3** – Increase CMA pediatric primary and acute care encounters by 2% over baseline; 67,764 expected encounters.
- **DY4** – Increase CMA pediatric primary and acute care encounters by 4% over baseline; 69,092 expected encounters.
- **DY5** – Increase CMA pediatric primary and acute care encounters by 6% over baseline; 70,421 expected encounters.

**Category 3 outcomes:** IT-9.3- Pediatric/Young Adult Asthma Emergency Department Visits – NQF 1381 (Standalone measure). Reduction of pediatric and young adult asthma emergency department visits by TBD% by the ends of both DY4 and DY5 for the target population.

**Project Description:**

Our goal is to increase access to quality pediatric care in Bexar County, Texas. This will be accomplished by expanding the existing health service model of care to more fully support delivery of pediatric health services including, expanding hours of operations at primary care clinic sites and increasing number of pediatric clinicians to more fully support segments of the pediatric population in need of preventive care and treatment. These goals aim to improve delivery of high quality evidence-based clinical preventive services to special populations that consist of screening and immunizations that can prevent disease and encourage healthy behavior and adherence to preventive care from a very young age. It is estimated that 22 million children lack access to medical care due to provider shortages (Patient Protection and Affordable Act, 2012). Disparities in access to health care services are also due to the high cost of care as well as the result of being uninsured. These factors can have a deleterious effect on the health status of individuals such as delays in seeking care or treatment, the inability to receive timely clinical preventive care (immunizations) and screening (obesity, asthma) for conditions that untreated can consequently result in admissions to the emergency room (Healthy People 2020). Studies find that economically vulnerable populations including minority children are much less likely to have access to timely and appropriate health care. This occurs at a time when minorities are contributing to a major demographic shift in this nation. For example, minority children account for almost half (46%) of the population under 18 (Annie E. Casey Foundation, 2011). Within the past decade, Hispanic children grew by 4.8 million (or 39 percent). Local data for Bexar County, illustrate similar trajectories in racial/ethnic minority growth. For example, a recent demographic assessment estimates that almost one third of the population will be 18 years of age or younger, with 9 out 10 being of Hispanic origin.

Delivery of evidence-based clinical preventive services (i.e., immunizations, screenings), and the integration of these activities within a primary care setting are central to improving and enhancing the health status of children in Bexar County, Texas. Enhancing access to pediatric health services support implementation of community-based preventive services and enhance linkages with clinical care, especially among populations at greatest risk for disease and injury.
Specific Project Goals

This project will increase and expand access to pediatric health care within the University Health System medical home model of care by collaborating with both current and planned community health service interventions that will take place within the geographic service catchment area of University Health System, resulting in expansion of services. Specifically this project will:

- Reduce disparities in access to preventive pediatric health services in underserved populations
- Increase pediatric care provider capacity to ensure timely, accessible and integrated care to underserved pediatric populations in Bexar County, Texas
- Increase awareness among target population on the importance of adherence to clinical preventive care in reducing risk for disease and injury.

This undertaking will be made possible by leveraging the University Health System ambulatory network of clinical and preventive health clinics that are located in both high-growth and high-need areas delineated primarily by economically vulnerable populations that include minority individuals with multiple chronic conditions with limited and non-existent health insurance coverage. For example project efforts will coincide with University Health System initiatives to partner with FQHCs to expand primary care capacity and access, oral health services, establish school-based clinics in major urban sectors of the city and health promotion efforts that enhance awareness of preventive care at all life stages to further help establish linkages between communities and preventive care.

The Health System will monitor, evaluate, and adjust the project based on quality improvement activities throughout the development and implementation phases, offering “lessons learned” to our partners in RHP6 through the appropriate Learning Collaborative to be established.

Relationship to Regional Goals

This project will further achievement of the regional goals of the Triple Aim; improved health care infrastructure to better serve Medicaid and currently uninsured residents in RHP 6; reduce health disparities; further develop and maintain a coordinated care delivery system; and improve outcomes while containing cost growth.

Challenges

Challenges to this project will be the timely expansion and care coordination of pediatric health services to (1) ensure timely receipt of care by patients, (2) ensure appropriate infrastructure (electronic medical record systems), (3) the coordination and capacity (providers, hours of operation and clinical space) to appropriately accommodate increased volume from newly established referral pathways. In an effort to proactively address these challenges strategic planning and assessment efforts will be undertaken that includes meeting with key stakeholders to ensure that a balance is maintained between resources, capacity and projected demand. This is considered essential to providing care at the right time and in the
right setting.

**5 Year Expected Outcome for Provider and Patients:**
University Health System expects to see improvements in clinical linkages (integration and coordination of health services), as well as a fully expanded pediatric health service model of care between University Health System and target population. The anticipated 5 year goal is to reduce the proportion of Pediatric/Young Adult Asthma Emergency Department Visits.

**Starting Point/Baseline:**
Baseline will include 2011 annual number of pediatric primary care and urgency primary care encounters seen at Community Medical Associates Primary Care and Urgent Care sites (encounters include CMA primary care network (Main clinical home, PHC, all locations that provide primary and preventive services).

During the baseline year ending September 30th, 2012, there were 66,435 CMA pediatric primary care and pediatric acute care encounters.

**Rationale:**
Studies find disparities in health and well-being often begin in early in life. The etiology of adverse health events are often a reflection of gaps in access to services that lead unequal treatment, adverse congenital health conditions, as well as early exposure to distressed social and economic conditions (i.e., poverty). Expanding access to pediatric services especially among economically underserved population is central to increasing adherence to clinical preventive services, such as routine disease screening and scheduled immunizations, which is key to reducing death and disability. These strategies are important and strongly coincide with interventions that see to improve the nation’s health (Healthy People 2020, National Prevention Strategy, 2011).

There is clear evidence that timely access to clinical preventive services and screening can both prevent and detect illnesses and disease that range from the flu to cancer that if caught in their earlier, more treatable stages, can significantly reducing the risk of illness, disability, early death, and health care costs. For example, on average, 42,000 deaths per year are prevented among children who receive recommended childhood vaccines. Yet, despite this evidence and such services are now covered by Medicare, Medicaid, and many private insurance plans under the Affordable Care Act (ACA), large segments of the U.S. population which translate into millions of children, adolescents, and adults go without clinical preventive services that could protect them from developing a number of serious diseases or help them treat certain health conditions before they worsen.

This project addresses the following Core Components:

a) Expand primary care clinic space: University Health System anticipates obtaining new space in a location to be selected in the baseline assessment phase. Milestone 2 was chosen to address this component.

b) Expand primary care clinic areas: We also anticipate adding hours of service in at least one clinic site, potentially more, based on a demand study conducted during the baseline assessment phase, which is reflected in milestone 3.
c) Expand primary care clinic staffing to two or more clinic locations and will determine in the baseline assessment phase where the greatest impact will be for the growing patient population. This component is initially addressed with milestone 1.

This project specifically addresses community need three (CN.3): Address the lack of medical and dental health services in the community due high rates of uninsurance and provider shortages

The current project is a system redesign that enhances the current delivery of care model by leveraging the network of University Health System Preventive Health Clinics in the community. Specifically, these preventive health clinics will help to establish a usual source of care in the population through integration and maintenance that is accessible, coordinated, comprehensive and patient-centered for children and adolescents.

These efforts will therefore serve to reduce health inequities and address the triple aim of providing high quality care, improving population health and reducing the per capita cost of health care; University Health System will engage in population-based interventions that are coordinated, comprehensive and multi-component to more effectively address the health needs of the 1.7 million residents of this major urban Texas region.

With particular emphasis placed on children with health service needs residing in economically underserved areas of Bexar County, this will occur by implementing evidence-based strategies that encourage healthy lifestyles through delivery of clinical preventive services. Such efforts coincide with Healthy People 2020, The National Prevention Council’s National Prevention Strategy to engage and empower individuals, promote healthy and safe communities and align with clinical and community preventive services to reduce disparities in health.

### Related Category 3 Outcome Measure(s):

**Outcome Measure Description:**

**IT-9.3 – Pediatric/Young Adult Asthma Emergency Department Visits – NQF 1381**

a. Numerator: Percentage of patients with asthma who have greater than or equal to one visit to the emergency room for asthma during the measurement period.

b. Denominator: Denominator is all patients age two through age 20, diagnosed with asthma during the measurement period. The denominator will include recipients with claims with asthma as primary and secondary diagnoses with the dates of service “Begin Date through End Date” equal any consecutive 12 month period with paid dates from "Begin Date through End Date which includes 3 month tail"

c. Data Source: EHR, Claims

### Relationship to other Projects:

**This Project is related to:**

136141205.2.1 - Enhance/Expand Medical Homes

Increasing access to primary care will give patients access to other preventive services
offered in the medical homes

136141205.2.3 - Redesign to Improve Patient Experience
Providing the ability to access healthcare in a timely manner and in locations where services are needed will to a better patient experience.

136141205.1.1.3 - Expand Mobile Clinics: University Health System’s Healthy U
Delivery of evidence-based clinical, community preventive services (i.e., immunizations, screening), and the integration of these activities within a school-based setting are central to enhancing the health status of children and adolescents.

Related Category 4 measures include potentially preventable admissions measures in RD-1, 30 day readmissions in RD-2, Patient Satisfaction in RD-4.1 and RD-4.2.

</thead>
<tbody>
<tr>
<td>The project achieves the waiver goal and meets community needs by expanding pediatric care capacity in a predominantly Hispanic, underserved area of Bexar County. This program strengthens healthcare linkages with local community partners and enhances access to health care services to a target population who struggle with poverty, receive acute or emergency healthcare services, and do not have usual providers. In addition, many in the target population often with no or limited access to quality pediatric care are unaware of being at risk or are not diagnosed with conditions which can become far more complicated and costly to treat. Access to coordinated and timely pediatric health services has shown to improve health, improve health care, and lower care costs.</td>

**Identifying Project and Provider Information:**

| Title: 1.13.1 Develop and implement crisis stabilization services to address the identified gaps in the current community crisis system Psychiatric Emergency Services (PES) |
| Unique RHP ID#: 136141205.1.9 - PASS 3 |
| Performing Provider: University Hospital |
| Performing Provider TPI: 136141205 |

**Project Summary:**

**Provider Description:** University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access to primary, specialty the preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County.

**Intervention(s):** This project proposes development and expansion of a psychiatric emergency service with capacity to accommodate voluntary and involuntary patients with mental illness and in acute crisis. It offers an alternative to medical emergency rooms for those patients not requiring emergent/urgent evaluation and stabilization of physical medical conditions. Partnering this effort with other inventions, like a crisis intervention unit, is critical in order to prevent psychiatric crises and to intervene effectively when they do arise.

**Need for the project:** A study of the Bexar County Mental Health System identified the following problems: stacking in the ER, increase in emergency detention patients (brought in by law enforcement), lack of psychiatrists, and increase use of the criminal justice system by these patients. During a six-month period (July 1 – December 31, 2009), 2,580 indigent patients with mental health diagnoses were evaluated in emergency rooms across San Antonio (accounted for 37.5% of total emergency room patients with mental illness diagnoses) at a total cost of $2.1M. Of those evaluated, 7% were return visits during the same period. As indicated in the RHP 6 Community Needs Assessment this project meets the regional goal to increase access to outpatient care for adults with moderate acuity behavioral health needs in order to mitigate readmissions for acute care services and the inappropriate use of emergency departments.

**Target population:** Patients in Bexar County who traditionally access the emergency department for behavioral health care interventions. Bexar County has a significant number of low income, uninsured and minority residents who suffer from multiple chronic conditions. The majority of our patients are either Medicaid eligible, underinsured, or indigent. Patients will benefit from this project by receiving quality care in the most appropriate setting.

**Category 1 or 2 expected patient benefits:** This project will assure that the right care is being provided in the right setting (OD-9.3.1) and includes the following components:

- Expand the system of care by creating a psychiatric emergency service (PES)
- Increase access to an underserved patient population by hiring additional psychiatrists and psychiatric nurse practitioners to provide evaluations urgently and emergently
• Treating patients in the safest and most appropriate setting with access to psychiatric expertise

We anticipate a patient benefit through provision of an estimated number of PES visits of 1,200 during DY4 and 2,400 in DY5.

Category 3 outcomes: IT 3.8 The goal is to reduce Behavioral Health/Substance Abuse ED visits in the medical ED

• DY4 – Reduce readmission rates by TBD%
• DY5 – Reduce readmission rates by TBD%

Project Description:
In March, 2011, a study of the Bexar County Mental Health system was conducted by U.S. Army Department Army-Baylor Program Intern, Major Samantha S. Hinchman, often referred to in the community as the “Hinchman Study” and focused on indigent care for behavioral health patients presenting to local hospital emergency rooms. The study identified the following problems: stacking in the ER, increase in emergency detention patients (brought in by law enforcement), lack of psychiatrists, and increase use of the criminal justice system by these patients. During a six-month period (July 1 – December 31, 2009), 2,580 indigent patients with mental health diagnoses were evaluated in emergency rooms across San Antonio (accounted for 37.5% of total emergency room patients with mental illness diagnoses) at a total cost of $2.1M. Of those evaluated 7% were return visits during the same period. During 2011, University Hospital provided emergent psychiatric evaluations for 3,127 patients, 50% of whom were brought in by law enforcement. The length of stay for those patients deemed voluntary was 16 hours, and for those needing involuntary admission was 37 hours (average 18 hour LOS). Because of the volume of patients and length of stay, a back log in the medical emergency room is experienced by patients with and without psychiatric conditions. In addition, stabilization of crises occurs more readily in a site where psychiatric providers are readily available, thus potentially avoiding unnecessary inpatient admissions.

This project proposes to expand on that assessment of community need and develop and expand a psychiatric emergency service with capacity to accommodate voluntary and involuntary patients with mental illness and in acute crisis. This solution would offer an alternative to medical emergency rooms for those patients not requiring emergent/urgent evaluation and stabilization of physical medical conditions. The capacity would be 16 beds.

This project will assure that the right care is being provided in the right setting (OD-9.3.1) and includes the following components:

• Expand the existing system of care by creating a psychiatric emergency service (PES)
• Increase access to an underserved patient population by hiring additional psychiatrists and psychiatric nurse practitioners to provide evaluations urgently and emergently
• Treat patients in the safest and most appropriate setting with access to psychiatric expertise

Anticipated challenges include financial sustainability and recruitment of psychiatrists and
mid-level behavioral health providers. From a financial perspective this project addresses the underserved needs of indigent behavioral health patients in the San Antonio community. The lack of treatment resources for the indigent mental health patient is a community problem which we hope to significantly address through this project. Multi-year expected outcomes include the PES (and its sister project the Crisis Intervention Unit, CIU) becoming integrated within a community-wide behavioral health system of care with seamless transitions between hospital-based services (ER’s and inpatient units) to community outpatient settings. The project goal is to enable immediate access for patients to urgent/emergent care with interdisciplinary expertise, and stabilization of crises in a more appropriate setting than a hospital inpatient unit.

Another challenge is the ability to recruit psychiatrists to our community since that specialty is under-represented already. Thus we anticipate using a staff model of some employed psychiatrists and mid-level providers, supplemented by providers contracted hourly, and those made available through telemedicine.

As indicated in the RHP 6 Community Needs Assessment this project meets the regional goal to increase access to outpatient care for adults with moderate acuity behavioral health needs in order to mitigate readmissions for acute care services and the inappropriate use of emergency departments.

**Starting Point/Baseline:**

The annual number of admits to the Hospital’s psychiatric emergency service is 3,127 (2011). We hope to increase this number to include those patients who now would present to an emergency room not having psychiatric evaluation capability.

We anticipate that once the psychiatric emergency service is opened and community education to EMS, health care systems, and law enforcement, is completed, that volume of services will increase fairly quickly. Ongoing data collection should include:

- Number of patient visits
- Number of unduplicated patients evaluated
- Number of patients brought in by law enforcement (emergency detention or otherwise), EMS, walk-in, or transferred
- Identification of frequent utilizers of these services
- Payer mix
- Length of stay
- Final disposition: including # admitted to University Hospital psychiatry inpatient unit or other unit, # referred to other crisis stabilization services, # referred to outpatient treatment
- Quality indicators
**Rationale:**

This project was selected due to the critical need for emergency psychiatric care for patients that do not otherwise need medical treatment for a physical condition. Providing psychiatric emergency services will facilitate care for psychiatric patients in the most appropriate treatment setting. In addition it will decrease emergency room traffic in medical care settings for those with primary psychiatric diagnoses who can be appropriately served in other settings thereby enhancing throughput in that setting for medical patients. Finally, with availability of psychiatric staff and other support staff, unnecessary admissions can be avoided by providing crisis intervention in a setting more appropriate than a medical emergency room without such support and facility structure conducive to stabilizing psychiatric crises.

It is responsive to Community Need #4 (CN4): Address the shortage of high quality integrated mental and behavioral health services in the community.

This project significantly enhances the way we will provide care to patients seeking emergent or urgent psychiatric services. It allows patients to be seen in the most appropriate setting by the most appropriate health professional. It offers an alternative to medical emergency rooms for those patients not requiring emergent/urgent evaluation and stabilization of physical medical conditions.

The following core components will be addressed:

a) Convene community stakeholders who can support the development of crisis stabilization services to conduct a gap analysis of the current community crisis system and develop a specific action plan that identifies specific crisis stabilization services to address identified gaps (e.g. for example, one community with high rates of incarceration and/or ED visits for intoxicated patients may need a sobering unit while another community with high rates of hospitalizations for mild exacerbations mental illness that could be treated in community setting may need crisis residential programs).

b) Analyze the current system of crisis stabilization services available in the community including capacity of each service, current utilization patterns, eligibility criteria and discharge criteria for each service.

c) Assess the behavioral health needs of patients currently receiving crisis services in the jails, EDs, or psychiatric hospitals. Determine the types and volume of services needed to resolve crises in community-based settings. Then conduct a gap analysis that will result in a data-driven plan to develop specific community-based crisis stabilization alternatives that will meet the behavioral health needs of the patients (e.g. a minor emergency stabilization site for first responders to utilize as an alternative to costly and time consuming Emergency Department settings)

d) Explore potential crisis alternative service models and determine acceptable and feasible models for implementation.

e) Review the intervention(s) impact on access to and quality of behavioral health crisis stabilization services and identify “lessons learned,” opportunities to scale all or part of the intervention(s) to a broader patient population, and identify key challenges associated with
expansion of the intervention(s), including special considerations for safety-net populations

**Related Category 3 Outcome Measure(s):**

**IT-9.2 ED appropriate utilization (Standalone measure)**
- Reduce Emergency Department visits for target conditions
  - Behavioral Health/Substance Abuse

A literature review of high utilizers of emergency room services for psychiatric services indicates that frequent users typically have clinical conditions such as alcohol or drug use. In addition, significant social barriers such as housing, lack of health insurance, poor social support and lack of transportation were identified. This project serves to evaluate patients in psychiatric crisis and to stabilize the crisis within a psychiatric emergency service in order to avoid clogging hospital medical emergency departments, to divert to crisis stabilization services outside of a hospital decreasing the length of stay in University Hospital’s ER.

This evidence provides support for why we feel that that project proposed will produce the outcomes targeted through the project.

The outcomes targeted in this project are a priority for the regional health partnership due to the potential impact on effective operations of emergency departments in the community for the benefit of all populations served there, including low-income populations. These outcomes also improve health delivery both for those patients with medical, non-behavioral health diagnoses and those patients with behavioral health diagnoses as both patient populations are treated in a setting appropriate to their condition.

**Relationship to other Projects:**

The two projects for RHP 6 that relate to this project applying to the same population and geography are:
- 136141205.2.1 2.12.1 Develop, implement, and evaluate standardized clinical
protocols and evidence-based care delivery model to improve care transitions. (University Health System)

- 136141205.1.5 1.9.2 Expand access to specialty care (outpatient psychiatry) to provide follow-up after hospitalization. With increased timely access to outpatient services, particularly post hospital discharge, use of hospital-based emergency and inpatient services is reduced. (University Health System)

- 1.13.2 Crisis Intervention Unit and Intensive Outpatient Program Development (Development of Behavioral Health Crisis Stabilization Services as Alternatives to Hospitalization). Access to these services may also mitigate unnecessary emergency room evaluations. (University Health System)

<tr>
<th>Project Valuation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>This project achieves the Waiver goals by a) improving the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further developing and maintaining a coordinated care delivery system; c) contributing to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and serving as a powerful tool to help providers improve outcomes and reduce ED utilization (containing cost growth). This project addresses community needs by improving access to care for persons with mental illness in crisis and who need immediate access to medical and psychiatric evaluation and subsequent stabilization in a setting outside of inpatient hospital setting when appropriate.</td>
</tr>
</tbody>
</table>

This project is based on a 16 bed psychiatric emergency service (PES). The project is designed to provide services to individual’s age 18 years and above with <24 hour LOS. Populations served will include individuals with mental health and/or substance abuse diagnosis. The model is based on expanding mental health resources in our community.

Operating assumptions include a staffing model similar to the following:
**PES (for 16 bed capacity):**

- RN 2 per shift 24/7 = 9 FTE
- MHT 2 per shift 24/7 = 9 FTE
- Social Worker = 1.5 FTE
- MD (psychiatrist): Monday – Sunday 16 hours per day = 2.8 FTE
- MD Psychiatric Medical Director Admin Time = 0.2 FTE
  
  **(NOTE: If PES is not co-located with CIU, and is free-standing, then 24/7 MD coverage is needed for restraint orders = 4.7 FTE)**
- NP: 1 FTE 24/7 + 1 additional NP during hours MN-8am Monday – Sunday = 6 FTE’s
  
  **NOTE: NP + MD coverage provides for 2 providers 24/7**
- Unit Secretary 1 per shift 24/7 = 4.5 FTE
- Nurse Manager = 1 FTE
- Volume assumptions were projected based on historical data for peak hours between 10 am-11 pm which captures 75% of the patients evaluated in UHS emergency department annually.
- Supplies (pharmaceuticals, meals, linens, etc) estimated to be $36-$46 per patient day
- Leased space estimated at between $1,000,000 and $1,600,000 per year
- Insurance estimated to be $5,000 to $15,000 per year

---

**PES Volume Calculation**

- 6,886 cases in the community/6 months (Hinchman Study) of which 50% are discharged without admission
- 6,886 cases X 18 hours (average LOS in PES 2011) =123,948 total hours for 6 months or 247,896 hours annualized
- Estimate that we would attract half of the cases in the city, thus 123,948 hours annualized for patients that would arrive at this unit.
- Based on a 24 hour service in the unit and an 18 hour average length of stay our estimated average daily census is 14 patients (assuming efficient turn-over of beds)

**Milestone 1**

P-1. Conduct stakeholder meetings among consumers, family members, law enforcement, medical staff and social workers from EDs and psychiatric hospitals, EMS, and relevant community behavioral health services providers.

P-1.1. Metric: Number of meetings and participants. Goal: 2 planning meetings will be held.

Data Source: Attendance lists

Milestone 1 Estimated Incentive Payment: $1,762,829.50

**Milestone 2**

P-2. Conduct mapping and gap analysis of current crisis

**Milestone 3**

P-3: Develop implementation plans for psychiatric emergency services

Metric 1 [P-3.1]: Baseline/Goal: Produce data-driven written action plan for development of specific psychiatric emergency services that are needed based on gap analysis and assessment of needs

Data Source: Written plan

Milestone 3 Estimated Incentive Payment: $1,414,021.67

**Milestone 4**

P-4. Hire and train staff to implement identified crisis stabilization services.

P-4.1. Metric: Number of staff hired and trained.

**Milestone 5**

P-5. Implement identified crisis stabilization services.

Milestone 5 Estimated Incentive Payment: $1,762,829.50

**Milestone 6**

P-6. Evaluate and continuously improve crisis services

P-6.1. Project planning and implementation documentation demonstrates either plan, do, study, act or Lean quality improvement cycles

Goal: conduct 2 quality improvement cycles

a. Data Source: Project reports include examples of how real-time data is used for rapid-cycle improvement to guide continuous quality improvement (i.e. how the project continuously uses data such as weekly run charts or monthly dashboards to drive improvement)

Milestone 6 Estimated Incentive Payment: $1,414,021.67

**Milestone 7**

P-7. Evaluate and continuously improve crisis services

P-7.1. Project planning and implementation documentation demonstrates either plan, do, study, act or Lean quality improvement cycles

Goal: conduct 2 quality improvement cycles

a. Data Source: Project reports include examples of how real-time data is used for rapid-cycle improvement to guide continuous quality improvement (i.e. how the project continuously uses data such as weekly run charts or monthly dashboards to drive improvement)

Milestone 7 Estimated Incentive Payment: $1,762,829.50

**Milestone 8**

P-8. Evaluate and continuously improve crisis services

P-8.1. Project planning and implementation documentation demonstrates either plan, do, study, act or Lean quality improvement cycles

Goal: conduct 2 quality improvement cycles

a. Data Source: Project reports include examples of how real-time data is used for rapid-cycle improvement to guide continuous quality improvement (i.e. how the project continuously uses data such as weekly run charts or monthly dashboards to drive improvement)

Milestone 8 Estimated Incentive Payment: $1,414,021.67
### Goal: Hire and train the appropriate number of staff consistent with a staffing plan like that listed above.
- **a. Staff rosters and training records**
- **b. Data Source: Training curricula**

**Milestone 4**
Estimated Incentive Payment: $1,414,021.67

### Milestone 5
**P-5.** Milestone: Develop administration of operational protocols and clinical guidelines for crisis services.
- **P-5.1. Metric: Completion of policies and procedures.**
  - Goal: Complete policies and procedures for crisis services.
  - **a. Data Source: Internal policy and procedures documents and operations manual.**

**Milestone 5 Estimated Incentive Payment:** $1,414,021.67

### Milestone 6
- **Estimated Incentive Payment:** $2,210,047.50

### Milestone 7
**I-12.** Utilization of appropriate crisis alternatives
- **I-12.1. Metric: increase in utilization of appropriate crisis alternative (PES).**
  - Baseline: 0 visits
  - Goal: 2500 to PES in DY 4
- **c. Data source:** Claims, encounter, and clinical record data.
- **d. Rationale:** see project goals.

**Milestone 7 Estimated Incentive Payment:** $2,210,047.50

### Milestone 8
**Estimated Incentive Payment:** $1,865,361

### Milestone 9
**I-12.** Milestone: Utilization of appropriate crisis alternatives
- **I-12.1. Metric: increase in utilization of appropriate crisis alternative (PES).**
  - Baseline: 0 visits
  - Goal: 3750 visits to PES in DY 5
- **c. Data source:** Claims, encounter, and clinical record data.
- **d. Rationale:** see project goals.

**Milestone 9 Estimated Incentive Payment:** $1,865,361

### Project Summary:

**Provider Description:** University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access to primary, specialty and preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County.

**Intervention(s):** Creation of a crisis intervention unit that can provide care in a safe environment for those patients who do not require acute care admissions. By providing them with case management service in the least restrictive environment acute inpatient beds are preserved for more appropriate admissions. This will increase emergency room throughput for medical as well as mental health patients. By expanding access and providing clinical consultation, patients will be evaluated and dispositioned in a timely manner.

**Need for the project:** A gap analysis conducted in 2011 by a joint task force between University Health System (UHS), Methodist Healthcare Ministries (MHM), The Center for Health Care Services (CHCS), The University of Texas Health Science Center at San Antonio Department of Psychiatry and Methodist HealthCare System of San Antonio (MHS) identified gaps in the current crisis system & community that are resulting in emergency rooms being inundated with psychiatric patients. In 2011, University Hospital’s Psychiatric Emergency Services evaluated 3,127 patients, and of those, 1,332 (42.6%) were released home. As indicated in the RHP 6 Community Needs Assessment this project meets the regional goal to increase access to outpatient care for adults with moderate acuity behavioral health needs in order to mitigate readmissions for acute care services and the inappropriate use of emergency departments.

**Target population:** Per the 2009 Hinchman study, 3346 indigent inpatients with psychiatric diagnoses were treated in the community for that calendar year. UHS anticipates diverting 25% of those from inpatient stays through this project.

**Category 1 or 2 expected patient benefits:** This project will assure that the right care is being provided in the right setting (OD-9.3.1) and will serve patients through:

- Offering crisis stabilization services outside of the ED and inpatient settings

We intend to positively impact the current year population equivalent of the 3,346 indigent populations present in the community during 2009 through offering a crisis intervention unit service that doesn’t exist in the community today. Through this service delivery vehicle, in concert with the community-based psychiatric emergency service, we intend to materially reduce visits to the traditional emergency department and then to materially reduce readmissions to the
hospital after inpatient admissions. We will quantify this opportunity in an updated estimate of CIU visits in the community.

Category 3 outcomes: 3.IT-3.8: Behavioral Health/Substance Abuse 30 day readmission rate

- DY 4: Reduction of readmission rate by TBD for the target population
- DY 5: Reduction of readmission rate by TBD for the target population

Project Description:

A gap analysis conducted in 2011 by a joint task force between University Health System (UHS), Methodist Healthcare Ministries (MHM), The Center for Health Care Services (CHCS), The University of Texas Health Science Center at San Antonio Department of Psychiatry (UTHSCSA) and Methodist HealthCare System of San Antonio (MHS) identified gaps in our current mental health crisis stabilization system which result in hospital emergency rooms being inundated with psychiatric patients. The primary gaps identified included the lack of adequate outpatient services, the lack of adequate numbers of psychiatrists providing psychiatric inpatient care, and insufficient inpatient beds for the community (both in community hospitals and state hospitals). The recommendations made were for developing a unit to provide crisis stabilization, expansion of outpatient services, creation of an intensive outpatient treatment program, and creation of a discharge clinic. This project addresses one of these areas (crisis stabilization). In 2011, University Hospital’s Psychiatric Emergency Services evaluated 3,127 patients, and of those, 1,332 (42.6%) were released home. This latter group represents patients who might have been more appropriately evaluated in an alternative setting to the emergency room. Other communities have created units providing crisis stabilization for those patients who do not require the more expensive and less desirable setting of an emergency room or inpatient hospital admission for resolving crises. In addition, moving patients out of the hospital-based emergency room setting when such level of care is not needed diminishes overcrowding and provides more timely evaluation of those who DO require a hospital-based level of care.

This project is designed to address the needs of adult (>18 years of age) psychiatric patients in Bexar County emergency departments by expanding access to alternative behavioral health treatment settings. This project will assure that the right care is being provided in the right setting (OD-9.3.1) and includes the following components:

- Increase access to an underserved patient population by hiring additional psychiatrists, psychiatric nurse practitioners and other support staff to provide evaluations emergently with subsequent short term stabilization
- Treat both voluntary and involuntary patients in the safest and most appropriate setting by creating a Crisis Intervention Unit (CIU)

Anticipated challenges include recruitment of psychiatrists and mid-level psychiatric practitioners and financial sustainability. From a financial perspective this project addresses the underserved needs of indigent behavioral health patients in the San Antonio community. The lack of treatment resources for the indigent mental health patient is a community problem and the burden of providing care should not be the responsibility of any one health system. Developing funding streams which distribute the financial burden among other healthcare
systems in the San Antonio are essential to maintaining this service in the future.

Another challenge is the ability to recruit psychiatrists to our community since that specialty is under-represented already. Thus we anticipate using a staff model of some employed psychiatrists and mid-level providers, supplemented by contracted hourly providers, and contracted providers available through telemedicine.

As indicated in the RHP 6 Community Needs Assessment this project meets the regional goal to increase access to outpatient care for adults with moderate acuity behavioral health needs in order to mitigate readmissions for acute care services and the inappropriate use of emergency departments.

By the end of DY5, an increase in crisis stabilization services will be provided to patients currently not receiving such services. There is currently no crisis stabilization service in Bexar County for indigent patients.

**Starting Point/Baseline:**

A baseline does not exist for this project as a crisis intervention unit for indigent patients does not exist in the community today.

We anticipate that once the Crisis Intervention Unit is opened and community education to EMS, healthcare systems, and law enforcement is completed, the volume of services will increase fairly quickly. We plan to compile baseline demographic data for the first six months in reporting systems to be built with the development of this new service. Data collected should include the following:

- Number of patient visits
- Number of unduplicated patients evaluated
- Number of unduplicated patients admitted to University Hospital’s inpatient psychiatry unit
- Number of patients re-admitted within 30 days of discharge from University’s inpatient psychiatry unit to any University Hospital inpatient unit
- Identification of frequent utilizers of inpatient services who have primary or secondary behavioral health diagnoses
- Payer mix
- Length of stay
- Average daily census
- Disposition at release
- Quality indicators

**Rationale:**

The Mental Health Care Services Project conducted by Methodist Healthcare Ministries in July, 2010 identified a psychiatric shortage in San Antonio. Based on projected population growth and the national ratio of 13.9 psychiatrist/100,000 population, San Antonio currently needs 49 additional psychiatrists. In addition, psychiatrists are trending toward working in outpatient settings rather than in hospital inpatient units. Given both of these factors, local health systems have challenges providing 24/7 acute stabilization services. Development of a Crisis Intervention Unit accessible to the community, would allow for more efficient use of psychiatrists and psychiatric nurse practitioners.
In 2011, University Hospital had 987 total admissions (unduplicated) to the inpatient psychiatric unit. Of those, 172 (unduplicated) were readmitted to any service within 30 days (17%). By creating an alternative to inpatient admission for those appropriate but needing crisis intervention beyond the evaluation and stabilization provided within an emergency room, the inpatient readmission rate should decrease psychiatric services outside of the hospital will facilitate care for psychiatric patients in the most appropriate treatment setting.

This project model is based on adding to and expanding existing mental health resources and not in lieu of existing mental health services and programs in our community. Less than 33% of the state’s 48,700 practicing physicians accept Medicaid patients. That, along with the mental health provider shortage, leads to increasing the inappropriate use of emergency rooms and criminal justice systems. (RHP pg. 14)

This project is responsive to Community Need #4 (CN4) – Address the shortage of high quality integrated mental and behavioral health services in the community.

This is a new initiative for our Health System as the service doesn’t exist now.

The following core components will be addressed:

a) Convene community stakeholders who can support the development of crisis stabilization services to conduct a gap analysis of the current community crisis system and develop a specific action plan that identifies specific crisis stabilization services to address identified gaps (e.g., one community with high rates of incarceration and/or ED visits for intoxicated patients may need a sobering unit while another community with high rates of hospitalizations for mild exacerbations mental illness that could be treated in community setting may need crisis residential programs).

b) Analyze the current system of crisis stabilization services available in the community including capacity of each service, current utilization patterns, eligibility criteria and discharge criteria for each service.

c) Assess the behavioral health needs of patients currently receiving crisis services in the jails, EDs, or psychiatric hospitals. Determine the types and volume of services needed to resolve crises in community-based settings. Then conduct a gap analysis that will result in a data-driven plan to develop specific community-based crisis stabilization alternatives that will meet the behavioral health needs of the patients (e.g., a minor emergency stabilization site for first responders to utilize as an alternative to costly and time consuming Emergency Department settings)

d) Explore potential crisis alternative service models and determine acceptable and feasible models for implementation.

e) Review the intervention(s) impact on access to and quality of behavioral health crisis stabilization services and identify “lessons learned,” opportunities to scale all or part of the intervention(s) to a broader patient population, and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations.
**Related Category 3 Outcome Measure(s):**

**IT-3.8 Behavioral Health/Substance Abuse 30 day readmission rate**

a. Numerator: The number of readmissions, for patients 18 years and older, for any cause, within 30 days of discharge from the index behavioral health and substance abuse admissions is indicated as either the primary or secondary diagnosis. If an index admission has more than 1 readmission, only the first is counted as a readmission.

b. Denominator: The number of admissions, for patients 18 years and older, for patients discharged from the hospital with a principal or secondary diagnosis of behavioral health and substance abuse and with a complete claims history for the 12 months prior to admission.

According to a 2009 American Hospital Association report approximately 18% of Medicare patients are readmitted within 30 days costing the Medicare program approximately $15 billion a year. Legislators and regulators at all levels of government are exploring options for increasing quality and reducing health care costs. While not all readmissions are avoidable, understanding what is causing them and the development of strategies to reduce them should be implemented.

A literature review of high utilizers of emergency room services for behavioral health related issues indicates that frequent users typically have clinical conditions such as alcohol or drug use. In addition, significant social barriers such as housing, lack of health insurance, poor social support and lack of transportation have been identified. One of the components of this project is the creation of a Crisis Intervention Unit that can provide care in a safe environment for those patients who do not require acute care admissions. By providing these services in the least restrictive environment acute inpatient beds are preserved for more appropriate admissions.

**Relationship to other Projects:**

The four projects for RHP 6 that relate to this project applying to the same population and geography are:

- 136141205.2.1 2.12.1 Develop, implement, and evaluate standardized clinical protocols and evidence-based care delivery model to improve care transitions. (University Health System)
- 136141205.1.5 1.9.2 Expand access to specialty care (outpatient psychiatry) to provide follow-up after hospitalization. This same program could provide follow up after discharge from a Crisis Intervention Unit and collaborate with the Intensive Outpatient Program for continuity of care. (University Health System)
- 137251808.1.3 1.13.1 Develop and implement crisis stabilization services to address the identified gaps in the current community crisis system through establishment of crisis transitional residential options (32 beds), for adults. Crisis residential services are typically for voluntary patients who are not a danger to self/others and could provide a broader continuum of step-down care for the target population. (Center for Health Care Services)
- 085144601.1.6 1.14.2 Expand specialty care capacity through the Sustained Treatment as
an Outpatient Priority (STOP) Program. Establishes a clinical training program for the
treatment of Substance Use Disorders and targets behavioral health/substance abuse 30
day readmission rate. This program could provide substance abuse treatment for the
target population. (University of Texas Health Science Center)

1.13.2 Development of Psychiatric Emergency Services (University Health System).

**Identifying Project and Provider Information:**

| Title: 1.8.6 Increase and expand oral health services |
| Unique RHP ID#: 136141205.1.11 – PASS 3 |
| Performing Provider: University Hospital |
| Performing Provider TPI: 136141205 |

**Project Summary:**

**Provider Description:** University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access to primary, specialty and preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County.

**Intervention(s):** Establish an affiliated/integrated dental health services program that incorporates patient navigation within the medical home model of care by partnering with Federally Qualified Health Centers. These efforts will result in timely, accessible, integrated, and patient-centered preventive dental health care services for economically underserved populations with diabetes residing in Bexar County, Texas.

**Need for the project:** Oral diseases ranging from dental caries (cavities) to oral cancers cause pain and disability for millions of Americans (Healthy People 2020). Studies link oral health, particularly periodontal (gum) disease, to several chronic diseases that include diabetes and heart disease. Such conditions may be prevented in part with regular preventive visits to the dentist. Economically vulnerable populations that include minority adults, persons with a chronic disease are also significantly less likely to have access to oral health care compared to their non-poor and non-minority peers. For example, a recent survey conducted on leading oral health indicators found that less than half (44.5%) of eligible individuals have had a dental visit within the past 12 months. (Medical Expenditure Panel Survey, Agency for Healthcare Research and Quality, 2007).

In Bexar County, Texas, 22% of the 1.7 million residents live at or below the poverty level ($22,557), 17% receive no medical care due to cost, and 21% have no form of health insurance coverage. Recent health assessments of the population find that residents with less than a high school education and an annual household income of less than $15,000 are significantly less likely to rate their oral health status as good to excellent (25% and 20%, respectively). In addition, Hispanics and African-Americans and individuals living in the Southeast and Southern regions of the county were less likely to rate their oral health status good to excellent or report having adequate dental health coverage (Bexar County Health Collaborative, 2010).

**Target population:** Our target population will be Carelink enrollees diagnosed with diabetes that seek services at UHS including patient centered medical homes and or who receive services at our FQHC partner sites.

**Category 1 or 2 expected patient benefits:** This project seeks to provide the following components:
- Reduce/close disparities in access to preventive dental health services in underserved populations
- Increase awareness among the target population on the importance of oral health to overall health and well-being

**Category 3 outcomes:** IT-7.8 Chronic Disease Patients Accessing Dental Services: Percentage of patients with chronic disease conditions accessing dental services (*Standalone measure*)

- DY4: Improvement Target: Increase in chronic disease patients who access dental health services TBD% from baseline
- DY5: Improvement Target: Increase in chronic disease patients who access dental health services TBD% from baseline

**Project Description:**

In the United States, safety-net hospitals remain essential to providing access to health services for over 50 million uninsured Americans as well as other underserved populations. The passage of the Affordable Care Act in 2010 marked an important legislative commitment to addressing rising health care costs and improving access to quality healthcare for all Americans. To ensure implementation of healthcare reform, safety-net hospitals will remain critical to responding to the mandate of providing preventive health care services to economically vulnerable populations within a model of healthcare delivery that is accessible, integrated, and patient-centered.

University Health System (UHS) proposes to partner with local safety net providers that include Federally Qualified Health Centers (FQHCs) to establish timely, accessible, integrated, and patient-centered preventive dental health care services for economically vulnerable populations residing in Bexar County, Texas.

This project will increase and expand access to preventive oral health care within the UHS medical home model of care by collaborating with FQHCs alongside patient navigation to ensure that patients adhere to their recommended dental treatment plan.

This collaboration will result in the establishment of dental health services at the Texas Diabetes Institute, which is one the nation's largest and most comprehensive centers, entirely dedicated to diabetes prevention, treatment, education and research.

In an effort to strengthen delivery of patient-centered care for persons with diabetes, delivery of preventive dental health services will be made possible by having a patient navigator work closely with board-certified endocrinologists and or their primary care provider and related diabetes specialists to ensure timely receipt of this service. These services will compliment in what is considered to be a firmly robust clinical treatment and prevention model of diabetes care that includes: family physicians, endocrinologists, renal specialists, orthopaedists, ophthalmologists, dermatologists, podiatrists, and wound care specialists.

Expansion of preventive dental health services will also occur through development of an additional two (2) sites at FQHC partner locations. A patient navigation model will also be incorporated within this preventive dental health care delivery design to ensure that patients adhere to receive care in a timely manner.
The primary patient population includes individuals diagnosed with diabetes and enrolled in CareLink; a financial assistance program for uninsured residents of Bexar County. The program was created in 1997 to help address the needs of Bexar County residents without health care coverage who were not eligible for Medicaid or other public or private funding. While CareLink is not an insurance product per se, it has many similar advantages in terms of promoting access to preventive health services, encouraging a long lasting relationship with a primary care provider, and instilling a sense of shared responsibility between member and staff for the member’s health. As of December 31, 2011, there were 54,256 members enrolled in CareLink.

Community Medicine Associates (the UHS owned provider group) is the primary care access point for University Health System patients, and there is currently a need for establishing clinical linkages that reduce disparities in oral health care by expanding dental health services infrastructure that currently reside within partner safety net providers (FQHCs). This will primarily occur by establishing a memorandum of understanding (MOU) to expand timely access to preventive dental health services and establish a dental health service referral process.

**Goals and Relationship to Regional Goals**

Project goals are to strengthen the health care infrastructure of the region by enhancing access to preventative oral health services and thereby addressing the regional goals of reducing gaps in access to care. Further, project goals will strongly coincide with regional goals as followed: improve health care infrastructure to better serve both Medicaid and uninsured residents of RHP 6, reduce healthcare disparities, further develop and maintain a coordinated care delivery system, and improve outcomes while containing cost growth.

**Specific Project Goals:**

- Reduce/close disparities in access to preventive dental health services in underserved populations with diabetes
- Increase awareness among the target population on the importance and relationship of oral health to overall health and well-being

**Challenges**

Challenges to this project will be the integration and coordination of preventive oral health services between University Health System and partner safety net providers (FQHCs) to (1) ensure timely receipt of care by patients, (2) ensure appropriate infrastructure (electronic medical record systems), (3) the coordination and capacity (providers, hours of operation and clinical space) to appropriately accommodate increased volume from newly established referral pathways, including CareLink. In an effort to proactively address these challenges strategic planning and assessment will be undertaken that includes meeting with key stakeholders to ensure that a balance is maintained between resources, capacity and projected demand. This is considered essential to providing care at the right time and in the right setting.

**5-Year Expected Outcome for Provider and Patient**

University Health System expects to see improvements in clinical linkages (integration and coordination of health services), well established referral pathways (primary care to dental provider) and an established infrastructure delivery of oral health services between UHS, FQHCs and the target population. The anticipated 5 year goal is to increase the proportion of
economically vulnerable individuals with diabetes that access quality dental health services following a referral from a primary care/medical provider.

### Starting Point/Baseline:
Currently, an affiliated/integrated dental health services program with partner FQHCs does not exist for patients at University Health System. Therefore, the baseline for number of participants as well as the number of participating dental providers ending on September 30, 2013 is zero (0).

### Rationale:
The National Institute of Medicine’s Committee on Access to Oral Health Services finds that almost half of all Americans do not visit a dentist each year and nearly one-third lack access to basic preventive and primary oral health care services. Published studies on disparities in access to oral health care also find that individuals who are least likely to access preventive oral health care are more likely to have higher rates of oral disease. In particular, economically vulnerable populations, including minority children, are significantly less likely to have access to oral health care compared to their more affluent and non-minority peers. Disparities in access to preventive and primary oral health care are primarily associated with factors such as education level, income, race and ethnicity, the high costs of care, and the uneven geographic distribution of dental providers (Committee on Oral Health Access to Services; Institute of Medicine and National Research Council, July 2011; Healthy People 2020).

The Patient Protection and Affordable Care Act (ACA) aims to expand delivery of preventive care to large segments of the population through expansion of healthcare coverage and cost-reduction measures that will make access to preventive oral health more accessible and affordable. Expansion of preventive care through ACA also coincides with national oral health goals for Americans that include: increasing awareness of the importance of oral health to overall health and well-being, increasing acceptance and adoption of effective preventive interventions, and reducing disparities in access to effective preventive and dental health services (Healthy People 2020).

In Bexar County, Texas, 22% of the 1.7 million residents live at or below the poverty level ($22,557), 17% receive no medical care due to cost, and 21% have no form of health insurance coverage. Recent health assessments of the population find that residents with less than a high school education and an annual household income of less than $15,000 are significantly less likely to rate their oral health status as good to excellent (25% and 20%, respectively). In addition, Hispanics and African-Americans and individuals living in the Southeast and Southern regions of the county were less likely to rate their oral health status good to excellent or report having adequate dental health coverage (Bexar County Health Collaborative, 2010).

Demand in access to timely preventive and primary oral health care in the population will be driven by demographic changes with respect to race/ethnicity, educational attainment, and age. The Bexar County population is relatively young (median age of 32 years) in comparison to the national average (median age of 37 years) and is considered a minority-majority county; 59% of county residents are Hispanic, of which 80% are of Mexican descent. It is projected that the Hispanic population in this area will grow by 45% by the year 2040 (Office of the State...
This project directly addresses:

**CN. 1 – Improve quality of healthcare delivery and patient experience**

**CN.3 – Address the lack of medical and dental health services in the community due to lack of health insurance and provider shortages**

The current health service infrastructure does not fully allow for timely access to preventive oral health services. This newly proposed initiative will invest in the expansion and enhancement of infrastructure to provide quality preventive oral health care access to the underserved of Bexar county. Proposed efforts are considered a new health system initiative that will seek to leverage existing resources with FQHCs partners to increase, expand, and enhance clinical capacity that reduce gaps in access to dental health services and help to improve the health status of residents of Bexar County, Texas.

Continuous quality improvement strategies will include assessing our clinical workflow to reduce wait times, assure timely scheduling of appointments, provide data systems to support population health management, establish effective navigation coordination, and support patient self-care, development, and accountability, and develop performance reporting and improvement plans using LEAN concepts to identify and reduce waste.

**Related Category 3 Outcome Measure(s):**

**IT-7.8 Chronic Disease Patients Accessing Dental Services: Percentage of patients with chronic disease conditions accessing dental services (Standalone measure)**

- **a)** Numerator: Number of chronic disease patients who access dental services
- **b)** Denominator: Total number of referrals for dental services for chronic disease patients by a health provider
- **c)** Data Source: EHR, Claims
- **d)** Rationale/Evidence: National studies on disparities in receipt of oral health services find that almost half of all Americans do not visit a dentist each year and nearly one-third lack access to basic preventive and primary oral health care services. Published studies on disparities in access to oral health care also find that individuals who are least likely to access preventive oral health care are more likely to have higher rates of oral disease. In particular, economically vulnerable populations that include minority adults and children are significantly less likely to have access to oral health care compared to their non-poor and non-minority peers. Studies on adherence to preventive oral health services find that patients are more likely to seek dental services when the importance of need is documented by a formal referral being made.

**Relationship to other Projects:**

No other projects proposed by University Health System currently.

**Relationship to Other Performing Providers’ Projects in the RHP:**

This Project is Related to the Following Other Performing Providers’ Projects:
085144601.1.12 – Increase, Expand, and Enhance Dental Services (UTHSCSA): Establish an emergency dental clinic for treating patients presenting with urgent dental conditions, including oral infections, abscesses, pain and fractured dental restorations.

0913089-02.1.1 – San Antonio Metropolitan Health District: Expand Community-Based prevention programs that provide access to early diagnosis, fluoride varnish and dental sealants to serve additional children with unmet dental needs.

**Plan for Learning Collaborative:**

This project fully lends itself to participation in an RHP-wide learning collaborative with other Performing Providers in RHP6 to develop or enhance preventive oral health/dental health services in other parts of the region for similar patient populations. Processes and techniques developed and implemented during this project will be documented by the project team. Successes as well as lessons learned will be shared with regional collaborators who are also working to improve dental care access.

**Project Valuation:**

Project valuation for enhancing access to preventative oral health/dental health services directly responds to waiver goals including the triple aim and improving the health delivery infrastructure to better serve the Medicaid and uninsured residents of the community and region. This includes providing care in the right setting at the right time and enhancing the ability to prevent and/or treat disease earlier in the course of illness, both of which may contribute to avoidance of unnecessary admissions.

The project also addresses community need by responding to gaps in delivery of basic medical and dental services due a high percentage of the population being uninsured and limited access to providers.

Additionally, pertaining to oral health, studies have found that certain chronic diseases, such as cardiovascular disease, diabetes, obesity and stroke, are associated with dental disease after controlling for common risk factors (Griffin et al., 2009). Therefore, providing timely access to vulnerable/undeserved populations in a coordinated and integrated method can improve health status, experience, and overall quality of care delivered.

The project is considered large in scope as it looks to increase outreach to the targeted population and thereby increase the number of patients who receive needed preventive oral health care, thus reducing cost and avoidable hospitalizations.

Relative to other projects, the proposed efforts are large in scale and will require investment in human resources, technology, and organizational priorities that strengthen the opportunity to deliver integrated and accessible care to the target population.

### Identifying Project and Provider Information:

- **Title:** 1.2.2 - Increase the number of primary care providers and other clinicians/staff: Improving Rural Access to Primary Care  
- **Unique RHP ID#:** 121782003.1.1 – PASS 1  
- **Provider Name:** Uvalde County Hospital Authority, DBA Uvalde Memorial Hospital (UMH)  
- **TPI:** 121782003

### Project Summary:

- **Provider Description:** Uvalde Memorial Hospital is a 66-bed sole community hospital located in Uvalde, TX serving approximately 47,000 individuals residing within 5 counties (7,000 square mile area).

- **Intervention(s):** This project will increase primary care capacity while decreasing potentially preventable readmissions by recruiting new primary care physicians and by training community health workers.

- **Need for the project:** Currently there only 9 primary care physicians serving our 5 county service region. 32% of residents within these counties are uninsured. Our current primary care provider shortage combined with our high percentage of uninsured has caused our ED volume to steadily increase. This problem is exacerbated by 30 day readmissions and ED “frequent flyers”.

- **Target population:** The target population includes: ED patients with non-emergent conditions, patients discharged with a high risk for readmission, patients without a primary care provider, and patients in need of enhanced follow-up post discharge. Our hospital operates with a Medicaid inpatient utilization rate higher than 50% and a low income utilization rate also higher than 50%.

- **Category 1 or 2 expected patient benefits:** The project seeks to recruit at least 4 new primary care providers to our service region. At the end of DY 4, the combined patient panels of primary care providers recruited in DY 2, 3 and 4 is expected to at least total 2,600 patients. This should result in between 5,200 and 7,800 combined patient visits. With the conclusion of DY 5, the combined patient panels of new primary care providers is expected to at least total 4,600 patients. This should result in between 9,200 and 13,800 combined patient visits. Also, the project aims to train 8 new community health workers (CHWs) by the end of DY 5. In DY 4 and DY 5, CHWs trained and selected for employment at UMH will ensure that 100 (DY 4) and 150 (DY 5) additional patients receive care under the Chronic Care Model for targeted chronic diseases or for MCC. The will achieve this by working alongside and communicating with RNs, case managers and physicians. These CHWs will enhance the continuum of care while assisting primary care providers and case managers to reduce preventable readmissions and ED visits for target conditions.

- **Category 3 outcomes:** IT-9.2 Our goal is to reduce ED visits for target conditions (CHF, Diabetes, Cardiovascular Disease/Hypertension, and Chronic Obstructive Pulmonary Disease). Percent reduction TBD in DY 3.  
  IT-3.1 Our goal is to reduce the all cause 30-day readmission rate. Percent reduction TBD in DY 3.
Project Description:

Uvalde Memorial Hospital proposes to improve access to primary care within our rural service region through expanding capacity and a community health worker training program.

The need for additional primary care providers, who serve our low income border county population (70% Hispanic), has never been more pressing. Most, if not all of the local PCPs within our 5 county service region, are not accepting new patients. This has resulted in a high volume of patients who rely on the UMH emergency department for primary care. A high volume of patients with non-emergent conditions strains Emergency Department (ED) staff and physicians whose primary role is caring for acute, emergency conditions. In addition, many patients without a primary care physician delay treatment until their health has deteriorated substantially.

When the appropriate level of care is matched to the appropriate setting, high quality health care is more likely to occur. An emergency room is not the appropriate setting within which to treat patients in need of primary care. Improving rural access to primary care will alleviate this burden placed on ED staff and physicians while reducing cost to the patient, the payer and the hospital. Most importantly, it will result in a higher quality of care for patients. UMH will improve rural access to primary care in our service area by combining two approaches.

First, UMH will conduct a primary care gap analysis to determine workforce shortage areas. UMH will expand local primary care capacity by recruiting at least 4 new primary care physicians (1 per year) and/or 4 new mid-level providers (1 per year) within the identified shortage area(s).

Next, UMH will begin and expand primary care training for case managers and community health workers. In DY 2, UMH will establish a community health worker (CHW) training program. At least 3 CHWs will complete the program by the end of DY 3. This program will involve training in the Chronic Care Model. In DY 3 UMH will conduct a pilot test of the case management/community health worker program within Uvalde. This pilot test will include CHW involvement in quality improvement projects. The CHW training program will grow in class size from DY 3 – DY 5. CHW training program assessment scores and satisfaction scores will also be tracked and improved upon in DY 4 and DY 5.

Goals and Relationship to Regional Goals:

The goal of this project is to use community health workers (CHWs), case managers and primary care physicians/mid-levels to improve access to and utilization of primary care. CHWs will be supervised by case managers and will focus on enhanced care coordination and culturally competent care to high-risk patients.

Project Goals:

- A reduced number of patients who utilize the ED for primary care
- Patients with chronic disease(s) who are well educated with respect to managing their condition(s) and health appropriately
- A substantial decrease in the rate of potentially preventable re-admissions
- Greater access to and utilization of local primary care providers

This project meets the following regional goals:

- Work together to make significant progress towards the Triple Aim goals of assuring patients receive high-quality and patient-centered care, in the most effective ways.
- Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our region.
- Further develop and maintain a coordinated care delivery system.
- Improve outcomes while containing cost growth.

The project achieves an improved infrastructure for Medicaid and uninsured residents through its primary care capacity expansion in workforce shortage areas. The project develops and maintains a coordinated care delivery system through its CHW training program. The project improves outcomes while containing cost growth through reducing ED admissions for target conditions and reducing all-cause 30 day readmissions.

**Challenges:**

A major challenge this project will face will be recruiting primary care physicians and/or mid-levels to an extensively rural service area. However with appropriate incentives and recruiting strategies, UMH believes can overcome this challenge. Additional challenges will be establishing trust between patients and CHWs; and establishing trust between primary care physicians and CHWs. Through proper communication and education regarding the intent of the program, UMH will overcome this challenge.

**5-Year Expected Outcome for Provider and Patients:**

UMH plans to see improvements in 30 day readmission rates, ED admissions and in the overall continuum of care. The service region and population will see much greater access to primary care with a focus on management of chronic conditions through CHW and primary care provider communication. The population will also be more educated on managing their health appropriately through the use of CHWs in the community.

**Starting Point/Baseline:**

Baseline for primary care capacity expansion will be established by the primary care gap analysis conducted in DY 2. Currently there are 9 primary care physicians serving patient within the UMH 5 county service region. This baseline will shift every year, based on the accomplishments achieved in the prior year. Baseline for the community health worker training program will be established in DY 2 when the program begins.

**Rationale:**

The executive committee of UMH, as well as its governing board, took time to identify needs of our rural population and create various projects addressing these needs. “Improving Rural Access to Primary Care” was chosen out these projects. It was determined to be the most likely to have the greatest impact on the health of our population. This project fit within the project option area 1.2.2 because it not only mentions increasing the number of primary care providers but it also specifically mentions increasing the number of community health workers/promotoras, an important piece of our project.

The CHWs trained throughout the project will have close ties to the community. These CHWs will be bi-lingual and possess cultural skills needed to connect with patients in our underserved, low-income community. CHWs will be:

- Compassionate, sensitive, and culturally attuned to the people and community
- Knowledgeable about the environment and healthcare system
- Connected with critical decision makers inside the system

The primary functions of CHWs employed by the hospital, after completing the training program, will be to educate and motivate patients to: follow their discharge instructions, take their medications consistently and attend their appointments with physicians. They may also assist patients overcome common rural barriers such as: transportation, lack of insurance, and lack of health knowledge/literacy. Under the supervision of the case manager, the CHWs will
perform these functions in a non-threatening, simple manner that wins their trust. These CHWs will be assigned to high-risk patients and ED “frequent flyers” to reduce 30 day PPRs and ED admissions for target conditions (see Cat. 3 selected outcomes). However, these goals would be unrealistic if primary care capacity was not being expanded throughout the project. Improvement milestone (I-X) was created and inserted into the project to provide needed access to primary care for rural patients. Currently, the primary care capacity shortage in our community makes efforts to shift care from an acute care mentality to prevention/chronic disease management mentality extremely difficult, if not impossible. An increased capacity combined with a line of communication between CHWs, case managers and primary care physicians/mid-levels will reduce ED admissions and 30 day readmissions. This project will give us the resources and training to make this shift in focus to prevention and chronic disease management feasible and realistic.

Unique community need identification numbers the project addresses:
- CN.1 – Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.
- CN.2 – A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patient with chronic conditions. Leading causes of death in RHP 6 include cardiovascular disease, cancer and diabetes.
- CN.3 – Many residents in RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
Currently UMH does not have a case management or a community health worker training program. Also, most if not all local primary care physicians are not accepting new patients. This has created a high demand by patients for primary care services. This project will reduce patients’ reliance on the UMH emergency room for primary care. It will also lower potentially preventable re-admissions. As there is not currently a case management program, a baseline for all cause potentially preventable re-admissions will be established in DY 2.

Related Category 3 Outcome Measure(s):

| OD-3: Potentially Preventable Re-Admissions – 30 day Readmission Rates (PPRs) |
| IT-3.1 All cause 30 day readmission rate- NQF 1789 (stand-alone) |
| • Cohort (1): admissions to acute care facilities for patients aged 65 years or older |
| OD-9: Right Care, Right Setting |
| IT-9.2 ED appropriate utilization (stand-alone) |
| • Rate: ED admissions for target conditions (Congestive Heart Failure-CHF, Diabetes, Cardiovascular Disease/Hypertension, Chronic Obstructive Pulmonary Disease-COPD) |

Reasons/rationale for selecting the outcome measures:
These outcome domains with their associated improvement targets were chosen after considering the outcomes most likely to be impacted the most by the project. These outcomes are also a priority for RHP 6 because they directly related to CN.1, CN.2 and CN.3 in the RHP community needs assessment.

An example given in a review of literature of CHW success was found at CHRISTUS Spohn Health System in Corpus Christi, TX. As a result of their CHW pilot study, CHRISTUS
estimated a $56,000 savings to the hospital per ED assigned a CHW per year. While the UMH program “Improving Rural Access to Primary Care” has substantial differences, we anticipate a similar or greater impact on ED usage and costs.

Our program will reduce PPRs through case management that utilizes CHWs with an open line of communication with PCPs. Increasing the number of PCPs alongside this case management/CHW program is vital as there is a severe shortage of PCPs in the region currently. All 5 counties within the UMH service area are currently designated as primary health care professional shortage areas (HPSAs). This project will lower patient cost of care (important for a low-income population) through reducing re-admission rates and educate patients on the benefit of primary care over emergency department care. CHWs will help patients overcome common local barriers to primary care: transportation, insurance coverage, income, culture and education.

Relationship to other Projects:

This project is related to other primary care capacity and primary care training projects [1.1, 1.2]. It focuses on expanding primary care capacity while training community health workers and case managers. This project will “improve the health care infrastructure to better serve the Medicaid and uninsured residents of our region” while “improving outcomes and containing cost growth” both of which are RHP 6 goals. Examples of projects of other providers that are related: University Hospital 136141205.1.2, UTHSCSA [TPI].1.2

Related Category 4 Population-focused measures.

RD-2: 30-day readmissions
RD 4: Patient-centered Healthcare
RD 5: Emergency Department

Relationship to Other Performing Providers’ Projects in the RHP:

University Hospital, PA: 1.2
Uvalde Memorial Hospital, PA:1.2
UTHSCSA, PA: 1.2
Medina Regional Hospital, PA: 1.1
Frio Regional Hospital, PA: 1.1
Val Verde Regional Medical Center, PA: 1.1

Plan for Learning Collaborative:

UMH plans to participate in an RHP-wide learning collaborative with other providers with similar projects. RHP 6 is committed to transforming health care in our region and throughout the state. Given the large number and value of projects proposed for our region, University Health System, as the RHP 6 anchor, will promote and facilitate learning collaboratives.

UMH plans to be a significant part of a learning collaborative with other performing providers with similar projects, as outlined above by the RHP 6 anchor, University Health System. This may include a quarterly newsletter distributed the other providers concerning progress towards goals and lessons learned. Meeting semi-annually or more regularly is also being considered.

Project Valuation:

Out of all potential DSRIP projects considered, UMH has chosen “Increase the number of primary care providers and other clinicians/staff: Improving Rural Access to Primary Care”. This project received a score of 5 on a scale of 1-5 in all categories used to assess project value to the RHP and to our community. Categories included in the valuation process included: project scope, achieves waiver goals, and addresses community needs and project investment. UMH also assessed projects based on cost avoidance to the payer, in addition to valuing potential projects
based on these 4 areas. “Improving Rural Access to Primary Care” was high on the list of projects with the most costs avoided. A more detailed look at how UMH valued the project based on cost avoidance follows.

**Cost Avoidance - “Improving Rural Access to Primary Care”**:

Based on research conducted, it was estimated that 1 primary care provider covers 1,900 lives. From this number, it was estimated that for each primary care physician added, a corresponding 20 ER visits/month decrease would occur by DY 5. Also, a reduction in the amount Medical/Surgical department admissions of 10/month by DY 5 would occur for each PCP added. The average cost of an ER visit is $1,318 per visit. The average cost of a Med/Surg. department admission is $5,359. The total cost avoidance by the end of DY 5 using these figures is:

- **DY 2**: $643,080
- **DY 3**: $1,286,160
- **DY 4**: $1,929,240
- **DY 5**: $2,572,320

$6,430,800 + $1,611,992 (est. investment) = **8,042,792**

Est. investment = cost of primary care physician recruitment, case management/CHW program

This cost avoidance number, $6,430,800, is only cost avoided to the payer. It does not include costs avoided by the patient. Also, this amount does not include estimated costs to be saved as a direct or indirect result of the community health worker training program. Costs will be reduced further by decreasing potential preventable 30-day readmissions and ED utilization from this program. A valid estimate of the cost avoidance for this community health worker program has not been determined at this time. However, UMH anticipates this cost avoidance to be significant.

When the cost avoidance and the project investment are totaled the potential value of the project has a variance of $277,340 from the Total DSRIP funding allocated to Cat. 1.2 projects $8,320,096. This variance however will be more than accounted for when the cost avoidance of the case management/CHW program is accounted for. The cost avoidance figures above assume primary care capacity expansion will occur at a rate of 1 new physician per year. However, if capacity expansion occurs at rate greater than this, it would greatly increase the cost avoidance of the project.

**Milestone 1**

**[P-1]** Conduct a primary care gap analysis to determine workforce needs.

**Metric 1** [P-1.1]: Gap assessment of workforce shortages

Baseline: Currently there are 9 active primary care physicians, baseline for other documented gaps in primary care established through gap assessment. 0, or no CHW, case management or primary care provider training program currently exists.

**Goal:** Submission of completed assessment.

**Data Source:** Assessment results

**Milestone 4**

**[P-3]** Expand positive primary care exposure for residents/trainees

**Metric 1** [P-3.2]: Train trainees in the Chronic Care Model

Baseline: 0, There is not currently a Chronic Care Model training program for primary care trainees at UMH

**Goal:** Documentation of program

**Data Source:** Curriculum, rotation hours, and/or patient panels assigned to resident/trainee

**Milestone 4 Estimated Incentive Payment:** $739,952.67

**Milestone 7**

**[I-11]** Increase primary care training and/or rotations

**Metric** [I-11.1]: Increase the number of primary care residents and/or trainees as measured by percent change of class size over baseline. Trainees may include physicians, mid-level providers, and/or other clinicians/staff (e.g. health coaches, community health workers/promotoras).

Baseline: 3 primary care trainees, i.e. baseline established by DY 3 goal achievement.

**Goal:** A 100% increase in class size from DY 3 baseline, i.e. double class size from 3 to 6.

**Milestone 10**

**[I-11]** Increase primary care training and/or rotations

**Metric** [I-11.1]: Increase the number of primary care residents and/or trainees as measured by percent change of class size over baseline. Trainees may include physicians, mid-level providers, and/or other clinicians/staff (e.g. health coaches, community health workers/promotoras).

Baseline: 6 primary care trainees, i.e. baseline established by DY 4 goal achievement.

**Goal:** A 25% increase in class size from DY 4 baseline, i.e. increase class size from 6 to 8.

**Milestone 2**

[P-2] Expand primary care training for primary care providers, including physicians, physician assistants, nurse practitioners, registered nurses, certified midwives, case managers, pharmacists, dentists and others.

**Metric 1 [P-2.1]**: Expand the primary care residency, mid-level provider, and/or other clinician/staff (e.g., health coaches, community health workers/promotoras) training programs and/or rotations

**Baseline**: 0, There is not currently any primary care training programs at UMH.

**Goal**: Documentation of applications and agreements to expand training programs.

**Data Source**: Training program documentation

**Milestone 2 Estimated Incentive Payment**: $739,952.67

---

**Milestone 6**

**Goal**: A 300% increase in class size from DY 2 baseline, i.e. triple class size from 0 or 1 to 3.

**Data Source**: Documented enrollment by class by year by primary care training program

**Milestone 5 Estimated Incentive Payment**: $739,952.67

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $8,320,096**
Identifying Project and Provider Information:
Title: 1.1.1 Expand Primary Care Capacity – Val Verde County and Del Rio, Texas
Unique RHP ID#: 119877204.1.1 – PASS 1
Performing Provider: Val Verde Regional Medical Center
Performing Provider TPI: 119877204

Project Summary:

Provider Description: Val Verde Regional Medical Center is a 93-bed acute care county hospital located in the medically underserved border community of Del Rio, Texas. It is the only hospital serving Val Verde County. The county’s population is approximately 50,000 with the majority of those persons living in and around Del Rio.

Intervention(s): This project aims to expand primary care resources in this medically underserved community. The hospital has a clinic affiliated with it, and the scope of the project will be to add providers in an effort to expand access to care in Val Verde County.

Need for the project: A community needs assessment was performed, and the top priority identified was to bring more doctors to the community. There is a shortage of primary care physicians in both Del Rio and Val Verde County. The following actuarial data provided by HCAPS Community Needs Assessment Group earlier this year illustrates the gaps in current supply of primary care providers in the clinic’s PSA/SSA versus what is needed to take care of the population:

<table>

</tr>
</tbody>
</table>

Target population: Additional care providers will benefit potentially all of the 48,643 residents of Val Verde County who require care by a doctor. Specifically, there will be an effort to target the sicker patients, the 4,202 that were discharged from an inpatient facility in the previous year, to make sure they have appropriate outpatient care. There will also be an effort toward preventative care under the premise that if there are more providers and more appointment slots, there is a higher probability that patients will seek care more routinely.

Approximately 32% of the population that we serve is uninsured. Our current payer mix for VVRMC consists of 28% Medicaid, 41% Medicare, 20% HMO/PPO and 11% Self Pay. Considering these percentages, the percent of Medicaid/indigent patients we anticipate to serve at the primary care clinics could easily range between 20-30%.

Category 1 or 2 expected patient benefits: The primary benefit will be access to primary care as measured by the increases in clinic visits. In DY 3 we will recruit an additional primary care provider. We estimate our baseline of patient visits will increase from 4,740 visits currently to 7,145 visits by the end of DY 3, with addition of this new provider. In DYs 4 and 5 we have set goals to increase patient visits from this new baseline by 10% and 20%, respectively.

For both primary care physicians, we expect an average of 3 visits per patient per year. The mid-
One key patient benefit of increasing access to and utilization of primary care services will be a decreased dependence on emergency room care by patients who are currently without primary care providers. There will be an effort to track this utilization as well with this patient population.

**Category 3 outcomes:** The measured category 3 outcome associated with this program is patient satisfaction. Currently, the clinic has no formal mechanism to measure patient experience in the clinic as it does for ER and inpatient services. The plan is to develop a similar, formal format to ensure that patients are pleased with the services and value the experience in an effort to enhance the full continuum of care at the hospital and its clinic. The clinic intends to benchmark its results against similar operations and set goals in the top quartile of performers, which is a mark consistent with expectations for other hospital/clinic services. There will be a phased approach to demonstrate progress toward this goal.

**Project Description:**

Establish additional primary care providers to a medically underserved area along the Rio Grande border. The intent is to add primary care providers throughout the life of the project.

The primary goal of this project is to expand primary care in Val Verde County and improve access to services so that there are more clinics available to patients and the number of patients utilizing primary care increases over time. We intend to expand preventative medicine and create an environment that residents of Val Verde County feel like they always can see the doctor, whether that is by appointment, walk-in or through an after-hours offering.

This project will meet the following regional goals:

- The project will encourage working together to make significant progress towards the Triple Aim goals of assuring patients receive high-quality and patient-centered, in the most effective ways
- The project will improve the health care infrastructure to better serve the Medicaid and uninsured residents of our region.
- The project will further develop and maintain a coordinated care delivery system. Finally the project will improve outcomes while containing cost growth.

The project achieves an improved infrastructure for Medicaid and uninsured residents through increasing primary care capacity. The project will increase capacity by expanding the number of primary care clinics. The project develops and maintains a coordinated care delivery system through the establishment of a nurse advice line. The project improves outcomes while containing cost growth by providing access to primary care providers. Patients who now rely on the emergency room for primary care will then have access to a less costly and more appropriate mode of care.

The challenge and key issue which this project will address will be to reduce the dependency on the emergency room for primary care-type visits due to a lack of access to doctors.

We will also look to develop a call-a-nurse program that will also serve as an additional clinic resource while the patient is at home. This service can aid the patient in decision-making in regards to what healthcare resources are best to utilize given each unique situation. The
community develops more confidence in knowing that health information from a qualified professional is readily available not only in person but over the phone as well.

The 5-year expected outcome is better health, better patient satisfaction, increased utilization of primary care services and a reduced utilization of the ER for this patient population.

This project that we have selected is especially important in RHP 6 as so much of the RHP is rural. In the rural healthcare setting, especially Texas and especially along the border, there is a short supply of healthcare resources. Del Rio and Val Verde County will be better served and healthier if there is more access to physicians.

**Starting Point/Baseline:**

Dr. Charles Rigney (Family Practice) 4,740 visits

We estimate our baseline of patient visits will increase from 4,740 visits currently to 7,145 visits by the end of DY 3, with addition of this new provider.

**Rationale:**

As evidenced in the RHP Community Needs Assessment, access to (or lack of) primary care is a serious issue in Texas, especially in rural parts of Texas. The following Community Needs are specifically related to this project and were identified locally in Del Rio as well:

CN.1 Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.

CN.2 A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions. Leading causes of death in RHP 6 include cardiovascular disease, cancer, and diabetes.

CN.3 Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages.

The project option (1.1.1) will be to establish more primary care clinics. Val Verde Regional Medical Center began to seriously tackle this issue in 2011. The hospital established a 501(a) for which it is the sole member for, and as a result developed a recruitment vehicle for physicians and mid-levels. Prior to this organization being established it was even more challenging than it is today to recruit doctors and physician extenders to a rural, border community. Through this effort, primary care clinics have recently been established, and the hospital has good baseline data from which to compare its progress to in improving and increasing access to care to patients in its community. The hospital has just gotten started recruiting providers to the area. It is the intention over the life of this project to attract additional doctors, physician assistants and nurse practitioners to the clinics so that number of clinics can be expanded as well as the number of patients seen in the clinics.

By increasing access, there is a greater opportunity to practice preventative medicine and also watch as utilization of the emergency room declines for these patients declines as well as their
readmission rate to the hospital.

**Process Milestone:**
P-1. Milestone: Establish additional/expand existing/relocate primary care clinics
P-1.1. Metric: Number of additional clinics or expanded hours or space
   a. Documentation of detailed expansion plans
   b. Data Source: New primary care schedule or other Performing Provider
document or other plans as designated by Performing Provider.
   c. Rationale/Evidence: It is well known the national supply of primary care
does not meet the demand for primary care services. Moreover, it is a
goal of health care improvement to provide more preventive and
primary care in order to keep individuals and families healthy and
therefore avoid more costly ER and inpatient care. RHPs are in real
need of expanding primary care capacity in order to be able to
implement the kind of delivery system reforms needed to provide the
right care at the right time in the right setting for all patients.

**Process Milestone:**
P-7. Milestone: Establish a nurse advice line and/or primary care patient appointment unit.
P-7.1. Metric: Documentation of nurse advice line and/or primary care patient appointment unit.
   a. Data Source: Documentation of advice line and appointment unit
      implementation, operating hours and triage policies. Advise line system
      logs, triage algorithms and appointment unit operations/policies.
   b. Rationale: In many cases patients are unaware of the appropriate
      location and timing to seek care for urgent and chronic conditions.
      Implementation of a nurse advice line allows for primary care to be the
      first point of contact and offer clinical guidance around how to mitigate
      symptoms, enhance patient knowledge about certain conditions and
      seek timely care services.

**Process Milestone**
P-5 Train/hire additional primary care providers and staff and/or increase the number of primary
care clinics for existing providers
Metric 1: 5.1 Documentation of increased number of providers and staff and/or clinic sites
Data Source: Documentation of completion of all items described by the RHP plan for this
measure. Hospital or other Performing Provider report, policy, contract or other documentation
Rationale: Additional staff members and providers may necessary to increase capacity to deliver
care.

**Improvement Milestones:**
I-12. Milestone: Increase primary care clinic volume of visits and evidence of improved access
for patients seeking services.
I-12.1. Metric: Documentation of increased number of visits. Demonstrate
improvement over prior reporting period.
a. Total number of visits for reporting period
b. Data Source: Registry, EHR, claims or other Performing Provider source
c. Rationale/Evidence: This measures the increased volume of visits and is a method to assess the ability for the Performing Provider to increase capacity to provide care.

I-14. Milestone: Increase the number of patients served and questions addressed on the nurse advice line and patient scheduling unit. Demonstrate improvement over prior reporting period.
I-14.1 Metric: Number of patient served by the nurse advice line. Demonstrate improvement over baseline rates.
a. Numerator: number of unique records created from calls received to the nurse advice line.
b. Denominator: total number of calls placed to the nurse advice line (distinct from number of calls answered)
c. Data Source: Automated data from call center
d. Rationale/Evidence: This measure will indicate how many calls are addressed successfully as well as an overall call abandonment rate. Abandonment rate is the percentage of calls coming into a telephone system that are terminated by the person originating the call before being answered by a staff person. It is related to the management of emergency calls. This metric speaks to the capacity of the nurse advice line.

One of the key quality improvement efforts will be with all new patients established with new providers will be to track and measure physician and hospital utilization before and after access and interaction with the clinic. The goal will be to increase the clinic intervention with providers as necessary over a historic time period and also over time realize a decreased utilization on hospital inpatient services.

There are no initiatives related to this project that have related activities that are funded by the U.S. department of Health and Human Services.

**Related Category 3 Outcome Measure(s):**

The category 3 Outcome Measure related to this project is Patient Satisfaction (stand alone). As we visited with constituents in the Del Rio and Val Verde County communities, there is a sense of frustration in regards to not being able to get in to see a doctor. Then there is extreme dissatisfaction if the only resource available to them is the emergency room. And no matter how well the hospital is performing in regards to ED throughput, care takes longer and costs more. There is clearly a perception in Del Rio to that Del Rio needs more doctors. Actuarial data supports this claim that Del Rio and Val Verde County are medically underserved.

If the hospital is successful in establishing more clinics and having more providers available, and if the hospital can enhance the patient experience while at the clinics, the hypothesis is that patients will be satisfied with healthcare in their community.

In regards to low-income populations, this group stands to benefit the most from this initiative as this patient population is likely the most dissatisfied with their healthcare in the community. Lack of access typically means a greater dependency on the ER for primary care needs.
The clinic(s) will measure patient satisfaction and will establish Process Milestones in DY 2 & 3:

P-1 Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans – DY 2
P-2 Establish baseline rates – DY 3

For DY 4 & 5, the clinic will have improvement targets (stand-alone measure) as follows:

**OD-6 Patient Satisfaction**

**IT-6.1 Percent improvement over baseline of patient satisfaction scores (all questions within a survey need to be answered to be a standalone measure)**

Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAHPS survey may be used to establish if patients:

1. are getting timely care, appointments, and information; *(Standalone measure)*

   **a Numerator:** Percent improvement in targeted patient satisfaction domain

   **b Data Source:** Patient survey

   **c Denominator:** Number of patients who were administered the survey

   **d Rationale/Evidence:** The intent of the HCAHPS initiative is to provide a standardized survey instrument and data collection methodology for measuring patients’ perspectives on hospital care. The surveys are designed to produce comparable data on the patient's perspective on care that allows objective and meaningful comparisons between institutions on domains that are important to consumers. Public reporting of the survey results is designed to create incentives for institutions to improve their quality of care. Public reporting will serve to enhance public accountability in health care by increasing the transparency of the quality of institutional care provided in return for the public investment.

**Relationship to other Projects:**

This project is related to 1.2 Increase Training of Primary Care Workforce. To the extent that there are providers within the RHP as well as outside the RHP are focused on this initiative, it helps to increase the pool of providers that are available to expand primary care in medically underserved areas.

This project is also related to 2.4 Redesign to Improve Patient Experience. The Category 3 measure associated with this project is Patient Satisfaction. Our redesign of not only the infrastructure to increase medical resources but also the redesign of how the care is delivered within this newly expanded infrastructure will drive results so that patients are happier with their care and have a greater confidence in the local rural healthcare delivery system.

This project is related to Category 4 measures RD-1 Potentially Preventable Admissions and RD-2 30-day Readmissions. If access to primary care is increased, then the goal will be to see lower utilization of hospital resources as measured by Category 4 measures.

This project is also related to the hospital’s other project, 1.9 Expand Specialty Care Capacity. To the extent that providers are located in the same clinic, and expansion of both primary care
and specialty physicians working together will enhance the communication process and afford the opportunity for patients to move seamlessly through the system. In a small rural community it makes sense to align providers and develop an infrastructure by which everyone is working on the same EMR so that medical information can be shared and to some extent minimize duplication of services.

**Relationship to Other Performing Providers’ Projects in the RHP:**

<table>

</tr>
</tbody>
</table>

**Plan for Learning Collaborative:**

Val Verde Regional Medical Center plans for participating in a RHP-wide learning collaborative with other providers, especially in the rural communities, who are also working to expand primary care in medically underserved areas of the state of Texas.

It is our opinion that getting groups together will foster collaboration and sharing of ideas to best come up with plans to accomplish our goals.

RHP6 anchor University Health System intends to do the following, which Val Verde Regional Medical Center will participate in:

- Following completion of the RHP Plan, University Health System will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include the following:
  - Identify participants
  - Establish Learning Collaborative goals
  - Develop a calendar of regular meetings, site visits, and/or conference calls
  - Develop a plan to communicate ideas, data, and successes across the region and state
  - Organize a learning event and invite experts and other Performing Providers from outside the region to share knowledge and best practices
  - Adopt metrics to measure success

**Project Valuation:**

Our approach to valuing this project was by figuring how significant the impact would be to the patient population this clinic and the providers it serves is. Since the majority of the adult population requires some level of medical intervention at least annually, the potential impact is rather significant. If there are more providers to be able to meet the demand, then the overall health of Del Rio and Val Verde county ought to improve. Costs ought to go down. If our hypothesis holds true that by virtue of increasing access to primary care that ER utilization for
level 4 & 5 visits decreases, all other things equal, we will have moved the care delivery system from a more expensive environment to a less expensive environment.

Identifying Project and Provider Information:

Title: 1.9.2 Expand Specialty Care Capacity – For Val Verde County and Del Rio, Texas
Unique RHP ID#: 119877204.1.2 – PASS 1
Performing Provider: Val Verde Regional Medical Center
Performing Provider TPI: 119877204

Project Summary:

Provider Description: Val Verde Regional Medical Center is a 93-bed acute care county hospital located in the medically underserved border community of Del Rio, Texas. It is the only hospital serving Val Verde County. The county’s population is approximately 50,000 with the majority of those persons living in and around Del Rio.

Intervention(s): This project aims to expand specialty care resources in this medically underserved community. The hospital has a clinic affiliated with it, and the scope of the project will be to add providers in an effort to expand access to care in Val Verde County.

Need for the project: A community needs assessment was performed, and the top priority identified was to bring more doctors to the community. There is a shortage of specialty care physicians in both Del Rio and Val Verde County. The following actuarial data provided by HCAPS Community Needs Assessment Group earlier this year illustrates the gaps in current supply of primary care providers in the clinic’s PSA/SSA versus what is needed to take care of the population:

Target population: Additional care providers will benefit potentially all of the 48,643 residents of Val Verde County who require care by a doctor. Specifically, there will be an effort to target the sicker patients, the 4,202 that were discharged from an inpatient facility in the previous year, to make sure they have appropriate outpatient care. Because there is a lack of specialists in this medically underserved part of the state, many patients end up traveling to San Antonio for care, which increases the cost of care. However, for many of the socioeconomically challenged patients in the county who cannot afford the trip to San Antonio, they end up not getting the care they need. Ultimately, they end up in the emergency room where their condition is more acute and the cost of care to provide for them, which often includes a transfer to higher level of care, is
significantly more expensive.

Approximately 32% of the population that we serve is uninsured. Our current payer mix for VVRMC consists of 28% Medicaid, 41% Medicare, 20% HMO/PPO and 11% Self Pay. Considering these percentages, the percent of Medicaid/indigent patients we anticipate to serve at the specialty care clinics could easily range between 20-30%.

**Category 1 or 2 expected patient benefits:** The primary benefit will be access to specialty care as measured by the increase in encounters in the clinic. Currently we are actively trying to recruit a cardiologist; a mid-level specializing in cardiology, an ENT and a urologist. Recruitment into these and other specialties will likely be completed during DY 3. Based on the small number of specialty care clinic visits currently (1,100 in 2012) combined with recruitment into cardiology ENT and urology, we anticipate 2,700 specialty clinic visits by the end of DY 3. In DYs 4 and 5 we have set goals to increase patient visits from this new baseline by 10% and 20%, respectively.

For all specialist providers we expect an average of 2 visits per patient per year.

One key patient benefit of increasing access to and utilization of specialty care services will be a decrease in patient transfers. Access to specialty care is extremely limited. It causes many patients to be transferred 2 ½ hours to San Antonio for care. Driving to visit specialty providers in San Antonio becomes very expensive for residents of our community over time. Reducing the need for this travel through greater access to local providers is a significant benefit to our population.

There will be an effort to track this utilization as well with this patient population.

**Category 3 outcomes:** The measured category 3 outcome associated with this program is patient satisfaction. Currently, the clinic has no formal mechanism to measure patient experience in the clinic as it does for ER and inpatient services. The plan is to develop a similar, formal format to ensure that patients are pleased with the services and value the experience in an effort to enhance the full continuum of care at the hospital and its clinic. The clinic intends to benchmark its results against similar operations and set goals in the top quartile of performers, which is a mark consistent with expectations for other hospital/clinic services. There will be a phased in approach to demonstrate progress toward this goal.

**Project Description:**

Establish additional specialty care providers to a medically underserved area along the Rio Grande border. The intent is to add specialty care providers throughout the life of the project.

The primary goal of this project is to expand specialty care in Val Verde County and improve access to services. The hospital intends to make services available locally that are currently not available at all or limited services at best.

This project will meet the following regional goals:

- The project will encourage working together to make significant progress towards the Triple Aim goals of assuring patients receive high-quality and patient-centered, in the most effective ways
- The project will improve the health care infrastructure to better serve the Medicaid and uninsured residents of our region.
The project will further develop and maintain a coordinated care delivery system. Finally the project will improve outcomes while containing cost growth.

The project achieves an improved infrastructure for Medicaid and uninsured residents through increasing specialty care capacity. The project will increase capacity by expanding the number of specialty clinics. The project develops and maintains a coordinated care delivery system through implementing “raise the floor” quality improvement initiatives agreed upon during semi-annual RHP learning collaboratives. The project improves outcomes while containing cost growth through reducing transfers into San Antonio and by focusing on improving patient satisfaction.

The challenge and key issue which this project will address will be to see to it that residents do not have to travel to large, urban areas for specialty care. There are many people in Val Verde County that cannot afford the trip to San Antonio and thus go without seeing a specialist until their condition worsens. At this point they access the ER and often times must be acutely transferred by air ambulance.

The 5-year expected outcome is better health, better patient satisfaction, increased utilization of specialty care services and appropriate utilization of the ER for this patient population.

This project that we have selected is especially important in RHP 6 as so much of the RHP is rural. In the rural healthcare setting, especially Texas and especially along the border, there is a short supply of healthcare resources. Del Rio and Val Verde County will be better served and healthier if there is more access to physicians.

<tr>
<td>Vascular Surgery-300 visits</td>
</tr>
</tbody>
</table>

Based on the small number of specialty care clinic visits currently (1,100 in 2012) combined with recruitment into cardiology ENT and urology, we anticipate 2,700 specialty clinic visits by the end of DY 3. We will use this as our baseline in DY 4 and 5.

<table>
<thead>
<tr>
<th>Rationale:</th>
</tr>
</thead>
<tbody>
<tr>
<td>As evidenced in the RHP Community Needs Assessment, access to (or lack of) specialty care is a serious issue in Texas, especially in rural parts of Texas. The following Community Needs are specifically related to this project and were identified locally in Del Rio as well:</td>
</tr>
</tbody>
</table>

- **CN.1** Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.
- **CN.2** A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions. Leading causes of death in RHP 6 include cardiovascular disease, cancer, and diabetes.
- **CN.3** Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages.

The project option (1.9.2) will be to improve access to specialty care. Val Verde Regional Medical Center
Val Verde Regional Medical Center began to seriously tackle this issue in 2011. The hospital established a 501(a) for which it is the sole member for, and as a result developed a recruitment vehicle for physicians and mid-levels. Prior to this organization being established it was even more challenging than it is today to recruit doctors and physician extenders to a rural, border community. Through this effort, specialists are currently being recruited to practice in Del Rio. It will be reasonable to track progress as additional providers are added and clinics established. It is the intention over the life of this project to attract additional doctors, physician assistants and nurse practitioners to the clinics so that number of clinics can be expanded as well as the number of patients seen in the clinics. By increasing access, there is a greater opportunity to serve these patients timely and locally.

Project Components:

Through “Improving Rural Access to Specialty Care”, we propose to meet all required project components, except for component B.

E. Identify high impact/most impacted specialty services and gaps in care and coordination. This component will be accomplished in DY 2. We plan to hire a third-party healthcare consultant to perform this specialty care gap assessment. The results of this assessment will establish a firm baseline for our project in those specialty care areas where there are gaps in coverage. Our current specialty clinic visit volume (2012) is 1,100 visits with 800 urology visits and 300 vascular surgery visits.

F. Increase the number of residents/trainees choosing targeted shortage specialties. This project component will not be addressed in this project. The reason this component is left out is because of the small size of the hospital (93 licensed beds) and its rural location (150+ miles west of San Antonio). Currently our facility does not have the resources, space or staff to provide residencies for physicians. Also, completing this project component is unrealistic given the few specialists available in our area to provide such training.

G. Design workforce enhancement initiatives to support access to specialty providers in underserved markets and areas (recruitment and retention). Our community is an underserved market considering the lack of specialty care services and its designation as a HPSA. We plan to meet this project component through increasing the number of specialist providers, clinic hours and/or procedure hours in targeted specialties. This will occur in DY 3.

H. Conduct quality improvement for project using methods such as rapid cycle improvement. We plan to meet this project component through participating in face-to-face learning (i.e. meetings or seminars) at least twice per year with other providers and the RHP. These meetings will be to promote collaborative learning around shared or similar projects. We will then implement at least one “raise the floor” improvement initiatives established at the semiannual meeting per year for DY 3, 4 and 5.

Process Milestone:
P-1 Milestone: Conduct specialty care gap assessment based on community need
P-1.1 Metric: Documentation of gap assessment. Demonstrate improvement over prior reporting period (baseline for DY2).
   a. Data Source: Needs Assessment
   b. Rationale/Evidence: In order to identify gaps in high-demand specialty areas to best build up
supplies of specialists to meet demand for services and improve specialty care access

**Process Milestone:**
P-11. Milestone: Launch/expand a specialty care clinic (e.g., pain management clinic)
P-11.1. Metric: Establish/expand specialty care clinics
   a. Number of patients served by specialty care clinic
   b. Data Source: Documentation of new/expanded specialty care clinic
   c. Rationale/Evidence: Specialty care clinics improve access for targeted populations in areas where there are gaps in specialty care.
   Additionally, specialty care clinics allow for enhanced care coordination for those patients requiring intensive specialty services.

**Process Milestone**
P-21 Participate in face-to-face learning (i.e. meetings or seminars) at least twice per year with other providers and the RHP to promote collaborative learning around shared or similar projects.
Metric 1: 21.1 Participate in semi-annual face-to-face meetings or seminars organized by the RHP
   a. Data Source: Documentation of semiannual meetings including meeting agendas, slides from presentation, and/or meeting notes
   Rationale/Evidence: Investment in learning and sharing of ideas is central to improvement. The highest quality health care systems promote continuous learning and exchange between providers and decide collectively how to “raise the floor” for performance across all providers

**Metric 2:** Implement the “raise the floor” improvement initiatives established at the semiannual meeting
   a. Data Source: Documentation of “raise the floor” improvement initiatives agreed upon at each semiannual meeting and documentation that the participating provider implement the initiative after the meeting
   Rationale/Evidence: Investment in learning and sharing of ideas is central to improvement. The highest quality health care systems promote continuous learning and exchange between providers and decide collectively how to “raise the floor” for performance across all providers

**Improvement Milestone:**
I-23. Milestone: Increase specialty care clinic volume of visits and evidence of improved access for patients seeking services.
I-23.1. Metric: Documentation of increased number of visits. Demonstrate improvement over prior reporting period (baseline for DY2).
   a. Total number of visits for reporting period
   b. Data Source: Registry, EHR, claims or other Performing Provider source
   c. Rationale/Evidence: This measures the increased volume of visits and is a method to assess the ability for the Performing Provider to increase capacity to provide care.

One of the key quality improvement efforts will be with all new patients established with new providers will be to track and measure physician and hospital utilization before and after access and interaction with the clinic. The goal will be to increase the clinic intervention with providers...
as necessary over a historic time period and also over time realize a decreased utilization on hospital inpatient services.

There are no initiatives related to this project that have related activities that are funded by the U.S. department of Health and Human Services.

**Related Category 3 Outcome Measure(s):**

The category 3 Outcome Measure related to this project is Patient Satisfaction (stand alone). As we visited with constituents in the Del Rio and Val Verde County communities, there is a sense of frustration in regards to not being able to get in to see a specialist. Then there is extreme dissatisfaction if the only resource available to them is the emergency room. And no matter how well the hospital is performing in regards to ED throughput, care takes longer and costs more. There is clearly a perception in Del Rio to that Del Rio needs more doctors. Actuarial data supports this claim that Del Rio and Val Verde County are medically underserved.

If the hospital is successful in establishing more clinics and having more specialists available, and if the hospital can enhance the patient experience while at the clinics, the hypothesis is that patients will be satisfied with healthcare in their community.

In regards to low-income populations, this group stands to benefit the most from this initiative as this patient population is likely the most dissatisfied with their healthcare in the community. Lack of access typically means a greater dependency on the ER for primary care needs.

The clinic(s) will measure patient satisfaction and will establish Process Milestones in DY 2 & 3:

P- 1 Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans – DY 2
P- 2 Establish baseline rates – DY 3

For DY 4 & 5, the clinic will have improvement targets (stand-alone measure) as follows:

**OD-6 Patient Satisfaction**

**IT-6.1 Percent improvement over baseline of patient satisfaction scores (all questions within a survey need to be answered to be a standalone measure)**

Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAHPS survey may be used to establish if patients:

1. are getting timely care, appointments, and information; *(Standalone measure)*
   a Numerator: Percent improvement in targeted patient satisfaction domain
   b Data Source: Patient survey
   c Denominator: Number of patients who were administered the survey
   d Rationale/Evidence: The intent of the HCAHPS initiative is to provide a standardized survey instrument and data collection methodology for measuring patients’ perspectives on hospital care. The surveys are designed to
produce comparable data on the patient's perspective on care that allows objective and meaningful comparisons between institutions on domains that are important to consumers. Public reporting of the survey results is designed to create incentives for institutions to improve their quality of care. Public reporting will serve to enhance public accountability in health care by increasing the transparency of the quality of institutional care provided in return for the public investment.

**Relationship to other Projects:**

This project is related to 1.7 Introduce, Expand or Enhance Telehealth/Telemedicine. Part of our strategy to gain access to specialists in our rural community will be through telemedicine and robotic technology. It is also related to 1.13 Development of behavioral health crisis stabilization services as alternatives to hospitalization as if the hospital is successful in developing additional behavioral health services to the community it has the opportunity to impact this project as well.

This project is also related to 2.4 Redesign to Improve Patient Experience. The Category 3 measure associated with this project is Patient Satisfaction. Our redesign of not only the infrastructure to increase medical resources but also the redesign of how the care is delivered within this newly expanded infrastructure will drive results so that patients are happier with their care and have a greater confidence in the local rural healthcare delivery system.

This project is related to Category 4 measures RD-1 Potentially Preventable Admissions and RD-2 30-day Readmissions. If access to primary care is increased, then the goal will be to see lower utilization of hospital resources as measured by Category 4 measures.

This project is also related to the hospital’s other project, 1.1 Expand Primary Care Capacity. To the extent that providers are located in the same clinic, and expansion of both primary care and specialty physicians working together will enhance the communication process and afford the opportunity for patients to move seamlessly through the system. In a small rural community it makes sense to align providers and develop an infrastructure by which everyone is working on the same EMR so that medical information can be shared and to some extent minimize duplication of services.

**Relationship to Other Performing Providers’ Projects in the RHP:**

University Hospital  
Baptist Medical Center  
Children’s Hospital of San Antonio  
Methodist Hospital  
Southwest General Hospital  
Dimmit County Memorial Hospital (rural performing provider)  
Connally Memorial Medical Center (rural performing provider)

**Plan for Learning Collaborative:**
Val Verde Regional Medical Center plans for participating in a RHP-wide learning collaborative with other providers, especially in the rural communities, who are also working to expand primary care in medically underserved areas of the state of Texas.

It is our opinion that getting groups together will foster collaboration and sharing of ideas to best come up with plans to accomplish our goals.

RHP6 anchor University Health System intends to do the following, which Val Verde Regional Medical Center will participate in:

Following completion of the RHP Plan, University Health System will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include the following:
Identify participants
Establish Learning Collaborative goals
Develop a calendar of regular meetings, site visits, and/or conference calls
Develop a plan to communicate ideas, data, and successes across the region and state
Organize a learning event and invite experts and other Performing Providers from outside the region to share knowledge and best practices
Adopt metrics to measure success

**Project Valuation:**

Our approach to valuing this project was by figuring how significant the impact would be to the patient population this clinic and the providers its serves is. Specialty care, especially in areas like cardiology, vascular surgery and podiatry in an area with so much diabetes and hypertension, is very important to the community. In additional, behavioral services are in short supply in Del Rio. When valuing our two projects, we arrived at an equal weight between primary and specialty care. If there are more providers to be able to meet the demand, then the overall health of Del Rio and Val Verde county ought to improve. Costs ought to go down. If our hypothesis holds true that by virtue of increasing access to specialty care that ER utilization and air transfers decrease, all other things equal, we will have moved the care delivery system from a more expensive environment to a less expensive environment.

### Milestone 1
P-1 Conduct specialty care gap assessment based on community need
**Metric 1:** P-1.1 Documentation of gap assessment.
**Baseline:** 0
**Goal:** Establish a baseline with gaps in specialty care documented. Identify high impact specialty care services to fill gaps and meet population needs.
**Data Source:** Needs Assessment

**Milestone 1 Estimated Incentive Payment:** $1,021,045

### Milestone 2
P-11 Launch/expand a specialty care clinic
**Metric 1:** P-11.1
Establish/expand specialty care clinics
**Baseline:** 1,100 specialty clinic visits in 2012, (800 urology, 300 vascular surgery).
**Goal:** Expand number of patients served by specialty clinic
**Data Source:** Documentation of new/expanded specialty clinic

**Milestone 2 Estimated Incentive Payment:** $556,953

### Milestone 3
P-21 Participate in face-to-face learning (i.e. meetings or seminars) at least twice per year with other providers and the RHP to promote collaborative learning around

### Milestone 4
I-23 Increase specialty care clinic volume of visits and evidence of improved access for patients seeking services
**Metric 3:** I-23.1 Documentation of increased number of visits; demonstrate improvement over prior reporting period
**Baseline:** 2,700 visits (estimated DY 3 baseline after accomplishment of P-11)
**Goal:** 10% increase over DY 3 baseline
**Data Source:** EMR, appointment schedule

**Milestone 4 Estimated Incentive Payment:** $558,572

### Milestone 5
I-23 Increase specialty care clinic volume of visits and evidence of improved access for patients seeking services
**Metric 4:** I-23.1 Documentation of increased number of visits; demonstrate improvement over prior reporting period
**Baseline:** Baseline: 2,700 visits (estimated DY 3 baseline after accomplishment of P-11)
**Goal:** 20% increase over DY 3 baseline
**Data Source:** EMR, appointment schedule

**Milestone 5 Estimated Incentive Payment:** $461,429

### Milestone 6
P-21 Participate in face-to-face learning (i.e. meetings or seminars) at least twice per year with other providers and
Metric 1: 21.1 Participate in semi-annual face-to-face meetings or seminars organized by the RHP

Baseline: 0

Goal: attend 2 collaborative learning RHP meetings

Data Source: Documentation of semiannual meetings including meeting agendas, slides from presentation, and/or meeting notes

Metric 2: Implement the “raise the floor” improvement initiatives established at the semiannual meeting

Baseline: 0

Goal: implement at least 1 “raise the floor” improvement initiative.

Data Source: Documentation of “raise the floor” improvement initiatives agreed upon at each semiannual meeting and documentation that the participating provider implement the initiative after the meeting.

Milestone 3 Estimated Incentive Payment: $556,953

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $4,174,952**
Identifying Project and Provider Information:
Title: 1.7.1 Implement telemedicine program to provide or expand specialist referral services in an area identified as needed to the region – Val Verde County and Del Rio, Texas
Unique RHP ID#: 119877204.1.3 – PASS 2
Performing Provider: Val Verde Regional Medical Center (VVRMC)
Performing Provider TPI: 119877204

Project Summary:
Provider Description: Val Verde Regional Medical Center is a 93-bed acute care county hospital located in the medically underserved border community of Del Rio, Texas. It is the only hospital serving Val Verde County. The county’s population is approximately 50,000 with the majority of those persons living in and around Del Rio.

Intervention(s): This project aims to develop a robust telemedicine program aimed at enhancing access to services across the full continuum of care for patients in the hospital and at the clinic.

Need for the project: A community needs assessment was performed, and the top priority identified was to bring more doctors to the community. There are three targeted areas for the telemedicine program to have an impact: 1) behavioral health, 2) neurology and 3) cardiology. The telemedicine services will be primarily offered in the ER and on the inpatient units. Currently, there are no resources available in any of these three important specialties for patients who require these services in the ER or inpatient setting. While there are efforts underway to recruit permanent specialists to Val Verde County (see 119877024.1.2), the likelihood of procuring all specialties permanently to our rural border community is small. However, with this technology, specialists in urban areas can access and provide services to patients remotely while significantly enhancing the delivery of care.

Target population: Additional care providers will benefit potentially all of the 48,643 residents of Val Verde County who require care by a doctor. Specifically, patients who present to the ER or who are admitted to the hospital with diagnosis in neurology (stroke), cardiology (heart attack), and psychiatry (mental health) will be ideal candidates for telemedicine intervention.

Approximately 32% of the population that we serve is uninsured. Our current payer mix for VVRMC consists of 28% Medicaid, 41% Medicare, 20% HMO/PPO and 11% Self Pay. Considering these percentages, the percent of Medicaid/indigent patients we anticipate to serve in the telemedicine program could easily range between 20-30%.

Category 1 or 2 expected patient benefits: In DY 3 we will expand the geriatric psych telemedicine program to additional medical specialties, based upon regional and community need. Our baseline is 420 Gero psych telemedicine visits (2012). However, we have set DY 4, and 5 goals at 1000 and 1150 visits, respectfully. Based on the specialties the telemedicine program expands into and the provider, telemedicine visits per patient may range between 1 and 3 per patient per year.

The primary benefit will be access to specialty care as measured by the increase in visits through telemedicine. This is a new program, and its benefits will be easily measurable. We intend to realize a reduction in both ground and air transfers as a result of the telemedicine program as more patients can be treated locally in Del Rio.
Category 3 outcomes: The measured category 3 outcome associated with this program is patient satisfaction. Our plan is to develop a formal patient satisfaction response geared specifically for patients receiving services through telemedicine. With this new technology it will be important to make sure that patients have the confidence in this non-traditional process and that the results being delivered are positively perceived.

### Project Description:

**Project Description**

VVRMC intends to introduce a robotic telemedicine program for access to specialty care in its rural community in the emergency room and inpatient bedded units.

**Goals**

Goals include expanding access to specialty care and being able to provide specialty care more timely. Many patients present to the VVRMC emergency room today and immediately must be transferred out to a higher level of care. This transfer is oftentimes risky when treatment time is of the essence and is also costly. Through robotic telemedicine, specialists are available to better interact on the case, intervene quicker and potentially reduce or eliminate the need to transfer patients out of the facility.

**Challenges/Issues**

The challenge and key issue will be to align with specialists who have an interest in this technology and a commitment to the rural community. The project will not work unless those specialists on the other end treat episodes of care that present via this medium just as they would in their locality from a priority perspective. Another challenge is developing protocols and techniques that parties on both sides can agree upon.

This will be brand new technology which stands the chance to greatly improve patient care, but some of the local, rural community physicians often times are slow to change, especially when it involves technology.

**5-Year Expected Outcome**

The 5-year expected outcome is better health, better patient satisfaction, increased utilization of specialty care services and reduced transfers out of the facility.

**Relationship to Regional Goals**

This project that we have selected is especially important in RHP 6 as so much of the RHP is rural. In the rural healthcare setting, especially Texas and especially along the border, there is a short supply of healthcare resources. Del Rio and Val Verde County will be better served and healthier if there is more access to physicians.

**Starting Point/Baseline:**

Our baseline is 420 Gero psych telemedicine visits (2012), No baseline exists for other specialties we plan to expand into.
Rationale:

As evidenced in the RHP Community Needs Assessment, access to (or lack of) specialty care is a serious issue in Texas, especially in rural parts of Texas. The following Community Needs are specifically related to this project and were identified locally in Del Rio as well:

CN.1 Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.

CN.2 A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions. Leading causes of death in RHP 6 include cardiovascular disease, cancer, and diabetes.

CN.3 Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages.

The project option (1.7.1) will be to implement telemedicine program to provide or expand specialist referral services in an area identified as needed to the region. VVRMC has invested in robotic telemedicine technology in the past 3 months with the intent to deploy the resource to expand services to patients presenting with specific conditions in the emergency room and on the inpatient bedded units. The primary service areas where VVRMC sees the greatest benefit as evidenced by the community needs assessment is in cardiology, neurology and behavioral health.

By increasing access, there is a greater opportunity to serve patients of Val Verde County timely and locally.

By virtue of having the technology in place and establishing relationships with medical and surgical specialists who are willing to service our area, we will have accomplished the first core component required. The second core component will be accomplished as the team will continually participate in quality improvement efforts to help evaluate the merits of the program. This includes but is not limited to identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

Process Milestone:
P-1. Milestone: Conduct needs assessment to identify needed specialties that can be provided via telemedicine
P-1.1. Metric: Needs assessment to identify the types of personnel needed to implement the program and hiring of the respective personnel.
a. Submission of completed needs assessment
b. Data Source: Needs assessment
c. Rationale/Evidence: It is important to expand telemedicine to areas where greatest need and highest potential for impact is demonstrated in order to have optimal effect.

P-3. Milestone: Implement or expand telemedicine program for selected medical specialties, based upon regional and community need.
P-3.1. Metric: Documentation of program materials including implementation plan, vendor agreements/contracts, staff training and HR documents.

a. Submission of implementation documentation
b. Data Source: Program materials
c. Rationale/Evidence: It is important to expand telemedicine to areas where greatest need and highest potential for impact is demonstrated in order to have optimal effect.

**Improvement Milestone:**

I-12. Milestone: Increase number of telemedicine visits for each specialty identified as high need

I-12.1. Metric: Number of telemedicine visits

a. Numerator: Number of visits in which patients are seen using telemedicine services for each type of medical or surgical subspecialty provided by specified timeframe (e.g. one year) and geographic area in a RHP or for individual provider.
b. Denominator: Number of patients referred to medical specialties
c. Data Source: EHR or electronic referral processing system; encounter records from telemedicine program
d. Rationale: demonstrate increase in access due to teleservices

One of the key quality improvement efforts will be with all new patients established with new providers will be to track and measure physician and hospital utilization before and after access and interaction with the clinic. The goal will be to increase the clinic intervention with providers as necessary over a historic time period and also over time realize a decreased utilization on hospital inpatient services.

There are no initiatives related to this project that have related activities that are funded by the U.S. department of Health and Human Services.

**Related Category 3 Outcome Measure(s):**

The category 3 Outcome Measure related to this project is Patient Satisfaction (stand alone). As we visited with constituents in the Del Rio and Val Verde County communities, there is a sense of frustration in regards to access to specialty care. Because of this frustration, many people in the community avoid the local hospital for fear that the hospital does not have the appropriate resources to take care of their healthcare need. There is clearly a perception in Del Rio to that Del Rio needs more doctors. One alternative to permanent recruitment to this rural community is to access additional doctors through telemedicine. Actuarial data supports this claim that Del Rio and Val Verde County are medically underserved.

If the hospital is successful in establishing better access to specialists through telemedicine, and if the hospital can enhance the patient experience while at the clinics, the hypothesis is that patients will be satisfied with healthcare in their community.

In regards to low-income populations, this group stands to benefit the most from this initiative as
this patient population is likely the most dissatisfied with their healthcare in the community. Lack of access typically means a greater dependency on the ER for specialty care needs which through this project can now be better accessed through telemedicine.

VVRMC will measure patient satisfaction for patients who access care through telemedicine and will establish Process Milestones in DY 2 & 3:

P-1 Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans – DY 2
P-2 Establish baseline rates – DY 3

For DY 4 & 5, the clinic will have improvement targets (stand-alone measure) as follows:

**OD-6 Patient Satisfaction**
**IT-6.1 Percent improvement over baseline of patient satisfaction scores (all questions within a survey need to be answered to be a standalone measure)**
Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAHPS survey may be used to establish if patients:
(1) are getting timely care, appointments, and information; *(Standalone measure)*

a Numerator: Percent improvement in targeted patient satisfaction domain
b Data Source: Patient survey
c Denominator: Number of patients who were administered the survey
d Rationale/Evidence: The intent of the HCAHPS initiative is to provide a standardized survey instrument and data collection methodology for measuring patients' perspectives on hospital care. The surveys are designed to produce comparable data on the patient's perspective on care that allows objective and meaningful comparisons between institutions on domains that are important to consumers. Public reporting of the survey results is designed to create incentives for institutions to improve their quality of care. Public reporting will serve to enhance public accountability in health care by increasing the transparency of the quality of institutional care provided in return for the public investment.

**Relationship to other Projects:**
This project is related to 1.9 Expand Specialty Care Capacity. In the 1.9 project, there will be targeted specialists that VVRMC strategically works to recruit permanently to Val Verde County. However, there are certain specialties that logistically do not make sense to have on a full-time basis but these services are needed ad hoc. This certainly is the case in the emergency room and during acute situations while patients are in the hospital. Through robot telemedicine technology, VVRMC will work to expand access to specialists who otherwise would likely never be providing services in a rural community.

This project is also related to 2.4 Redesign to Improve Patient Experience. The Category 3 measure associated with this project is Patient Satisfaction. Our redesign of not only the infrastructure to increase medical resources but also the redesign of how the care is delivered within this newly expanded infrastructure will drive results so that patients are happier with their
care and have a greater confidence in the local rural healthcare delivery system.

This project is related to Category 4 measures RD-1 Potentially Preventable Admissions and RD-2 30-day Readmissions. If access to specialists through telemedicine is increased, then the goal will be to see lower utilization of hospital resources as measured by Category 4 measures ongoing.

<tbody>
<tr>
<td>Val Verde Regional Medical Center plans for participating in a RHP-wide learning collaborative with other providers, especially in the rural communities, who are also working to expand primary care in medically underserved areas of the state of Texas.</td>
</tr>
</tbody>
</table>

It is our opinion that getting groups together will foster collaboration and sharing of ideas to best come up with plans to accomplish our goals.

RHP6 anchor University Health System intends to do the following, which Val Verde Regional Medical Center will participate in:

Following completion of the RHP Plan, University Health System will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include the following:

Identify participants
Establish Learning Collaborative goals
Develop a calendar of regular meetings, site visits, and/or conference calls
Develop a plan to communicate ideas, data, and successes across the region and state
Organize a learning event and invite experts and other Performing Providers from outside the region to share knowledge and best practices
Adopt metrics to measure success

<table>

### Project Summary:

**Provider:** Community Medicine Associates (CMA) is the provider group practice of University Health System, a publicly supported, academic medical center and safety net provider. CMA serves the San Antonio area with an estimated population of 2 million. CMA currently has approximately 100 providers who practice within an ambulatory network of 19-primary, specialty and preventive health clinics located throughout Bexar County.

**Intervention(s):** Community Medicine Associates will increase the number of mid-level provider and allied health professional trainees, including Nurse Practitioners and Physician Assistants, in the primary care setting by increasing the number of training slots available to mid-level provider and allied health professional students.

**Need for the project:** Texas ranks last among the six most-populous states in both the ratio of active patient care physicians per capita and the ratio of active primary care physicians in patient care per capita. In comparison to all 50 states, Texas ranks near the bottom of the list: 46th for ratio of active patient care physicians per capita and 48th for active patient care primary care physicians per capita *(Source: 2011 State Physician Workforce Data Book, Assoc. of American Medical Colleges).* Nurse Practitioners and Physician Assistants can serve as an extension to the primary care physician.

**Target population:** The target population will include the CMA patient population which is comprised of 32.4% CareLink, 31.9% Medicaid, 12.6% HMO/PPO, 12.1% Medicare, and 10.9% self pay.

**Category 1 or 2 expected patient benefits:** The Health System will increase mid-level provider training programs in DY2 through DY5. While students are in this program, they will be trained in the PCMH model and disease registry use, will focus on population health, and assist providers in managing their panels. Practice and focus in these areas will improve patient experience and outcomes.

- **DY2**- Increase the number of mid-level trainees by 2 over baseline; 17 trainees for year.
- **DY3**- Increase the number of mid-level trainees by 4 over baseline; 19 trainees for year.
- **DY4**- Increase the number of mid-level trainees by 6 over baseline; 21 trainees for year.
- **DY5**- Increase the number of mid-level trainees by 8 over baseline; 23 trainees for year.

**Category 3 outcomes:**

- **DY4** – Decrease ED visits by TBD% for patients with COPD, behavioral health diagnoses, diabetes exacerbations, and asthma from baseline.
- **DY5** – Decrease ED visits by TBD% for patients with COPD, behavioral health diagnoses, diabetes exacerbations, and asthma from baseline.
diagnoses, diabetes exacerbations, and asthma from baseline

**Project Description:**

Our aim is to increase training of allied health providers including Nurse Practitioners and Physician assistants in the primary care setting. Our goal is to expand the primary care workforce to address the challenges of access to care and train provider and care team member students in patient centered concepts.

**Starting Point/Baseline:**

As of University Health System Year end September 30, 2012 CMA primary care Nurse Practitioners and Physician Assistants trained by this program is 15.

**Rationale:**

Passage of the Affordable Care Act (ACA) and the success in expanding high quality affordable care to millions of Americans will be determined, in large part, by the strength and capacity of the primary care workforce. National studies on access to health care make salient the importance of investing in a primary care workforce that will meet the health needs of an aging population as well as rapidly growing minority populations. Demographic and market forces are also having an impact on the current primary care workforce both in terms of retirement as well as the declining number of medical students choosing primary care as their career focus. In addition, primary care providers are geographically mal-distributed; often located in major urban centers and less likely to work in rural, economically underserved areas with high minority populations. This growing shortage has subsequently led to increased wait times, lower quality of care and poor patient experience.

Texas has consistently remained one of the top states in the nation in population growth fueled largely by a migration from other states as well as a large Hispanic immigrant population. However, Texas ranks last among the six most-populous states in both the ratio of active patient care physicians per capita and the ratio of active primary care physicians in patient care per capita. In comparison to all 50 states, Texas ranks near the bottom of the list: 46th for ratio of active patient care physicians per capita and 48th for active patient care primary care physicians per capita (Source: 2011 State Physician Workforce Data Book, Assoc. of American Medical Colleges). Increasing the supply of primary care doctors has become a focus through health care reform.

This project specifically addresses community need identification number three (CN3) which finds that large segments of the population in RHP 6 lack access to medical and dental care as result of high percentage of the population being uninsured and a limited supply of health care provider in close proximity to patients in need.

This project directly responds to this community need by expanding allied health professional training. This program is central to addressing the primary care workforce shortage. University Health System has served as a primary care training site for the University of Texas Health Science Center at San Antonio (UTHSCSA) school of Allied Health and seeks to expand primary care training opportunities. In addition, by working with our CareLink members directly, we will provide much needed access to primary care while training mid-level providers. The CareLink program was created in 1997 to help address the needs of Bexar County residents without health care coverage who were not eligible for Medicaid or other public or private...
funding. While CareLink is not an insurance product per se, it has many similar advantages in terms of promoting access to preventive health services, encouraging a long lasting relationship with a primary care provider, and instilling a sense of shared responsibility between member and staff for the member’s health.

By increasing the number of allied health provider training slots, the project addresses the national primary care workforce shortage. Students in this program will have the added benefit of being trained and participating in the Patient Centered Medical Home model and disease registries. Students in this program will also develop a focus on population health by assisting providers in the management of their panels during their training, which will improve the health outcomes in the community.

### Related Category 3 Outcome Measure(s):

High emergency room (ER) utilization is a considerable concern for the increasing cost of health care. Frequent and inappropriate use of hospital ERs is extremely costly and care could be provided in a less expensive setting. Patients, when possible, should be treated by their primary care provider for non-emergency conditions in order to promote consistent, quality care. The targeted population will be the Carelink members assigned to University Health System patient centered medical homes.

**IT-9.2 ED appropriate utilization (Standalone measure)**

- Reduce all ED visits (including ACSC)271
- Reduce pediatric Emergency Department visits (CHIPRA Core Measure)272
- Reduce Emergency Department visits for target conditions:
  - Chronic Obstructive Pulmonary Disease
  - Behavioral Health
  - Diabetes
  - Asthma

### Relationship to Other Projects:

**This Project is related to:**

92414401.2.2 Enhance/Expand Medical Homes – The PCMH is designed to increase access to primary care through the presence of a medical home model, and access to specialty and preventive services offered in one location, in close proximity to patient homes and communities.

92414401.2.1 Apply evidence-based care management model to patients identified as having high-risk care needs: Implement Care Model for University Health System Clinic settings.

**Relationship to Other Performing Providers’ Projects in the RHP:**

**This Project is related to:**

136141205.1.2 Expand primary care capacity. Training future providers in primary will assist with filling the need to create more access for patients and having newly trained providers to staff additional clinical sites.
136141205.1.4 Introduce, Expand, or Enhance Telemedicine/Tele-health
Telemedicine can be utilized to expand services and access to new clinical sites and will serve to
teach new providers this new modality in treating patients.

136141205.2.4 Establish/Expand a Patient Care Navigation Program. This project will link much
needed care coordination, social support and culturally competent care to vulnerable patient
populations at risk for admissions and re-admissions.

136141205.2.5 Use of Palliative Care Programs: Patients in the medical homes with chronic end
of life conditions will have an avenue that addresses patient populations who are at risk for
suffering, frequent emergency room visits, admissions and death.

Plan for Learning Collaborative:
This project lends itself to participation in learning collaboratives as other Performing Providers
in RHP6 seek to expand the primary care workforce services in other parts of the region for
similar patient populations. Processes and techniques developed and implemented during this
project will be documented by the project team. Successes as well as lessons learned will be
shared with regional collaborators who are also working to improve primary care access.

Project Valuation:
The project achieves the waiver goal and meets community needs by expanding primary care in
a predominantly Hispanic, underserved area of Bexar County. This program builds the primary
care workforce, strengthens healthcare linkages with local community partners and enhances
access to health care services to a target population who struggle with poverty, receive acute or
emergency healthcare services only, and do not have usual providers. In addition, many in the
target population have chronic disease; with no primary care access these condition will become
far more complicated and costly to treat. Access to a primary care medical home been has shown
to improve health, improve health care, and lower care costs.

Title: 1.10.1 Enhance improvement capacity within people (Improving Inter-professional Team-Based Care for Patient Safety)
Unique RHP ID#: 085144601.1.1 – PASS 1
Performing Provider: University of Texas Health Science Center at San Antonio
Kathleen R. Stevens, RN, Ed D, FAAN
Performing Provider TPI: 085144601

Project Summary:

Provider Description:
The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.

Intervention(s):
This project will implement the evidence-based national standard of team performance training, TeamSTEPPS, with healthcare providers across a range of inter-professional disciplines. Following train-the-trainer interventions, quality improvement projects will be performed throughout the region, spreading the team performance training.

Need for the project:
Currently, the lack of team performance training results in communication defects and threats to patient safety and effectiveness of care.

The project seeks to establish a customized for team training (YR 2); train 20 Master Trainers in TeamSTEPPS (YR2=20; YR3-5=30); establish baseline for team attitudes toward team performance (YR2); stimulate improvement projects (implementation of fundamentals training) (YR2=3; YR3-5=15).

Target population:
Healthcare providers in UTHSCSA and within the Region, including physicians, advance practice nurses, clinical nurses, clinic and unit staff, other health professions (e.g., PT, OT), faculty, students, and residents. Primary targets for this project are those providers who service patients throughout the region, particularly through the University Health System (UHS), including hospital and outpatient-based care teams. The project will train a total of 110 Master Trainers who will spread the training through at least 48 quality improvement projects.

It is expected that every patient in the Region stands to ultimately benefit from this project as it produces safer, better team care practices across the hospitals and clinics in the Region. Estimates (see Table 2 below) are that patients proceeding through 20,000 hospitalizations and 1.7 million outpatient visits will benefit from strengthened team performance.

As the providers in the Region practice care with greater team skills, care for these patients becomes safer and more efficient and adverse events resulting from inadequate team
communication and performance are reduced.

Category 1 or 2 expected patient benefits:

The following offers a snapshot of the Medicaid and indigent population that is targeted for safer and better team care, to be impacted through this project. Texas has the highest percentage of uninsured residents in the nation. Bexar County is one of several urban counties in Texas with large public or nonprofit hospitals, the primary of which is the University Health System, that have developed programs for serving a wider range of medical needs for a greater proportion of low-income uninsured.

Table 1. Bexar County 2008 statistics are as follows:

| Population | 1.6 million |
| Hispanic   | 60%         |
| Poor       | 17%         |
| Uninsured  | 1 in 4 adults |

Category 3 outcomes:

Our goal is to improve scores on the Culture of Patient Safety survey by 5% (YR4 and YR5).

Project Description:

Currently, team-based care is not widely practiced nor broadly taught in healthcare, including our region. The resulting communication defects result in threats to patient safety and effectiveness of care. The major delivery solution is implementation of the evidence-based national standard of TeamSTEPPS team performance training across all healthcare providers in UTHSCSA, including physicians, advance practice nurses, clinical nurses, clinic and unit staff, other health professions (e.g., PT, OT), faculty, students, and residents.

The goal is to customize, implement, and evaluate an innovative evidence-based inter-professional team-based care model to achieve high team performance for patient safety in all healthcare practice settings of the HSC. The target is better care through improved team performance to impact care transitions, team communication, culture of patient safety, and patient satisfaction. We will extend, replicate, and test an innovative evidence-based inter-professional team-based care model to achieve team-based care for patient safety in all healthcare practice
settings of the HSC. The expected outcome target is better care through improved team performance to impact team communication, culture of patient safety, and patient experience.

Outcome: Team-based care will improve quality and safety for patients and families through a number of channels. The 4-year expected outcome resulting from implementation of the project would include greater team-based care effectiveness and cost avoidance from better patient safety and satisfaction with experience. Essential interim outcomes include expanded care provider attitudes and skills in team performance. Training program outcomes include: Sustained team-based care training for professional development (continuing education) for faculty and clinicians; sustained team-based care training in formal inter-professional coursework and clinical practicum settings in which education occurs and improvement projects performed by newly-trained staff.

Challenges faced in promoting team-based skills include assembling inter-professional groups (practicing professionals, faculty, and students) to engage in this training to acquire team-based care skills. The 2 ½ day Master Training and the 4-hour basic training will require dedicated time and effort from these groups and from the trainers. Another challenge noted by others who have implemented TeamSTEPPS on a broad scale is the paradigm shift that must occur to achieve team-based care across disciplines. Often silos and traditional communication/collaboration styles are embedded in team-based care. Finally, the shift by organizations to evolve systems supporting patient safety demands both administrative and frontline provider to effect a culture of patient safety.

Quality:

To achieve continuous quality improvement we shall assess the projects impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

Region 6 goals:

This project achieves CMS’s Triple aim objectives of assuring patients receive high quality and patient centered care, in the most cost effective way, improves the health care infrastructure to better serve the Medicaid and uninsured residents of the counties we serve, further develops and maintains a coordinated care delivery system and improves outcomes while containing costs.

Starting Point/Baseline:

A strong foundation of available resources has been developed over the last 3 years, including 100+ Master Trainers (MT’s) in the TeamSTEPPS program, who will serve as resources to extend the training. The ACE center has experience in planning and implementing the 2 ½ day Master Training and national affiliations (e.g., Agency for Healthcare Research and Quality) to assure the most current training locally. Although these advances have been made in training the trainers, diffusion into clinical settings still lags and sustainment is not yet stabilized. For example, of the MT’s from this program, about 1/3 have moved forward with agency integration; and this group reports scores that have remained low on the AHRQ Hospital Survey on Patient Safety Culture (HSOPS)\textsuperscript{15}. Clearly, the proposed program can contribute to gains in team-based care for patient safety.
Human factors research demonstrates that even proficient professionals are vulnerable to error due to inherent human limitations. High reliability organizations, such as aviation, find that teams of professionals who communicate effectively compensate for individual vulnerability and reduce consequences of errors, resulting in enhanced safety and improved performance. A major finding of the report, To Err Is Human was that inadequate communication was the largest contributing factor to the occurrence of errors and near misses in healthcare. Communication failures have been shown to be the leading cause of sentinel events, including preventable patient deaths, accounting for up to 80% of adverse events. Preventable medical errors in US hospitals cost an estimated 98,000 patient lives and $17 to 29 billion each year.

Accrediting agencies acknowledge that poor team communication in the form of intimidating and disruptive behavior also undermine a culture of safety. In this vein, The Joint Commission established a new leadership standard and as of January 2009, requires sentinel event reporting of disruptive and inappropriate behaviors. Suggested actions include encouragement of interprofessional dialogues across a variety of forums. Preventive measures include standardized communication techniques, such as those contained in teamwork training.

Effective inter-professional teamwork in healthcare is essential to patient safety. Although sparse, research on inter-professional education (IPE) is suggestive that IPE may produce positive outcomes on department culture, patient satisfaction, collaborative team behavior, and reduction of errors. Key IOM recommendations are that healthcare organizations “establish interdisciplinary team training programs for providers that incorporate proven methods of team training…” that all health professionals are educated to deliver care as members of an interdisciplinary team, and that common language and core inter-professional competencies are developed.

The quick response to these recommendations by multiple government agencies produced a standardized team training program based on best evidence: Team Strategies and Tools to Enhance Performance and Patient Safety (TeamSTEPPS™). This new teamwork system is designed to optimize team performance and outcomes across the health care delivery system. TeamSTEPPS is the standardized federal program for healthcare team training.

In this context, Academic Health Centers have been called on to create positive clinical education environments. Given that approximately 50% of nursing education and 70% of physician education occurs in clinical settings, IOM urges that Academic Health Centers create positive clinical education environments. Our own UTHSC Strategic Plan, Goal #1 targets the provision of an “environment for educational excellence”.

There is an urgent need for standardized training in inter-professional teamwork and communication that moves easily from academic to practice settings. In addition to human factors in systems failures, often the basis of breakdowns in communication is the differing communication styles used by clinicians attributable to differences in education and lack of formal education in teamwork. Every quality improvement intervention, at its core, is targeted at making sure that a team of healthcare workers with various levels of education and often with various agendas come together and coordinate effectively and have some equal teamwork competency and standing. This multidisciplinary nature of the team and its work inhibit the team’s ability to coordinate and communicate effectively. Yet standardized team communication is not typically taught as core competencies in health professions although required or recommended. Few
members of the present workforce have had opportunity to be trained in standardized communication such as TeamSTEPPSTM. Emerging evidence indicates that TeamSTEPPSTM diffusion is correlated with improvement in scores of the AHRQ Hospital Survey on Patient Safety Culture (HSOPS), a system change much needed in most clinical settings.

To our knowledge, no other similar projects funded by the USDHHS are currently underway at UTHSCSA.

**Core Project Requirements:**

(a) Provide training and education to clinical and administrative staff on process improvement strategies, methods and culture.

(b) Develop an employee suggestion system that allows for the identification of issues that impact the work environment, patient care and satisfaction, efficiency, and other issues aligned with continuous process improvement.

A & B represent all core project components listed above are implemented.

The project will train a total of 110 Master Trainers who will spread the training through at least 48 quality improvement projects led by these trainers within 6 months of completion of training. These CQI projects will scale and spread the team performance training in order to drive their entire organizations on a more rapid trajectory of improvement.

CN.1 Enhance quality of care and improve patient satisfaction

**Related Category 3 Outcome Measure(s):**

OD-4 Potentially Preventable Complications and Healthcare Acquired Conditions Response to reviewer: Because OD-9 is Right Care, Right Setting, we respectfully submit that OD-4 remains the most closely aligned.

IT-4.10 Other Outcome Improvement Target Enhance Improvement Capacity within people (Improving Inter-professional Team-Based Care for Patient Safety)

Measure for Category 3 outcomes: Performance improvement for culture of patient safety. Appropriate Care that is Safe; Improved Clinical Performance Outcomes in terms of care team performance. Outcome: Team-based care will improve quality and safety for patients and families through a number of channels. The 4-year expected outcome resulting from implementation of the project would include greater team-based care effectiveness and cost avoidance from better patient safety and satisfaction with experience. Essential interim outcomes include expanded care provider attitudes and skills in team performance. Training program outcomes include: Sustained team-based care training for professional development (continuing education) for faculty and clinicians; sustained team-based care training in formal inter-professional coursework and clinical practicum settings in which education occurs and improvement projects performed by newly-trained staff.

**Relationship to other Projects:**

1.1 Expand Primary Care Capacity Dr. Julie Cowan Novak
1.2 TeamSTEPPS is a program whose ultimate objective and purpose is improved patient safety and as such reinforces, enables, and is related directly to most other projects or at a minimum indirectly to all others. The direct application of newly-developed modules and metrics makes TeamSTEPPS relevant to ambulatory care settings and patient engagement. In every setting that offers care through team-based processes, TeamSTEPPS is essential.

**Relationship to Other Performing Providers’ Projects in the RHP:**

The objective of this project is to improve patient safety via tools and training centered around quality. As a result it is directly related to all other projects.

**Plan for Learning Collaborative:**

A learning collaborative will be formed such that organizations are able to share ideas, challenges and develop solutions. The learning collaborative will bring participating sites together via conference call once a quarter where project-level goals are discussed and other projects are able to learn. A face-to-face meeting will occur once a year at the CTSA CER meeting where informatics is the topic of discussion. During this meeting, those belonging to the learning collaborative along with others outside of the region are able to share knowledge and participating sites are able to learn from the successes/challenges of other sites.

**Project Valuation:**

Because a healthcare setting’s culture of patient safety is demonstrated to be directly related to prevention of healthcare associated harm and reflects higher organizational just cultures, teams that hold strong allegiance to high team performance are crucial within the context of the high reliability organization. The project is valued based upon achieving waiver goals, meeting community needs, scope, and investment.

The project is valued based upon achieving waiver goals, meeting community needs, scope, and investment.

### Year 2
(10/1/2012 – 9/30/2013)

#### Milestone 1
P-2. Establish a customized program for trained experts on process improvements to mentor and train other staff for safety: Project planning, stakeholder engagement. Lead improvement projects.

- **P-2.1 METRIC** Train the trainer program established
  - Numerator: 20 staff trained as TeamSTEPPS Master Trainers
  - Denominator: NA
  - Data Source: Training program records: 22 hrs/staff person is required for completion; 20 staff = 440 hours of training.

#### Milestone 2
P-2. Implement the training program; ongoing training will increase capacity for QI.

- **P-2.1 METRIC** Number of staff trained as TeamSTEPPS Master Trainers
  - Numerator: 30 staff trained as TeamSTEPPS Master Trainers; Denominator: NA
  - Data Source: Training program records: 22 hrs/staff person is required for completion; 30 staff = 660 hours of training

#### Milestone 3
P-2. Implement the training program; ongoing training will increase capacity for QI.

- **P-2.1 METRIC** Number of staff trained as TeamSTEPPS Master Trainers
  - Numerator: 30 staff trained as TeamSTEPPS Master Trainers; Denominator: NA
  - Data Source: Training program records: 22 hrs/staff person is required for completion; 30 staff = 660 hours of training

### Year 3
(10/1/2013 – 9/30/2014)

#### Milestone 2
P-2. Implement the training program; ongoing training will increase capacity for QI.

- **P-2.1 METRIC** Number of staff trained as TeamSTEPPS Master Trainers
  - Numerator: 30 staff trained as TeamSTEPPS Master Trainers; Denominator: NA
  - Data Source: Training program records: 22 hrs/staff person is required for completion; 30 staff = 660 hours of training

- **P-2.2 METRIC** Improvement projects led by newly trained staff
  - Numerator: 15 projects
  - Denominator: NA
  - Data Source: Training program records: 22 hrs/staff person is required for completion; 30 staff = 660 hours of training

- **P-2.2 METRIC** Improvement projects led by newly trained staff
  - Numerator: 15 projects
  - Denominator: NA
  - Data Source: Training program records: 22 hrs/staff person is required for completion; 30 staff = 660 hours of training

### Year 4
(10/1/2014 – 9/30/2015)

#### Milestone 3
P-2. Implement the training program; ongoing training will increase capacity for QI.

- **P-2.1 METRIC** Number of staff trained as TeamSTEPPS Master Trainers
  - Numerator: 30 staff trained as TeamSTEPPS Master Trainers; Denominator: NA
  - Data Source: Training program records: 22 hrs/staff person is required for completion; 30 staff = 660 hours of training

- **P-2.2 METRIC** Improvement projects led by newly trained staff
  - Numerator: 15 projects
  - Denominator: NA
  - Data Source: Training program records: 22 hrs/staff person is required for completion; 30 staff = 660 hours of training

### Year 5
(10/1/2015 – 9/30/2016)

#### Milestone 5
P-2. Implement the training program; ongoing training will increase capacity for QI.

- **P-2.1 METRIC** Number of staff trained as TeamSTEPPS Master Trainers
  - Numerator: 30 staff trained as TeamSTEPPS Master Trainers; Denominator: NA
  - Data Source: Training program records: 22 hrs/staff person is required for completion; 30 staff = 660 hours of training

- **P-2.2 METRIC** Improvement projects led by newly trained staff
  - Numerator: 15 projects
  - Denominator: NA
  - Data Source: Training program records: 22 hrs/staff person is required for completion; 30 staff = 660 hours of training

- **P-2.2 METRIC** Improvement projects led by newly trained staff
  - Numerator: 15 projects
  - Denominator: NA
  - Data Source: Training program records: 22 hrs/staff person is required for completion; 30 staff = 660 hours of training

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $1,793,123**
Identifying Project and Provider Information:

Title: 1.3.1 Implement/enhance and use chronic disease management registry functionalities (Longitudinal Diabetes and Other Chronic Disease Registries to Improve Patient Outcomes)
Unique RHP ID#: 085144601.1.2 – PASS 1
Performing Provider: University of Texas Health Science Center at San Antonio
Performing Provider TPI: 085144601

Project Summary:

Provider Description: The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.

Intervention(s): This project will develop longitudinal clinical registries to improve quality of care at our collaborating primary care practices that train medical students and residents in medicine and will implement evidence-based community health worker (promotora) interventions to address health risks in patients who are not meeting their disease management goals.

Need for the project: This project serves as a basis for many other initiatives to improve the quality and outcomes of patient care by developing longitudinal clinical registries to help primary care physicians evaluate their care and identify patients who are in need of support to improve outcomes. Our study population is majority Latino with a large proportion who receive care through CareLink, a county-based financial assistance program. We will offer valuable data about predictors of poor achievement of clinical care goals such as uncontrolled hypertension, poor control of diabetes, and excessive weight gain. These are all associated with the development of complications that can compromise quality of life and survival as well as increase the need for costly urgent care services including admission/readmissions and emergency department utilization. In addition, this project will contribute to a coordinated care delivery system and improve outcomes while containing cost growth through evidence-based interventions for patients who do not meet quality of care metrics. Through electronic medical record-derived registries, we will be able to examine the continuum of care across ambulatory primary care providers and specialists, and hospital admissions as well as laboratory and procedures performed in these linked systems of care.

Target populations: We will focus our project on improving outcomes of low income patients with Medicaid, CareLink (county-funded financial assistance), and no insurance who are not meeting quality of care, health maintenance goals or requiring treatment with narcotics for pain. We will first target individuals with diabetes mellitus who have a mean hemoglobin (Hb) A1C level of >= 7.5% which increases the patients’ risk of diabetes complications. Second, we will identify a similar cohort of persons who have sustained uncontrolled systolic hypertension, which is the dominant form of uncontrolled hypertension. Third, we will identify persons who have chronic non-cancer pain and are treated with narcotics long-term since these individuals are known to be heavy users of emergency and hospital services as well as at risk for overdose events. Finally, we will identify HIV-infected persons in our local HIV clinic who have Ryan White or CareLink insurance because we have found that over 60% are overweight or obese and are still having significant weight gain.

Category 1 or 2 expected patient benefits:

DY 2: Patient Navigation (2.9): This project will target over 1,000 patients who fail to achieve health maintenance and disease management goals at three clinics. Once these patients are identified, we will
train and guide 5 patient navigators (promotoras) and peers from the practice to assist the patients at
greatest need with culturally appropriate interventions and provide at-risk patients with coordinated,
timely, and site appropriate health care services.

DY 3: By improving patient navigation, the patient experience (2.4) will also be improved.
Enhancement/Expansion of Medical Homes (2.1): Central to successful medical homes is access to
excellent information about quality of care metrics and insuring well-coordinated, comprehensive care.
Longitudinal chronic disease registries provide a foundation for these goals. Our goal is to have all key
personnel at the Brady Green clinics understand how to read and use the registry by the end of year 5.

DY 4: Expansion of Chronic Care Management Model (2.2): By using a longitudinal study design, this
project will provide comprehensive information on how patients use and receive services over time – so
that we can identify those who have not been seen within a recommended timeframe to evaluate their
chronic disease status. We can also examine patterns of care. A key predictor of poor outcomes in our
prior research on patients with diabetes in our primary care clinics at University Health System is the
proportion of scheduled visits that a patient keeps (% visit non-attendance). We have found that patients
who fail to keep scheduled visits in a baseline three-year period are at increased risk of hospitalization in a
follow-up year – with a two-fold greater risk of hospitalization for persons who keep only 60% of
scheduled visits compared with patients who keep >75% of visits (absolute difference 6% vs. 13%,
respectively) after adjusting for patient demographic, clinical, and health care variables. We have also
found that the % visit non-attendance is also linearly associated with less reduction in hemoglobin A1c
(HbA1c) among patients who have a baseline HbA1c >8%. Sustained HbA1c over 8 is associated with an
increased risk of avoidable complications in the long term including renal failure, blindness, and vascular
diseases. In all of these analyses, 50-60% of these patients have CareLink or Medicaid insurance and most
are Latino. For our DSRIP project, we will be able to examine the pattern of visit non-attendance among
patients in our cohorts and then stratify on baseline poor control to target patients who need additional
promotora support along with proactive practice-based interventions. We aim to have >98% of active
patients have documented HbA1c as well as documentation as to why they are not on medication if they
HbA1c is over 6.5%. We will also look for all patients with hypertension to have documented blood
pressures at least twice a year. We also have approximately 5% of our 1433 patients in HIV clinic who
have fewer than two BMI measurements. We aim to have all HIV patients have BMI recorded at visits at
least twice a year. Finally we are looking to see documentation of a urine drug screen and an opioid use
agreement for at least 60% of patients on long-term narcotics. Goal is to increase the percentage of
patients with diabetes in the registry by 5%. Our goal is to have a complete updated registries for patients
with hypertension, long-term opioids (defined as at least 90 days in a 6 month period), and HIV infection.
Lastly, our goal is to have reached 95% of the providers in the Brady Green Clinic with educational
materials about the interventions and educate them about providing all patients with disease specific
information to overcome barriers to achieving goals.

DY 5: Redesign for Cost Containment (2.5): This project will allow us to investigate if patients receive
either too many or not enough services. By examining these areas, we can also offer feedback to
physicians about their level of service utilization relative to other providers (e.g. too many MRIs for low
back pain or too few patients immunized against pneumococcal vaccine). For example, we will focus on
our chronic non-cancer pain registry in identifying patients who are receiving high dose opioids or
prescriptions without being seen in the office because they have excess utilization of emergency room and
hospital services. Reports will be generated for over 75% providers/care teams for care delivered outside
the office visit. Our goal is to reduce the mean A1c to <7.3 for these patients using an outreach
intervention. We can expect to substantively improve blood pressure control in this population from an overall mean of 135 mmHg to 131 mmHg. Lastly, we will work to reverse the observed rapid weight gain to <1% BMI per year. For patients with chronic pain on narcotics, our goal is to have 80% receive urine drug testing at least once a year and 80% have documented opioid use agreements. We will also monitor the morphine equivalent doses for these patients and offer feedback to 100 percent of the providers about the risks of doses over 50 per day.

Category 3 outcomes: This project will address Outcome Dimension 11: Addressing Health Disparities in Minority Populations, specifically Improvement in Clinical Indicators in Latino Populations. The clinical indicators chosen for this project include hypertension control, HbA1c reduction to goal, and stabilization of weight in HIV infected patients who are overweight or obese. We will also work to improve our non-attendance rate for our patients. Currently, the mean non-attendance rate for our diabetes population is 31%. For persons with diabetes and mean HbA1c >= 7.5%, efforts to reduce this level to < 7.5% are most cost-effective according to the American Diabetes Association. We propose to first target persons with baseline A1c and a last A1c mean 7.5% reduce their mean to <7.5%. In terms of hypertension, the goal of this project is to insure that the majority of our Latino population meets targets for blood pressure control, including <140 mmHg systolic blood pressure for non-diabetics and ideally <130 Hg for diabetics We will reduce the proportion of patients who have uncontrolled hypertension despite drug therapy by 10% and achieve at least a 3-5 mmHg reduction in systolic blood pressure. We will use our registries to define patients who need support to achieve goals and implement evidence-based promotora and peer support interventions to address these health risks.

For patients treated with long-term narcotics, our goal is to offer additional support to reduce the proportion of patients who meet quality of care metrics including, visits every 3-6 months, urine drug screening, opioid agreement, and morphine equivalent dose <50. In other analyses in an insured population, our group has found that patients with chronic non-cancer pain who have are prescribed high dose long-term opioids have 8 times the risk of hospitalization compared with those on no opioids. Our group has also examined weight gain as an adverse outcome for patients with HIV infection and found that those who are from minority groups (Latino or non-Hispanic black) with no insurance (CareLink or Ryan White) have 8 times greater risk of gaining more than 3% of their BMI annually vs. non-Hispanic whites with Medicaid or Medicare insurance. This results in a rapid rise in the obesity; among 455 overweight (BMI 25 to 30) HIV patients at baseline, 25% will become obese (BMI=>30) within only 3 years and among 491 normal BMI (19-25), 9% will become obese in 3 years. We must address this additional risk factor for complications in HIV-infected persons.

Project Description:
The University of Texas Health Science Center at San Antonio (UTHSCSA) and our practices in collaboration with University Health System (UHS) are well positioned in our region to address the DSRIP category I project area 1.3 “Implement a Chronic Disease Management Registry”. We are already engaged in developing registries to support effective care management. University Health System has each initiated longitudinal Diabetes Registries to inform delivery of care, to educate providers and patients, and to target disease management interventions that will improve quality of care and clinical outcomes in the population we serve. The first specific aim of this project is to create a quality improvement (QI) data mart for the outpatient management by UT primary care and HIV practices located at UHS Brady Green campus for patients with diabetes, hypertension, HIV, and patients with chronic pain treated with opioids. A second specific aim is to assist with building a parallel data mining resource for University Health System clinics because we share many of the same patients. We are in the process of developing a Health Information Exchange (HIE) to ensure seamless exchange of information
about our patients. A third specific aim is to use these data to inform providers and patients about care outcomes and to offer a resource to target and evaluate case management and other interventions to improve outcomes when needed.

**Challenges.** Major professional societies and international public health organizations including the World Health Organization and the American Diabetes Association endorse targeting diabetes as a key health care threat. Our goal is to reduce the significant adverse impact of diabetes not only on our patients but on our community because it can be a very costly, high morbidity condition. The other conditions that we are targeting have similar serious consequences for our community: a) hypertension - the main cause of cardiovascular disease that, in turn, is the most common cause of death in adults in our region, b) HIV - a deadly condition that has been transformed into a chronic disease if given excellent care, and c) chronic pain management with opioids -- can lead to diversion and overdose when care is not well monitored and coordinated.

**Approaches to Address Challenges:** Using diabetes as our model for a registry, it is critical that providers receive information about quality of care indicators, longitudinal patterns of care (e.g., examining adherence to scheduled appointments), adherence to medications, and clinical outcomes as defined by hemoglobin (Hb) A1c and renal function to avoid complications such as diabetes-related renal disease and blindness. The diabetes registry should be the backbone for population management to identify at-risk persons within a defined population and to provide specific patient support strategies for these persons who are failing to achieve care goals, directed by the patient’s usual source of care through a clinical nurse case manager and case management team. Feedback to providers based on periodic registry review will be conducted to insure that these outreach patient support programs are effective.

**5-year outcomes include:** 1) Improvement in the proportion of registry patients who receive recommended services; 2) Improvements on lab results including but not limited to: HbA1c tests and lipid tests; and 3) documentation of patient-specific goals, and reduction in urgent care services. Currently, we have identified 6,780 patients followed in the Family Medicine clinic at the Brady Green Building at UHS who have CareLink, Medicaid, or self-pay, of whom 24.7% have diabetes. Currently we have identified 1,171 patients followed in the General Internal Medicine clinic at the Brady Green who have CareLink, Medicaid, or self-pay, of whom 39.1% have diabetes. Similarly, the proportions of patients in these two clinics with hypertension are 38.8% and 64.4%, respectively. The HIV clinic at the Brady Green currently follows approximately 1,200 patients. By tracking various chronic disease metrics (e.g. HbA1c, lipid, weight, exercise frequency), we will be able meet patient-specific goals by targeting patients in need of support by promotoras and peers to address deficiencies in care such as poor medication adherence and unhealthy lifestyle, thereby improving clinical status and reduce urgent care utilization consistent with the region 6 waiver goals of: meeting CMS stated triple aim goals of assuring patients receive high quality patient centered care, in the most cost effective ways. In addition this project improves the health care infrastructure to better serve the Medicaid and uninsured residents of our counties, further develops and maintains a coordinated care delivery system, and improves outcomes while containing cost growth.

**Starting Point/Baseline:**

The data source for the diabetes registry is Sunrise electronic medical record that serves all of the clinics located at a UHS site – for UT Medicine clinics the site is the Brady Green campus. In this project, we are serving three clinics at UHS that have large numbers of Medicaid, CareLink or self-pay patients. The guiding principle of this project is to develop a centralized analytic system that offers a centralized data repository, technology and knowledge management. We will establish an analytics/data mining center of excellence that creates, implements and maintains longitudinal registry databases of health care utilization and services for patients with common chronic diseases and ambulatory care sensitive conditions. UT Medicine has over 30 primary care providers, including residents and faculty as well as allied health
professionals (nurse practitioners, physician serving patients in these settings)

Currently, the Brady Green diabetes registry for the UT Medicine practices has over 2,000 persons from 2011-12 with longitudinal data on demographics, health care utilization, vital signs (e.g. BMI), clinical lab measures (e.g. HbA1c), prescribed medications, and other comorbidities. We are working to improve this registry by developing improved, more complete data queries, by reducing missing or incomplete data elements, and by linking patients to their usual source of care. No formal provider training has been undertaken on the use of this registry. This needs to be completed to ensure that physicians/allied health personnel and their support staff can use the registry data properly and to its fullest capacity. The HIV registry from 2008-2011 includes over 1,500 persons who have been validated by chart review as having this infection. Our database includes all encounters, diagnoses, relevant HIV tests, vital signs (validated), medications, insurance and demographics. We plan to train all providers at Brady Green primary care practices to use the data in the registry and, in order to improve clinical outcomes, to direct promotoras and peers to help patients who are not achieving quality of care goals.

Rationale:

Reasons for Selecting Project: This project serves as a basis for many other initiatives to improve the quality and outcomes of patient care. It meets all the Triple Aim goals by assuring that patients receive high-quality and patient-centered care and in the most cost effective manner. Our providers serving an indigent population including persons with Medicaid, CareLink, and no insurance. We will offer valuable data to inform implementation of patient support and practice procedures that will improve patient clinical outcomes such as reduced HbA1c, systolic blood pressure and weight control – all of these factors are associated with increased use of health care resources and preventable complications when not controlled to nationally accepted goals. We have plans to unite the University Health System (UHS) and UT Medicine electronic medical record systems through a Health Information Exchange called DBMotion. However, even before the HIE is implemented, we are able to examine the continuum of care across ambulatory primary care providers and specialists, hospital admissions as well as laboratory and procedures performed in these linked systems of care. In addition, this project will further develop and maintain a coordinated care delivery system and improve outcomes while containing cost growth. This project addresses Categories 1.3, 2.9, and 3 Outcome Dimension 11.

The following project Required Core Project Components are included in the milestone and steps to achieve milestone sections below:

(a) Enter patient data into unique chronic disease registry.
(b) Use registry data to proactively contact, educate, and track patients by disease status, risk status, self-management status, community and family need.
(c) Use registry reports to develop and implement targeted QI plan.
(d) Conduct quality improvement for project using methods such as rapid cycle improvement.

Milestones:

DY 2: Identify one or more targeted patient populations diagnosed with selected chronic disease(s). For the diabetes registry, various data elements will be extracted from the EMR: 1) patient encounters, 2) diagnosis codes from problem lists, medical history and encounters, 3) lab orders and results, 4) necessary services (e.g. immunizations, eye examination) – all stored in different tables in the Sunrise electronic medical record database that will be linked to provide comprehensive longitudinal data on patient care. For the hypertension and HIV registries, elements extracted include demographics, BMI, blood pressures, arrival status of visits, relevant labs, disease specific medications, comorbidities, providers, ER use, and hospitalization.
DY 2: Develop cross-functional team to evaluate registry program
DY 2: Implement/expand a functional disease management registry
DY 3: Undertake provider training to prepare practices and providers to use the registries to evaluate/inform patient care, target outreach, and evaluate outcomes of initiatives to improve patient care.
DY 3: Conduct staff trainings on populating and using registry functions
DY 3-5: Case manager/promotora, peer coaches, and associated team members will use this registry to coordinate services for at risk patients in collaboration with the usual source of care.
DY 4: Increase the percentage of patients with diabetes based on billing data from UT Medicine (N=2121) recorded in the registry (that currently has 2005) by 5% by searching UHS electronic medical records for patients who are not yet in the registry
DY 5: Generate registry-based reports for each provider/care team for the care delivered outside the office visit.
DY 5: Increase the percentage of patients with chronic disease entered into the registry who receive instructions appropriate for their chronic disease or MCCs to over 80%

Steps to achieve milestones
- Microsoft SQL Server Database will be accessed from SAS on Microsoft Windows, using ODBC (Open Database Connectivity and data will be imported to SAS.
- SAS programs will be written for definitions of established patient, assigned physician, diagnosis of diabetes, last HbA1c, last LDL cholesterol as well as more complex variables including the proportion of scheduled visits that were attended (low proportion = high risk), and adherence to medications.
- The accuracy of data will be assessed by manual verification of selected patient records and, when necessary, the process of data extraction and import will be modified to improve accuracy.
- Once fully functional, SAS will continually generate reports for physicians caring for patients with diabetes in UT Medicine and their UHS administrators and other team members. Further, reports will be generated for providers to alert them when certain goals need to be addressed.
- The ‘at-risk’ outliers not achieving therapeutic goals will be identified and “red-flagged.”
- A case manager and case management team will be hired and trained with the goal of periodically reviewing the red-flagged patients with the physicians and care team independent of scheduled visits.
- Outreach project will be designed and implemented to contact and communicate with these outliers and evidence-based interventions implemented to assist them to achieve their therapeutic goals.
- We hypothesize that an iterative intervention by a “population manager,” who would identify at risk patients and collaborates with the physician as well as the patient to address barriers to success could potentially result in significantly better overall diabetes management compared with a population of patients receiving usual care. Similar potential for improvement is possible for the other chronic disease that we will target.

Metrics for Diabetes Registry as an example
Year 1. Develop/implement a registry, hire and train staff in use of registry.
Year 2. 50% - 70% of patients with diabetes are entered in the registry.
Year 3. 60%-80% of patients with diabetes are entered in the registry
50%-60% of physicians receive monthly registry reports on their patients with diabetes.
Year 4. 60%-80% of physicians receive monthly registry reports on their patients with selected conditions.
50% - 60% of physicians communicate periodically via face-to-face meeting, teleconference or electronically with panel manager and care team to red-flag patients to receive outreach by phone, mail or in-person.  

75% - 100% of physicians receive monthly registry reports on their patients with selected conditions. 60% - 80% of physicians communicate periodically via face-to-face meeting, teleconference or electronically with panel manager and care team to red-flag patients to receive non-physician outreach by phone, mail or in-person.

**Community Need:** This project has great potential to address community needs defined in the Community Health Improvement Plan for Bexar County. Specifically, we will address priority areas of Healthy Eating and Active Living (#1) as well as Behavioral and Mental Well-Being (#4). Health issues addressed by identifying patients with diabetes, HIV, and hypertension who require additional services to meet lifestyle and care goals. In regard to Behavioral and Mental Health, patients who do not achieve chronic disease management goals are significantly more likely to have unmet behavioral and mental health support needs. A key component of our outreach support and services for at risk patients who are identified from the registry will be offering formal (promotora) and informal (peer support) as needed to address these health care needs.

CN.2 is the unique community need being addressed by this project.

**Related Category 3 Outcome Measure(s):**

OD-11 Addressing Health Disparities in Minority Populations.

[IT-11.2]: Improvement in disparate health outcomes for target population, including identification of disparity group

(IT-11.1]: Improvement in Clinical Indicator in identified disparity group. Improvement in clinical indicators of hypertension control, HIV viral load suppression, hemoglobin A1C in both Hispanic and non-Hispanic populations but reductions are expected to be greater in the former group because poorer status at baseline

Related to Category 3 Outcome Measures, this project will address Outcome Dimension 11: Addressing Health Disparities in Minority Populations, specifically Improvement in Clinical Indicators in Latino Populations. The clinical indicators chosen for this project include hypertension control, Hb A1C reduction to goal, and HIV care goals of reducing excessive weight gain in persons who are overweight or obese. These measures are a priority for the RHP because research and national surveys conducted by the CDC have shown that low-income, Hispanic populations are disproportionately affected by poor clinical and functional status reflecting poor achievement of chronic disease management goals and a high prevalence of overweight and obesity. Thus, morbidity and chronic disease management are areas of great concern for providers working with Latinos. In terms of hypertension, the goal of this project is to improve our data entry and registry accuracy so that valid blood pressure data are recorded for at least 90% of our Latino population. For persons with a mean HbA1c over 7.5, efforts to reduce this level to under 7.5 is not only cost-effective but also significantly reduces the risk of diabetes complications when <7% according to the ADA. We propose to reduce the mean HbA1c from the current 7.7% in our study practices to 7.3 (5% absolute reduction) by targeting the persons who fail to keep their appointments and
who have elevated HbA1c. Currently, we have found that the average relative reduction over a three year period in HbA1c for persons with an HbA1c over 8% at baseline is -15.9% for persons who keep >75% of visits vs. only -9.5% for persons who keep <60% of visits. Similarly, we will reduce the proportion of patients who have uncontrolled hypertension despite therapy by 10% and achieve at least a 3 to 5 mmHg reduction in systolic blood pressure. We will be able to achieve these goals by using the registry to define patients who need additional support to achieve goals and to implement evidence-based community health worker (promotora) interventions to address these health risks through promotoras and peer support. In collaboration with the patient practices, promotoras and trained peers will provide culturally appropriate outreach aimed at reducing disparities for low-income and Hispanic patients. To address health disparities, Dr Turner led a successful randomized controlled trial of peer support for uncontrolled hypertension in a minority population that resulted in a reduction in systolic blood pressure similar to adding a new drug (Turner, et al. 2012).

### Relationship to other Projects:

In relation to other projects and interventions within the RHP plan, this project supports, reinforces and enables Patient Navigation, Redesign to Improve Patient Experience, Enhancement/Expansion Medical Homes, Expansion of Chronic Care Management Models, and Redesign for Cost Containment.

**Patient Navigation (2.9):** This project will target patients who fail to achieve health maintenance and disease management goals. Once these patients are identified, we train and guide patient navigators (promotoras) and peers to assist the patients at greatest need and provide at-risk patients with coordinated, timely, and site appropriate health care services. By improving patient navigation, the patient experience (2.4) will also be improved.

**Enhancement/Expansion of Medical Homes (2.1):** Central to successful medical homes is access to excellent information about quality of care metrics and insuring well-coordinated, comprehensive care. Longitudinal chronic disease registries provide a foundation for these goals.

**Expansion of Chronic Care Management Model (2.2):** By using a longitudinal study design, this project will provide comprehensive information on how patients use services over time – so that we can identify patients who have not been seen within a recommended timeframe to evaluate their chronic disease status. We can also examine adherence to medications and patterns of care. Patients who receive only urgent care can be identified as well as those who persistently cancel or no show to scheduled appointments. These patients are in particular need of targeted management and support programs.

**Redesign for Cost Containment (2.5):** This project will allow us to investigate if patients receive either too many or not enough services. By examining these areas, we can also offer feedback to physicians about their level of service utilization relative to other providers (e.g. too many MRIs for low back pain or too few patients immunized against pneumococcal vaccine).

Related to Category 3 Quality Improvement of Chronic Disease, this project especially focuses on diabetes to ensure that patients who have a mean HbA1c >7.5% and who keep <75% of their visits (associated with an increased risk of adverse events and end organ damage) receive outreach to improve control of their diabetes. We also aim to target patients who continue to have uncontrolled systolic hypertension (>140 mmHg) on treatment. HIV registry data will be used to identify patients who are overweight or obese and work to reduce their rate of weight gain. We have observed a 3% annual increase in BMI in 34% for the 434 HIV infected persons in our registry who are Hispanic or black and who have CareLink or Ryan White insurance and 18% for the 496 Hispanic or Black patients with Medicaid or Medicare insurance. Through culturally appropriate outreach by promotoras and peers, this project aims to reduce disparities for low-income and Hispanic patients. Our primary goals are to improve diabetes and hypertension control and reduce the rate of weight gain for these patients. These are secondary outcome
metrics that we will monitor and expect to see reductions blood pressure, cholesterol, and hyperglycemia that are all related to obesity. We are also going implement team based care programs to improve quality of care metrics for patients who are treated with long-term narcotics for chronic non cancer pain – approximately 100 patients – including record of an opioid use agreement, yearly urine drug testing, and at least one visit every 6 months.

Related to **Category 4 Population-Focused Measures**, this project targets a low-income, Medicaid, and uninsured population because University Health System is our region’s safety net institution and provides care to a largely indigent population. UT Medicine primary and specialty care to these patients. This is a high priority patient population—largely minority (Mexican-American) and low income. These patients are in great need of targeted support to improve health outcomes – this effort will be informed by these longitudinal chronic disease registries.

**Relationship to Other Performing Providers’ Projects in the RHP:**

Other groups with RHP proposals that have similar projects to our implementation of a chronic disease management registry will be asked to form a learning collaborative. These providers include University Hospital who is a central partner in this shared registry and patient support program, Baptist Medical Center that shares many patients with UT Medicine, and San Antonio Metropolitan Health District that supports all efforts to improve the health of our region’s population. Currently, UTHSCSA has a close working relationship to University Hospital through several projects and through its support of our Center for Research to Advance Community Health. Many of the faculty members at UTHSCSA are also providers at University Hospital. Baptist Medical Center is a partner in providing health care and has been very supportive of UT Medicine initiatives such as a new regional children’s hospital. The San Antonio Metropolitan Health District is a close partner of UT Medicine on projects as well as in sharing data on the health status of our residents.

**Plan for Learning Collaborative:**

The learning collaborative will be formed such that organizations are able to share ideas, challenges and develop solutions. The learning collaborative will bring participating sites together via conference call once a quarter where project-level goals are discussed and other projects are able to learn. A face-to-face meeting will occur once a year at the CTSA CER meeting where informatics is the topic of discussion. During this meeting, those belonging to the learning collaborative along with others outside of the region are able to share knowledge and participating sites are able to learn from the successes/challenges of other sites. Metrics will be used to measure success of the learning collaborative (e.g. Network affinity, rate of spread). We propose to develop linkages to other groups around the country that have developed registries to learn from their experiences and to guide our initiatives to improve clinical outcomes: these include the UT Houston (Dr. Bernstam), UT Southwestern (Dr. Halm); University of Pennsylvania (Dr. Day); and MGH (Dr. Atlas).

**Project Valuation:**

**Achieves Waiver Goals:** This project assures that patients on Medicaid, CareLink or self-pay --will receive evidence-based patient-centered care with high value services that will ultimately reduce the risk of complications of these chronic diseases and thereby reduce use of costly urgent care services and reduce unnecessary tests/services. Previous research on the effectiveness of patient registries show that they facilitate identification of at-risk patients and, for diabetics, can direct programs to help patients met HbA1c control goals and reduce complications as well as costs of care.

**Address Community Need(s):** This project addresses community priority needs described in the Community Health Improvement Plan for Bexar County for: Healthy Eating and Active Living and
Behavioral and Mental Well-Being. Priority health issues addressed by this project include diabetes, obesity and hypertension. Registries are increasingly adopted nationally to effectively characterize patient health care needs and respond with appropriate interventions. Through the diabetes and other registries, we will make this unique resource available to providers and patients in order to guide efforts to achieve the goals of the Community Health Improvement Plan for Bexar County.

**Project Scope:** All the proposed database registries will include approximately 10,000 patients and 30 providers. Providers who are recruited and trained in using these data will be more empowered to improve patient outcomes by targeting interventions and support to those who need it most. The cost of diabetes is high (as of 2007, $91.8 billion in direct costs and $39.8 billion spent on indirect expenses) and rising. Previous research estimates costs will be decreased if we are able to decrease hemoglobin A1c in patients with comorbid heart disease and hypertension from an average of 9 to 10% to an average of 6% to 7% (a $2,536 cost differential accrued over 3 years) (Gilmer TP, O'Connor PJ, Rush WA, et al., 2005). Similarly to diabetes, obesity and hypertension also have high costs. Costs attributable to overweight and obesity in Texas in 2001 totaled $10.5 billion including $4.2 billion in direct costs for health care, $5.2 billion in indirect costs for lost productivity due to mortality and $1.1 billion in indirect costs for lost productivity due to morbidity (Texas Department of State Health Services, 2004). In 2010, hypertension was projected to cost the United States $93.5 billion in health care services, medications, and missed days of work. (Heidenreich, Trogdon, Khavjou, Butler, Dracup, Ezekowitz, et al., 2011).

**Project Investment:** The expected investment in this program for Human Resources will include the cost of trainers, promotoras, project coordinator and the data mining team. Equipment purchase and maintenance will be covered by our accompanying project to develop a Health Information Exchange – making this a relatively cost-effective project. The time to implementation of updated diabetes and HIV registries will be one year which will be used to complete the registry and hire and train staff in use of the registry. Subsequent hypertension registry will be completed in year 2-3 and staff trained by year 4. Several organizational priorities will be met by the development of these longitudinal chronic disease registries but the most important is to insure that we provide comprehensive, value-based care that improves the health of the vulnerable populations that we serve.

## Project Summary:

<table>
<thead>
<tr>
<th>Provider:</th>
<th>The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intervention(s):</td>
<td>Clearly state the intervention(s).Example: This project will increase the number of primary care physicians trained in San Antonio by increasing the size of the UTHSCSA Family Medicine Residency.</td>
</tr>
<tr>
<td>Need for the project:</td>
<td>Texas has a severe shortage of primary care physicians. Recruiting agencies are currently reporting that these positions are hard to recruit physicians into since there is a nationwide shortage. The best solution is to train more primary care physicians here is San Antonio since many residency graduates practice nearby to where they train.</td>
</tr>
<tr>
<td>Target population:</td>
<td>The Target population ultimately is all patients in South Texas since there is a general shortage of primary care. During training, residents will see an underserved, underinsured population of patients in San Antonio.</td>
</tr>
<tr>
<td>Category 1 or 2 expected patient benefits:</td>
<td>More graduates from the Family Medicine residency will mean more primary care physicians in South Texas. Most of our graduate practice in Texas, many stay in San Antonio.</td>
</tr>
<tr>
<td>Category 3 outcomes:</td>
<td>Right care in right setting and patient centeredness: 15 % increase of primary care visits in the FHC during years 4 and 5</td>
</tr>
<tr>
<td>Number of residents who remain in South Texas to practice after 2 years. Expected increase is 10%</td>
<td></td>
</tr>
</tbody>
</table>

## Project Description:

<table>
<thead>
<tr>
<th>Brief Description:</th>
<th>Increase the number of primary care physicians in South Texas by increasing the number of Family Medicine residents in training.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Goal:</td>
<td>Increase residency from 12 residents per year to 13 residents per year.</td>
</tr>
<tr>
<td>Expected Outcome:</td>
<td>In year one, increase to 39 residents in training with 13 graduates per year with increases in number of faculty members and patient visits consistent with the growth.</td>
</tr>
<tr>
<td>Challenges/Issues:</td>
<td>The major challenge for this project is the funding. Currently, we have 38 funded positions. Two of three classes are on 4 week schedules. The other class rotates on a monthly schedule. All funded positions are filled, and faculty are maximally engages. Additional faculty support would be important.</td>
</tr>
</tbody>
</table>
A longer term vision would be to grow the program to 15 residents per year, then to 18 residents per year. The patient care base exists to develop the residency to this size. However, a project of that magnitude requires coordination, approval and support from many outside organization, including the ACGME, other university department and University Health System. More space is needed in the FHC and more CareLink patients and Medicaid Pediatric patients assigned to our practice. Several additional faculty members would be needed for the larger expansion, and it takes time to develop or hire faculty members. We would need 240 more deliveries per year to train the residents, which would require coordination and support from OB/Gyn. We likely would need the support of other departments to help us ensure that we have the right inpatient experiences for a quality residency. Other support needed from other departments should not be a major issue. By the 5 year point, the residency should be able to have 15 residents per year, with the possibility of being ready to recruit the first class of 18 residents at that time.

Quality:

To achieve continuous quality improvement we shall assess the projects impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

Region 6 goals:

This project achieves CMS’s Triple aim objectives of assuring patients receive high quality and patient centered care, in the most cost effective way, improves the health care infrastructure to better serve the Medicaid and uninsured residents of the counties we serve, further develops and maintains a coordinated care delivery system and improves outcomes while containing costs. CMS does have a system to support graduate medical education nationwide which includes funding for resident salaries which is paid to the hospitals. There are no other federal funds involved in the project.

Starting Point/Baseline:

The residency practice sees over 30,000 visits per year. Increasing the resident complement will increase the amount of patient care provided in addition to increasing the amount of training. The number of patients that can be enrolled into the clinic as a Patient Centered Medical Home should increase consistent with the increase in number of visits. Increasing to 15 residents per year should increase the number of patient visits by 15,000 and the number of patients enrolled in the clinic as a Patient Centered Medical Home by 3000.

Rationale:

Texas has a growing shortage of primary care doctors due to increasing population and an aging Of the population. There is a decline in the number of medical students choosing primary care. Only a very small percentage of Internal Medicine and Pediatric residency graduates do primary care as the majority of their career. The most important number in determining the number of physicians doing primary care in the future is the number of Family Medicine residency training slots. Qualified applicants are available for an expanded number of positions.

It is difficult to recruit and hire primary care physicians. The shortage of primary care providers has contributed to increased wait times in hospitals, community clinics, and other care settings. Expanding the primary care workforce will increase access and give patients an opportunity to have
a personal physician and a Patient Centered Medical Home, which should improve quality and reduce costs. Expansion of Family Medicine residency slots will strengthen an integrated health care system and play a key role in implementing disease management programs.

A greater focus on primary care will be crucial to the success of an integrated health care system. Furthermore, in order to effectively operate in a medical home model, there is a need for residency and training programs to expand the capabilities of primary care providers and other staff to effectively provide team-based care and manage population health.

In 2010, Texas ranked 47 in the number of primary care patients per 100,000 population. Increasing medical school enrollment, as has occurred in Texas will have no effect on the problem since the number of residency positions in the state is inadequate in most specialties and especially inadequate in Family Medicine. The Texas Higher Education Coordinating Board recommends a ratio of 1.1 entry level GME positions for each Texas medical school graduate. To get to this number, 400 additional GME Positions are needed. The shortage of GME positions for primary care is the most important aspect of the state’s physician shortage.

CN.3 Addresses provider shortage needs
CN.2 By addressing provider shortages disparities in health outcomes will also be addressed

### Related Category 3 Outcome Measure(s):

- Appropriate Care, Appropriate Setting
- Reduced ED utilization
- By increasing the number of primary care physicians coming into the system from local training programs, patients in South Texas will have better access to primary care services in the Patient Centered Medical Home. There is ample evidence that services in this setting are more comprehensive and are delivered at lower cost. By improving access to primary care, fewer patients will need to rely on local Emergency Departments of on going care.

### Relationship to other Projects:

The project will support and reinforce the Advanced Primary Care, Enhance PCMH infrastructure project. We will work closely with that group to incorporate The training curriculum developed for the medical assistants will be directly relevant to that project as will lessons learned about implementing elements of the medical home.

### Relationship to Other Performing Providers’ Projects in the RHP:

### Plan for Learning Collaborative:

I am aware of some early discussions about creating a Family Medicine residency in McAllen at Doctors Hospital Renaissance. There is some hope that this can be associated with DSRIP. If this concept becomes a reality, there will be opportunities for collaboration on activities to grow the number of primary care physicians in South Texas.
<table>
<thead>
<tr>
<th>Project Valuation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>The project is valued based upon achieving waiver goals, meeting community needs, increasing the scope of services available to the community, and resources deployed. Although the outcome domain chosen targets number of physicians in training, each additional trainee is expected to graduate from residency. Since 90% of physician practice near where they train, this should greatly increase the number of practicing primary care physicians in Texas, including Health Profession Shortage Areas. Improved availability of services can be expected to improve health outcomes for the communities of South Texas.</td>
</tr>
</tbody>

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $ 6,724,213**
**Identifying Project and Provider Information:**

| Title: 1.9.2 Improve access to specialty care: Implement EpicCareLink Referral Portal |
| Unique RHP ID#: 085144601.1.4 – PASS 1 |
| Performing Provider: University of Texas Health Science Center at San Antonio; Timothy D. Barker, MD |
| Performing Provider TPI: 085144601 |

**Project Summary:**

**Provider Description:** The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.

**Intervention(s):** This project will make 90% of UT Medicine Specialty Clinics accessible through the EpicCareLink electronic referral system while significantly increasing the volume of specialty clinic visits at UT Medicine.

**Need for the project:** UT Medicine does not have a system in place to accept electronic referrals from non-UT Medicine physicians. DY2 will be used to develop baseline data for the number of specialty care clinic visits and patient satisfaction scores related to referral access issues.

**Target population:** UT Medicine provides care for over 205,000 unique patients per year. 17% are covered by Medicaid, 17% by Carelink (the local county indigent coverage program) and 5% are self-pay.

**Category 1 or 2 expected patient benefits:** The percentage of UT Medicine specialty clinics accepting referrals via EpicCareLink will be 10% in DY3, 50% in DY4 and 90% in DY5. The volume of care provided by UT Medicine specialty clinics will increase by 5% over baseline each year from DY3 through DY5. Assuming a baseline of 20,000 specialty care visits per year in DY2 the increase would result in 21,000 visits in DY3, 22,050 in DY4 and 23,152 in DY5.

**Category 3 outcomes:** In DY 2 the focus will be on project planning, establishing baseline patient satisfaction scores and developing and testing the EpicCareLink referral system. Once baseline satisfaction scores are available the outcome improvement target for DY 3-5 will be determined. DY 3 will be devoted to conducting Plan Do Study Act (PDSA) cycles, disseminating findings through learning collaboratives and beginning to demonstrate improvement in patient satisfaction scores. The focus in DY 4-5 will be continued improvement in patient satisfaction scores.

**Project Description:**

UT Medicine San Antonio is an academic medical practice which includes physicians from more than 60 different medical specialties and sub-specialties from the faculty of the School of Medicine at the University of Texas Health Science Center at San Antonio. As such, UT Medicine fills a critical role as a major provider of medical specialty care for South Texas. The current phone based system of referring patients to UT Medicine for specialty care is cumbersome, inefficient, and frustrating for primary care physicians and presents a significant barrier to specialty care for patients in need of those services. The process of communicating patient information from UT Medicine specialists back to referring physicians yields inconsistent
and often unsatisfactory results. This observation is consistent with the conclusion drawn in the 2010 Bexar County Health Assessment that care is often fragmented.

Patients needing specialty care are at high-risk of admissions and/or readmissions, and streamlining their access to specialty physicians can help manage their conditions and therefore avoid unnecessary ED utilization, hospitalizations or readmissions. The goal of this project is to make the specialty care services of UT Medicine more accessible to non-UT Medicine physicians throughout the South Texas area through the implementation of a web based, HIPAA compliant, referral portal integrated with UT Medicine’s EpicCare electronic health record (EHR) system. This portal will enable primary care physicians throughout South Texas to arrange for referrals online and subsequently access their patients’ health information in UT Medicine’s EHR system. In addition, UT Medicine will add marketing staff to promote the use of the referral portal and referral management staff to process electronic referrals.

The 5-year expected outcome of this project is to make 90% of UT Medicine Specialty Clinics accessible through the EpicCareLink electronic referral system while significantly increasing the volume of specialty clinic visits at UT Medicine.

Quality:
To achieve continuous quality improvement we shall assess the projects impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

Region 6 goals:
This project achieves CMS’s Triple aim objectives of assuring patients receive high quality and patient centered care, in the most cost effective way, improves the health care infrastructure to better serve the Medicaid and uninsured residents of the counties we serve, further develops and maintains a coordinated care delivery system and improves outcomes while containing costs.

**Starting Point/Baseline:**
UT Medicine does not have a system in place to accept electronic referrals from non-UT Medicine physicians. DY2 will be used to develop baseline data for the number of specialty care clinic visits and patient satisfaction scores related to referral access issues.

**Rationale:**
The overall goal of this project is to increase referrals from non-UT Medicine physicians throughout the South Texas area to specialty care services at UT Medicine. An increase in referrals will allow UT Medicine to further expand capacity to meet the need for specialty care throughout the RHP. Ultimately more patients will have access to specialty care and their wait times for specialty appointments will decrease. Improved communication between referring providers and UT Medicine specialists will result in improved care overall. In order to achieve these goals UT Medicine will implement a robust referral management system to ensure that referrals are processed, reviewed and the patient’s clinical issue addressed in a timely manner.

The community need addressed by this project is health information technology to improve physicians’ lines of communication and health care quality (RHP 6 Community Needs Assessment). The project option for this proposal is 1.9.2 – Improve access to specialty care with components c) Implement transparent, standardized referrals across the system. d)
Conduct quality improvement for the project in the form of Plan Do Study Act cycles focusing on identifying and addressing key challenges. Components a, and b are beyond the scope of this project.

We are unaware of any projects currently underway at UTHSCSA funded by the US Department of Health and Human Services serving a similar purpose as this project.

CN.1 This project meets the community need for enhanced quality of care.
CN.3 This project meets the community need for enhanced access to health care services.

### Related Category 3 Outcome Measure(s):

<table>
<thead>
<tr>
<th>Outcome Measure(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>OD-6 Patient Satisfaction</td>
</tr>
<tr>
<td>IT-6.1 Percent improvement over baseline of patient satisfaction scores, item 3 patient’s rating of doctor access to specialist</td>
</tr>
</tbody>
</table>

The RHP 6 needs assessment has identified access to specialty care as a key health challenge for the region, and continued population growth is expected to exacerbate this problem in the future. A large academic medical center in the Midwestern US addressed a problem with specialty care access by implementing a web-based referral system, showing that referrals generated through that system were more than twice as likely to lead to a scheduled visit with a specialty physician (Weiner, M, El Hoyek, G. A web-based generalist-specialist system to improve scheduling of outpatient specialty consultations in an academic center. J Gen Intern Med. 2009 Jun;24(6):710-5).

We have selected the Category 3 outcome measure of **IT-6.1 Percent improvement over baseline of patient satisfaction scores, item 3 patient’s rating of doctor access to specialist** (Standalone measure). The baseline for this measure will be determined in year 2 using data obtained from supplemental modules for the adult CG-CAHPS survey.

### Relationship to other Projects:

This project is related conceptually to the proposal submitted by UTHSCSA – Implement a Shared Electronic Health Record (EHR) System. While this project opens a referral portal for physicians in the region, the shared EHR project would make the complete EHR available to unaffiliated physicians.

### Relationship to Other Performing Providers’ Projects in the RHP:

Given the nature of this project, there is either a direct or indirect relationship to all other projects in the region.

### Plan for Learning Collaborative:

University Health System, as the RHP 6 anchor, will promote and facilitate learning collaboratives through the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include the following: identify participants, establish learning collaborative goals, develop a calendar of regular meetings, site visits, and/or conference calls, develop a plan to communicate ideas, data, and successes across the region and state, organize a learning event and invite experts and other performing providers from outside the region to share knowledge and best practices.
**Project Valuation:**

In 2010 Bexar county had 14,769 potentially preventable hospitalizations costing approximately $370,000,000 at $25,212 per hospitalization (www.dshs.state.tx.us/ph). Access to specialty care will reduce the number of potentially preventable hospitalizations as well as preventable emergency department visits. We anticipate that this project will prevent at least 80 hospitalizations over the project period resulting in a savings of $2,016,960.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $3,586,246
Project Summary:

Provider Description: The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.

Intervention(s): This project will implement a Health Information Exchange (HIE) which will automate the flow of key clinical information between disparate EHR systems. Data in the HIE will be used to populate a chronic disease registry enabling effective population management.

Need for the project: UT Medicine and University Health System do not exchange health information in a meaningful way, and neither organization shares information with the local (HIE) - HASA. UT Medicine does not currently maintain a Chronic Disease Management Registry.

Target population: University Health System provides care to more than 230,000 unique patients every year. 19% are covered by Medicaid and 43% are self-pay. UT Medicine provides care for over 205,000 unique patients per year. 17% are covered by Medicaid, 17% by Carelink (the local county indigent coverage program) and 5% are self-pay. Many patients overlap between University Health System and UT Medicine.

Category 1 or 2 expected patient benefits: The Chronic Disease Management Registry Committee (CDMRC) will meet on at least a quarterly basis to evaluate registry functionality, guide enhancements to the data capture system, and expand the clinical use of the registry for identification and recall of targeted patients. The project seeks to add 1% of active patients to the registry in DY2, 5% by DY3, 10% by DY4 and 20% by DY5.

Category 3 outcomes: DY 2 will be devoted to project planning, developing and testing the chronic disease database/registry and establishing baseline rates of diabetic patients in the registry with HbA1C > 9.0%. In DY 3 we will begin to conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities, disseminate our findings to other groups and reduce the percentage of diabetic patients with HbA1C > 9.0% by 1% compared to the baseline that will be determined in DY 2. In DY 4 we will reduce the percentage of diabetic patients with HbA1C > 9.0% by another 1%. In DY 5 we will reduce the percentage of diabetic patients with HbA1C > 9.0% by another 1%, resulting in a reduction of 3% by the end of the waiver.

No other federal funds are utilized in this project.

Project Description:

UT Medicine and University Health System share thousands of patients and hundreds of medical
staff, yet have separate electronic health record (EHR) systems that do not currently exchange health information in a meaningful way, thus presenting many challenges for patient care, particularly with transitions of care. This project will address the lack of connectivity between UT Medicine, University Health System and the community Health Information Exchange (HIE) Healthcare Access San Antonio (HASA). This project achieves CMS’s Triple aim objectives of assuring patients receive high quality and patient centered care, in the most cost effective way, improves the health care infrastructure to better serve the Medicaid and uninsured residents of the counties we serve, further develops and maintains a coordinated care delivery system and improves outcomes while containing costs.

Patient care is currently negatively impacted by the inaccessibility of the UT Medicine ambulatory EHR in the University Health System Emergency Department and Hospital. When a patient who receives specialty or primary care services at a UT Medicine clinic using the EpicCare EHR presents for care at the University Hospital Emergency Department the ED personnel do not have immediate access to information in EpicCare and therefore must rely on patient supplied data regarding past medical history, current medical problems, medications, allergies, diagnostic tests, etc. In this scenario the lack of access to key clinical information prolongs the patient’s stay in the ED, and may result in duplicated diagnostic tests or a preventable hospital admission. Patient safety could be placed at risk if the information supplied by the patient is incomplete or inaccurate. With a functional HIE the HIE client application within the ED’s EHR system would alert ED personnel to the availability of important clinical information from the ambulatory EHR and at the same time make that information immediately available. A 13 month study in Memphis, Tennessee found that accessing HIE data was associated with a decrease in hospital admissions and statistically significant decreases in head CT use, body CT use, and laboratory test ordering (Frisse ME, Johnson KB, Nian H. The financial impact of health information exchange on emergency department care. J Am Med Inform Assoc 2012 19: 328-333.).

The following scenario describes a patient admitted to University Hospital and discharged with a follow up appointment with their UT Medicine PCP or a UT Medicine Specialist. The results of several important diagnostic studies are pending at the time of discharge. The patient misses their hospital follow up appointment due to transportation issues that are beyond their control. Inadequate access to transportation services is a frequent barrier to seeking health care and accessing community resources among Bexar residents (2010 Bexar County Health Assessment. p. 224). The results of the diagnostic studies reveal a potentially serious new health problem, but these results never made their way through a cumbersome paper system to the patient’s UT Medicine PCP or Specialty Physician. With the HIE’s patient list management feature the PCP would have been alerted to the patient’s admission and discharge and they would receive the results of studies that become available after the patient’s discharge.

Next, consider how the currently fragmented medical record negatively impacts UT Medicine’s ability to optimally manage high risk patients such as a poorly controlled diabetic patient who has been recently discharged from the hospital. As UT Medicine transitions to the Patient Centered Medical Home (PCMH) model of care more emphasis is being placed on identifying, tracking, and performing outreach to high risk patients. The current manual system for tracking high risk patients recently discharged from the hospital is inefficient and ineffective. By
implementing a Chronic Disease Management Registry which automatically captures data from UT Medicine and University Health System, via their shared HIE, and other local hospitals and providers, via the community HIE, it will become possible to proactively manage recently discharged high risk patients in an efficient manner, ensuring that they return for important post discharge clinic visits and receive important support services so that they avoid unnecessary hospital readmissions.

Five year expected outcomes include:

- Glycemic control of patients with diabetes mellitus will improve.
- The Chronic Disease Management Registry Committee (CDMRC) will meet on at least a quarterly basis to evaluate registry functionality, guide enhancements to the data capture system, and expand the clinical use of the registry for identification and recall of targeted patients.
- The HIE will include data from at least 20 percent of active patients and, where applicable, data from those patients will be used to populate the Chronic Disease Management Registry.

Quality:
To achieve continuous quality improvement we shall assess the projects impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

Region 6 goals:
This project achieves CMS’s Triple aim objectives of assuring patients receive high quality and patient centered care, in the most cost effective way, improves the health care infrastructure to better serve the Medicaid and uninsured residents of the counties we serve, further develops and maintains a coordinated care delivery system and improves outcomes while containing costs.

Starting Point/Baseline:
UT Medicine San Antonio is an academic medical practice including physicians from primary care and more than 60 different medical specialties and sub-specialties from the faculty of the School of Medicine at the University of Texas Health Science Center at San Antonio and provides access to critical services to residents of Bexar county and South Texas. UT Medicine operates 13 clinics in the San Antonio area. In addition, many UT Medicine physicians care for patients at University Health System clinics, and University Hospital. University Hospital, is a Bexar county owned 498 bed hospital, is one of just 15 Level I trauma centers in Texas, and the lead trauma center for all of South Texas. The Emergency Center at University Hospital is the busiest in the region and averages nearly 70,000 visits each year. In addition, University Health System provides a broad range of healthcare services at multiple clinic locations, including the Robert B. Green Campus, Texas Diabetes Institute, 13 neighborhood clinics across the community, five urgent-care clinics (ExpressMed) and four outpatient renal dialysis centers. Healthcare Access San Antonio (HASA) is a 501 (c)(3) community collaborative initiative to enhance access to health and medical care for Central Texas residents through health information exchange (HIE).

At baseline UT Medicine and University Health System do not exchange health information in a meaningful way, and neither organization shares information with HASA. UT medicine does not
currently maintain a Chronic Disease Management Registry

**Rationale:**  
San Antonio has a majority Hispanic population and Hispanic/Latino Americans are 2 times more likely to have diabetes than non-Hispanic whites. Diabetes is the 6th leading cause of death in Texas, the 4th leading cause of death in Bexar County and affects 11.8% of the population. The overall target goal of this project is the implementation of a state of the art Chronic Disease Management Registry built on the foundation of a new health information exchange (HIE) system. Chronic disease care is the specific issue and need noted in the Community Needs Assessment that this project will address.

Automating the flow of key clinical information between disparate EHR systems will vastly improve the safety, efficiency, and effectiveness of care transitions between University Health System and UT Medicine. According to the Roadmap to Better Care Transitions and Fewer Readmissions (US Department of Health and Human Services. http://www.healthcare.gov/compare/partnership-for-patients/safety/ transitions.html) “safe, effective and efficient care transitions should include…standardized and accurate communication and information exchange between the transferring and receiving provider in time to allow the receiving provider to effectively care for the patient.”

All of the following required core project components will be a part of this project.

- a) Enter patient data into unique chronic disease registry
- b) Use registry data to proactively contact, educate, and track patients by disease status, risk status, self-management status, community and family need.
- c) Use registry reports to develop and implement targeted QI plan
- d) Conduct quality improvement activities for the project using methods such as rapid cycle improvement. Activities may include: identifying project impacts, identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety net populations

We are unaware of any projects currently underway at UTHSCSA funded by the US Department of Health and Human Services serving a similar purpose as this project.

CN.2 The projects address community need CN.2 per the needs assessment.

**Related Category 3 Outcome Measure(s):**

We have chosen **IT 1.10 Diabetes care: HbA1c poor control (>9.0%) NQF 0059** as the Category 3 outcome measure for this project. Diabetes registries have been shown to be an effective tool to help manage underserved populations with diabetes as evidenced by improvements in A1C values (Seto W, Turner BS, Champagne MT, Liu L. Utilizing a diabetic registry to manage diabetes in a low-income Asian American population. Population Health Management 2012;15:220-229). Sixty percent of the 16,000 deaths in RHP 6 in 2008 were the result of preventable causes including diabetes. According to the RHP 6 Needs Assessment, “Disease management …programs are critical to reducing morbidity and mortality of these diseases.”

### Year 2 (10/1/2012 – 9/30/2013)

**Milestone 1**  
[P-3] Develop cross-functional team to evaluate registry program  
**Metric 1**  
[P-3.1] Documentation of personnel (clinical, IT, administrative) assigned to evaluate registry program  
**Baseline/Goal:** Team will meet on a regular basis as the Chronic Disease Management Registry Committee (CDMRC) to evaluate and improve the registry program.  
**Data Source:** CDMRC Roster and meeting minutes  
**Milestone 1 Estimated Incentive Payment:** $1,017,001

### Year 3 (10/1/2013 – 9/30/2014)

**Milestone 3**  
[P-6]: Conduct staff training on populating and using registry program  
**Metric 1**  
[P-6.1]: Documentation of training programs and list of staff members trained.  
**Baseline/Goal:** Training materials have been developed and 10 trainees have completed initial training.  
**Data Source:** Training program materials.  
**Milestone 3 Estimated Incentive Payment:** $1,116,793

### Year 4 (10/1/2014 – 9/30/2015)

**Milestone 5**  
[P-8]: Create/disseminate protocols for registry driven reminders and reports for clinicians and providers regarding key health indicator monitoring and management in patients with diabetes  
**Metric 1**  
[P-8.1]: Submitted protocols for the diabetes for A1C and LDL cholesterol  
**Baseline/Goal:** Protocols have been developed for A1C and LDL Cholesterol including goals and criteria for patient recall.  
**Data Source:** Protocols  
**Milestone 5 Estimated Incentive Payment:** $1,194,708

### Year 5 (10/1/2015 – 9/30/2016)

**Milestone 7**  
[P-9]: Implement an electronic process to correctly identify number of screening tests that require additional follow up  
**Metric 1**  
[P-9.1]: Documentation of an electronic process to correctly identify number of screening tests that require additional follow up  
**Baseline/Goal:** Identification of diabetic patients in need of screening for diabetic retinopathy.  
**Data Source:** Reporting documentation  
**Milestone 7 Estimated Incentive Payment:** $1,154,308

Identifying Project and Provider Information:
Title: 1.14.2 Other Project Option: Expand Specialty Care Capacity through the Sustained Treatment as an Outpatient Priority (STOP) Program
Unique RHP ID#: 085144601.1.6 – PASS 1
Performing Provider: University of Texas Health Science Center at San Antonio-John Roache, Ph.D. and Pedro Delgado, M.D.
Performing Provider TPI: 085144601

Project Summary:

Provider Description:
The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.

Intervention(s): In collaboration with our regional healthcare partner, this project will establish the Sustained Treatment is an Outpatient Priority (STOP) Program as a means to provide a substance abuse disorder (SUD) training program within the Bexar County community setting. It will develop the infrastructure (Category 1, Project Area 1.14.2) to expand the capacity to provide evidence-based interventions for SUD in order to reduce the unnecessary use of hospital and emergency room services by patients in Bexar County. The intervention will increase access to specialty care providers of SUD treatment by 1) recruiting addiction specialists to structure and support the evidence-based treatment programs necessary for developing Psychology and an American Council on Graduate Medical Education (ACGME)-approved Addictions Psychiatry program; 2) providing the evidence-based treatment by psychiatrists, advanced practice nurses, psychologists and social work care providers utilizing evidenced-based medication prescription and motivational and cognitive behavioral therapy (CBT); and 3) providing advanced SUD treatment training for Psychiatry Residents and Fellows as well as Psychology Interns and Fellows, advanced practice nurse trainees, and social work students.

Need for the project: SUDs are highly prevalent conditions in Bexar County and there are an insufficient number of SUD treatment programs or community treatment providers; even less that use evidence-based approaches; and none that take the sustained treatment approach to prevent relapse. The STOP Program will implement two evidence-based initiatives to support increased access to innovative care in the underserved community. First, we plan a training program involving multidisciplinary teams including psychiatry, psychology, nursing, and social work. In this model, psychological therapies are considered essential, but for many patients, not sufficient approaches to care. Many patients also require medications and social work outpatient case management approaches to treatment – especially given the prevalence of dual diagnosis psychiatric needs in the population. The Transition Care Clinic (TCC) in the Dept. Psychiatry is successfully taking this approach to training multidisciplinary teams in the transitional care and outpatient stabilization of acutely ill community psychiatry patients. Not only are the training experiences of trainees improved by the
multidisciplinary environment, but also, patient care needs are more comprehensively met in a coordinated fashion by the multiple disciplines working together. Our second innovation is the deployment of multidimensional treatments in an outcomes-based approach. Most treatment clinics have a unitary treatment model (i.e., medication plus counseling, or 12-step group etc.) that all patients receive when they attend that clinic. However, research shows that only some 20-50% of patients entering treatment will demonstrate desirable outcomes and clearly, some patients are more likely to benefit with a particular approach (i.e., some benefit more than others with Cognitive therapies or some will do better in individual therapy than in group, etc.). This is the reason that evidence-based programs such as the Nexus Program in Dallas attempt to provide multiple different treatment options so that patients can access the continuum of care they most need at the time. The STOP program will add the innovation that current patient outcome will be monitored for individual patients so that patient care is individualized and maximized to match the individual patient needs.

**Target population:** Patients with SUDs in University Health System. The program will target recently hospitalized patients or those that are at high risk for hospitalization.

**Milestone Achievement benefits:**

**Yr02**, we expect to hire the necessary staff to conduct our preliminary Gap Analysis, hire and train a Licensed Practical Nurse to assure an initial launch of the STOP Program and begin seeing at least 100 patients; and to recruit an Addiction’s Psychiatrist; an Addiction’s Psychologist; and hire and train a Psychology Fellow and a Social Worker.

**Yr03**, we will have hired and credentialed all Faculty necessary to train at least 2 Psychiatry Residents, 2 Psychology Interns and 1 Fellow, 1 Nurse Practice student, and 1 Social Worker who will provide treatment for at least 800 patients.

**Yr04** The STOP program will expand by seeing more patients (at least 1200) and including more trainees at least 3 Psychiatry Residents, 2 Psychology Interns and 2 Fellows, 2 Nurse Practice students, and 2 Social Workers. We also expect to have established an ACGME accredited Addiction’s Fellowship and to begin recruiting Psychiatry Fellows though they may not be in place till later in the year.

**Yr05** will finally demonstrate the full potential of the STOP Program by training 4 Psychiatry Residents, and 2 Psychiatry Fellows, 3 Psychology Interns and 2 Psychology Fellows, 3 Nurse Practice students, and 3 Social Workers who will staff at least 1900 community patients.

The STOP Program will provide direct patient care for at least 4,000 SUD patients in a multidisciplinary environment where we will expand capacity by also training Psychiatry, Psychology, Social Work, and Nursing students outcomes-based programs to reduce hospitalization or rehospitalization. Though the program will take some time to build momentum, the recruitment of new faculty and growth in training programs are critically important steps to assure a growing and continued supply of community-based providers to address the overwhelming need of community SUD patients.

**Category 3 outcomes:** Our goal is to reduce potentially preventable admissions and readmissions to University Hospital. Preventable substance-related 30 day readmissions to the hospital will be reduced by at least 10%.
Project Description:

Substance Use Disorders (SUD), including alcoholism and drug dependence (including opiate, cocaine, and methamphetamine) are psychiatric conditions that are highly prevalent in Bexar County. The majority of people with an SUD also suffer from a chronic general medical condition or another psychiatric disorder and they contribute disproportionately to emergency room visits and complicated inpatient hospital admissions. Drug addiction may directly cause or exacerbate pulmonary, gastrointestinal, cardiovascular, hepatic, and infectious diseases that cost the county-area hospitals millions of dollars in health services each year. Further, people who are impaired due to use of an addictive substance have very high rates of trauma due to falls and motor vehicle accidents. For example, the annual number of deaths associated with accidental overdose or abuse of prescription opiates tripled in Bexar County between 2000 and 2010. The relatively small cost of treatment for alcohol or drug addiction results in multifold-increases in economic cost savings to the community in the form of reduced health care expense, reduced criminal justice expense, and increased economic productivity of rehabilitated patients. The scientific evidence-basis for treatment indicates that no one treatment works for all patients, but that effective outpatient intervention and long-term support (months to years) is necessary to affect long-term rehabilitation. Unfortunately, there are insufficient community provider resources to address the needs identified in the 2010 Community Health Assessment for Bexar County; Lifestyle Behaviors, Alcohol Consumption.

Therefore we propose to expand SUD specialty care capacity through infrastructure development (Category 1, Project Area 1.9.1) laying the foundation for delivery system transformation by increasing the number of providers of evidence-based interventions for SUD, in order to reduce the unnecessary use of hospital and emergency room services by patients in Bexar County. Currently, there are an insufficient range of evidence-based treatment options or integrated care programs in the community to help patients access the psychological and psychiatric continuum of care that many patients require or over the time-periods that are required. Through the establishment of a clinical training program for treatment of SUDs, this proposal will expand both the number of trainees that choose this area of training, the number of future providers for these services, and establish a program that supports access to specialty providers through a continuum of care of available treatment options. Finally, the program will enhance the continuity of patient care necessary to establish and sustain rehabilitation. UT Health Science Center will establish the Sustained Treatment as an Outpatient Priority (STOP) Program to support evidence-based clinical care and training opportunities for Psychiatry, Psychology, and Nursing Professionals in training. Through a collaboration with University Health System Primary Care Clinics, the STOP Program will expand the specialty care capacity in the area of SUDs and increase access to specialty care providers of SUD treatment by 1) recruiting addiction specialists to structure and support the evidence-based treatment programs necessary for developing an American Council on Graduate Medical Education (ACGME)-approved Addictions Psychiatry Fellowship program; 2) providing direct service to patients utilizing evidenced-based approaches; and 3) providing advanced SUD treatment training for Psychiatry Residents and Fellows, Psychology Interns and Fellows, and Advanced Practice Nurse trainees. All necessary
treatment planning and coordination, care provision, and training supervision will be achieved through the STOP program. Care will be provided within the context of a medical home model integrated into University Health System primary care clinics, providing for integration of behavioral healthcare into the medical environment. Consequently, the capacity, continuum, and continuity of outpatient care for SUD will be substantially increased. The STOP Program will enhance medication-treatment capacity and multimodal individual and group therapy options including cognitive behavioral therapy (CBT) which all have an evidence basis for outpatient detoxification, active intervention, relapse prevention, and long-term maintenance of rehabilitation. The multimodal treatment environment provides evidence-based mental health training in community primary care environments. It also expands the breadth and depth of services in University Health System and increases the continuum and continuity of care available to patients. The theoretical framework for the STOP Program is to provide Psychiatry, Psychology, and Psychiatric Advanced Practice Nurse Specialist training within an interdisciplinary evidence-based clinic providing psychiatric, psychological, and behavioral interventions at the acuity level necessary to achieve validated outcomes of success. Behavioral and motivational procedures will be used along with validated and standardized assessments to enhance training and program outcome. Urine drug screens will validate outcome, and medication cost subsidies will support evidence-based medication for patients without adequate financial means. The STOP Program will include a variety of medication and therapy approaches so that patients unsuccessfully-treated in one modality can switch to alternative care in a “patient-matching” approach that evidentially works for them. Finally, the STOP Program will support a rehabilitative maintenance clinic whereby psychiatric or relapse preventative medication can be maintained over time-periods of 6 months to 2 years after initial treatment and patients can return for supplemental therapy or booster therapy as necessary to prevent relapse. The STOP Program will consist of 2 Psychiatrists, 2 Advanced Practice Nurses, 1 Psychologist, and one Social worker as core faculty to provide direct patient care and supervision of a multidisciplinary group of up to 8 Psychiatry Residents and Fellows, Psychology Interns and Fellows, and Psychiatric Advanced Practice Nurse each year. The faculty alone will increase the capacity to provide SUD specialty care in our community, but the community provider base can be expected to grow with the addition of trainees graduating from our program with community programs expertise and interests in SUD specialty treatment.

The overall goal of the STOP Program is to increase the number of residents/trainees choosing the targeted shortage area of SUD treatment while increasing service availability by developing a novel program that will provide rapid access to a continuum of care options for SUD intervention. This program will: (a) benefit individuals by treating the underlying SUD-problems and allow them to remain productive members of the community; (b) benefit the RHP by directly reducing costs associated with ER visits and hospitalization, exacerbation of general medical illness, and reduce the need for other community services including emergency and medical services, as well as reduced law enforcement and jail expense. Program development will expand the breadth and depth of treatment services available in the community and will do so programmatically by design as well as through clinical provider resources from participating faculty and trainees. The outcomes-focused program using our continuum and continuity of care
model is expected to provide standardized and objectively-validated improvements in treatment outcome beyond what is available in any other outpatient treatment program in Bexar County. The long-term maintenance of relapse prevention provides a continuity of care that is not available in any other community program. Treatment success will improve the lives and health outcomes of STOP patients. It also will reduce the social, criminal-justice, and health-care expenditures of Bexar County because successful rehabilitation will reduce the unnecessary service utilization associated with comorbid disease deterioration or law enforcement and criminal incarceration.

Quality:

To achieve continuous quality improvement we shall assess the project’s impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

Region 6 goals:

This project achieves CMS’s Triple aim objectives of assuring patients receive high quality and patient centered care, in the most cost effective way, improves the health care infrastructure to better serve the Medicaid and uninsured residents of the counties we serve, further develops and maintains a coordinated care delivery system and improves outcomes while containing costs.

5-Year Project Goal.

Over the project period, the STOP program will increase the access to care for community patients with SUD by two important means. First, the STOP program will be staffed with Psychiatric and Psychology faculty training Fellows, Residents, and Interns in evidence-based community practice. Second, these clinical resources will provide a continuum and continuity of care that will provide treatment for an estimated 4,000 SUD patients. Two important outcomes will be achieved through this program. First, successful treatment and sustained relapse prevention will reduce readmission rates of UHS patients. Second, successful training will increase the number of community care providers in RHP 6 which will expand the access to evidence-based care beyond the STOP program.

Starting Point/Baseline:

No ACGME-approved addictions psychiatry fellowship programs are available in all of South Texas. Additionally, no evidence-based continuity of care model substance abuse treatment services are available in our community. Most existing programs lack the multimodal therapy and none include the medication-based dual diagnosis approach.

Rationale:

We selected Project Option 1.9.1 because the gaps generated by the lack of sufficient numbers of community providers or a continuum of evidence-based care programs in Bexar County are well known and documented already. Therefore, the STOP Program is designed to remedy the problem by increasing the number of SUD specialty care
providers and by establishing a clinical program that will provide a more complete continuum of evidence-based care (i.e., integrated medication and therapy) designed to reduce Relapse Risk.

We are not aware of any DHHS projects funded at UTHSCSA or in Bexar County to support this comprehensive approach to enhance substance abuse treatment in the community.

CN. 4 This project addresses the need for higher quality MH services that are better integrated with physical health care services.

**Related Category 3 Outcome Measure(s):**

We selected OD-3-IT-3.8 as a Category 3 Outcome because of the compelling cost-effectiveness argument where effective outpatient Specialty Care for SUD will result in reduced hospitalization or readmission through the STOP Program. Thus we expect to demonstrate potentially preventable readmissions of STOP Program patients once discharged from the hospital. Inadequate outpatient care for adults with moderate behavioral health needs including substance abuse/dependence is well known and was identified in the Section III Needs Assessment Report to result in unnecessary hospitalizations and Emergency Room visits. The STOP program will provide the outpatient continuum of care necessary to give University Health System primary care clinics with the referral source for patients to receive the level of substance abuse care required to prevent hospitalization and to provide inpatient and ER services with the outpatient follow-up necessary to prevent readmission. Successful rehabilitation and maintenance of relapse prevention through the STOP Program also will reduce unnecessary University Health System service utilization associated with comorbid disease deterioration.

**Relationship to other Projects:**

To our knowledge, no other programs within our institution are submitting applications to Develop specialty care capacity in the area of SUD’s. If such projects are identified, we’d be excited to work with them to coordinate programs and services and minimize overlap.

**Relationship to Other Performing Providers’ Projects in the RHP:**

There are other Performing Providers submitting applications within our department and institution, but none to our knowledge, developing workforce enhancement of SUD Specialty Care (Category 1.9.1) to treat substance abuse/dependence. If the RHP6 Anchor identifies other related projects submitted by Performing Providers from the community, we’d be excited to coordinate services or milestones and to learn from others experiences so as to minimize overlap while maximizing improvement outcomes for the RHP.
### Plan for Learning Collaborative:

There are other Performing Provider DSRIP projects being submitted that could help the RHP Anchor to achieve Category 3 Outcomes of preventable admissions. We have not as yet developed a Plan for a Learning Collaborative with this other applicants. However, we are open and ready to collaborate with others within the RHP6 to share challenges and new ideas for solutions to achieve similar improvements. As the RHP is a natural hub for such activity, we are ready to partner with the anchor and other Performing Providers to achieve our common goals. This can and should include regular meetings, site visits, and conference calls as planned by the RHP.

### Project Valuation:

The most important factor for valuation is the prevalence of substance abuse in the community with very few provider treatment options available. Any increase in the number of psychiatric or psychologically-based providers will be beneficial, but more important will be multidimensional continuum of care model of the STOP program which will provide unique enhancements to our community resources. We anticipate being able to treat more than 4,000 patients over the four year period of this project. Economic analysis suggests that community cost savings in medical and social costs approximate 3-7 times the cost savings of the expense of treatment. While there could be a wide range of parameters used to estimate the value of this program, if you consider only three factors, the anticipated value would be more than $6 million in cost savings. There are several ways to calculate this value: 1. Value to the individual patient. Of course productive employment is an important outcome of addictions treatment. A minimum wage employee would earn $15,600 in a year, which is a gain relative to unemployment costs to society of $14,400 for a net benefit of at least $30,000 per year per employed patient with only a minimum wage job. 2. Savings due to reduced ER Visits or Hospitalization. The costs of an ER visit would be $1,000-2,000 and the cost of University Health System of hospitalization ranges from $750-$2500 per day depending on the acuity of the visit. A 4-day length of stay for an alcohol detox may average $6,500 and treatment or triage preventing hospitalization would save University Health System that expense. Of course the costs of trauma care and transplant services and the treatment of infectious diseases are much higher and effective outpatient treatment will also reduce these adverse outcomes. 3. Cost associated with preventing a single fatality related to DWI is estimated to be $3,300,000. There also are substantial cost savings in law enforcement and incarceration costs that could be considered in terms of community savings.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $8,069,055**
### Identifying Project and Provider Information:

| Title: 1.9.2 Improve Access to Specialty Care: Outpatient Neurology Services |
| Unique RHP ID#: 085144601.1.7 – PASS 1 |
| Performing Provider: University of Texas Health Science Center at San Antonio-Michael Palm, MD |
| Performing Provider TPI: 085144601 |

### Project Summary:

**Provider Description:** The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.

**Intervention(s):** This proposal is to improve access to outpatient neurology services with the addition of 1.0 FTE mid-level provider and 1.0 FTE LVN.

**Need for the project:** UTHSCSA Neurology provides care for the adult uninsured patients of Bexar County at University Health System’s downtown clinic. This clinic consists of a single general adult neurologist who provides clinic services 5 days per week. Approximately 150 patient visits are provided each month. The first available appointment is 3 to 4 months out with approximately 800 patients (as of Sept 2012) waiting to be seen. Timely access to outpatient neurology services for patients seen in the Emergency Department and discharged from the hospital will reduce inpatient length of stay and inappropriate admissions.

**Target population:**

The target population includes indigent, Medicare, and Medicaid patients referred by primary care providers for evaluation and/or management of neurological conditions and follow-up of patients seen in the Emergency Department or discharged from various hospital services. Greater than 90 percent of the neurology patients seen in this location are Medicaid/indigent.

**Category 1 or 2 expected patient benefits:**

This project seeks to increase the number of patients served to:

- **DY3:** 30 pct above baseline (195 visits per month)
- **DY4:** 40 pct above baseline (210 visits per month)
- **DY5:** 50 pct above baseline (225 visits per month)

**Category 3 outcomes:**

**IT-6.1 Patient Satisfaction Scores**

The goal is to improve patient satisfaction scores by 10 pct over baseline by DY5 as measured by the CG-CAHPS instrument for the following domains:

1. Timely care, appointments, and information
2. Patient rating of doctor access to specialist
**Project Description:**

**Background:**

The UTHSCSA Department of Neurology provides care for the adult uninsured patients of Bexar County through a contract with the Community Medical Associates. Services are provided through University Health System’s downtown clinic. The service consists of a single general adult neurologist who provides clinic services 5 days a week. In addition to seeing indigent, Medicaid and Medicare outpatients, this service is also tasked with provided timely follow-up visits for patients seen in Emergency Department as well as patients discharged from various hospital services, in an effort to provide continuity of care and prevent hospital readmissions. Some patients are evaluated and returned to their PCP, while others require ongoing neurologic workup or care. This service has been in place for 2 years, and it has had some success; however, the number of referrals has increased, so that the backlog of new referrals has markedly increased (see baseline data below). In addition, all available follow-up slots are being filled as well, so that the first available slot is typically 3-4 months out. Because of this, patient access is again becoming limited. In addition, the absence of consistent staffing has limited patient access via telephone.

**Goals:**

In order to provide continued high quality neurologic care to the indigent patients of Bexar County, accessibility needs to be increased. This proposal will increase accessibility by hiring 1.0 FTE mid-level provider to see follow up patients and 1.0 LVN to provide patients with improved telephone access and to perform injections and other procedures as required. We will utilize the skills of these providers and the neurologist in a team-based approach to improve the efficiency of neurologic care in this setting.

**Expected Result:**

With a mid-level provider seeing follow-up patients, access for follow-up patients is expected to improve. This will also allow additional time for the neurologist to see new patients, improving access to care. In addition with a nurse providing improved communication with patients, patient questions and concerns can be addresses more efficiently without the need for an additional visit with the neurologist.

The five-year expected outcome for this project is that the appointment capacity will be increased by 50 percent.

**Quality:**

To achieve continuous quality improvement we shall assess the projects impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

**Region 6 goals:**
This project achieves CMS’s Triple aim objectives of assuring patients receive high quality and patient centered care, in the most cost effective way, improves the health care infrastructure to better serve the Medicaid and uninsured residents of the counties we serve, further develops and maintains a coordinated care delivery system and improves outcomes while containing costs.

Starting Point/Baseline:
Outpatient neurology services for the adult uninsured patients of Bexar County are provided through the University Hospital – Downtown Neurology Clinic consisting of a single adult neurologist who provides clinic services 5 days a week. In addition to seeing indigent, Medicare, and Medicare patients, this service is also tasked with providing timely follow up visits for patients seen in the Emergency Department as well as patients discharged from various hospital services in an effort to provide continuity of care, reduce length of stay, and prevent hospital readmissions. The number of referrals to the clinic is far in excess of the capacity resulting in a backlog of new referrals that has reached approximately 800 patients (as of 9/12). In addition, the first available follow up appointment slot is 3 to 4 months out.

Rationale:
Providing patients with increased access to neurologic services leading to earlier intervention in patients with neurologic illnesses may prevent or slow deterioration or improve quality of life, and decrease the need for emergency department visits. Currently, the clinic is not adequately staffed to meet the ongoing needs of patients with neurologic diseases. Lack of timely access to a neurologist results in unnecessary visits to the emergency department often resulting in unnecessary admissions and/or increased length of stay for services that are not available in a timely fashion.

We are unaware of any projects underway at UTHSCSA funded by the US Department of Health and Human Services serving a similar purpose as the project being submitted.

CN.1 Meets community need to improve quality and patient satisfaction

Related Category 3 Outcome Measure(s):
OD-6 Patient Satisfaction
IT-6.1 Percent improvement over baseline of patient satisfaction scores as measured by the adult CG-CAHPS instrument for the following domains: Timely care, appointments, and information; and patient rating of doctor access to specialist

Currently, more than 800 patients are waiting to be seen by the Neurology Clinic for an initial evaluation with follow-up appointments being scheduled more than 4 months from the date of the initial appointment.

The above measure was selected to measure patient satisfaction with access to services.

Relationship to other Projects:
UTHSCSA submitted a proposal to expand neuropsychological services. Individuals with neurological diseases and impairments require neuropsychological testing to effectively characterize neurocognitive changes associated with their diseases. Neuropsychological testing aids in patient management, diagnostic clarification, prediction of disease progression,
evaluation of disease staging, assessment of function status, and development of treatment recommendations.

### Relationship to Other Performing Providers’ Projects in the RHP:
This project will require the diagnostic services provided by the following proposal:

UTHSCSA 1.9.2 Neuropsychological Services

Providers from both proposals will collaborate to discuss best practices and treatment options for patients they both serve.

### Plan for Learning Collaborative:
This project is staffed by providers who will be faculty of the UTHSCSA Department of Neurology. As such, providers will participate in Departmental educational activities and discussions regarding best practices and treatment innovations which can be applied to the patient population served.

### Project Valuation:
Lack of timely access to a neurologist results in unnecessary visits to the emergency department often resulting in unnecessary admissions and/or increased length of stay for services that are not available in a timely fashion. Increased availability of outpatient neurologic services will result in reduced appointment waiting times, decreased ED utilization, and reduced lengths of stay.

The project is valued based upon achieving waiver goals, meeting community needs, scope, and investment.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $2,241,404**
Identifying Project and Provider Information:
Title: 1.9.2 Improve Access to Specialty Care: Neuropsychological Services
Unique RHP ID# : 085144601.1.8 – PASS 1
Performing Provider: University of Texas Health Science Center at San Antonio-Russell Pella, PhD
Performing Provider TPI: 085144601

Project Summary:
Provider Description: The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.

Intervention(s): This proposal is to develop and expand the Neuropsychological Division to improve access to neuropsychological evaluation and testing services for patients with epilepsy, stroke, Alzheimer’s disease, brain tumors, and traumatic brain injuries with the addition of 1.0 FTE neuropsychologist and 1.0 FTE psychometrist.

Need for the project: The University has multiple programs and clinical services serving patients with neurological diseases and impairment but lacks adequate capacity to support the neuropsychological needs of these patients. Neuropsychological evaluation and testing provides effective characterization of neurocognitive changes and/or impairments associated with neurological diseases which aids in patient management, diagnostic clarification, prediction of disease progression, evaluation of disease staging, assessment of functional status and consequences of neurocognitive dysfunction, and the development of treatment recommendations. There is currently a six month wait to see the neuropsychologist for evaluation and testing.

Target population: Patients with epilepsy, stroke, Alzheimer’s disease, memory disorders, movement disorders, neuromuscular disorders, brain tumors, and traumatic brain injuries. Approximately 40 percent of the patients served will be Medicaid/indigent.

Category 1 or 2 expected patient benefits:
This project seeks to increase the number of patients served over the number served in baseline in DY2 (200 projected) to:

DY3: 25 pct above baseline (250 visits)
DY4: 50 pct above baseline (300 visits)
DY4: 100 pct above baseline (400 visits)

Category 3 outcomes:
IT-6.1 Patient Satisfaction Scores
The goal is to improve patient satisfaction scores in DY5 by 10 percent over baseline in DY2 for the following domains:

(1) Timely care, appointments, and information
(2) Patient rating of doctor access to specialist

The five-year expected outcome for this project is that an additional 350 patient visits for neuropsychological evaluation and testing will be provided.

**Project Description:**

The University of Texas Health Science Center at San Antonio serves a diverse population that lacks access to comprehensive personalized healthcare for individuals who are diagnosed with medical conditions affecting brain functioning. Such conditions often result in neuropsychiatric symptoms and impaired cognitive abilities both of which are risk factor for decline in functional abilities.

To address the behavioral health and medical needs of Bexar County and the San Antonio metropolitan population area, the Department of Neurology is proposing to develop and expand Neuropsychology Division that will improve access to neuropsychological testing services for patients with epilepsy, stroke, Alzheimer’s disease, brain tumors, and traumatic brain injuries with the addition of 1.0 FTE psychometrist and 1.0 FTE neuropsychologist.

**Region 6 Goals:**

This project achieves CMS’s Triple aim objectives of assuring patients receive high quality and patient centered care, in the most cost effective way, improves the health care infrastructure to better serve the Medicaid and uninsured residents of the counties we serve, further develops and maintains a coordinated care delivery system and improves outcomes while containing costs.

**Quality:**

To achieve continuous quality improvement we shall assess the projects impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

**Starting Point/Baseline:**

The Department of Neurology currently has 1.0 FTE faculty neuropsychologist who provided neuropsychological testing to 86 patients during the period November 2011 and June 2012.

**Rationale:**

The University has multiple neuroscience programs and clinical services in a number of departments serving patients with neurological diseases and impairments but does not have adequate capacity to support the neuropsychological needs of these patient populations. Effective characterization of neurocognitive changes and or impairments associated with neurological diseases aids in patient management, diagnostic clarification, prediction of disease progression, evaluation of disease staging, assessment of functional status and consequences of neurocognitive dysfunction, and development of treatment recommendations.

We are unaware of any projects currently underway UTHSCSA that are funded by the US Department of Health and Human Services serving a similar purpose as the project being submitted.
CN.3 This project expands access to care addressing provider shortages
CN.1 This project will enhance quality and improve patient satisfaction

Related Category 3 Outcome Measure(s):

IT-6.1 Percent improvement over baseline of patient satisfaction scores

There is limited access to neuropsychological testing services in Bexar County for patients with epilepsy, stroke, Alzheimer’s disease, brain tumors, and traumatic brain injuries.

The above measures were selected to measure patient access and demand for services as well as patient satisfaction with services.

Relationship to other Projects:

UTHSCSA submitted a proposal to develop a program to provide epilepsy care for outlying areas of South Texas. Individuals utilizing such a service will also benefit from neuropsychological services provided through the current proposal, which will expand the quality of care for patients in rural sectors of the region. There are also a number of clinical specialties within the sponsoring institution that are projected to benefit from neuropsychological services including movement disorder specialists, comprehensive epilepsy center, trauma center, stroke center, geriatric medicine, neurorehabilitation center, sports medicine, neurosurgery, psychiatry, and primary care.

Relationship to Other Performing Providers’ Projects in the RHP:

This project provides diagnostic services that are related to the following proposals:

- UTHSCSA 1.9 Expand Specialty Care Capacity: Epilepsy Outreach – Uvalde and
- UTHSCSA 1.9 Neurology Outpatient Services.

Plan for Learning Collaborative:

The South Texas Comprehensive Epilepsy Center based at University Health System consists of a multidisciplinary group of physicians and staff. This group meets weekly to review cases, exchange ideas, and discuss best practices/approaches to patient management. Services provided under this proposal will be included in these weekly discussions.

Project Valuation:

Individuals with medical conditions affecting brain functioning often result in neuropsychiatric symptoms impaired cognitive abilities. Both of which are risk factor for decline in functional abilities. A decline in functional abilities affects patients’ ability to obtain/maintain employment resulting in lost productivity and work-related earnings.

<td>The patients will have the benefit of extended clinic hours (evenings) and days at AVANCE and Healy-Murphy from 2 days to 5 days/week. Patient populations will be expanded at each site (pediatric, adult and geriatric; across the lifespan). Services will be developed to include psych/behavioral health care, increased Harvard Brazelton Touchpoints parent coaching and patient educational programs regarding monthly evidence-based health promotion programs: (Healthy Eating and Activity Together (HEAT); ALA smoking cessation; Keep your children/yourself Safe, Secure (KySS) mental health promotion; Teen Outreach Program (TOP), teen pregnancy and dropout prevention) and chronic disease...</td>
</tr>
</tbody>
</table>
management. The benefit to the patients is increased access, additional days/extended hours of service; additional psych NP, hearing and pediatric screenings and services. This promotes a greater level of health promotion, disease prevention, early intervention, and patient/parent coaching which all contribute to ER diversion and lower cost care. Patient population and visits will increase as follows:

Year 2 encounters/patient visits will increase in Year 3 to: AVANCE 399 to 432; SHC 3006 to 3300; EHWC 1700 to 2040; Healy-Murphy 200 day care users only to 923 day care and high school users;

Year 3-4 will increase from: AVANCE 432 to 1200; SHC 3300 to 4030; EHWC 2040 to 2448, Healy-Murphy 1846 3 days per week;

Year 4-5 will increase from: AVANCE 1200 to 1920; SHC 4030 to 5872; EHWC 2448 to 2938; Healy-Murphy 1846 three days per week to 5533 five days per week (birth through elder patient population)

Category 3 outcomes: This project will increase collaborative interprofessional student and faculty participation by 50%-75%. It will allow increased admission of pediatric, family and psych/mental health NP students, hiring of primary care providers, allowing increased access to high quality, cost-effective health care. Pediatric patient appointments will increase by 40%; psych/behavioral health appointments will increase by 80% at the Student Health Clinic, AVANCE and Healy-Murphy sites and by 20% at the Employee Health and Wellness Clinic. Data analytics from the EPIC EHR system will promote care continuity, patient safety and quality, and will enable reporting to be shared with the community partners, UT peer groups, and disseminated at local, state and national nursing and interprofessional health and health policy conferences. The components noted in the project summary are reflected in the milestones. We are not aware of any similar projects at UTHSCSA funded by the USDHHS.

Project Description:

This project proposal, Nurse-Managed Clinics: Improving Access, Expanding Clinical Sites, Promoting Interprofessional Education and Evidence-based Practice, Optimizing EHR Use and Financial Sustainability, documents needs and addresses health problems identified within the “Bexar County Community Health Assessment.” This proposal meets the RHP 6 Community Needs Assessment and emphasizes primary care, health promotion and disease prevention, increases access to care, proposes integration of mental health services into primary care, promotes interprofessional practice and education, and promotes ER diversion through increased access, early intervention and patient/parent coaching/education at four sites. The UT Nursing Clinical Enterprise (UTNC) model serves a birth to 5 year old population (90% Latino) at the AVANCE Community Partnership Clinic (ACPC), an Early Head Start and Head Start site. The UTNC will expand service provision to the families of these infants and children as well as increase slots available for primary care nurse practitioner students as well as other Health Science Center students (Med, dentistry, PT, OT, PA and audiology). The second site, the UTHSCSA Student Health Center (SHC) will expand interprofessional healthcare for students’ family members. The SHC is a designated Medically Underserved Population (MUP) as more than 50% of students come from underrepresented groups and qualify for state and federal programs. Many report that they are Head Start graduates. Services would also be expanded at the third site, UTHSCSA’s Employee Health and Wellness Clinic where 60% of the population is from underrepresented groups. The fourth site, Healy-Murphy (a community partnership
The UTHSCSA clinic (78% Latino) will significantly expand and provide services within an alternative high school and day care center with a focus on health promotion/disease prevention. Expansion of this child and family centered Health Home model will provide full UTNC service across the lifespan. Community workers and senior public health nursing students will enhance care continuity through home visits. The four existing nurse-managed clinics target children and young adults, birth through college age, as well as the adult populations of employees, and parents and grandparents of the community-based clinics’ pediatric patients. This project is also consistent with the UTHSCSA, School of Nursing and School of Medicine strategic initiatives for healthcare: expand primary care services tailored to the needs of our patients; effective coordination and integration of care; enhance quality and delivery of care; develop alternative reimbursement methodologies that reward quality outcomes and efficiencies; explore novel opportunities for healthcare delivery. The number of patients served will exceed 20,000 annually with annual encounters increasing by 40-50%. Expansion of access to primary care is demonstrated in the number of patients we can care for during the project timeline in settings where the patients live, work, study or enroll in Head Start or daycare. Patient populations will expand as shown in the chart in the next section. This project targets health promotion/disease prevention, mental health, obesity, teen pregnancy, child abuse prevention, tobacco use prevention/cessation, and chronic disease prevention, intervention and management. Use of evidence-based interventions: NAPNAP CDC-approved KySS Mental Health promotion and Healthy Eating and Activity Together (HEAT); Harvard Brazelton Touchpoints parent coaching and child abuse prevention; Harvard/UVA Teen Outreach Program for teen and pregnancy and dropout prevention. The American Cancer Society evidence-based smoking cessation programs targeted to specific populations. This project has a high level of return on investment. One example is that the 50% of the teens at Healy-Murphy are pregnant or parenting - our services are helping them stay in school, graduate, and transition to a post secondary educational or training program. The parent coaching prevents child abuse. Our education, coaching, role modeling, and provision of healthcare aids in breaking the cycle - 70-80% of prisoners were abused as children and 80% were high school dropouts. Other programs for targeted audiences include tobacco use prevention/cessation using ACA developmental and age appropriate EB programs. Children who live with smokers have 4-16 times higher rates of Otitis Media than children who live with non-smokers. In addition, otitis media alone exceeds $6 billion in healthcare costs. Due to obesity, Type 2 diabetes is reaching epidemic proportions. The CDC-approved NAPNAP Healthy Eating Activity Together (HEAT) provides effective evidence-based prevention and intervention related to physical activity and eating disorders including obesity. These evidence-based programs are integrated into the School of Nursing Curriculum. Our community partnerships are well established and will allow us to achieve and sustain our milestones and metrics. One aspect of our mosaic of support and sustainability is the broad interprofessional participation. These evidence-based best practice programs are embedded in the School of Nursing curriculum. All interprofessional students will have access to computer modules for review.

Region 6 objectives:

This project achieves CMS’s **Triple Aim** objectives of assuring patients receive high quality and
patient centered care, in the most cost effective way, improves the health care infrastructure to better serve the Medicaid and uninsured residents of the counties we serve, further develops and maintains a coordinated care delivery system and improves outcomes while containing costs.

Quality:

To achieve continuous quality improvement we shall assess the project’s impact and make adjustments as necessary, share best practices and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

**Rationale:**

The target goal of this project addresses the following RHP 6 community needs: Demographics, Healthcare provider shortage and Access to Primary Care; Health Provider Shortage for Mental Health; Chronic Disease; and Maternal Health:

The purpose of this proposal is to expand the four UT Nursing Clinic (UTNC) components of the UT Nursing Clinical Enterprise (UTNCE) to become interprofessional clinical sites and to increase access to primary health care. The expansion includes: strengthening the innovative and comprehensive nature of primary care delivered in the existing sites by integrating mental health services, significantly expanding the hours of clinic operation, thus increasing the number of medically underserved and vulnerable population constituents served without regard to insurance or ability to pay. **This will double the number of training slots for primary care practitioner, medical, dentistry, PT, OT, PA and audiology students.** An interoperable electronic health record (EPIC) system has been implemented across the sites for practice management, data collection/analytics related to safety and quality measures and improvement, patient and clinic outcomes, best practice guidelines, and expanding care across the lifespan in all sites. The result is a foundation for our enhanced model ultimately leading to a network of UTNCs in San Antonio and South Texas which is interprofessional and sustainable.

Not only does this project address one of the key aims of the Texas 1115 Waiver, this project is a perfect fit with the **Triple Aim** goals of assuring patients receive high quality and patient-centered care in the most cost-effective way – specifically primary care, mental health promotion, child abuse prevention, obesity prevention/intervention, and tobacco use prevention/cessation. One innovative aspect of the enhanced UTNC emerges from recognition that individuals with behavioral health problems present first in primary care settings with these settings being ill-equipped to meet urgent needs of these patients. The comprehensive primary care provided through the UTNC includes the integration of mental health services within the context of providing holistic interprofessional patient care. This addresses the issue of the RHP 6 counties being identified as a HPSA for mental health. Another novelty of this proposal is the diverse target population of both medically underserved and vulnerable populations who currently seek care at the UTNCs.

**In addition, our programs directly correlate to Table 5 of the RHP 6 Community Health Improvement Plan for Bexar County:** Priority Area – Healthy Eating and Active Living; UTNCE program – NAPNAP and CDC approved “Healthy Eating Activity Together” (HEAT); Priority Area – Healthy Child and Family Development; UTNCE program – NAPNAP and CDC approved “Keep Your Children/Yourself Safe and Secure” (KySS) and “Teen Outreach Program” (TOP – teen pregnancy and dropout prevention); Priority Area – Safe Communities; UTNCE program – “Touch Points” an evidence-based theory of child development, based upon more than 60 years of ground-breaking research by Dr. T. Berry Brazelton and his colleagues at Harvard Children’s Hospital in Boston and in communities around the world. The Touch Points program promotes healthy parenting thus breaking the cycle of child abuse. The KySS program promotes mental health, and the prevention of family dysfunction, violence, substance abuse, eating disorders, depression and suicide. 70-80% of prisoners were abused as children and 80% were high school dropouts.
This project addresses the need for greater access to primary care services in South Texas.

1.1.2 Expand existing primary care capacity
Required core project components:
  a) Expand primary care clinic space
  b) Expand primary care clinic hours
  c) Expand primary care clinic staffing

Related Category 3 Outcome Measure(s):
Project Area 1.1; OD- 9 Right Care, Right Setting; IT-9.2 ED appropriate utilization (Standalone measure)

Reduce ED visits for patients with asthma in the UTNCs Medicaid, pediatric and indigent populations. This project will allow accessible, cost-effective primary care, provide patient/parent coaching and education, and will allow maintenance of asthma care patients.

Relationship to other Projects:
1.7 - Introduce, Expand, or Enhance Telemedicine/Telehealth – Dr. Robert Novak
1.1 - Improving Inter-professional Team-Based Care for Patient Safety - Dr. Kathleen R. Stevens

Dr. Kathleen Steven’s TeamSTEPPS master’s trainers will complete a “train the trainers” with 30 UT Nursing clinic faculty, staff and interprofessional students from all four sites to further promote quality, safety and evidence-based practice.

Hearing health promotion and assessment are important components of primary healthcare from the EPSDT/Texas Team Steps for the Early Head Start/Head Start and daycare populations to the Student Health, Employee Health/Occupational Health to comprehensive care across the lifespan. Dr. Robert Novak’s project will promote hearing health promotion and the hearing assessment skills and skills related to innovative collaborative support of teleaudiology services with partner audiologists, for our faculty, staff and interprofessional students (2nd pass project).

Relationship to Other Performing Providers’ Projects in the RHP:
1.7 - Introduce, Expand, or Enhance Telemedicine/Telehealth – Dr. Robert Novak (2nd pass project)
1.1 - Improving Inter-professional Team-Based Care for Patient Safety - Dr. Kathleen R. Stevens

Plan for Learning Collaborative:
We look forward to participating in a RHP-wide learning collaborative. It is very important to share challenges and to learn from others. This will aid in sustaining each performing provider’s project and its success. We are available for any format selected, i.e., conference calls, meetings.
Project Valuation:

Objectives of the project will address such issues as the inability of the practitioner to communicate with the patient due to a language barrier, issues surrounding health literacy, and the inability of the patient to fully understand prescribed care. The majority of UTNC APNs are native Spanish speakers or bilingual. Developing and implementing systems and services: Our established clinics have systems and services in place; however, funding limitations result in clinic service provision only 1-2 days per week at AVANCE and Healy-Murphy. This project will allow primary and behavioral health care expansion at each site. Of the 3,813 Health Science Center students (Nursing, Medicine, Dentistry, Health Professions, and Basic Sciences), 50% come from underrepresented groups (38% Hispanic, 10% African American, and 2% “Other”) and qualify for state and federal programs. In FY2011, the SHC had 4,730 patient visits and averaged 20 patient visits a day. Thus far in 2012, patient visits have increased in the range of 40-50 visits per day. Services provided at the SHC and EHWC include health promotion/disease prevention, immunizations, comprehensive health assessments, diagnosis and management of acute and chronic health problems including behavioral health counseling, onsite collection of laboratory specimens, and ER diversion through early intervention and patient/parent coaching/education. All SHC and EHWC nurse practitioners (NPs) hold dual roles as faculty in the School of Nursing with cross appointments in the Department of Family Medicine. With the goal of expanding services at the SHC to dependents (children and spouses) of UTHSCSA students, we can increase primary care rotations for APN, PA and med students and service learning projects for students in other HSC programs, e.g., PT/OT. Inter professional students will participate in annual UTHSCSA employee health fairs, fun run/walks, pandemic preparedness, and research opportunities. The EHWC, serves approximately 6,000 UTHSCSA employees. The EHWC opened on November 15, 2010 and the patient base continues to grow. 60% of the employee population is from underrepresented groups. Redesigning and expanding the number of exam rooms in the SHC and EHWC, will allow a collaborative workspace for the interprofessional faculty and students of both clinics. In addition, this expansion would allow a private exam room for the counseling/behavioral health appointments and an evening pediatric clinic for children of HSC students and children enrolled at Murphy or AVANCE. In 2012, an employee survey by the HR department identified mental health issues as the top concern among UTHSCSA employees. A doctorally prepared psych mental health NP/APN will be added to each clinic.

The UTHSCSA AVANCE Community Partnership Clinic, is located within the very heart of the high-risk community it serves (a designated MUA). AVANCE has been a family/community program in SA for 40 years and is a national model. Two rooms have been dedicated to the clinic. With this funding, a third examination room will be fully equipped. AVANCE services 400 children from birth to age 3 and over 2,000 children city-wide with further expansion planned. AVANCE is ranked number 10 by the Hispanic Business Journal, as a significant contributor to parent education, promotion of parent’s high school completion and primary healthcare. This clinic is seen as a replicable model for the development of Head Start Health Homes. Since its inception, the clinic has ensured 100% immunization compliance among the enrolled children. The requested funding would allow expansion of services from 1.5 to 5 days a week. Women’s health services will be added. There is a documented need for services for the parents/grandparents, given an AVANCE Early Head Start 2011 survey where 29% of the parents reported alcohol or substance abuse disorders, 27% report domestic violence,
and 10% being on probation or parole. **Thirty-four percent reported mental health problems, with 18% reporting personal experience with child abuse and neglect.**

The Healy-Murphy Wellness Center (HMWC), is committed to serving at-risk youth, **including pregnant teens**, parents (both male and female), those who have dropped out of high school and others unable to achieve success in traditional school settings. HMWC is licensed by the state of Texas, and was one of only 17 schools in SA to receive the award for Texas School Readiness 2007-2011. Implementing the “TOP” program – Teen Outreach Program and education for teen pregnancy and dropout prevention is critical. **Also, having an on-site child development center and nurse-led clinic has provided young parents with a safe, nurturing educational environment for their children during the school day. This also allows APNs to provide care to the children on site, as most face transportation issues.** The high school serves approximately 150 students per year; approximately **50% of the students are pregnant, parenting, or both.** The culturally diverse population is 78% Hispanic, 18% African American, and 4% Anglo. Over 95% of students qualify for free or reduced meals. The daycare serves 200 infants/children per year, from 4 weeks to 5 years of age. The program is affiliated with the SA Independent School District.

A NAPNAP and CDC approved study entitled “KySS: Keep Your Children/Yourself Safe and Secure” revealed that approximately 1 in 4 children and teens experience mental health problems or psychosocial morbidities. A survey of 621 children/teens, and 603 of their parents reported concerns or “worries” regarding coping with stress, anxiety, depression, self-esteem problems and family relationships (Melnyk et al, 2001). Health care providers (600 PNPs and physicians) in the study contended that they were ill equipped to provide optimal care for children with these psychosocial morbidities. Increased educational content and continued education courses related to family dysfunction, substance abuse, eating disorders, depression and suicide were recommended and subsequently integrated into the UTHSCSA APN/Nurse Practitioner curriculum. Modules will be available for each of the interprofessional students to review the CB programs used in this project.

Since childhood obesity rates are alarming at 34% among Hispanics, the NAPNAP and CDC approved "Healthy Eating and Activity Together" (HEAT) evidenced based program will be introduced at each of the project sites. UTNCE provides parenting/childbirth classes, parent coaching using Harvard Touchpoints, behavioral/mental health promotion using evidence-based NAPNAP KySS and obesity prevention using evidence-based NAPNAP HEAT. Both the alternative high school students/parents and their children who attend the day care center are enrolled in Medicaid or meeting the criteria for enrollment. **The proposed project would significantly expand clinic operations from 1 day per week to 5 days per week.** Healy-Murphy received a capital improvement grant to create a 2,000 square foot clinic that opened August, 2012. This allows expansion of services and space for an interprofessional team of APN/NP students, PA students, and med students and their faculty. **This project will create a patient and family centered primary care health home for enrolled children expanding to include their parents and their grandparents and other family members over the course of the project years.** This interprofessional primary care Health Home and collaboration will allow integration of discovery, learning, and engagement. The content will be shared with all interprofessional student and faculty project participants. These clinics when expanded from one to five days/week can be operated for approximately 30-50% of the cost of traditional models.

**Milestone 1**

[P-1]: Establish additional/expand existing/relocate primary care clinics

**Metric 1** [P-1.1]: [Expand space]
- Document the expansion plan with UTHSCSA Facility Services Dept. and determine short and long-term needs.

Data Source: Scope of Work and Architecture plan for expansion.

Milestone 1 Estimated Incentive payment: $339,000

**Milestone 2**

[P-2]: Implement/expand a community/school-based clinics program

**Milestone 3**

[P-1]: Establish additional/expand existing/relocate primary care clinics

**Metric 1** [P-1.1]: [Expand space]
- Initiate and complete Phase I of expansion to increase number of exam rooms from 3 to 4 for the EHCW; provide NP and interprofessional faculty and student team office for SHC/EHWC.

Data Source: Scope of Work and Architecture plan for expansion.

Milestone 4 Estimated Incentive Payment $372,264

**Milestone 4**

[P-1]: Establish additional/expand existing/relocate primary care clinics

**Metric 1** [P-1.1]: [Expand space]
- Increase primary care clinic volume of visits and evidence of improved access for patients seeking services.

Metric 1: [I-12.1] Patient visits will increase as follows:
- AVANCE 399 to 432
- SHC 3006 to 3300
- EHCW 1700 to 2040
- Healy-Murphy 200 day care users only to 923 day care and high school users

Milestone 7 Estimated Incentive Payment $298,677

**Milestone 5**

[P-2]: Implement/expand a community/school-based clinics program

**Milestone 6**

[P-2]: Implement/expand a community/school-based clinics program

**Milestone 7**

[I-12]: Increase primary care clinic volume of visits and evidence of improved access for patients seeking services.

Metric 1 [I-12.1]: Patient visits will increase as follows:
- AVANCE 432 to 1200
- SHC 3300 to 4030
- EHCW 2040 to 2448
- Healy-Murphy 1846 3 days per week

Milestone 11 Estimated Incentive Payment: $577,153

**Milestone 8**

[P-2]: Implement/expand a community/school-based clinics program
<table>

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $ 4,482,808
Identifying Project and Provider Information:

Title: 1.1.1 Establish more primary care clinics: Primary care and behavioral care capacity expansion at UT Medicine San Antonio
Unique RHP ID#: 085144601.1.11 – PASS 1
Performing Provider: University of Texas Health Science Center at San Antonio (UTHSCSA)
   Carlos R. Jaén MD, PhD
Performing Provider TPI: 085144601

Project Summary:

Provider Description:

The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.

Intervention(s): This project will build two new medical homes that in addition to the usual primary care clinicians, we will have services provided by behavioral health professionals, pharmacists, nutritionists and RN case management services to deal with patients with complex medical problems.

Need for the project: There are significant gaps in the number of primary care clinicians who practice in the region and thus lacks the capacity to care for common chronic diseases (e.g., diabetes and heart disease), provide clinical preventive services (e.g., colon cancer screening and breast cancer screening), and in the treatment of obesity and tobacco use disorder. Treatment of behavioral problems is also a big gap identified in the needs assessment. These gaps are effectively addressed by primary care and behavioral services that are integrated and community responsive. Moreover, building clinics such as the ones proposed here will help attract and retain more primary care clinicians to the region.

Target population: The target population is patients without primary care and behavioral health services, specifically Medicaid and indigent patients.

Category 1 or 2 expected patient benefits: By the end of this project, the region will have 10 additional primary care and behavioral health clinicians practicing in the community. The primary care capacity of UT Medicine will be increased by 25% to almost 50,000 unduplicated patients in all primary care clinics from a baseline of 39,818. At the end of the project we expect to be caring for a panel of 9600 patients. At this rate the value in savings to the system could be as high as $867,072 at the final year in savings to the region. By the 5th year, the clinics will have 4 FTE primary care physicians and 4 FTE PAs/NPs, 1 FTE behavioral clinician, 4 FTE RN care managers, 1 FTE dietician and 1 FTE primary care pharmacist. These two new clinics directly address the regional goal of expanding primary care capacity to serve residents of Bexar County, the largest county in the region, and by recruiting and retaining a primary care force needed to address critical chronic disease and prevention needs specifically among Medicaid and indigent patients.
Patient Benefit:

DY 3 4,000 unique patients clinic 1
DY4 12,600 visits clinic 1, and 1,000 visits clinic 2
DY5 12,720 visits clinic 1, and 12,000 visits clinic 2

Category 3 outcomes:

We selected IT 1.11 Diabetes care: BP control (<140/90mm Hg) NQF 0061 (Standalone measure) as our Category 3 outcome measure. Diabetes is one of the most costly and highly prevalent chronic diseases in the United States. Approximately 20.8 million Americans have diabetes, and half these cases are undiagnosed. Complications from the disease cost the country nearly $100 billion annually. In addition, diabetes. The known prevalence of diabetes in Bexar County is 10% and more than double for African Americans (14%) and Hispanics (13%) compared to 6% among Non-Hispanic Whites. Hispanics represent 54% of residents of RHP 6. A highly functional primary care office in addition to increasing access will improve the quality of care for diabetics and hypertensives.

**Project Description:**

The overall goal is to increase UT Medicine San Antonio primary care capacity by 1/3 improving care for chronic diseases and prevention and also to enhance behavioral health availability by providing behavioral health services at the 2 new clinic locations. Considerable evidence is now accumulating that carefully executed transformation to a patient-centered medical home model achieves better outcomes with lower costs. In order to be effective medical homes must have staff and resources not usually available in primary care practices in most communities. We propose building new medical homes that in additional to the usual primary care clinicians, will have services by behavioral health professionals, pharmacists, nutritionists and RN case management services to deal with patients with complex medical problems. By the 5th year, the clinics will have 4 FTE primary care physicians and 4 FTE PAs/NPs, 1 FTE behavioral clinician, 4 FTE RN care managers, 1 FTE dietician and 1 FTE primary care pharmacist. These two new clinics directly address the regional goal of expanding primary care capacity to serve Medicaid and indigent patients and by recruiting and retaining a primary care force needed to address critical chronic disease and prevention needs.

**Quality:**

To achieve continuous quality improvement we shall assess the projects impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

**Region 6 goals:**

This project achieves CMS’s Triple aim objectives of assuring patients receive high quality and patient centered care, in the most cost effective way, improves the health care infrastructure to
better serve the Medicaid and uninsured residents of the counties we serve, further develops and maintains a coordinated care delivery system and improves outcomes while containing costs.

**Starting Point/Baseline:**

UT Medicine San Antonio is the practice plan of the School of Medicine at UTHSCSA. Currently primary care visits account for less than 9% of the total yearly visits (100K visits of the 1.1 million visits during the last year). In terms of unduplicated adult patients, all the primary care clinics at UT Medicine only cared for 39,818 unduplicated patients over the last 2 years (June 2010-May 2012). There is clearly a need to grow the primary care footprint of UT Medicine to better serve our community and reap the benefits of primary care for our community. Currently only 2 of 7 primary care clinics offer behavioral health services and only one offers case management by RN on a pilot basis.

**Rationale:**

The RHP6 Needs Assessment identifies significant gaps in the number of primary care clinicians who practice in the region and thus lacks the capacity to care for common chronic diseases (e.g., diabetes and heart disease), provide clinical preventive services (e.g., colon cancer screening and breast cancer screening), and in the treatment of obesity and tobacco use disorder. Treatment of behavioral problems is also a big gap identified in this assessment. These gaps are effectively addressed by primary care and behavioral services that are integrated and community responsive. Moreover, building clinics such as the ones proposed here will help attract and retain more primary care clinicians to the region. The known prevalence of diabetes in Bexar County is 10% and more than double for African Americans (14%) and Hispanics (13%) compared to 6% among Non-Hispanic Whites. Hispanics account for 54% of residents in the region. A significant proportion of Bexar County residents, 67%, are obese or overweight and 23% are sedentary.

With the current direction of health reform towards ACOs and other arrangements featuring population management and some form of prospective payment, it is imperative that the RHP6 develops local experience and expertise with state-of-the-art care delivery systems to appropriately manage population risk, improve quality indicators, and achieve cost savings through reductions in avoidable morbidity (i.e., inappropriate visits to emergency departments and avoidable hospitalizations). Many PCMH projects using care management and related protocols are achieving cost savings of 20-30% and demonstrating positive returns on investment. In order to achieve these outcomes is imperative to have a critical mass of primary care clinics and behavioral health services to allow the expression of these benefits. We are not aware of any related U.S. Department of Health and Human Services underway at UTHSCSA.

CN.2 Reduce health disparities by expanding access to integrated primary care services
CN.4 There is a shortage of high quality mental and behavioral health services that are integrated with physical health care services and/or provide crisis stabilization.

**Related Category 3 Outcome Measure(s):**

We selected IT 1.11 Diabetes care: \(BP\) control \(<140/90\text{mm Hg}\) NQF 0061 (Standalone measure) as our Category 3 outcome measure. Diabetes is one of the most costly and
highly prevalent chronic diseases in the United States. Approximately 20.8 million Americans have diabetes, and half these cases are undiagnosed. Complications from the disease cost the country nearly $100 billion annually. In addition, diabetes accounts for nearly 20 percent of all deaths in people over 25 years of age. Many complications, such as amputation, blindness, and kidney failure, can be prevented if detected and addressed in the early stages. Although many people live with diabetes years after diagnosis, it is a costly condition that leads to serious and potentially fatal health complications. Diabetes control can improve the quality of life for millions of Americans and save billions of health care dollars. The known prevalence of diabetes in Bexar County is 10% and more than double for African Americans (14%) and Hispanics (13%) compared to 6% among Non-Hispanic Whites. Hispanics represent 54% of residents of RHP 6. These estimates do not account for undiagnosed diabetics and pre-diabetics. A highly functional primary care office in addition to increasing access will improve the quality of care for diabetics and hypertensives. The system changes needed to achieve this outcome will benefit both diabetic and hypertensive patients treated at these clinics with substantial savings preventing major complications from both diseases. These conditions are more prevalent among low-income populations because of their higher prevalence of obesity and sedentary lifestyle.

**Relationship to other Projects:**
The project will support and reinforce the “Health Workforce Training to Support Patient-Centered Medical Homes” project. The training curriculum developed for the medical assistants will be directly relevant to that project as will lessons learned about implementing elements of the medical home. This project will also benefit from the “Expanding chronic care management in a safety net clinic” in that the training and protocols developed for this project will directly benefit the RN case managers that will be part of the new clinics. The risk stratification methods used for that project would also be useful for the functioning of the new clinics. There is ongoing close coordination at the leadership level among these projects.

**Relationship to Other Performing Providers’ Projects in the RHP:**
It is our intention to synergize with other projects that are in the process of implementing primary care transformation efforts conducted by University Health System, Community Medicine Associates and other RHP 6. We have a history of collaboration and joined projects that will facilitate close collaboration.

**Plan for Learning Collaborative:**
We are ready to participate and lead if necessary the development of RHP-wide learning collaborative with other providers with similar projects. We have substantial experience in planning and executing these. Dr. Jaén was the Principal Investigator of the team that evaluated the first National Demonstration Project of the Patient-Centered Medical Home. We can work closely with the leadership of the RHP 6 to make this process a reality.
**Project Valuation:**

Achieves waiver goals (score 5): The project directly addresses waiver goals, with its objectives to assure that patients receive high-quality and patient-centered care in the most cost effective ways; improves health care infrastructure by expanding primary care and behavioral health access care access; further develops and maintains a coordinated care delivery system; and improves outcomes while containing cost growth by avoiding expensive emergency department visits and improving preventive and chronic disease care.

Addresses community needs (score 5): The project directly addresses multiple community needs including the recruitment and retention of a primary care workforce and thus addressing the shortage and access to primary care; addresses the need to have integrated behavioral health and primary care services; and directly addresses cardiovascular disease, cancer and diabetes, three of the top causes of death in the region.

Project Scope – (score 5) – By the end of this project, the region will have 10 additional primary care and behavioral health clinicians practicing in the community. The primary care capacity of UT Medicine will be increased by 25% to almost 50,000 unduplicated patients in all primary care clinics from a baseline of 39,818. A recently published article in Health Affairs provides us with an estimate of savings (Z. Song, D. G. Safran, B. E. Landon et al., “The ‘Alternative Quality Contract,’ Based on a Global Budget, Lowered Medical Spending and Improved Quality,” Health Affairs Web First, published online July 11, 2012.) Properly implemented changes similar to those proposed here provide savings as high as $22.58 per member per quarter. At the end of the project we expect to be caring for a panel of 9600 patients. At this rate the value in savings to the system could be as high as $867,072 at the final year in savings to the region.

Project Investment – (score 5) – The expected capital investment in human resources, lease, equipment, medical supplies, IT infrastructure and support, and time to implement is relatively large. The sustainability of the project is risky in that it requires a significant change in the payment structure for primary care from a fee-for-service only to a medical home blended payment similar to those implemented in other states.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $7,620,774
Title: 1.8.6 Increase, expand and enhance dental services
Unique RHP ID#: 085144601.1.12 – PASS 1
Performing Provider: University of Texas Health Science Center at San Antonio - Dr. Kenneth M Hargreaves
Performing Provider TPI: 085144601

**Project Summary:**

Provider Description:

The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas. The primary mission of the UTHSCSA Dental School is to educate the future dental workforce for the state of Texas. In order to accomplish that goal, the Dental School requires an adequate patient pool to ensure that all of our dental students and residents receive the training required to attain competency to practice dentistry in Texas. Accordingly, the UTHSCSA Dental School does not require income verification in order to become a patient at the Dental School. We do however track patients by source of payment. Approximately 70% of the Dental School patients in all of the clinics in the school are identified as "self-pay" patients (dentally uninsured). In order to determine whether or not a patient is indigent, the DS can run a query, sorting patients by zip code and then ascertaining what % of the population in each specific zip code fall below the Federal Poverty Level (FPL). If we apply that Zip code percentage below the FPL to patients from the same Zip Code, we can estimate the % of indigent patients treated by the Dental School.

Also, we do obtain/track information (payor status) for children enrolled in Medicaid CHIP, and Title V at the DS and off-site clinics on the same clinic information system. In order to determine the percentage of adult who are eligible/enrolled in Medicaid for Medical benefits, but not dental benefits, we could add that element to our certified electronic health record. This would be proof of indigent status even though Medicaid does not cover adult dental benefits in Texas. It is assumed that the majority of the patients who would seek emergency dental care in the new clinic are going to be adults (Self-paying).

Most Dental Schools in the US have similar clinical operations due to the common primary goal of educating the future dental workforce and the requirement have adequate patient pools to attain our outcomes. In order to increase our pool of indigent/uninsured patients we will need to establish this baseline without requiring income verification in order not to undermine the total patient pool. Generally speaking, the indigent population also presents with the greatest treatment needs and therefore are very good teaching cases. The challenge for uninsured adults in the country who are indigent to be able to afford comprehensive dental care, The goal of the Emergency Dental Clinic proposal is to increase access to "emergency dental care" while simultaneously controlling costs and educating future workforce. The intent is to address the patient’s chief complaint in a timely manner at a reasonable price. A secondary goal is to educate the patients that present for emergency care about the importance of treating active dental disease and to encourage this cohort of patients to seek primary care to restore them to health and then to encourage them to seek regular dental care, including
prevention. This approach is not designed to restore full function, that is, to provide comprehensive rehabilitative care, but rather to encourage this cohort of patients to work towards that goal. Some people will choose not to seek comprehensive dental care due to the costs which are not covered by Medicaid or Medicare. The focus is on urgent care with referrals for primary care and comprehensive care. Hopefully, a segment of this cohort of emergency patients will decide to seek the care they need as the Dental School offers dental care to patients using different fee schedules for care provided by dental students in training, general and specialty residents in training, and dental school faculty. The fees associated with dental student training are considerably lower that the fees associated with care rendered by a faculty member.

**Intervention(s):**

The major goal of this project is to establish an emergency dental clinic for treating patients presenting with urgent dental conditions including oral infections, abscesses, pain and fractured dental restorations. This clinic will provide treatment to resolve the emergency condition and refer patients seeking comprehensive oral care to the UTHSCSA Dental School.

**Need for the project:**

Access to emergency oral health care is a challenging problem that greatly impacts both medical and dental treatment teams. For example, a recent Agency for Healthcare Research and Quality (AHRQ) report demonstrated that the number of hospital ER visits (>830,000) due to oral health emergencies has increased by nearly 16% from 2006-2009 (1). This has major health care resource implications since hospital ER visits for dental emergencies cost nearly ten times more than similar care delivered in a dental office ($6,498/visit versus $660) (2). Development of an emergency dental clinic is likely to have major community impact, particularly since nearly 66% of all emergency room visits for oral emergencies are by patients with a mean annual household income of <$47,000 (3).

**Target population:**

Our web-based survey indicates that low income populations with moderate/severe health disparities comprise the majority of subjects contacting the UTHSCSA Dental Clinic with requests for access to emergency/urgent dental care. Thus, the focus on these outcomes directly addresses a health care issue in this population.

**Category 1 or 2 expected patient benefits:**

As described above, a hospital ER visit for emergency oral health care costs about $6,498/visit. The enclosed Table lists the projected numbers of patients and incentive payments for each year. In the aggregate, the total incentive costs are $6,724,213 for treating a projected 8,917 patient visits, giving a calculated cost of $1,006/patient visit. Thus, considerable value is added by establishing this oral health care emergency clinic. Given that the UTHSCSA Dental School is an academic institution with a primary teaching mission, this value is quite similar to the comparison costs for oral health emergency care delivered in a dental office, and much lower than hospital ER costs ($6,498/visit) for dental emergencies (2).

### Category 3 outcomes:

The category 3 patient benefit is a 40% increase in the proportion of indigent and impoverished patients treated over baseline values.

### Project Description:

The major goal of this project is to establish an emergency dental clinic for treating patients presenting with urgent dental conditions including oral infections, abscesses, pain and fractured dental restorations. This clinic will provide treatment to resolve the emergency condition and refer patients seeking comprehensive oral care to the UTHSCSA Dental School. It is important to note that this is a new entity since existing hospital emergency rooms or dental clinics only offer limited and/or irreversible treatments consisting of extractions. Access to emergency oral health care is a challenging problem that greatly impacts both medical and dental treatment teams. For example, a recent Agency for Healthcare Research and Quality (AHRQ) report demonstrated that the number of hospital ER visits (> 830,000) due to oral health emergencies has increased by nearly 16% from 2006-2009 (1). This has major health care resource implications since hospital ER visits for dental emergencies cost nearly ten times more than similar care delivered in a dental office ($6,498/visit versus $660) (2). Development of an emergency dental clinic is likely to have major community impact, particularly since nearly 66% of all emergency room visits for oral emergencies are by patients with a mean annual household income of <$47,000 (3). Despite this widely recognized problem, no current emergency dental clinic exists in Bexar Country that offers any form of treatment other than an irreversible extraction, leading to a major negative impact on long-term stable oral health. In addition, this Clinic will develop a triage service that bridges emergency treatment to dental providers that can provide comprehensive care. This service will directly benefit patients, by increased oral health, as well as providing increased training opportunities for students and residents at the UTHSCSA Dental School.

### Quality:

To achieve continuous quality improvement we shall assess the projects impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

### Region 6 goals:

This project achieves CMS’s Triple aim objectives of assuring patients receive high quality and patient centered care, in the most cost effective way, improves the health care infrastructure to better serve the Medicaid and uninsured residents of the counties we serve, further develops and
maintains a coordinated care delivery system and improves outcomes while containing costs.

Starting Point/Baseline:

The UTHSCSA Dental School developed an online patient screening website application in 2007 (4). This application collects demographic information and preliminary oral health history information that is maintained in a secure database. As of July 12, 2012, a total of 32,824 records have been entered by prospective patients. An analysis of this database indicates that there is a large unmet need for treating oral emergencies. Nearly 55% of the 32,824 records included patients who entered at least one of the following keywords indicative of a need for emergency/urgent care: “pain”, “ache”, “hurt”, “broken”, “toothache”, “emergency”, “swollen” or “swelling”. Moreover, we have conducted a Geo Map analysis of the subjects entering these keywords for the top 20 most frequently used home zip codes (Fig 1). The top 20 zip codes entered by these subjects were represented in ~42% of all online records using the key words listed above.

Two major conclusions emerge from this analysis. First, the UTHSCSA Dental School has a large catchment zone that includes broad representation across our community. However, the second finding is even more significant. The zip codes most frequently used by prospective emergency dental patients are highly linked to elevated scores on the Community Needs Index (CNI; see Fig 1). The CNI identifies the severity of health disparity for every zip code in the United States (5,6). It is a composite measure of income barriers, culture/language barriers, education barriers, insurance barriers and housing barriers. The CNI ranges from 1 (lowest socioeconomic barriers) to 5 (highest socio-economic barriers). There is >95% correlation between CNI scores and hospitalization rates, with admission rates for communities with CNI scores of 5 being ~60% greater than rates observed in communities with CNI scores of 1 (5). Importantly, the mean CNI score for the top 20 zip codes in our database is 3.7. This analysis clearly demonstrates that there is strong need for an emergency dental clinic at UTHSCSA and that such a clinic will directly address populations with substantial health disparities.
To specifically relate this to the December 2011 starting point, we have re-analyzed the online patient screening database for Dec 2011 and found 100 patients who reported dental emergencies via this internet based application.

References

**Rationale:**

Reasons for selecting the project option: Access to emergency oral health care is a challenging problem that greatly impacts both medical and dental treatment teams. For example, a recent Agency for Healthcare Research and Quality (AHRQ) report demonstrated that the number of hospital ER visits (> 830,000) due to oral health emergencies has increased by nearly 16% from 2006-2009 (1). This has major health care resource implications since hospital ER visits for dental emergencies cost nearly ten times more than similar care delivered in a dental office ($6,498/visit versus $660) (2). Development of an emergency dental clinic is likely to have major community impact, particularly since nearly 66% of all emergency room visits for oral emergencies are by patients with a mean annual household income of <$47,000 (3). Despite this widely recognized problem, no current emergency dental clinic exists in Bexar Country that offers any form of treatment other than an irreversible extraction, leading to a major negative impact on long-term stable oral health.

Unique Community Need Identification Number: This project relates to RHP 6 Community Needs Assessment-Current Healthcare Infrastructure & Health Care Quality.

Access to emergency oral health care is a challenging problem that greatly impacts both medical and dental treatment teams. For example, a recent Agency for Healthcare Research and Quality (AHRQ) report demonstrated that the number of hospital ER visits (> 830,000) due to oral health emergencies has increased by nearly 16% from 2006-2009 (1). This has major health care resource implications since hospital ER visits for dental emergencies cost nearly ten times more than similar care delivered in a dental office ($6,498/visit versus $660) (2). Development of an emergency dental clinic is likely to have major community impact, particularly since nearly 66% of all emergency room visits for oral emergencies are by patients with a mean annual household income of <$47,000 (3). Despite this widely recognized problem, no current emergency dental clinic exists in Bexar Country that offers any form of treatment other than an irreversible extraction, leading to a major negative impact on long-term stable oral health. Therefore, this is a new initiative.

CN.3 Addresses the community need for improved access to dental services.

References:

**Related Category 3 Outcome Measure(s):**

We have selected IT-7.10. Other Outcome Improvement Target: Proportion of children and adults with urgent dental care needs *(Stand alone measure)*

a Numerator: Number of children and adults with urgent dental care needs
b Denominator: Total number of patients seen by a dental provider
c Data Source: EHR, Claims
d Rationale/Evidence: patients are less likely to suffer from more severe, urgent oral health
problems with adequate and regular access to dental care

- This outcome should be a priority for the RHP since it directly addresses a community need for emergency/urgent dental care. Data are described in “Starting Point/Baseline” section, above.
- The proposed Category 1 project will help achieve this Category 3 outcome measure by providing emergency/urgent dental care to children and adult (including geriatric) patients. Thus, each patient treated contributes directly to the numerator for this Outcome Measure.
- As described above in the “Starting Point/Baseline” section, our web-based survey indicates that low income populations with moderate/severe health disparities comprise the majority of subjects contacting the UTHSCSA Dental Clinic with requests for access to emergency/urgent dental care. Thus, the focus on these outcomes directly addresses a health care issue in this population.

Relationship to other Projects:
This project is related to the UTHSCSA Dental School IT project (1.8) in that this project establishes a new clinic within the DS which will rely on the IT project to provide the data source including core clinical quality outcome indicators required of certified EHR’s for all patients treated for emergency dental care, allowing us to analyze results and assess impact. Also, this project is related to the San Antonio Metropolitan Health District’s School-Based prevention project, in that the DS Emergency Dental Clinic will serve as a referral site for children identified as having “urgent need” for dental care as well as connection to a pediatric dental care clinic for children who need comprehensive care and do not have a dental home.

Relationship to Other Performing Providers’ Projects in the RHP:
We will be collaborating closely with Dr. Gary Guest, Interim Associate Dean for Patient Care at the DS and project director for the IT project, regarding the integration of the Emergency Dental Care Clinic into the DS clinical infrastructure as staffing of this clinic will require the collaboration of several disciplines in addressing the patients with urgent care visits, including Oral Surgery, Endodontics, Advanced General Dentistry, and Pediatric Dentistry. The residency directors of these disciplines will be involved in the Learning Collaborative to enable us to develop a schedule that will allow us to treat the patient’s urgent need in this new clinic as well as provide an academic framework for cross fertilization, teaching dental students and residents in the same environment.

Plan for Learning Collaborative:
Since the DS is building a new 200,000 sq. ft. clinical/research facility with 350 operatories will open in 2015, it will be essential to establish a Learning Collaborative that includes Faculty within the DS collaborating to integrate the Emergency Dental Care Clinic into the overall Mission and Goals of the institution as well as linking the departmental goals and objectives together for the good of the patient. As mentioned, the IT project provides the necessary foundation for data collection and analysis to enable successful implementation of this project. Because the educational mission of dental schools is to graduate competent general dental practitioners, a significant portion of the curriculum and clinical training is focused on the treatment of adults and as we are all aware, Medicaid does not cover adult dental benefits, making it difficult for Dental Schools in the nation to qualify for the Electronic Health Record Incentive program in terms of the 30% rule. However, in preparation for the opening of the new DS, the DS has ordered the certified edition of the AxiUm software. All of the faculty, residents,
staff and students will be trained via the IT project to use the new software – this also requires a
great deal of coordination, collaboration and efficiency so as to avoid interruption of the
academic, research, and clinical missions of the DS. Also, since this project will depend upon
staffing from various departments as well as calibration of training in operation of an ER Dental
clinic, developing a referral base form various sources, and integrating sustainability in an
uninsured patient pool environment, the Learning Collaborative will need to include partners
outside the DS, including the Dental Coordinator from the San Antonio Metropolitan Health
District. The DS Emergency Care Clinic will serve as the referral site for children having urgent
care needs. Other partners may be added to address specific issues that arise.

**Project Valuation:**

Achieves Waiver Goals (Self-Score =5): This project will develop a new dental care clinic for
treating emergency/urgent care patients and provides new training and rotations for dental
students and residents. As cited above, the cost of treating dental emergency patients in a dental
clinic is about 10% of the cost of treatment provided in the ER. Thus, this project addresses the
Triple Aim by providing high quality and patient centered care in a cost effective manner. It also
directly improves the health care infrastructure by BOTH establishing a new dental care clinic
and reducing the volume of patients who otherwise may use hospital ER services. Since ER
services often are only extractions, the dental clinic treatments would improve health outcomes
by saving teeth.

Addresses Community Needs (Self-Score =5): As indicated above, nearly 55% of the 32,824
patient contacts to the UTHSCSA Dental School requested emergency/urgent care treatment.
Since this sample only included patients who had access to the internet and knew about the
dental school clinic website, it likely represents a large under-estimate of the actual community
need. Moreover, our GeoMapping analysis reveals that these patient contacts occurred from our
RHP zip codes with particularly high socio-economic barriers (see Fig above). Thus, this
project application documents a strong community need for emergency/urgent dental care that is
based both upon literature review and direct analysis of our RHP’s population.

Project Scope (Self-Score = 4): This project scope is large in impact from four perspectives.
First, it provides a new dental care clinic that does not currently exist. Second, it will employ
expanded hours to increase patient visits/encounters. Third, it will involve training of both
dental students and residents to treat these populations increasing the number of recruited/
trained practitioners for the population living in the borders of RHP 6. Fourth, it will provide
savings from avoiding unnecessary ER visits.

Project Investment (Self-Score = 5): This project involves human resources (faculty, staff, dental
students, residents), new clinic space, new equipment and time to implement with an overall plan
that integrates improvement and process to achieve the milestones.

## Project Summary:

**Provider Description:** The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas. The primary mission of the UTHSCSA Dental School is to educate the future dental workforce for the state of Texas. In order to accomplish that goal, the Dental School requires an adequate patient pool to ensure that all of our dental students and residents receive the training required to attain competency to practice dentistry/specialty practice in Texas. Accordingly, the UTHSCSA Dental School does not require income verification in order to become a patient at the Dental School. We do however track patients by source of payment. Approximately 70% of the Dental School patients in all of the clinics in the school are identified as "self-pay" patients (dentally uninsured). Through our Electronic Health Record system we will be able to track patients by financial class and determine percentage of patients that are low income, including those below federal poverty level. We will also capture information related to Medicaid status.

### Intervention(s):

Upgrade the oral healthcare IT infrastructure to be used with Certified Software in support of the dental treatment of all patients served by the Dental School, including special populations and mothers, infants, and children. The certified version of the EHR incorporates core clinical quality measures allowing for the tracking of medical conditions related to dental health status, and the treatment of special needs patients.

### Need for the project:

The RHP Planning protocols delineate Specific Project Goals which include, the enhancement of quality dental care but does not include an option to provide training and use of the use of a certified electronic health record. The Federal government supports the use of the certified EPR to enhance quality as demonstrated by the EHR Incentive Program that has established and standardized clinical quality measures. Training of all clinic personnel in an academic dental school setting will facilitate automated reporting and allow providers to track patient demographics, diagnoses, treatment status, referrals, and cost of care which is essential to improving quality and providing quality assurance. The system will expand performance improvement and reporting capacity through participation in a clinical database for standardized data sharing and the development of a quality dashboard that is shared with faculty in the DS as well as with faculty in all other Dental Schools in the US who are using the Certified version of the Electronic Health Record. The system will also provide actionable quality data, streamline the specialty provider referral process, and enhance coordination of patient care at all DS sites. Referral will lead to joint consultation and treatment planning to improve patient education and
treatment as well as performance.

Target population (focus on quality of clinical care):

The Dental School Electronic Health Record will allow analysis of all patients to enable us to assess the quality of care rendered, provide effective care and focus on patient safety. This includes tracking key Quality Clinical Measures as designated by “Meaningful Use Rule” (tobacco use, diabetes, hypertension, drug and alcohol use etc). Our web-based survey indicates that low income populations with moderate/severe health disparities comprise the majority of subjects contacting the UTHSCSA Dental Clinic with requests for access to dental care. Thus, the focus on these outcomes directly addresses a health care issue in this population.

Category 1 or 2 expected patient benefits:

Expected patient benefit will be linked to standards of care, treatment outcomes, patient satisfaction survey results, health care provider compliance. The focus on quality of patient care is anticipated to enhance the benefit for all patients in the Dental School Clinic.

Category 3 outcomes:

The category 3 benefit relates to the implementation of the certified electronic record, training of users, analysis of patient data to support quality measures. This information will enable us to make necessary changes to improve oral health quality. Our benchmark for compliance will be 85% after year 3 implementation with goal of 95-100% in year 4. Expected result: to drive quality improvement through enhanced completion and information sharing.

Project Description:

The UTHSCSA Dental School (DS) is building a new 200,000 sq. ft. dental clinical/research facility which will be equipped with state-of-the-art dental equipment and information technology (350 dental operatories). Our existing clinic information system will be replaced with a “certified” electronic health record system (axiUm software). The goal of this proposal is to upgrade the oral healthcare infrastructure to be used with the certified software to support the dental treatment of all patients served by the Dental School, including special populations and mothers, infants, and children. In Bexar County, 57% of children enrolled in Head Start were found to have dental caries. Many of these children will receive basic dental care at the Ricardo Salinas Clinic owned by the San Antonio Housing Authority and operated by the DS and this clinic will be included in the network using the enhanced technology infrastructure. In order to accomplish this goal, the DS will need to upgrade the hardware technology and network systems throughout all of the clinics and to prepare the entire dental school workforce and future graduates of UTHSCSA Dental School to utilize an electronic health record (EHR). Funding for E.H.R. (Certified Version) has been provided through Meaningful use incentive payment. This was for software only. The certified version of the EHR incorporates core clinical quality measures to enable us to track medical conditions related to dental health status, as well as to track the treatment of special needs patients, improve quality controls, facilitate referrals to specialty providers as needed and enhance coordination of patient care at all DS sites. Results of queries from this type of system can be displayed, mapped and exported in multiple machine readable formats for customized data analysis and or the ability to combine multiple datasets for larger population analysis. The axiUm system that will be used by the DS has the capacity to integrate with a DICOM imaging system, MiPACS. This system has analytical tools that can
assist in quantification of findings that in turn can be utilized as quality improvement efforts. Standardized data elements related to radiographic analysis from images in MIPACS will be added to axiUm EHR. The Dental School will also utilize site licensing for a Drug Information System and Patient Education Software designed to improve the quality of patient care. Information from the Drug Information System will be integrated into the AxiUm EHR along with surveys of patient behavior related to digital forms of patient education materials. Faculty, students, staff and residents will be trained in the use of clinical modules of the EMR as part of their provision of dental care. Challenges: Our current CIS is outdated and does not include the clinical quality measures included in the certified version and DS personnel are not trained in the usage of this new system. Implementation will require significant training of all personnel without negatively impacting the delivery of dental care. Also, determining how to aggregate information in the EHR in a meaningful way will require accurate and precise data elements that need to be developed. All new/updated hardware and network systems will be required and will have to be integrated with the new certified software at all sites. The Dental School provides approximately 120,000 patient visits per year at its main clinical facility and off-site clinical training sites, serving as a safety net for dental patients in South Texas, most of whom are dentally uninsured and cannot afford dental care in the private sector. For every medically uninsured individual in Texas, approximately 2.6 individuals are dentally uninsured. This proposal supports the Emergency dental care proposal. Clinical Informatics System Project applies to all patients served (unduplicated -10,000 patients in the dental school clinic per year in San Antonio). Clinical Informatics System Project applies to all dental care services provided to all patients at each patient visit.

Quality:

To achieve continuous quality improvement we shall assess the projects impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

Region 6 goals:

This project achieves CMS’s Triple aim objectives of assuring patients receive high quality and patient centered care, in the most cost effective way, improves the health care infrastructure to better serve the Medicaid and uninsured residents of the counties we serve, further develops and maintains a coordinated care delivery system and improves outcomes while containing costs.

Starting Point/Baseline:

The Dental School provides approximately 120,000 patient visits/encounters per year (FY 2012) at its main clinical facility and off-site clinical training sites, serving as a safety net for dental patients in South Texas, most of whom are dentally uninsured and cannot afford dental care in the private sector. Currently none of the DS providers have been trained on the Certified Edition of the axiUm EHR. Approximately 500 individuals will be trained in the use of the Certified Edition of the axiUm EHR in year 2 (2013); all new entering students as well as new faculty and staff will be trained in subsequent years (2014-2016)
Rationale:

The primary reason for selecting this project is the need to adequately prepare our students and residents to practice in an environment where they will have the capability to assess their own performance and the quality of the care provided to their patients as well as the need to improve the oral healthcare technology infrastructure. The Dental School's goal is to teach students and residents to use best practices and practice evidence-based dentistry upon graduation, including the attainment of competence in the treatment of patients, including special populations. The milestones and metrics relate to the IT training of the entire Dental School personnel enterprise which includes approximately 400 dental students, 120 residents, 200 faculty and 125 staff. As specified in the Community Needs Assessment, a high dental caries rate (57%) was reported in Bexar County children enrolled in Head Start. Also, 11 of the 20 counties in RHP 6 are designated entire county dental HPSA’s and Bexar County is designated as a partial county dental HPSA. Other problems include: limited access to dental care, high dentally uninsured patient rates, and lack of dental providers. Recent prospects in the job market due to drilling for natural gas are expected to increase the population in this region and presumably a demand for health care services, including oral health care services. A comprehensive report by the Texas Department of State Health Services, *Oral Health in Texas 2008* provides a snapshot of oral health and the distribution of oral health problems among Texas residents. “Infections in the mouth, such as periodontal disease can increase the risk of heart disease (Beck at al.1998). Periodontal disease has also been associated with pre-term delivery (Scannapieco, et al, 2003) and complicates the control of blood sugar for people with diabetes (Taylor 12001).” We expect to track these parameters among the entire DS patient population, including at DS off-campus sites which serve, children, adults, and the homeless. In order to assess the effectiveness, timeliness and appropriateness of care. “Changes in the mouth often serve as first indicators of problems elsewhere in the body. And infectious diseases, immune disorders, nutritional deficiencies and cancer often first reveal themselves by changes in the mouth” (TDHS). Oral health disparities have been associated with race, ethnicity, sex and socioeconomic class relative to oral health status and access to oral health care. Therefore, this data could be used as indicators of socioeconomic differences in oral health and can be used to analyze the burden of oral disease among patients served by the Dental School. Use of the certified electronic record will also enable us to contribute to the body of scientific evidence related to oral health outcomes and to impact policy and the provision of services thru surveillance. The Clinic Information System/Dental EHR will serve as a data source to measure milestones for the project. The system contains patient record information, clinic schedules, transactional history for both patients and providers, billing information, consent forms and clinical notes. Dental School faculty and staff in the office of Patient Care/Information technology will be responsible for the implementation of the project and for the training of all the Dental School workforce providers involved in the delivery of patient care in the various general and specialty clinics. The DS has already begun the investment by submitting a purchase order to acquire the certified electronic record software thru the EHR Incentive Program. Hardware to support the system, including servers, computers and network upgrades will be needed to enable the implementation of the improved healthcare storage infrastructure project at the new Oral Health Care and Research facility. Training will be phased in by groups of users. Ready access and security arrangements will be made to protect servers by establishing 3 separate hubs on campus independent of the dental school. Since this system underlies the basis of tracking both educational and patient care outcomes, it will need to be in place and the providers trained in order to ensure successful transition to a new facility and
to an updated electronic health record system.

CN.3 This project addresses the need for greater access and enhance quality assessment to dental services for the indigent and Medicaid eligible populations as ascertained from the Certified Electronic System.

Related Category 3 Outcome Measure(s):

The primary reason for selecting this project is the need to adequately prepare our students and residents to practice in an environment where they will have the capability to assess their own performance and the quality of the care provided to their patients as well as the need to improve the oral healthcare technology infrastructure. The Dental School's goal is to teach students and residents to use best practices and practice evidence-based dentistry upon graduation. The milestones and metrics relate to the training of the entire Dental School personnel enterprise which includes approximately 400 dental students, 120 residents, 175 faculty and 125 staff. The current dental care delivery system and dental workforce are currently segregated from the healthcare system, making coordination of care and the attainment of overall health outcomes that are impacted by oral health status impossible. While the technology does not exist to enable electronic health record systems to communicate directly among all providers, the capacity to export relevant oral health status data to healthcare practitioners treating patients with diabetes, heart disease, cancer, etc. can impact patients’ overall health status.

a Numerator: Number of DS faculty, students, residents and staff trained in use of Certified EHR
b Denominator: Total number of faculty, students, residents and staff involved in patient care delivery at the Dental School and Off-campus sites
c Data Source: Training logs/schedules; training materials
d Rationale/Evidence: The ability to impact the effectiveness, timeliness and appropriateness of care within the UTHSCSA dental school and its’ off-campus sites all of which serve low-income populations and to have the capacity to share this information with other providers of health care services and dental educators is critical to maintaining the quality of dental educational institutions. (Fontaine et al).

Relationship to other Projects:

This project supports the UTHSCSA Emergency Care proposal (1.8). This project will enable the DS to track increased access to dental care, improve urgent dental care and improve performance and reporting capacity throughout all of the dental clinics using the same technology. Additionally, the training and upgrading of our electronic information system (hardware) to the utilization of a "certified" electronic record will enable us to provide information relative to many of the medical clinical measures in the DS population which is expected to increase dental care coordination within the dental school and identify patients.

With implementation of the certified system along with project goals database elements and their aggregation into reports, we will be able us to evaluate special populations to address project goals.
**Relationship to Other Performing Providers’ Projects in the RHP:**

We will be collaborating closely with Dr. Ken Hargreaves, Chairman, Department of Endodontics to support the establishment of a new Emergency Dental Care Clinic at the DS and the integration of the Emergency Dental Care Clinic into the DS clinical information technology storage infrastructure. All of this will require significant planning, collaboration of several disciplines in addressing the patients with urgent care visits, including Oral Surgery, Endodontics, Advanced General Dentistry, and Pediatric Dentistry as well as all patients in the Dental Scholl served by the 10 general and specialty disciplines as well as the undergraduate dental school and the dental hygiene clinics (approximately 240 dental operatories).

The residency directors of these disciplines as well as the undergraduate faculty clinic group leaders and dental hygiene faculty will be involved in the Learning Collaborative to enable us to develop a schedule that will allow us to not only treat the large volume of dental patients that present to the dental clinic for dental care on a daily basis. This will also provide the basis for an academic framework for cross fertilization, teaching dental/dental hygiene students and dental residents in the Dental School clinics.

**Plan for Learning Collaborative:**

Since the DS is building a new 200,000 sq. ft. clinical/research facility with 350 dental operatories that will open in 2015, it will be essential to establish a Learning Collaborative that includes faculty and staff within the DS collaborating to integrate the Emergency Dental Care Clinic into the overall Mission and Goals of the institution as well as linking the departmental goals and objectives together for the good of all patients. As mentioned the IT project provides the data collection and analysis necessary for the treatment of all patients. Because the educational mission of dental schools is to graduate competent general dental practitioners, a significant portion of the curriculum and clinical training is focused on the treatment of adults and as we are all aware, Medicaid does not cover adult dental benefits, making it difficult for Dental Schools in the nation to qualify for the Electronic Health Record Incentive program in terms of the 30% rule. However, in preparation for the opening of the new DS, the DS has ordered the certified edition of the axiUm software and will need to upgrade the hardware and network systems as well as train a large cohort of dental workforce personnel in the use of this new technology. All of the faculty, residents, staff and dental/dental hygiene students will be trained via the IT project to use the new software – this also requires a great deal of coordination, collaboration and efficiency so as to avoid interruption of the academic, clinical and research missions of the DS. Also, since the Emergency Care project will also require staffing from various departments as well as calibration of training in operation of an ER Dental clinic, developing a referral base form various sources, and integrating sustainability in an uninsured patient pool environment, the Learning Collaborative will also include partners outside the DS, including the Dental Consultant from the San Antonio Metropolitan Health District. The DS operates a pediatric dentistry clinic owned by the City of San Antonio. Also, the DS operates a 15 chair dental clinic at the Laredo Health Department which is staffed by UTHSCSA Dental School full-time and part-time faculty; this clinic will be incorporated into the upgraded EHR network and a representative from the LHD program will be part of the learning collaborative via video conferencing. Other partners may be added to address specific issues that arise.
Project Valuation:

This project is intended to provide the information infrastructure needed to ensure that patients treated at the Dental School and off-site clinics receive high quality, patient-centered dental care in a cost effective and efficient manner; and that the dental care is coordinated and that better dental care outcomes are attained for all dental school patients, including the uninsured, Medicaid and CHIP as well as Title V and special needs patients. The DS will implement and train the dental school faculty, staff, dental/dental hygiene students and residents in the use of the certified electronic record. Through this project, we will track dental treatment outcomes, cost savings, efficiency of dental care delivery and referral systems within dental school to specialty departments, reduction in dental errors/prosthetic replacements, measure student performance, provide broad array of clinical experiences required to train dentists, dental hygienists, and dental specialists to be competent practitioners, and identify gaps in training needs. The implementation of the certified electronic record, training of users, analysis of patient data to support quality measures. This information will enable us to make necessary changes to improve oral health quality. Our benchmark for compliance (patient records documentation, treatment outcomes, and diagnosis/treatment of oral diseases) will be 85% after year 3 implementation with goal of 95-100% in year 4. The Electronic Record System will be used to coordinate care between general and specialty dentists. Data from this system can aggregated and exported to machine readable formats for data mapping and warehousing to aid in quality of care assessments over multiple systems including systems used by medical providers. We are working with the City of San Antonio/San Antonio Metropolitan Health District to develop data warehousing strategy to assess quality of care for the Children’s Oral Health Initiative. This initiative proposes to provide preventive dental services to 10,000 underserved children in San Antonio / Bexar County. The dental school anticipates that all patients will benefit from the implementation of the Electronic Dental Record which has a significant focus is on quality of care. A value added benefit is the training of future oral health care workforce on use of technology to enhance quality of care.

Achieves Waiver goals: this project focuses on assuring that patients receive high-quality care through monitoring treatment via use of the certified electronic health record. It improves the oral health care infrastructure to better serve all patients, including Medicaid patients and will enable the DS to further develop and maintain an internal coordinated care delivery system. The implementation of this project is expected to improve oral health outcomes while containing cost and minimizing unneeded treatment. This project will also impact the DS urgent care clinic, facilitating reporting and standardization and impacts all patients treated by the DS. The evidence supports implementation of the Certified EHR. Addresses Community Needs: this project supports all of the DS treatment programs and is expected to provide real-time evidence regarding treatment outcomes for patients, including the underserved and uninsured, many of whom seek treatment in the DS. Project Scope: Patient visits/encounters will be tracked for all patients along with clinical core measures, providers will be trained and savings are anticipated due to better coordination of comprehensive dental care. Project Investment: this project involves human resources (faculty, staff, dental students, residents), new clinic facility, new equipment and time to implement with an overall plan that integrates improvement and process to achieve the milestones.

Identifying Project and Provider Information:

### Title: 1.7.1 - Implement telemedicine program to provide or expand specialist referral services in an area identified as needed to the region [Reengineering the Hearing Health Care System in South Texas: A Telehealth Model for Addressing the Unmet Hearing Health Care/Hearing Aid Needs of Adults with Mild to Severe Bilateral Sensorineural Hearing Loss]

**Unique RHP ID#: 085144601.1.15 – PASS 2**

**Performing Provider:** University of Texas Health Science Center at San Antonio

**Performing Provider TPI:** 085144601

### Project Summary:

**Provider Description:**

The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.

**Intervention(s):** This project will establish pilot hearing health care delivery model with the goal of making hearing health care services (including hearing aids) more accessible and affordable for those needing it. It will incorporate newly evolving teleaudiology technology placed in existing healthcare location that do not have audiology services; in the context of student training (1.cooperative Doctor of Audiology degree program (UT-Austin/UTHSCSA; and 2. UTHSCSA nursing and other professional degree (e.g. PA, OT) programs and possibly the St. Phillips Alamo College nursing program all participating in a Teleaudiology Clinical Technician course), who will together with mentor audiology faculty learn to deliver teleaudiology services to the target population of adults with self-identified hearing concerns who are not otherwise accessing hearing health care services.

**Need for the project:** It is estimated that 35+ million people in the U.S. have hearing loss significant enough to interfere with communication and quality of life, with only about 24% receiving help for their hearing loss. Accessibility, affordability and effectiveness of hearing health care services (including hearing aids) have been identified as significant factors related to the gap between those needing hearing health care services and those receiving them. As in the rest of the U.S., these issues related to poor utilization of hearing health care are also particularly true in the South Texas region with its vast geographical area, limited hearing health care facilities, and wide educational, health care, and socioeconomic diversity represented among South Texas residents.

**Target population:** Although a significant portion of the adult population with hearing loss are Medicaid and Medicare eligible, hearing health care services delivered via the telehealth modality are not currently reimbursed, with only limited coverage of hearing aids for Medicaid patients and no hearing aid payment coverage for Medicare patients. This pilot project is an effort to show the effectiveness of hearing health care services delivered via the telehealth modality, in terms of triage of patients to the next level of appropriate hearing health care when necessary, and on-site remote teleaudiology delivery of appropriate hearing health care (including hearing aids) for appropriate hard of hearing adult patients (e.g. those with mild to severe hearing loss).
severe bilaterally symmetrical hearing loss, uncomplicated by other medical conditions affecting the auditory system).

**Category 1 or 2 expected patient benefits:** 700 hard of hearing patients (100 in year three; 200 in year four and 400 in year five) will be served via teleaudiology consultation, by 15 Doctor of Audiology students in conjunction with 15-30 nursing students and other professional degree program students participating in the TCT course, working cooperatively under the supervision of audiology faculty in years 2 through 5 of the project.

**Category 3 outcomes:** The goal over years 2-5 of the project is to use teleaudiology to successfully deliver entry-level hearing health care and triage services to 700 patients, and open fit mini behind the ear hearing aids fit with standard earbud coupling to patients for whom they are appropriate and who would, according to the patients, otherwise not have had access to hearing health care and hearing aid services. Patient self-ratings for those using their new hearing aids will be completed regarding their ability to achieve their own goals for improved communication and social function, acceptable hearing aid satisfaction in daily life, and reduction in self-perceived hearing handicap.

**Project Description:**
Establish an innovative pilot South Texas (Bexar County) Hearing Health Care Delivery Model which incorporates existing and new resources including: Teleaudiology; a new level of support personnel (Teleaudiology Clinical Technicians (TCTs); a “Drop-In Hearing Clinic”; community clinic collaborations; and existing partner audiologists, otolaryngologists and Primary Care Providers (MDs/NPs/PAs). This model targets primarily members of the adult hard of hearing population; the majority of whom are not receiving diagnostic/rehabilitative help for their hearing loss. Our ability to communicate using the unique synergies of hearing, speech, voice and language separates humans from the rest of the animal kingdom. It is estimated that 35+ million people in the U.S. have hearing loss significant enough to interfere with communication; 4.6% between 18-44 years; 14% between 45-64 years; 32% over 65 years and 50-50% over 75 years. It is estimated that only 24% are receiving help for their hearing loss; with accessibility, affordability and effectiveness of hearing health care services being significant factors causally related to the gap between those needing hearing health care services and those receiving them. The South Texas Hearing Health Care Delivery Model proposed specifically addresses the challenges of accessibility, cost and effectiveness in the delivery of hearing health care (including hearing aids) to the majority of adults who need it. Specifically, this model proposes the integration of Doctor of Audiology education with the education of other professional students (e.g. nursing students, PA students, etc) who would be completing the new “Teleaudiology Clinical Technician Course”, and the delivery of teleaudiology clinical services via teams of audiologists/TCTs in a “Drop In Hearing Clinic” placed in collaborative partnership in the UTHSCSA Student/Employee Health. This project proposes to coordinate the education of audiologists with that of students in the Teleaudiology Clinical Technician Course to learn to jointly deliver teleaudiology services (hearing/otoscopic screening, hearing aid assessment and dispensing) at a service delivery site (“Drop In Hearing Clinic”) that is located away from the main audiology clinic and more geographically convenient to the target patients, with ability to triage and determine which hearing health care needs can be delivered at the Drop In Clinic versus which needs require referral to the next level of primary or specialty care. Five year expected outcomes for providers include: 15 UT-Austin/UTHSCSA Doctor of Audiology
students will complete clinical rotations among the CECSD hearing/balance consortium partners in the San Antonio region including participation in the Drop-In Teleaudiology Clinic; 15-30 LVN/RN/NP/PA students will complete the Teleaudiology Clinical Technician training course and engage in teleaudiology clinical service delivery in the Drop-In Hearing Clinic. Five year expected outcomes for patients: 700 adult patients will be served at the Drop In Hearing Clinic location and either provided with high performance mini-BTE hearing aids or appropriately referred to the next level of hearing health care.

The objectives (core components) of the project are: 1.7.1 e. to provide patient consultations by audiologists, and ENT specialists as needed, with the assistance of a Teleaudiology Clinical Technicians (a new and necessary category of telehealth support personnel) using telecommunications and digitally-based video otoscopes, audiometers, immittance equipment, real ear probe microphone equipment, and digitally programmable hearing aids that are all remotely controllable by the audiologist with the local assistance of the TCT, and 1.7.1 f. conduct continuous quality improvement by assessing the projects impact and make adjustments as necessary, share best practices and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

Region 6 goals: This project achieves CMS’s Triple aim objectives of assuring patients receive high quality and patient centered care, in the most cost effective way, improves the health care infrastructure to better serve the Medicaid and uninsured residents of the counties we serve, further develops and maintains a coordinated care delivery system and improves outcomes while containing costs.

Describe PM (Process milestones) and IT (Improvement Targets).

P 1 Conduct needs assessment to identify needed specialties that can be provided via telemedicine.
P 3 Implement telemedicine program for selected medical specialties based upon regional and community need

P10 Review project data and respond with tests of new ideas, practices, tools, solutions.
I18 Implement interventions to achieve improvements in access to care of patients receiving telemedicine/telehealth services.

P 1 Providers will engage the stakeholders.
P 2 Establish baseline

IT-10.1 Demonstrate improvement in quality of life (QOL) scores as measured by evidence based and validated assessment tools for quality of life.
Starting Point/Baseline:
UTHSCSA was awarded a University of Texas System grant (STARS) in June 2012 for $1.385 million to support facilities and equipment expansion in support of CECSD program development; including the development of a joint UT-Austin/UTHSCSA collaborative Doctor of Audiology program, a new Teleaudiology Clinical Technician (TCT) certificate program, and collaborative consortium of hearing/balance public/private/VA/DOD partners in the San Antonio region to support the development and delivery of innovative hearing health care programs associated with the CECSD. The DSRIP funding will complete the mosaic of funding to develop the proposed innovative audiology/TCT educational programs and pilot the new hearing health care delivery system model proposed. Baseline 12/1/2011 hearing health care services are currently delivered at a variety of unrelated audiology, hearing aid dispensing, and ENT offices in Bexar county; with hearing aids costing on average $2600/aid, and minimal to no existing third party coverage for them. Hearing aids are a core component of successful hearing loss rehabilitation, and with the current hearing health care delivery model, only those with hearing loss who can find, access and afford hearing health care are getting help for this chronic condition; resulting in failure to “thrive”, loss of productivity, social disengagement, and breakdown in family and social functioning. Currently no clients outside of the VA Hospital System in Bexar County are being served by a tele-hearing health delivery model as the model does not currently exist. There are also very few if any audiologists trained in the delivery of teleaudiology services in the United States, much less the state of Texas and Bexar County, and the category of hearing health care support personnel, Teleaudiology Clinical Technician (TCT), does not exist outside of the VA Health Care System. We also do not currently have a TCT course in place and the joint or cooperative UTHSCSA CECSD component of the UT-Austin Doctor of Audiology program is currently going through the development and approval process at UT-Austin, UTHSCSA, culminating in the creation of the joint or cooperative UT-Austin/UTHSCSA Doctor of Audiology program.

Rationale:
The target goal of this project is to develop a pilot model for a limited scope integrated South Texas Hearing Health Care Network that will enable an optimum continuum of care for patients with hearing/balance and related communication disorders and coordinate the education of audiology students in the UT-Austin/UTHSCSA Doctor of Audiology program with those nurses, PAs or other professional program students, in the new TCT certificate course, with the overall goal of expanding audiology clinical practice to include the delivery of teleaudiology services as proposed in this model. There is great disparity between those with chronic sensorineural hearing loss needing hearing health care services, including hearing aids, and those receiving it in Bexar county and elsewhere in Texas and the U.S. Behavioral Health and Mental Well-Being has been identified as a priority area in the RHP 6 Community Health Improvement Plan for Bexar County. One’s ability to effectively communicate with others through the most natural avenues of hearing and oral speech/language is fundamental to human behavioral and mental health. Research has shown that those with un-rehabilitated hearing loss significant enough to interfere with communication results in symptoms of social withdrawal, social isolation, depression, anxiety, frustration, and paranoia. Individuals who also have significant/debilitating tinnitus for which treatment has not been provided have also been shown to have sleep disorders, family/marital discord, vocational problems, and have even committed suicide because of their inability to cope with their unrelenting tinnitus and hearing loss. Hearing health care services including hearing aids and related adjustment and communication counseling have
been shown to significantly reduce these negative symptoms/behaviors in persons with hearing loss. This project proposes a hearing health care model that would enable more individuals with hearing loss to benefit from appropriate hearing health care intervention, including the use of hearing aids, with the goal of minimizing the contribution of hearing loss as one of the many stressors in the lives of Bexar County citizens participating in this pilot hearing health care system model. This teleaudiology model proposed in this project is made possible by the advent of computer-based hearing test equipment and hearing aids that can be operated remotely via two-way audio/video interactive digital Internet technology. This technology allows audiologists and ENTs to expand their existing practices to include teleaudiology/telehealth delivery of hearing health care, including hearing aids. This means that audiologists/ENTs participating in the South Texas Hearing Health Care Telehealth network could partner with a remote community-based Drop-In Hearing clinic (e.g. UTHSCSA student/employee health clinic) to provide hearing health care to patients being seen at that clinic, without the need to expand their own clinical infrastructure other than the addition of a two-way A/V desk-top video conferencing equipment (e.g. CISCO/Polycom) and their office computer. Via their desk-top video conferencing system, they can then hook-up to the video conferencing system at the Drop-In Hearing Clinic and the digital audiometric equipment (pure tone/speech audiometer, immittance system, video otoscope, real-ear probe microphone equipment and hearing aid programming software) to provide teleaudiology services and patient counseling with the essential support of the on-site TCT. A Hearing Health Care Network consists of audiologists/ENTs in the community who sign on as providers in the Network; enabling them to expand their existing practices and “reach” to locations closer to where the patients live, and enabling patients with hearing loss who would otherwise be un-served due to lack of access to, lack of trust in, and expense of the current hearing health care system, to receive the hearing health care that they need. This proposed innovative South Texas Hearing Health Care System model incorporating telehealth and new ways of providing patient hearing health care has been embraced by the NIH/NIDCD challenge to develop innovative approaches to hearing health care delivery that will demonstrate a model for delivery of hearing health care to underserved populations that is accessible/lower in cost and effective for the majority of adults with hearing loss desiring hearing health care and hearing aids ; NIDCD research on hearing health care (R01): (http://grants.nih.gov/grants/guide/pa-files/PA-100253.html and NIDCD Research on Hearing Health Care (R21/R33): http://grants.nih.gov/grants/guide/rfa-files/RFA-DC-12-003.html Dr. Novak has had initial discussions with NIDCD program officers Dr. Amy Donahue and Dr. Dan Sklare, regarding this proposed model for hearing health care and hearing aid delivery. They have expressed sincere interest in the model and funding of it as a demonstration project in the future.

**Related Category 3 Outcome Measure(s):**

**Category 3 reporting options related to this proposal:**

**OD-10 Quality of Life/Functional Status; IT-10.1 Quality of Life (Standalone measure)**
In general our goal for individuals with hearing loss that is significantly interfering with their ability to communicate and generally enjoy life is to enable them through appropriate assessment and intervention including use of appropriate hearing aids and supportive counseling, to hear more of the sounds around them and better understand speech in a range of situations. Our goal is to help them increase all communication-related activities (World Health Organization). In
short, to more effectively claim their unalienable rights to life, liberty and the pursuit of happiness.

To assess the benefit derived from amplification and the resultant reduction in hearing handicap and improved life quality we will administer three brief questionnaires, prior to intervention (at the time of initial assessment) and following intervention (30-45 days after the initial fitting of amplification and initial communication counseling). Need for programming changes to the hearing aid and further counseling will be determined at the second visit as well. Three standardized self-assessment measures will be used: The Client Oriented Scale of Improvement (COSI); The 10 item Hearing Handicap Inventory for Adults/Elderly Screening Version (HHIE) (Ventry & Weinstein, 1982) which assess both the social and emotional impact of hearing loss on the individual, and the 15 item Satisfaction with Amplification in Daily Life scale (SADL) (Cox and Alexander, 1999), which assess positive effect comprised of decreased communication disability, improved self-confidence, improved sound quality, and overall assessment of worth; service and cost, comprising reliability, clinician competence, and cost; negative features comprised of reaction to background sounds, feedback, and the hearing aid’s usefulness on the telephone; and personal image, comprised of appearance and the apparent reaction of others. Pre and post measures will be taken to assess reduction in hearing handicap and desired increase in communication ability and overall satisfaction and improvement in life quality. Documentation will be maintained to determine those patients are successfully served at the telehealth site, versus those needing referral to the next level of audiology/ENT care at the central site. Documentation will also be maintained to determine number of patients to whom hearing aids are dispensed and who are successfully using them versus those who have returned the aids with assessment of residual reasons for rejection of the hearing aids, after attempts have been made to support successful use, with implications for modifications in the telehealth delivery system as needed.

**Relationship to other Projects:**

1.1 Expand Primary Care: Dr. Julie Cowan Novak

We have identified the UTHSCSA Clinical Enterprise as well as the UTHSCSA School of Nursing as partners in enabling nursing students to develop the technical skills through participation in a Teleaudiology Clinical Technician Certification Course, necessary for them to support the delivery of teleaudiology services in partnership with Doctor of Audiology students in joint UT-Austin/UTHSCSA Doctor of Audiology program. We have also identified the UTHSCSA Student Health and Employee Health site as a location for a pilot Drop-In Hearing Clinic that would serve as both a laboratory for this collaborative/cross-disciplinary student education, as well as a convenient entry point for UTHSCSA students and faculty into the hearing health care delivery system.

**Relationship to Other Performing Providers’ Projects in the RHP:**

There are no other similar projects being proposed

**Plan for Learning Collaborative:**

There are no other similar projects being proposed
Project Valuation:
The value of this project is in its creation of a new model for hearing health care delivery that incorporates both new and existing personnel and new and existing health care facilities in multi-level hearing health care assessment/treatment model designed to address the gross disparity in percentage of adults with hearing loss receiving hearing health care services versus all who need those services. Consistent with the definition of health care “value” as health outcomes per dollar spent, it is designed to provide more convenient patient access to lower cost effective hearing health care resulting in improved hearing/communication ability for an increased percentage of those who need effective hearing health care. The model acknowledges that a significant percentage of this population has sensorineural hearing loss that is essentially bilaterally symmetrical with no other medically-related hearing/balance complications and who primarily need assessment of their hearing and appropriate fitting/adjustment of digital single processing hearing aid technology delivered and supported as close to their neighborhood as possible. A smaller percentage of the adult hard of hearing population needs more extensive audiology and medical services. They are in need of triage from the Drop-In Hearing Clinic with referral to the next level of audiology/medical care. A goal of this project is to demonstrate an approach to the “right care, each time for each patient” for individuals entering the hearing health care system. This triage and referral process would be accomplished through the Drop-In Hearing Clinic access point staffed by remote community audiologists participating in the Drop-In Hearing Clinic Network, working in conjunction with onsite Teleaudiology Clinical Technician whom they supervise. Next-level referrals would be to network audiology/ENT providers who the patients identify as located conveniently to them and/or who has the most immediate ability to schedule a next-level hearing health care appointment for the patient. This would enable the patient to begin the referral relationship facilitated at the Drop-In Hearing Clinic site.

The scope of this pilot project is limited to 2 site: UTHSCSA Student/Employee Health Clinic with audiology faculty and their Au.D. students providing the remote audiology services from the UTHSCSA MARC, University Health Systems Audiology Department; or UT-Austin Department of Communication Sciences and Disorders on-campus audiology clinic in conjunction with UTHSCSA nursing or other professional degree students taking the TCT course. This scope is designed to bring hearing health care services to UTHSCSA students, employees and their families at a central campus location. Project outcomes for providers include: 15 joint UT-Austin/UTHSCSA Doctor of Audiology students will complete clinical rotations among the CECSD hearing/balance consortium partners in the San Antonio region including delivery of audiology services under faculty supervision in the Drop-In Teleaudiology Clinics; 15-30 LVN/RN/NP students will complete the Teleaudiology Clinical Certificate training and engage in teleaudiology clinical service delivery under supervision in the Drop-In Hearing Clinic. Project outcomes for patients: 700 adult patients will be served at the Drop In Hearing Clinic locations and either provided with high performance mini-BTE hearing aids as appropriate or appropriately referred to the next level of hearing health care.

### Identifying Project and Provider Information:

| Title:  | 1.7.2 Implement remote patient monitoring programs for diagnosis and/or management of care |
| Unique RHP ID#: | 085144601.1.16 – PASS 2 |
| Performing Provider: | University of Texas Health Science Center at San Antonio |
| Performing Provider TPI: | 085144601 |

### Project Summary:

**Provider Description:** The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.

**Intervention(s):** This project is to use telemedicine to provide the specialized cancer-care to underserved areas delivered safely and effectively in their own communities. As a NCI-designated Cancer Center, the CTRC is committed to enhancing access to specialty cancer care in underserved areas.

**Need for the project:** Cancer is a leading public health issue in Texas (It is the number one cause of death for children in Texas age 1-14, and the leading cause of death for people in Texas age 85 or younger). Effective communication is central to quality cancer-care from Primary-Prevention to survivorship (Institute of Medicine Report 1999). In the absence of effective communication, providers of cancer-care are forced to refer patients to tertiary care centers, and the patients and public are forced to travel enormous distances to tertiary-care cancer centers at significant cost to their quality of life and financial health. Communication methods like telemedicine can improve cancer healthcare by enhancing cancer-related decision-making and motivate action to improve the quality of cancer care in underserved areas.

**Target population:** Our target population is the underserved population with or at-risk for cancer in Central and South Texas.

**Category 1 or 2 expected patient benefits:** The CTRC is committed to enhancing Cancer-Telemedicine to communities in underserved areas of South Texas by expanding use of telehealth to provide expert multidisciplinary cancer conferences and Tumor Boards to improve access to evidence-based cancer decision-making across the disease spectrum from prevention to survivorship and end of life care. Increase the percent of providers in underserved areas of South Texas accessing specialty cancer-care consultations by cancer telemedicine by 25% over baseline; and of patients in those areas receiving tertiary cancer-care by telehealth in their own communities by 30 % over baseline by Year-3 of implementation.

**Category 3 outcomes:**

The project seeks to increase the number of patients accessing cancer telemedicine from 60 to 75. Increasing the number of underserved areas from 3 to 5 in DY4 and Increase the number of patients accessing cancer telemedicine from 75 to 100. Increasing the number of underserved areas from 5 to 7 in DY5.
Project Description:
Our goal is to increase access to tertiary-level evidence-based cancer care from primary prevention to survivorship and palliative care in underserved areas of South Texas.

This project is to provide ideal cancer healthcare to underserved areas which is the highest priority for the Cancer Therapy and Research Center (CTRC). As a NCI-designated Cancer Center, the CTRC is committed to enhancing access to specialty cancer care in underserved areas, and to use telemedicine to provide the specialized cancer-care that they need delivered safely and effectively in their own communities. Please see attached table for milestone, metrics, targets. Increase the number of electronic consultations for specialty cancer care without patient being scheduled for an in-person visit, thereby reducing healthcare costs. Reduce wait times for specialty cancer care by expediting tertiary level care.

Finding the ideal time for telemedicine conference to suit the audience; designing just-in-time consultations for cancer prevention and treatment questions; garnering support from local community cancer healthcare providers to access the service; and advertising this service effectively.

With plans to implement cancer-related telemedicine services in Webb (Laredo), Hidalgo (Edinburgh), and Cameron (Brownsville) counties in the initial phase and expand to Val Verde (Del-Rio), Maverick (Carrizo Springs and Eagle Pass), Victoria and Medina (Hondo) Counties in years 3-5, we believe that this project will have a major positive impact on the cancer-related health care in this region.

Region 6 goals:
This project achieves CMS’s Triple aim objectives of assuring that patients receive high quality and patient centered care in the most cost effective way, improving the health care infrastructure to better serve the Medicaid and uninsured residents of the counties we serve, and further developing and maintaining a coordinated care delivery system that improves outcomes while containing costs.

Quality:
To achieve continuous quality improvement we shall assess the projects impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

Starting Point/Baseline:
Cancer is a leading public health issue in Texas (It is the number one cause of death for children in Texas age 1-14, and the leading cause of death for people in Texas age 85 or younger). Effective communication is central to quality cancer-care from Primary-Prevention to survivorship (Institute of Medicine Report 1999). In the absence of effective communication, providers of cancer-care are forced to refer patients to tertiary care centers, and the patients and
public are forced to travel enormous distances to tertiary-care cancer centers at significant cost to their quality of life and financial health. Communication methods like telemedicine can improve cancer healthcare by enhancing cancer-related decision-making and motivate action to improve the quality of cancer care in underserved areas. It is important to use modern communication technology to improve knowledge about, access to, and use of high quality, evidence-based cancer control strategies regardless of race, ethnicity, health status, education, income, age, gender, culture, or geographic region. As a National Cancer Institute-designated Cancer Center, the Cancer Therapy and Research Center (CTRC) is committed to enhancing access to speciality cancer care in underserved areas, and to use telemedicine to provide the specialized cancer-care that they need delivered safely and effectively in their own communities. To this end, the CTRC is committed to enhancing Cancer-Telemedicine to communities in underserved areas of South Texas by expanding use of telehealth to provide expert multidisciplinary cancer conferences and Tumor Boards to improve access to evidence-based cancer decision-making across the disease spectrum from prevention to survivorship and end of life care. Increase the percent of providers in underserved areas of South Texas accessing specialty cancer-care consultations by cancer telemedicine by 25% over baseline; and of patients in those areas receiving tertiary cancer-care by telehealth in their own communities by 30% over baseline by Year-3 of implementation.

### Rationale:

The CTRC is committed to enhancing Cancer-Telemedicine to communities in underserved areas of South Texas by expanding use of telehealth to provide expert multidisciplinary cancer conferences and Tumor Boards to improve access to evidence-based cancer decision-making across the disease spectrum from prevention to survivorship and end of life care. Increase the percent of providers in underserved areas of South Texas accessing specialty cancer-care consultations by cancer telemedicine by 25% over baseline; and of patients in those areas receiving tertiary cancer-care by telehealth in their own communities by 25% over baseline by Year-3 of implementation.

The CTRC has established strong collaborative partnerships to provide cancer telehealth services and virtual Tumor Boards with cancer health providers and communities in Laredo, Harlingen, Edinburgh, with plans to extend services to Del Rio, Eagle Pass, Carizo Springs, Victoria, and Hondo. Video-conferencing using Webex communication has been successfully tested for links to Laredo and Harlingen. Dr. Karnad has made trips to Harlingen and to Laredo with CTRC teams to establish cancer telemedicine conferences and tumor boards in formats most acceptable to the communities served, and highlighting specific cancer types common in those communities (hepatocellular carcinoma) or for expert consultation on uncommon cancers (leukemia and hematological cancers).

This project addresses the following community needs:

- CN.2, a high prevalence of chronic disease and related health disparities requiring greater prevention efforts and improved management of patients with chronic conditions. Cancer is a leading cause of death in RHP 6.
- CN.1, the need for improved health care quality in our community.
- CN.3, the need for improved access to medical care due to health care provider shortages.

There are no projects funded by the US Department of Health and Human Services serving a similar purpose as the project being submitted.
### Related Category 3 Outcome Measure(s):

<table>
<thead>
<tr>
<th>Related Category 3 Outcome Measure:</th>
<th>OD 9 Right Care, Right Setting IT-9.4 Other Outcome Improvement Target. Percentage increase the number of patients accessing cancer telemedicine services.</th>
</tr>
</thead>
</table>

1. Health Disparities: 1. Cancer is the leading cause of death among Hispanics in the US—the largest and fastest growing minority group in the US. It is therefore a priority for this RHP to serve 20% of all Hispanics in the US residing in Texas who potentially face cancer health disparity. It is essential to note that 1 in 2 Hispanic men, and 1 in 3 Hispanic women will be diagnosed with cancer, and the lifetime probability of dying from cancer is 1 in 5 for Hispanic men and 1 in 6 for Hispanic women.

2. Disparity between rural and urban cancer-survival can be improved by telemedicine efforts to enhance delivery of ideal care to populations at risk: Sabesan S, et al., Rural Remote Health. 2009 Jul-Sep;9(3):1146.

3. The delivery of complex cancer-care in the patient’s own communities instead of their having to travel to tertiary-care centers will result in significant improvement in quality of life, and eliminate delays between diagnosis and treatment leading to improvement in survival.

### Relationship to other Projects:

This project is related to 4 other projects under the plans to “Introduce, Expand, or Enhance Telemedicine/Telehealth. Three of these are hospital based in Bexar County: University Health System, Christus Santa Rosa, and Methodist Hospital Systems. The other, like our project is at UTHSCSA.

### Relationship to Other Performing Providers’ Projects in the RHP:

While a list of the other provider names is not available at this time, we would be able to immediately implement a learning collaborative to support this project and share best practices since all the other 4 projects are in our Medical Center Campus.

### Plan for Learning Collaborative:

Our project focuses on cancer as a primary disease category in our area. We would establish a learning collaborative meeting that is regularly scheduled, perhaps also conducted via teleconference, and identify shared goals even though the focus of the other projects will be a different category of illness, or target group: identifying stakeholders for areas served; telemedicine/telehealth program content; Information technology costs and implementation; and ideal outcome measure evaluation systems.

### Project Valuation:

Cancer is a huge burden in Texas and it is important to point out that Cancer is the leading cause of death among Hispanics in the US—the largest and fastest growing minority group in the US. With 20% of all Hispanics in the US residing in Texas, we will need to prepare for 1 in 2 Hispanic men, and 1 in 3 Hispanic women being diagnosed with cancer, and the lifetime probability of dying from cancer is 1 in 5 for Hispanic men and 1 in 6 for Hispanic women (American Cancer Society, Cancer Facts and Figures for Hispanics and Latinos 2012-2014), we will need to enhance the access to specialty cancer-care using telemedicine and for this...
population. In addition, there are projected to be nearly 12 million cancer survivors by 2020, >60% of whom are age >65—it is critical, therefore, to use the best technology to provide immediate access to specialty cancer-care across all areas of Texas urban and rural using telemedicine to deal with this magnitude of elderly cancer survivors who will need care, surveillance, and efforts to promote healthy aging (Parry C et al., Cancer Epidemiol Biomarkers Prev 2011;20:1996-2005).

There is a disproportionately higher incidence of the following cancers in South Texas: cervical cancer (11.5/100,000), liver and gall bladder cancer (10.4/100,000), stomach cancer (8.6/100,000) and childhood leukemia (47/million). This project will serve the needs of these high-incidence cancers in addition to all other types.

Identifying Project and Provider Information:

Title: 1.9.3 Implement other evidence based project to expand specialty care capacity in an innovative manner - Oncology
Unique RHP ID#: 085144601.1.17 – PASS 2
Performing Provider: University of Texas Health Science Center at San Antonio
Performing Provider TPI: 085144601

Project Summary:

Provider Description:

The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.

Intervention(s): The project is to increase trained oncology providers to serve the cancer population in Central and South Texas.

Need for the project: There is an overwhelming burden of cancer affecting our population in Texas—cancer is the leading cause of death in this state, coupled with serious shortage of trained oncology providers—Texas ranks 45th in the nation in the number of physicians per population: Therefore, we would like to educate the next generation of cancer care providers especially medical oncologists who can provide ideal cancer care from cancer prevention to survivorship care in rural and underserved areas of South Texas.

Target population: Our target population is the underserved population with or at-risk for cancer in Central and South Texas.

Category 1 or 2 expected patient benefits: The project seeks to increase the number of fellows in the ACGME accredited program by 25% per year over baseline

Category 3 outcomes:

The project seeks to increase the number of fellows serving in outreach clinics in underserved areas from 2 to 4 in DY4 and from 4 to 6 in DY5. It also seeks to serve 3 to 5 clinics in DY4 and 5 to 7 in DY 5

Project Description:

The aim of the project is to train new oncologists to enhance delivery of cancer care in underserved areas of South Texas.

The United States will likely face a major (36%) deficit in the number of oncologists relative to the demand for cancer care by the year 2020. This is in large part due to dramatic increases in cancer survivorship, and the projected 48% increase in cancer incidence caused by the aging population. Thus, there is likely to be a shortfall of between 2,550 and 4,080 oncologists by the year 2020. In Texas, cancer is the leading cause of death for those aged 85 and younger, and this year 110,135 Texans will be diagnosed with cancer and 39,072 will die of the disease. It is
estimated that there were 457,076 cancer survivors in Texas diagnosed between 1998 and 2007. The estimated cost of cancer care in Texas for 2010 was $25.3 billion. Texas ranks second in total population, but 45th in the nation in the number of physicians per population. Graduate Medical Education (GME) refers to the specialized training a physician receives after graduating from medical school, and specialty training in Oncology is obtained through completion of a residency program in that specialty. Texas has fewer GME slots than New York, California, or Pennsylvania. Training new oncologists is therefore critical to delivering ideal cancer care in South Texas in the future, especially with training in cancer health disparities and practice in outreach clinics in underserved areas. The fellowship training program in hematology and medical oncology at the UT Health Science Center, San Antonio, is fully accredited by the Association for Graduate Medical Education (ACGME) and currently has a three-year program which graduates 4 new oncologists per year. The Supreme Court’s decision to uphold the individual mandate in the Affordable Care Act (ACA) means 32 million newly insured Americans will be entering the health care system. This makes addressing the nation’s physician shortage—projected to climb to more than 90,000 by 2020—more important than ever. Additional residency slots and increased funding for doctor training will ensure that Americans have access to care, not just an insurance card. The training of new oncologists with special skills to practice in Texas will lead to quality cancer care provided to cancer patients, including those in active treatment, those facing a terminal illness, and for cancer survivors.

Our training program provides large amounts of indigent care. Funding for the existing approved training slots is threatened by a lack of stable state-supported GME funding through the state Medicaid Program (Texas is one of only three states in the country that does not provide GME funding through the state Medicaid program). Lack of sustained funding for oncology training may force a reduction in the number of slots for trainees at a time of desperate need to increase the training pipeline for new oncologists.

**Patient Benefit and 5 year expected outcome:**

The total number of new patients with cancer per year in Webb, Hidalgo, and Cameron Counties is estimated to be about 4,000. Conservative estimates indicate that about 30% (1,200) will be either Medicaid eligible, or considered indigent. The proposed project would provide outreach clinics staffed by fellows with supervision from Faculty to serve this population. The number of oncology clinics to be staffed in underserved areas, targeting this population, will grow from 2 in DY 4 to 6 in DY 5.

The number of Medicaid and Indigent patients that will receive cancer treatment/services within an outreach setting as a result of instituting this project by DY year is as follows:

- **DY 3:** 60 cancer patients (5% of total projected Medicaid/Indigent patients)
- **DY 4:** 120 cancer patients (10% of total projected Medicaid/Indigent patients)
- **DY 5:** 300 cancer patients (25% of total projected Medicaid/Indigent patients)

Uninsured estimated data from South Texas Health Status Review by Ramirez et al.
Region 6 Goals:

This project achieves CMS’s Triple aim objectives of assuring that patients receive high quality and patient centered care in the most cost effective way, improving the health care infrastructure to better serve the Medicaid and uninsured residents of the counties we serve, and further developing and maintaining a coordinated care delivery system that improves outcomes while containing costs.

Quality:

To achieve continuous quality improvement we shall assess the projects impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

Starting Point/Baseline:

Texas Medical Association (TMA) data show that physicians who complete both medical school and GME in the state are almost three times more likely to practice in Texas. Our own data on training oncologists from 2004-2012 in our ACGME accredited training program at the UT Health Science Center demonstrates the following: 19 of the total of 26 (73%) oncologists who graduated from our program in this period stayed in Texas upon graduating, and of those, 17 (89%) are still practicing in Texas.

Rationale:

The main reason for selecting this project is: educating the next generation of cancer care providers especially medical oncologists who can provide ideal cancer care from cancer prevention to survivorship care in rural and underserved areas of South Texas is one of the highest priorities for the NCI-designated Cancer Center, the CTRC. We would like to increase the capacity to provide cancer care and oncology specialty care services and the availability of highly trained specialty providers to better accommodate the high demand for cancer care and oncology specialty care so that patients have efficient and effective access to such services in their own community.

This project addresses the following community needs:

- CN.2, a high prevalence of chronic disease and related health disparities requiring greater prevention efforts and improved management of patients with chronic conditions. Cancer is a leading cause of death in RHP 6.
- CN.1, the need for improved health care quality in our community.
- CN.3, the need for improved access to medical care due to health care provider shortages.

There are no projects funded by the US Department of Health and Human Services serving a similar purpose as the project being submitted.
Related Category 3 Outcome Measure(s):

Related Category 3 Outcome Measure:
OD-11 Addressing Health Disparities in Minority Populations
IT-9.4 Other Outcome Improvement Target. Percentage increase the number of new oncology trainees.

In Texas, cancer is the leading cause of death for those aged 85 and younger, and this year 110,135 Texans will be diagnosed with cancer and 39,072 will die of the disease. It is estimated that there were 457,076 cancer survivors in Texas diagnosed between 1998 and 2007. The estimated cost of cancer care in Texas for 2010 was $25.3 billion. Texas ranks second in total population, but 45th in the nation in the number of physicians per population. Graduate Medical Education (GME) refers to the specialized training a physician receives after graduating from medical school, and specialty training in Oncology is obtained through completion of a residency program in that specialty. Texas has fewer GME slots than New York, California, or Pennsylvania. Training new oncologists is therefore critical to delivering ideal cancer care in South Texas in the future, especially with training in cancer health disparities and practice in outreach clinics in underserved areas.

The American Society of Clinical Oncology and other national organizations have published data on manpower shortage in oncology and these data can be accessed in:

a) A report to the American Society of Clinical Oncology (ASCO) from the AAMC Center for Workforce Studies. March 2007; 1-130.
c) Center for Workforce Studies. AAMC. Recent Studies and Reports on Physician Shortage in the US. August 2011 p1-21

Training oncology providers who will have expertise in delivering complex cancer prevention and treatment efforts in outreach clinics, and rural communities that are underserved will clearly improve the health of low-income populations who will have enhanced access to care in their own community.

Relationship to other Projects:
This project is related to 15 other projects under the plans to “Expand Specialty Care Capacity.”. 11 of these are hospital systems; 5 based in Bexar County; 3 based in Rural Communities; and. 4 others, like our project are at UTHSCSA.

Relationship to Other Performing Providers’ Projects in the RHP:
Projects at Bexar County Hospital Systems include: University Health System, Baptist, Childrens, Methodist, and Southwest General. Rural Providers include Dimmit County, Val Verde, and Connally. In addition, there are 4 others on campus at UTHSCSA. We would be able to immediately implement a learning collaborative to support this project and share best practices with many of the above providers especially if they are closely related to expanding specialty care capacity as it relates to training new providers.
**Plan for Learning Collaborative:**

Our project focuses on training oncology providers to provide and expand cancer-care in at-risk communities in rural areas and other communities. We would establish a learning collaborative meeting that is regularly scheduled, perhaps also conducted via teleconference, and identify shared goals, especially if projects are related to training programs to enhance the workforce, even though the focus of the other projects will be a different category of illness, or target group: identifying stakeholders for areas served; telemedicine/telehealth program content; Information technology costs and implementation; and ideal outcome measure evaluation systems.

**Project Valuation:**

Cancer is a huge burden in Texas and it is important to point out that Cancer is the leading cause of death among Hispanics in the US—the largest and fastest growing minority group in the US. With 20% of all Hispanics in the US residing in Texas, we will need to prepare for 1 in 2 Hispanic men, and 1 in 3 Hispanic women being diagnosed with cancer, and the lifetime probability of dying from cancer is 1 in 5 for Hispanic men and 1 in 6 for Hispanic women (American Cancer Society, Cancer Facts and Figures for Hispanics and Latinos 2012-2014), we will need to enhance the number and quality of trained oncologists to serve this population. In addition, there are projected to be nearly 12 million cancer survivors by 2020, >60% of whom are age >65—it is critical, therefore, to prepare a workforce to deal with this magnitude of elderly cancer survivors who will need care, surveillance, and efforts to promote healthy aging (Parry C et al., Cancer Epidemiol Biomarkers Prev 2011;20:1996-2005).

There will be a 48% increase in new cases of cancer, and an 81% increase in people living with or surviving cancer between 2000 and 2020. Visits to oncologists are expected to increase by 48% by 2020, the projected supply of oncologists will leave a shortfall of 9.4 to 15.1 million visits. This project aims to correct the shortfall by increasing the workforce of cancer doctors in South Texas.

Identifying Project and Provider Information:
Title: 1.9.2 Improve Access to Specialty Care (Pediatric Specialty Care Network)
Unique RHP ID#: 085144601.1.18 – PASS 2
Performing Provider: The University of Texas Health Science Center at San Antonio; Pediatric Cardiology, Pediatric Hematology, Pediatric Endocrinology, Pediatric Gastroenterology, Pediatric Neurology, Pediatric Pulmonology
Performing Provider TPI: 085144601

Project Summary:
Provider Description: The University of Texas Health Science Center at San Antonio serves San Antonio and a 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.

Intervention(s): This project will establish three pediatric specialty care clinics throughout greater San Antonio to improve access to pediatric specialists for children and families. The proposed new clinics are expected to be located in central San Antonio, south or southeast San Antonio, and north central San Antonio.

Need for the project: A recent study documented the current shortage of pediatric subspecialists in Bexar County, and projected an expanding need for additional pediatric subspecialists through the end of this decade. Additionally, the great majority of subspecialty providers are based in the South Texas Medical Center (northwest), creating an additional access barrier to patients and families. In particular, this access barrier is most acute for patients who are indigent.

Target population: The target population is children in greater San Antonio requiring outpatient pediatric cardiology, pediatric dermatology, pediatric endocrinology, pediatric gastroenterology, pediatric neurology, and pediatric pulmonology evaluation. Over 50% of children in RHP6 have Medicaid or are indigent and we anticipate this project will have Medicaid representation of 60% or more of total estimated patient visit volume. We expect all children, including those with Medicaid, to benefit from clinical expansion and improved access. The proposed clinic sites are located throughout greater San Antonio to minimize the effects of travel and access. In particular, the specialty clinic sites in downtown San Antonio and southeast San Antonio have been chosen specifically because central San Antonio, west San Antonio, and south San Antonio have a preponderance of Medicaid-eligible and indigent children. These locations will greatly enhance the access to care for these vulnerable populations.

UT-Medicine challenges related to this project
UT-Medicine, one of the major employers of pediatric specialists and subspecialists in San Antonio does not have adequate long-term outpatient capacity for specialty care pediatrics. With the construction of the new academic children’s hospital, planned for the South Texas Medical Center, the space available for specialty pediatrics will be expanded, but not until 2016. UT-Medicine is committed to the belief that much of pediatric specialty care can be delivered in community sites more convenient to patients and families than the Medical Center. This project will allow creation of satellite sites that are more convenient to the majority of the communities in greater San Antonio.
**Category 1 or 2 expected patient benefits:** This project seeks to provide 11,000 pediatric specialty care visits in DY3, 19,000 specialty care visits in DY4, and 24,000 specialty care visits in DY5. Additionally, this project seeks to improve access by establishing an electronic referral program.

**Category 3 outcomes:** This project will monitor patient satisfaction throughout the process of clinic establishment and will aim to continually improve patient satisfaction scores through education of staff and providers, improvement efforts, and a learning collaborative design to spread successes in patient satisfaction.

**Project Description:**

UT-Medicine has the opportunity to improve access to Pediatric Specialists through the addition of a group of multi-specialty, multi-site pediatric subspecialty clinics. This will be a part of a network of pediatric care, partnering with a new academic children's hospital delivering a comprehensive network of services. This initiative supports enhanced delivery of subspecialty pediatric services. It is expected that the new academic children’s hospital will be located in or adjacent to the South Texas Medical Center, in northwest San Antonio. By establishing alternate ambulatory specialty pediatric clinic access points throughout San Antonio, we propose to provide improved access through geographically convenient sites, and improved access by increasing the total number of available providers and total number of appointment slots available.

Delivery of pediatric specialty care will be enhanced through these improvements:
1. Establishment of a network of pediatric specialty care clinics staffed by specialists in pediatric cardiology, pediatric neurology, pediatric gastroenterology, pediatric hematology, and pediatric pulmonology and pediatric endocrinology. Eventually, there will be a central hub clinic adjacent to the academic children's hospital, and there will be three satellite clinics in Bexar county.
2. The satellite clinics will be supported and managed through the use of a multifunctional Electronic Medical Record that will allow electronic referrals to the clinics and will allow timely, reliable, and durable communication to referring physicians and practitioners. Additionally, the use of a common EMR for all sites and all providers will eliminate common process variation, enhancing delivery of service.
3. Additional subspecialty providers will be recruited to support this service expansion.

**Quality:**
To achieve continuous quality improvement we will assess the project’s impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

**RHP 6 goals:**
This project achieves CMS’s Triple aim objectives of assuring patients receive high quality and patient centered care, in the most cost effective way, improves the health care infrastructure to better serve the Medicaid and uninsured residents of the counties we serve, further develops and maintains a coordinated care delivery system and improves outcomes while containing costs.
**Starting Point/Baseline:**

A recent study, commissioned by the Methodist Healthcare Ministries, established that Bexar County currently lacks at least 20 pediatric subspecialists compared to the number of providers usually expected to provide reasonable access to care for children with specialty care needs. Additionally, the complement of pediatric specialists is aging with 2/3 of the current complement between the ages of 45 and 65 years. By the end of the decade, the number of children in Bexar County is projected to increase by at least 100,000. With this projected growth, and the expectation that providers will leave through retirement or relocation, it is expected that there is a need for an additional 75 to 95 pediatric subspecialists to join the medical community in San Antonio by the end of the decade to meet the needs of our children.

Currently, the greatest concentration of specialty care provider clinics in RHP6 bases in the South Texas Medical Center. This requires families with specialty care concerns to travel to the providers, creating access barriers. There are insufficient numbers of pediatric subspecialists in the community to address subspecialty care needs of infants, children and young adults.

Currently, in UT-Medicine, only the cardiology division provides subspecialty access outside downtown and the medical center, by providing regular outpatient clinics in north central San Antonio, New Braunfels, Seguin, and Jourdanton.

This project will be marked by multiple starting points, relevant to the three project interventions:

- Venues for pediatric specialty care will be established in downtown San Antonio, north central San Antonio, and southeast San Antonio. These sites will be established sequentially as additional providers are successfully recruited.
- UT-Medicine currently uses Epic as their EMR, but it has not yet been deployed throughout the practice. Epic training will occur for all providers and support staff that will be a part of the specialty care expansion. Epic will be deployed for use in each specialty care clinic as they are opened.
- UTHSCSA approval for additional faculty in pediatric cardiology, pediatric pulmonology, pediatric gastroenterology, pediatric neurology, pediatric endocrinology, and hematology will be secured. Recruitment will proceed for these new providers to allow adequate staffing of all subspecialty clinic sites.

**Patient Benefit:**

The number of pediatric visits to be generated by expansion of sub-specialty pediatric services as described within this project are as follows by DY Year:

<table>
<thead>
<tr>
<th>Year</th>
<th>Visits</th>
</tr>
</thead>
<tbody>
<tr>
<td>DY 3</td>
<td>11,000</td>
</tr>
<tr>
<td>DY 4</td>
<td>19,000</td>
</tr>
<tr>
<td>DY 5</td>
<td>24,000</td>
</tr>
</tbody>
</table>

Of the visits listed above UTHSCSA estimates at least 60% of those visits will be delivered to Medicaid and Indigent patients.
Rationale:
As related above, Bexar County and RHP 6 have a significant current shortage of pediatric specialty care providers and this shortage is predicted to become a critical shortage by the end of the decade. Partly related to this shortage of providers, there are few locations where children can access pediatric specialty care. The current systems of access and communication are limited by old models of communication which can be enhanced with adoption of novel electronic methods.
These improvements will help to:
1.9.2: Improve access to specialty care. This proposal will increase the total number of pediatric specialty providers in the community and will expand the number of locations in the greater San Antonio area that families can access pediatric specialty care. Establishing a network of specialty clinics throughout the metropolitan area increases the number of available appointments and creates more convenient locations for care. Implementing EpicCare and enrolling practitioners in EpicCare will establish and enhance processes for effective coordination and integration of care for our patients within our practice and with other partners.

Proposed Milestones:
Milestone 1 (P-1: Conduct specialty care gap analysis based on community need):
Milestone 2 (P-3: Develop baseline data for wait times, back log, and or return appointments).
Milestone 3 (P-11: Launch/expand a specialty care clinic: Goal: Add Pediatric Specialty Clinic Site in Southeast San Antonio)
Milestone 4 (P-8: Develop the technical capabilities to facilitate electronic referral.)
Milestone 5 (I-33]: Increased number of specialty care visits: Goal: A total of 11,000 patients will be seen in the specialty clinics)
Milestone 6 (I-24: Implement specialty care access programs, e.g., referral technologies, Goal: 20% of the referring providers will be enrolled in EpicCare.)
Milestone 7 (P-11: Launch/expand a specialty care clinic: Goal: Add Pediatric Specialty Clinic Site in North Central San Antonio)
Milestone 8 (P-8: Develop the technical capabilities to facilitate electronic referral. Goal: EpicCare will be implemented in the new Pediatric Specialty Clinic.)
Milestone 9 (I-33: Increased number of specialty care visits: Goal: A total of 19,000 patients will be seen in the specialty clinics)
Milestone 10(I-24: Implement specialty care access programs, e.g., referral technologies. Goal: 30% of referring providers will be enrolled in EpicCare.)
Milestone 11 (P-11: Launch/expand a specialty care clinic: Goal: Add Pediatric Specialty Clinic Site in Southeast San Antonio)
Milestone 12 (P-8: Develop the technical capabilities to facilitate electronic referral. Goal: EpicCare will be implemented in the new Pediatric Specialty Clinic.)
Milestone 13 (I-33: Increased number of specialty care visits. Goal: A total of 24,000 patients will be seen in the specialty clinics)

Core project components:
  a) Increase service availability with extended hours.
In the initial phases of this project, we anticipate that the specialty clinics will operate during standard hours (8AM to 5PM.) However, if there is an identified
need for further expansion of activities, this will be considered through our quality improvement process. In particular, after establishment of all three clinic sites, this will be evaluated as a potential opportunity for further expansion in DY-5.

b) Increase number of specialty clinic locations.

Three new unique pediatric specialty clinic locations will be established in this project. The three clinics are distributed throughout greater San Antonio, with geographic sensitivity, and avoiding the South Texas Medical Center. By design, the downtown pediatric specialty clinic and the southeast specialty clinic are placed in areas of greater community need due to a preponderance of Medicaid-eligible and indigent patients and families.

c) Implement transparent, standardized referrals throughout the system

We plan to use deploy an electronic referral system based in EpicCare. This will increase the ways that referrals can be processed, augmenting entry into the system, and allowing direct feedback to providers in a timely fashion.

d) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety net populations.

Information about service delivery will be collected through the use of the Agency for Healthcare Research and Quality tool “CAHPS Clinician & Groups Surveys – Visit Survey 2.0 (Child)”. This information will allow us to determine if we are delivering care in such a way that it is valuable and meaningful to the patients and families. All shortcomings that are identified with this tool will become targets for improvement. Formal quality improvement tools will be used to determine best steps for improvement. Differences in meeting the needs of indigent and Medicaid-eligible populations will be surveyed, and if the needs are found to be different in different locations, unique delivery interventions will be tested. The results of rapid cycle improvement tactics will be determined through ongoing use of the CAHPS tool. Successful interventions will be shared throughout the pediatric specialty clinic operations. Additional opportunities for further dissemination will be sought through presentations and publications.

CN.3 This project addresses the RHP 6 need of expanding access to medical care.

**Related Category 3 Outcome Measure(s):**

**OD-6: Patient Satisfaction.** IT 6.1 Patient satisfaction will be measured throughout the process of subspecialty clinic expansion and operation. Baseline data will be collected from a sample of patients in each specialty area in DY2. The survey tool used will be designed on the survey framework provided in the Agency for Healthcare Research and Quality tool “CAHPS Clinician & Groups Surveys – Visit Survey 2.0 (Child).”

Key survey elements will include:

A) Patient/parent impression of ease of access to specialist and timeliness of appointment

B) Patient/parent impression of the quality of physician communication.

C) Patient/parent impression of involvement in shared decision making.
The information collected through the survey process will be reviewed continually throughout the process (DY2 through DY5.) Quarterly feedback will be given to providers (physicians and nurse practitioners) in the specialty care clinics and to the clinic leadership. Individual specialty clinic sites will be empowered to adopt changes to improve patient satisfaction. Successful improvements will be shared formally throughout the Specialty Care network semi-annually through a Learning Collaborative model. This activity will accomplish the following Process Milestones:

P-1: Project planning. Information collected at baseline in DY2 and DY3 will be used to identify specific targets for improvement in the processes of new patient referral, appointments, communication, and decision making. This will allow planning for general improvements in access, and allow design of educational efforts to assure that patient satisfaction improves throughout the process. The new specialty clinics will not begin to be established until the end of DY2. Initial patient satisfaction data will be collected from existing UT-Medicine clinics in pediatric cardiology, pediatric hematology, pediatric endocrinology, pediatric gastroenterology, pediatric neurology, and pediatric pulmonology prior to opening new specialty clinics.

P-2: Establish baseline rates: This activity will establish specific baseline rates for patient satisfaction and will be used to identify practitioners and services with high baseline outcomes to guide improvements throughout the Pediatric Specialty Care Network.

P-3: Develop and test data systems. The initial survey tool will be modeled closely upon the CAHPS Clinician & Groups Survey – Visit Survey 2.0. The survey tool will be continually re-evaluated by leadership of the Pediatric Specialty Care Network. Additional elements will be added as necessary to assure that improvements are progressive.

P-4: Conduct PDSA cycles: Improvement targets that are identified through the Visit Survey will be formally addressed through improvement efforts, and tracking of the effects of the improvement will be followed through ongoing use of the Visit Survey. Improvement efforts and education will occur through a Learning Collaborative internal to the Pediatric Specialty Care providers (physicians and NPs) and the staff supporting the clinics. These efforts will take place in DY3-DY5.

P-5: Disseminate findings: Patient Satisfaction results will be distributed quarterly to providers and leadership. Specific guidance around findings will be given and individual specialty clinic sites will be empowered to adopt changes to improve patient satisfaction.

Relationship to other Projects:

Related to project 085144601.2.1. Reduce and prevent lead poisoning and asthma in children and adolescents by targeting environmental aspects of children’s health (TEACH)

Relationship to Other Performing Providers’ Projects in the RHP:

TBD

Plan for Learning Collaborative:

TBD. We anticipate that the information obtained through the use of the Agency for Healthcare Research and Quality tool “CAHPS Clinician & Groups Surveys – Visit Survey 2.0 (Child)” will yield improvement opportunities. We will use these to create improvement oriented learning opportunities that will share best practices and improvement strategies throughout the specialty network.
**Project Valuation:**
The overall target goal is to establish a network of pediatric specialty care clinics throughout greater San Antonio which will enhance the ability for all children in San Antonio and the surrounding region to have timely and convenient access to pediatric specialty care. This project will establish three unique, new sites for pediatric specialty care throughout greater San Antonio which will benefit the community by reaching out to various groups. With successful deployment of these clinics, we plan to create 54,000 new opportunities for children to see pediatric specialists through the end of DSRIP year 5. By reaching out through establishing community clinics, this will decrease the disruption to parents who work, and children who are in school, thus bringing additional benefit, beyond the direct healthcare benefits, and thereby also decreasing some of the hidden costs for parents. Overall health of the children of the region will be enhanced through effective delivery of care and effective communication with referring practitioners through the use of modern EMR application. These improvements will enhance access for all children to the new children's hospital and will support the addition of needed pediatric specialty care providers.

Identifying Project and Provider Information:

Title: 1.10.1 Enhance improvement capacity within people [redesign to improve patient experience]
Unique RHP ID#: 085144601.1.20 – PASS 2
Performing Provider: University of Texas Health Science Center San Antonio-Laura Monroe
TPI: 085144601

Project Summary:

Provider Description:
The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas. Located in Bexar County, we serve a large, Spanish-speaking, Medicaid population: 20% of our patient population is covered under Medicaid, almost an equal percentage to our Commercial payor population.

Intervention(s): The project will implement the CG-CAHPS patient experience survey among patients on behalf of all UT Medicine providers. All patients have an equal chance of being chosen to provide feedback via a 6-page survey, mailed to them in their preferred language.

Need for the project: Implementation of CG CAHPS is in line one of the Strategic Directions put forth by Bexar County’s Community Health Assessment (a document which laid out the biggest needs for Bexar County): more direct community involvement in healthcare. We currently have no way to measure patient satisfaction and experience, and as such, have been implementing quality improvement efforts without the input of the community. The CG-CAHPS survey will provide patients a direct way to become involved in their care, resulting in a more engaged, adherent patient population.

Target population: The target population is all of the patients seen at our UT Medicine clinics. 50 patients per provider will be selected randomly via a computer. 20% of our patient population is covered under Medicaid, and this intervention gives this often underrepresented patient population the opportunity for direct feedback.

Category 1 or 2 expected patient benefits: With the feedback that we received from over 8,000 patients, we will be able to identify operational inefficiencies in each of our clinics. Refinement of these operational processes will result in increased capacity and greater access for our patients across demonstration years (DY).

Category 3 outcomes: Research has shown that patient care experiences positively correlate to clinical quality processes and outcomes on both the practice and provider levels. We aim to increase patient experience scores in two domains specifically: to increase patient satisfaction scores for all providers on at least one measure from CG-CAHPS by 2.5% in year 4, and to increase patient satisfaction scores on shared decision making for all providers by 3% in year 5.
Project Description:
Providers at the MARC and CTRC currently have no way to measure patient experience, a measure that is becoming an explicit component of compensation and certification. Implementation of CG CAHPS is in line with two of the Strategic Directions put forth by Bexar County’s Community Health Assessment, a document which laid out the biggest needs for Bexar County. Patient care experience is broadly recognized as a core element of healthcare quality and also correlates to key financial indicators. The CG-CAHPS survey measures a broad range of core areas including access to care, provider communication, courtesy of clinic staff, how the patient would rate the provider, and whether or not they would recommend the clinic to family and friends. This invaluable information is presented in clear reports via the Catalyst program of NRC Picker, making the development and implementation of systems change easy, intuitive, and best of all, measurable.

The questions will be consistent across service lines so we will be able to see actionable system problems that have broad quality and efficiency implications. In implementing the evidence-based Clinician and Group Consumer Assessment of Health Providers and Systems (CG-CAHPS) at UT Medicine, we aim to measure and improve patient experience of care. The significance of this goal will be realized through increased patient loyalty, a more engaged and adherent patient population, and increased clinical quality.

Starting Point/Baseline:
The proposed project will include 50 randomly selected patients per UT Medicine providers, or 8750 patients total. By making available patient experience data available by provider, each provider will be more empowered to improve patient experience by targeting interventions and support in the areas that are needed most. We do not currently have a baseline for our providers in terms of patient care experience. This is part of the problem. With the implementation of CG-CAHPS, we will be able to not only get a baseline for our providers, but compare that baseline nationally with other institutions.

Core Project Components:
(a) Provide training and education to clinical and administrative staff on process improvement strategies, methodologies and culture.
(b) Develop an employee suggestion system that allows for the identification of issues that impact the work environment, patient care and satisfaction, efficiency, and other issues aligned with continuous process
(c) Implement CG-CAHPS survey to evaluate and improve patient satisfaction

Quality:
To achieve continuous quality improvement we shall assess the project’s impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

Region 6 goals:
This project achieves CMS’s Triple aim objectives of assuring patients receive high quality and patient centered care, in the most cost effective way, improves the health care infrastructure to
better serve the Medicaid and uninsured residents of the counties we serve, further develops and maintains a coordinated care delivery system and improves outcomes while containing costs.

**Rationale:**

Implementing the CG-CAHPS and CG-CAHPS/PCMH surveys fills two of the gaps recently identified by the most recent Bexar County Community Health Leadership Community Health Assessment: an increased focus on systems change and increased engagement with the community in improvement initiatives. Implementing the CG-CAHPS is a direct way to engage community members in providing feedback regarding the quality of their care experience. And unlike traditional patient satisfaction tools, CG-CAHPS asks behavior-based, patient experience questions to uncover whether and to what frequency patient-centered behaviors occurred during the patient’s visit. By providing this focused feedback, patients bring to light where care providers are consistently meeting or exceeding their expectations, and where they are not. In order to deliver higher quality care to Bexar County residents and beyond, we must have their direct feedback. Additionally, The CG-CAHPS survey measures a broad range of core areas including access to care, provider communication, courtesy of clinic staff, how the patient would rate the provider, and whether or not they would recommend the clinic to family and friends. This invaluable information is presented in clear reports via the Catalyst program of NRC Picker, making the development and implementation of systems change easy, intuitive, and best of all, measurable. The questions will be consistent across service lines so we will be able to see actionable system problems that have broad quality and efficiency implications. This project presents a new initiative for UTHSCSA as it has never been done in the past. I am not aware of any similar projects currently being funded by DHHS at UTHSCSA.

CN.1 Addresses community need for greater emphasis on quality.

**Related Category 3 Outcome Measure(s):**

We selected the Category 3 stand alone outcome domain of Patient Satisfaction. Research has shown that patient care experiences positively correlate to clinical quality processes and outcomes on both the practice and provider levels. Additionally, patients with better care experiences are more engaged and adherent, and have better health outcomes. For example, a recent study in the *Journal of Family Practice* demonstrated that adherence rates were 2.6 times higher among primary care patients whose providers had “whole person knowledge” of them compared to patients of providers without that knowledge. This translates to better, more cost effective healthcare and healthier patients.

There are also other financial implications to consider, in the form of incentives, lower malpractice risk, and increased patient loyalty. Increasingly, patient experience is being tied to financial incentives, as is the case in Massachusetts and California. And with the passage of the new healthcare law, Centers for Medicare and Medicaid Services (CMS) will be making

---

mandatory the implementation and reporting of patient experience survey results, and tying these measures to financial incentives. We will most likely be monetarily penalized for not collecting and reporting on this data. The implementation of CG-CAHPS now puts us in the position to have better scores once we are mandated to report them publicly.

Tracking patient experience data is cost efficient in other ways. The *Journal of the American Medical Association* has published several articles demonstrating that good patient experience correlates with lower medical malpractice risk. In fact, a 2009 study found that with each drop in patient-reported score along a five-step scale from “very good” to “very poor”, the likelihood of being named in a malpractice suit increased by 21.7%. Measuring patient experience using the CG-CAHPS and with the assistance of NRC Picker Service alerts is a hands-on approach for identifying and addressing issues in care that could lead to lawsuits.

Lastly, it is well known that patients keep or change providers based upon experience. Relationship quality is a key predictor of patient loyalty, and in Bexar County where patients have many choices for their healthcare needs, they can vote with their feet.

**Relationship to other Projects:**
This project directly supports those seeking to enhance/expand medical homes. When a medical home uses the CG-CAHPS survey, special recognition is given to that site.

**Relationship to Other Performing Providers’ Projects in the RHP:**
Providers at Methodist, University Health System, CHOSA, and CSR are proposing similar projects to improve patient satisfaction and the patient care experience.

**Plan for Learning Collaborative:**
Implementing CG-CAHPS is a huge endeavor. Being able to share challenges and solutions, brainstorm ideas, and work together with other providers going through the same process will be invaluable. Our collaborative will establish goals, develop a calendar of regular meetings, and develop a plan to communicate ideas/data/successes.

**Project Valuation:**

**Achieves Waiver Goals:** This project assures that patients—regardless of their income level or insurance status—will be full partners in their healthcare by providing feedback on their experiences. Previous research in this area shows that measuring and improving patient experience results in a more engaged and adherent patient population with better health outcomes.

**Address Community Need(s):** This project addresses community priority needs described in the Community Health Improvement Plan for Bexar County for: Healthy Eating and Active Living.

---

45 Fullam F, Garman AN, Johnson TJ, and Hedberg EC. The use of patient satisfaction surveys and alternate coding procedures to predict malpractice risk. *Medical Care* 47 (5).

and Behavioral and Mental Well-Being. Priority issues addressed by this project are health care quality and satisfaction. Indigent populations are notoriously underrepresented in studies of healthcare quality and satisfaction. However, our mail-based survey gives each patient an equal chance of being chosen to provide feedback. NRC Picker continues to follow up with the patient until a response is provided, or until the patient declines to provide feedback. This ensures this underrepresented patient population will be included in our feedback.

**Project Scope:** The proposed project will include 50 randomly selected patients for all 175 UT Medicine providers (8750 patients total, per year). By making available patient experience data available by provider each provider will be more empowered to improve patient experience by targeting interventions and support in the areas that are needed most.

**Project Investment:** The expected investment in this program for Human Resources will include the cost of a staff member to oversee the project onsite in conjunction with NRC Picker, the company who will be administering the surveys. Survey implementation will already be underway by year 2, allowing us to begin to develop and implement improvement plans in year 3.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $2,007,425**
Identifying Project and Provider Information:
Title: 1.9.2 Improve Access to Specialty Care (Outreach Epilepsy Clinic – Uvalde)
Unique RHP ID#: 085144601.1.23 – PASS 2
Performing Provider: University of Texas Health Science Center at San Antonio
Performing Provider TPI: 085144601

Project Summary:

Provider Description: The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.

Intervention(s): The goal of this proposal is to deliver epilepsy care to the underserved area of Uvalde by providing an outreach clinic for patients with epilepsy. Epilepsy specialist physicians and support staff comprised of a case manager, social worker, and medical assistant will travel to Uvalde once every other month at the beginning of the project and increase the frequency of the services as needed in response to increasing need.

Need for the project: Epilepsy is a chronic medical condition that is best treated in an outpatient clinic setting by neurologists with specialized training in epilepsy. When people with epilepsy do not have access to specialty care, they generally seek care in the Emergency Department (ED). Care in the ED is not sufficient for long-term effective management of seizures. Repeated use of the ED for seizure results in poor medication compliance and poor seizure management. By providing access to neurologists, patients with epilepsy will have improved seizure management which will reduce the need to visit the ED.

Target population:

Patients with epilepsy and/or seizures.

Category 1 or 2 expected patient benefits:

This project seeks to provide 60 visits in the outreach clinic in DY2 and increase the number of visits by 30 pct above baseline (76 visits) in DY3, 60 pct above baseline in DY4 (92 visits), and 80 pct above baseline in DY5 (108 visits).

Category 3 outcomes:

IT-9.2 ED appropriate utilization

The goal of this project is to reduce ED visit rate for seizures by 50 percent over current rates by DY5 for patients followed in this clinic.

The five-year expected outcome for this project is to provide approximately 285 patient visits and reduce the ED visit rate for seizures for patients receiving care in the outreach clinic by 50
percent over the initial ED visit rate.

**Project Description:**

**Brief Description:** The goal of this proposal is to develop a mechanism to deliver epilepsy care to underserved areas in South and West Texas. The main focus of the outreach program will be to provide expanded outpatient care to people with epilepsy, both insured and indigent, who are predominantly Latinos. We are already providing this service to patients in Harlingen, Texas in collaboration with the Epilepsy Foundation Central & South Texas (EFCST) (see baseline data below). We are proposing to expand this care to additional areas with the greatest needs including Uvalde. Our epilepsy specialists and EFCST staff will travel to these remote clinics one day every two months at the beginning of the project, and increase the frequency of services as the project proceeds and in response to increasing need. The services would continue to be provided jointly with the EFCST. EFCST would also provide subsidies for medical therapies, access to medication assistance programs from Pharma, social services for employment, behavioral health services, disability applications, epilepsy education, and access to support groups. EFCST serves over 23,000 individuals in 79 Texas counties annually. The funding requested will support a nurse case manager, physician services, and travel, and food for the nurse case manager and physicians traveling to these underserved areas.

**Goal:** The specific objective is to develop outpatient epilepsy services for the underserved populations of Uvalde as an extension of what is already being done in Harlingen (see baseline data below). In addition, the outreach clinics will provide community access to the services offered by the South Texas Comprehensive Epilepsy Center in San Antonio and the educational and social service resources of the EFCST.

**Scope of the Problem:** There are 6.4 million uninsured people in Texas, with 172,800 diagnosed with epilepsy. The uninsured generally seek care through emergency room or primary care settings which are not adequately prepared to diagnose and treat epilepsy. There are direct (medical costs) and indirect (work-related) costs when patients don’t receive the specialty care they need. Given the lack of access in these areas to epilepsy specialty care even for those individuals who have some type of insurance, the opportunity to improve care for epilepsy patients in these areas is even greater. Information attached below provides details about the demographics of epilepsy service needs of the proposed service area.

**Challenges/Issues:** Delivery of any type of specialty care to an underinsured, immigrant population is a large challenge. Health care services and infrastructure are rudimentary in most of our targeted locations. For this proposal to succeed, outreach to local physicians, hospitals, schools, and social service providers, among others, will be crucial. Our project will provide access to patients, but we must first raise community awareness of the service so patients will be able to benefit from it. Another challenge is the poverty in our targeted service areas. Many patients cannot afford necessary tests and medications to appropriately treat their epilepsy. By partnering with the EFCST, who has resources to help underwrite tests and help patients get medications, we will dramatically improve outcomes by helping patients get access to the diagnostic services and treatments they need. Even with access to medications, medication compliance is a big issue, as well. A recent study found that 26% of patients with insurance were non-compliant with their epilepsy medications, leading to an increase in hospitalizations and emergency room visits. For the uninsured, the problem is even worse. Our plan to provide robust educational services – in English and Spanish – will help patients understand what to expect from their medications and why it is important to take them as directed. We anticipate that this will improve compliance, and decrease seizure frequency and trips to the ED. As described
above, 75% of medically refractory seizure patients may be helped by epilepsy surgery or other non-medical therapies. Currently, most epilepsy patients in these regions have no access to this type of treatment. By partnering with the South Texas Comprehensive Epilepsy Center at University Hospital in San Antonio, with financial help from the EFCST, these potentially life-changing treatments will now be an option for patients.

As described in the Baseline Data section, approximately 37% of patients seen in our Harlingen location have some type of medical insurance (predominantly Medicaid and Medicare, with a smaller number with other insurance). Given the lack of neurology, let alone epilepsy, specialty care, we anticipate that the insured and uninsured patients served will continue to be seen by our group in the future rather than make the long trip into San Antonio for care. In addition, we anticipate that approximately 20% of patients per year seen in each clinic location will be candidates for an epilepsy surgery evaluation at University Hospital, which will bring in additional revenue that will help support the physician costs of the program.

Quality:

To achieve continuous quality improvement we shall assess the projects impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

Region 6 goals:

This project achieves CMS’s Triple aim objectives of assuring patients receive high quality and patient centered care, in the most cost effective way, improves the health care infrastructure to better serve the Medicaid and uninsured residents of the counties we serve, further develops and maintains a coordinated care delivery system and improves outcomes while containing costs.

Starting Point/Baseline:

Outreach epilepsy services are currently provided to patients in Harlingen in collaboration with the Epilepsy Foundation Central & South Texas. The clinic, in operation for 10 years, occurs 2 days every other month and provided 689 visits to 349 patients in FY11. To date, there have been a total of 92 patients from this out-reach clinic who have had epilepsy surgery at the South Texas Comprehensive Epilepsy Center at University Hospital.

Rationale:

Given that people living in this area do not have access to specialty care even if they have some type of health insurance, the opportunity to improve care of the patients with epilepsy is great. Many of these people use the emergency department frequently because of this lack of access. The total population for the Uvalde Clinic catchment area is 67,416. Of this population, there are approximately 1,348 individuals with epilepsy with an estimated 30 percent (404) who are indigent.

We expect to reduce emergency room visits through implementation of this project. Epilepsy surgery and other non-medical treatments may benefit as much as 75 percent of patients with
medically refractory epilepsy (patients who are not helped by appropriate antiepileptic therapy). Patients with frequent seizures are unable to drive, have difficult holding jobs, and are risk for seizure-related sudden death.

We are unaware of any projects underway at UTHSCSA funded by the US Department of Health and Human Services serving a similar purpose as the project being submitted.

CN.3 This project addresses the community need for greater access to medical care.

## Related Category 3 Outcome Measure(s):

**IT-9.2** ED appropriate utilization

The above outcome measure was selected to:
- measure reduction in visits to the emergency department resulting from improved seizure medication compliance/seizure management

## Relationship to other Projects:

UTHSCSA submitted a proposal to expand neuropsychological services. Patients served by this proposal benefit from neuropsychological testing as effective characterization of neurocognitive changes aid in patient management, diagnostic clarification, prediction of disease progression, assessment of functional status, and development of treatment recommendations.

## Relationship to Other Performing Providers’ Projects in the RHP:

This project is related to the following request:

UTHSCSA 1.9.2 Neuropsychology Services.

## Plan for Learning Collaborative:

The South Texas Comprehensive Epilepsy Center based at University Health System in San Antonio consists of a multidisciplinary group of physicians and staff. This group meets weekly to review cases, exchange ideas, and discuss best practices/approaches to patient management. Services provided under this proposal will be included in these weekly discussions.

## Project Valuation:
People with epilepsy who do not have access to specialty care generally seek care in an emergency room, at an average cost of $3,000 per visit. Difficulty in accessing needed medications will lead to noncompliance at a cost of about $5,000 per person. For those uninsured and without some type of assistance, epilepsy medications can’t be accessed through Pharma assistance programs ($1,338,525 in such assistance was facilitated by the EFCST in FY 2010 alone) and lost productivity in terms of work-related earnings for people with uncontrolled epilepsy amount to $8,953 per year per household. With seizure control due to appropriate treatment, approximately 60% of could return to work. The cost savings realized by this proposal detailed below is conservative, as it primarily accounts for benefits to those who are uninsured. As mentioned above, approximately 37% have some type of insurance and will be benefitted as well. The table below provides the data used to estimate the conservative value of this proposal in terms of cost savings.

Cost Savings of This Proposal

</tr>
</tbody>
</table>
Project Description:

Bluebonnet Trails Community Services (BTCS) is the state designated Local Mental Health Authority (LMHA) for Guadalupe County in Region 6 as well as for seven other Counties located east of and parallel to IH 35 and extending north of Austin, Texas in Travis County. In that capacity we are responsible for an array of public services as well as for behavioral health planning and coordination throughout our local service area. As the LMHA, we contract with the Department of State Health Services (DSHS) to provide specialty behavioral health services to children and adolescents with Severe Emotional Disturbance (SED), that DSHS identifies as the “priority population.”

BTCS proposes to develop a specialized therapeutic foster care setting (also called ‘treatment foster care’) that can be used to intervene with the target population, youth diagnosed with SED in crisis and divert them from admission to a psychiatric hospital or juvenile justice facility. Specifically, this setting will be used to provide a safe environment to begin reintegration and family reunification following diversion or discharge from hospital or residential facility. We will locate willing foster care homes in Guadalupe County certify these homes and provide specialized training to foster families. Therapeutic Foster Care is a distinct, powerful, and unique model of care that provides children with a combination of the best elements of traditional foster care and residential treatment centers. In Therapeutic Foster Care, the positive aspects of the nurturing and therapeutic family environment are combined with active and structured treatment. Therapeutic Foster Programs provide, in a clinically effective and cost-effective way, individualized and intensive treatment for children and adolescents who would otherwise be placed in institutional settings.

Youth diagnosed with SED generally have adjustment or functioning difficulties in more than one life domain and therefore are usually served by more than one child serving agency in the community including specialized school programs, juvenile probation as well as mental health and substance abuse providers. These youth experience self-identified or family-identified crises that put them in danger of removal from the home and transfer or physical relocation to distant communities for inpatient or secure residential care, usually under contract with juvenile probation. BTCS is responsible for transitioning youth from the state hospital system. We also work with local partners in coordinating care for the persons returning from private hospitals and residential settings; however, youth who are separated from their families are less likely to make a quick recovery and have difficulty re-integrating into family life without active participation in therapy services by the family unit. Families who have limited financial and external support are unable to travel to San Antonio or out of region to participate in hospital or residential treatment facility scheduled treatment meetings, treatment planning, therapy sessions and other re-integration activities. The limited family participation results in children who are often unable to stabilize and return home. This causes disruption in families, in child and adolescent development and leads to increased involvement with the juvenile justice system. Crisis Respite through Therapeutic Foster Care offers families and youth a chance to return home. Specific Improvement Targets relating to reductions in justice involvement for these youth are included in the table.

According to the Community Needs Assessment published by RHP 6 Guadalupe County is
one of the fastest growing Counties in the Region. The Assessment also identifies the entire county as a Health Provider Shortage Area by HRSA for both primary care and behavioral health care. BTCS participates in the Mental Health Task Force for this County and they identified a need for services to youth and families. This program of screening and early intervention in a community setting is a better alternative to address the challenges faced by these youth and families.

The goals of this project as it relates to BTCS are: to develop sites in Guadalupe County with trained foster parents recruited from within the communities and professional support provided by licensed and certified staff currently working for BTCS outpatient sites there; to place youth in these settings as an alternative to inpatient and secure residential settings. The goals for the youth and families are: to successfully reintegrate children with emotional and/or behavioral needs into their communities and families—families who are trained to have the skills to meet those needs; and to reduce the number of children who will be removed from home and placed out of county in juvenile probation contracted facilities. Stable families and increased access to care will result in better functioning and reduced reliance on juvenile justice interventions. The project meets the following regional goals: in support of the triple aim of CMS, the project ensures that youth receive high-quality patient centered care in the most cost-effective way; and this further develops a coordinated care delivery system. The Therapeutic Foster Care program will safely reduce the number of children in out-of-home care and expedite permanency for children currently in out-of-home placements; effectively maintaining a child with emotional and/or behavioral needs in a family setting. The program supports effective growth and relationships of the child through an intensive support and treatment program, this program is designed to assist children transitioning to a less restrictive environment—and, ultimately, into a healthy family situation. We support the following, nationally recognized definition of permanency: an enduring family relationship that is safe and meant to last a lifetime; offers the legal right and social status of full family membership; provides for physical, emotional, social, cognitive, and spiritual well-being; and assures lifelong connections to extended family, siblings, other significant adults, family history, traditions, race and ethnic heritage, culture, religion, and language. We believe that these family relationships help produce healthy and well-adjusted adults which strengthens the safety and security of our communities.

A major challenge for this program will involve the regulation and infrastructure needed to operate Foster Care services and to develop the philosophy of care to carry it out. We are certain that we can address the challenges and achieve the goal of this project because BTCS has reached agreement to collaborate with the Center for Health Care Services, (CHCS) the LMHA for Bexar County which is also a licensed Child Placing Agency and has been developing foster care sites for several years. The CHCS staff brings training and certification expertise. That staff along with the foster parents and BTCS staff in Guadalupe County will provide a therapeutic environment that will enable children in the area to stay connected to their families and community while learning the skills and coping mechanisms needed to be successful. Professional support will also be provided to the parents and key family members to develop skills strengthening the family unit, supporting successful reunification. There are a variety of evidenced based practices (EBP) that have been implemented in Therapeutic Foster Care settings, as noted in “Evidenced Based Practices in Treatment Foster Care- A
Over the next five years, we expect the outcomes for the youth and families to be: higher success rate for reintegration from residential treatment facilities as evidenced by longer average tenure than currently recorded with their natural family after discharge; a reduction in removals and placements out of the Region by Juvenile Probation; and a reduction in inpatient psychiatric placements. These outcomes are supported by the goals above, i.e., to establish this community alternative for crisis intervention that is cost effective, culturally competent and preserves families. The outcomes expected from this mental health program will address the needs in this Region.

**Starting Point/Baseline:**

Currently no Crisis Respite or Therapeutic Foster Care program exists in Guadalupe County and services are not provided for this group of involved with juvenile probation and experiencing crises. Therefore, the baseline is 0 in DY 2. We do not have data related to out of home placements through Juvenile Probation Department in Guadalupe County nor do we have a comprehensive picture of psychiatric hospitalizations for youth. We will undertake to identify resources and methods to capture and share information across these various child serving agencies.

**Rationale:**

Crisis Respite through Therapeutic foster Care expands the options for caregivers and agencies involved with these children and adolescents other than to assess and transport to San Antonio or even farther outside of RHP 6 for admission to a hospital or secure residential facility for stabilization. Aside from the distant locations of these stabilization options, we believe this is the best approach, an innovative use of a family oriented community setting rather than a more restrictive community institutional setting.

BTCS served 1,292 youth in FY 2012 most of whom had diagnoses that put them into the range of Serious Emotional Disturbance and were at or below the poverty level with multiple functional deficits to overcome. Guadalupe County saw a 47.8% increase in population from 2000 to 2010. According to that census data, 27.2% of the population is under 18 years of age and 36% is Latino. The Community Health Improvement Plan for Bexar County states that “Nearly 10 times as many Hispanic youth utilized state mental health services compared to the number of White and African American youth who utilized the same services.” There are no crisis behavioral health facilities or resources in the County. Families transport their child to an Emergency Department in their own community or in San Antonio because of concern for the safety and security of their child and family. Strategic planning sessions sponsored by the Bexar County Commissioners Court and Methodist Healthcare Ministries identified the following issue, “Inadequate and fragmented continuum of care for children with behavioral health diagnoses.” This project implements a crisis response for youth that addresses these identified gaps in the continuum of care.

The Crisis Respite through Therapeutic Foster Care project will address all of the required core project components:

a) **Convene community stakeholders who can support the development of crisis stabilization services to conduct a gap analysis of the current community crisis system and develop a specific action plan that identifies specific crisis stabilization services to address**
identified gaps. Our focus will be to work with stakeholders who are child serving agencies and to identify gaps that lead to referral to juvenile justice. We will convene community stakeholders during the remainder of FY 2013 to identify information needed to assess the gap in crisis services; the numbers of people removed by Juvenile Probation, taken to ED’s and admitted to private facilities.

b) Analyze the current system of crisis stabilization services available in the community including capacity of each service, current utilization patterns, eligibility criteria and discharge criteria for each service. We know that families transport their child to an Emergency Department in their own community or in San Antonio rather than contacting the LMHA because of the limited crisis response services and/or concern for the safety and security of their child and family. This creates a complex issue related to data identification and access. Working with community stakeholders and child serving agencies, we will identify tools to provide data to analyze the capacity for service, current utilization patterns and to identify the key characteristics of the people to be served.

c) Assess the behavioral health needs of patients currently receiving crisis services. Determine the types and volume of services needed to resolve crises in community-based settings. Then conduct a gap analysis that will result in a data-driven plan to develop specific community-based crisis stabilization alternatives that will meet the behavioral health needs of the patients. We will use the current staff to assess current needs of those who are now and have been detained in the last year.

d) Explore potential crisis alternative service models and determine acceptable and feasible models for implementation. Using the information from stakeholders, from capacity and utilization tools and from assessment of those detained, we will assess the intervention we are providing as to acceptability and feasibility to scale into other facilities in this County to increase capacity in Region 6.

e) Review the intervention(s) impact on access to and quality of behavioral health crisis stabilization services and identify “lessons learned,” opportunities to scale all or part of the intervention(s) to a broader patient population, and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations. Finally, we will review the intervention and the changes to identify lessons learned and adjust the model with respect to area, intensity and population. There is guidance available, and we plan to take care that the evidenced based practice (EBP) approach will evolve from a thorough needs assessment process that considers how well it fits with the clients, the staff and the organization.

Unique community need identification numbers the project addresses are: CN. 4 “There is a shortage of high quality mental and behavioral health services that are integrated with physical health care services;” and CN.5 “Lack of interconceptional and prenatal care for women and primary and preventive pediatric care results in poor maternal and child health outcomes.”

This project significantly enhances delivery system reform by enhancing the holistic health care approach of BTCS and its partners, including Community Health Centers of South Texas, the FQHC for Guadalupe County. We have received a grant from HRSA to build a clinic together to co-locate behavioral health and primary care services in Seguin. This program is another innovative community alternative. It reduces the need for institutional care and not
only saves money but also provides families with limited resources, the opportunity to engage in therapeutic interventions with their child in order to learn how to be more capable parents and caregivers. The project will improve child integration into the natural family; reduce in involvement with Juvenile Probation and subsequent removal from the home and family. The increased capacity and access to these specialty services will decrease unnecessary utilization the most costly healthcare delivery services such as emergency departments, psychiatric emergency services and psychiatric hospitals. BTCS currently receives funds from US Department of HHS to operate substance abuse screening and referral service, OSAR in other counties, and Mental Health block grant funds for outpatient mental health services. Those HHS funds will not be used for direct services; this project enhances and extends the care currently provided with Federal funds by a new and innovative to behavioral health crisis services. We are certain this intervention will improve the healthcare outcomes for entire community and improve the ability of these young people to become contributing members of their communities.

**Related Category 3 Outcome Measure(s):**

The Category 3 Outcome Measure that we selected is “OD-9 Right Care, Right Setting” the IT selected was IT- 9.1 Decrease in mental health admissions and readmissions to criminal justice settings such as jails or prisons.” This Improvement Target (‘IT’) language references criminal justice but more accurately, we are engaged in improvements related to juvenile justice. For the purpose of this project we are interpreting the IT to include the various levels of juvenile justice involvement to include residential treatment in a secure facility. We selected this measure because one of the key community partners in this project is the Juvenile Probation Department in Guadalupe County. Unfortunately, it is often the case that families have no options to care and treatment except through court action that removes custody and physically removes their child to a contracted Juvenile Probation residential facility. We feel treatment in the community rather than deeper and deeper involvement in the juvenile justice system would be a good predictor of success.

**Relationship to other Projects:**

BTCS has also proposed to establish a new outpatient substance abuse service in Guadalupe County that supports services to this group of youth, creating new opportunities for referral and care.

**Relationship to Other Performing Providers’ Projects in the RHP:**

This approach it child crisis services is different than the one proposed by CHCS and is for a population in a different County in RHP 6. We plan to coordinate care with CHCS and participate in learning collaborative with them so that we may both improve our systems of care.

**Plan for Learning Collaborative:**

BTCS will participate in all learning collaboratives organized or sponsored by University Health System that are relevant to our projects. We believe it is important to improving and adjusting the care provided.

### Identifying Project and Provider Information:

**Title:** 1.12.2 Expand the number of community based settings where behavioral health services may be delivered in underserved areas: Substance Abuse Treatment and Intervention Services  
**Unique RHP ID #:** 1268443-05.1.2 – PASS 1  
**Performing Provider:** Bluebonnet Trails Community Mental Health and Mental Retardation Center dba/Bluebonnet Trails Community Services  
**Performing Provider TPI:** 1268443-05

### Project Summary:

**Provider Description:** Bluebonnet Trails Community Services (BTCS) is the state designated Local Mental Health Authority (LMHA) for Guadalupe County in Region 6 as well as for seven other Counties located east of and parallel to IH 35 and extending north of Austin, Texas in Travis County. In that capacity we are responsible for an array of public behavioral health services as well as for behavioral health planning and coordination throughout our local service area. That responsibility includes identifying gaps in service or barriers to access for persons residing in the area.

**Intervention(s):** BTCS proposes to enhance service availability by establishment of a community based setting where behavioral health services may be delivered in this underserved area. We will open and staff substance abuse services within our current clinic site in Seguin, Texas. That site has space and it is suitable for the service without renovation or capital expenditure. This outpatient substance abuse service site which establishes services that are new to BTCS and to the community will provide supportive outpatient services, i.e., group and individual counseling; and an intensive outpatient program for persons who have been diagnosed with and require treatment for substance use disorders.

**Need for the project:** This project addresses RHP 6 Community Needs Assessment needs: **CN. 3**  
Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages; and **CN. 4** There is a shortage of high quality mental and behavioral health services that are integrated with physical health care services. There is only one licensed treatment provider in all of Guadalupe County and it does not serve primarily poor, uninsured and under insured.

**Target population:** Our target population is community referrals, and those referred from detoxification or ED’s who are poor, uninsured or underinsured and in need of outpatient substance abuse services. BTCS served 3,377 persons in Guadalupe County in FY 2012; 2,401 persons with behavioral health disorders. In FY 2012, an average of 43% of the adults were eligible for Medicaid; 73% of BTCS clients are below the federal poverty level; 55% are uninsured. We estimate that approximately 70% of those benefitting from this project will be poor, uninsured or underinsured.

**Category 1 or 2 expected patient benefits:** The project seeks to provide outpatient substance abuse services to 200 people in DY 4 and 400 people in DY 5.

**Category 3 outcomes:** IT-3.8 Our goal is to reduce the behavioral health/substance abuse 30 day readmission rate to detoxification and residential facilities by a percentage rate TBD after the baseline is established in DY 3.
Project Description:

Bluebonnet Trails Community Services (BTCS) is the state designated Local Mental Health Authority (LMHA) for Guadalupe County in Region 6 as well as for seven other Counties located east of and parallel to IH 35 and extending north of Austin, Texas in Travis County. In that capacity we are responsible for an array of public behavioral health services as well as for behavioral health planning and coordination throughout our local service area. That responsibility includes identifying gaps in service or barriers to access for persons residing in the area. As referenced in the Community Needs Assessment for RHP 6, page 14, the National Rural Health Association (NRHA) has identified several issues of particular interest to rural communities: and among them is lack of access to health care services, particularly health disparities and physician shortages; mental health services, particularly relating to provider shortages and lack of insurance coverage; and substance abuse services. Over the last year, staff of BTCS along with leaders and advocates participated in the Guadalupe County Mental Health Task Force to identify community needs. One of the most pressing deficiencies identified is lack of access to outpatient substance abuse treatment especially for the poor and uninsured or underinsured.

BTCS proposes to enhance service availability by establishment of a new substance abuse services within our current community based setting where behavioral health services may be delivered in this underserved area. Our current site has space and it is suitable for the service without renovation or capital expenditure. This new outpatient substance abuse service will include supportive outpatient services, i.e., group and individual counseling, and an intensive outpatient program for persons who have been diagnosed with and require treatment for substance use disorders. The goal of this project is to allow people who have limited resources to access outpatient substance abuse services in their home county. Many of these individuals will have this access following a detoxification or ED visit in adjacent Bexar county. Additionally the goal is to stop the cycle of detoxification or ED utilization and relapse that is triggered by inadequate access to supportive and intensive outpatient services.

The goal of the project is to establish this new outpatient service in Seguin in Guadalupe County to improve the availability of substance abuse services and targeting specifically the poor and uninsured. This project meets the following regional goals: achieving one of the CMS aims by improving the patient’s experience of care; will meet the regional need to reduce over utilization of ED’s in Bexar County by persons with behavioral health disorders.

The primary challenge to this project will be to achieve acceptance in the community of the need for and desirability of treatment for substance use disorders. The recovery community is under resourced and several agencies and services have ceased operation over the last several years. BTCS is a well-established the mental health provider and the LMHA in Guadalupe county and has a good relationship with the Federally Qualified Health Center and most health care providers in the community. We feel we are positioned to address the challenge by creating opportunities for community engagement and education concerning substance use and its impact.

Over the next five years we expect to an increase in the number of people accessing substance use disorder treatment and a concomitant reduction in the number of readmissions to detoxification facilities and substance abuse related ED visits for Guadalupe county residents,
both in Guadalupe County and in Bexar County. The goals stated above related to establishing this new service and educating the community about the need for intervention and treatment will directly affect achievement of these outcomes.

**Starting Point/Baseline:**

This is a new project for BTCS in Guadalupe County. There is no program for substance abuse treatment that targets the poor and uninsured and therefore the baseline for DY 2 is 0. We do not have current data to identify those from Guadalupe County who are accessing detoxification and ED services due to substance abuse disorders, but an important first step in this project will be link to Health Access San Antonio or some other means of gathering and tracking that data. We are also aware that we must secure licensure and for outpatient substance abuse services.

**Rationale:**

The primary intent of this project, which is to establish a new substance abuse service location within our current mental health clinic in an underserved area. There is one substance abuse provider in the County, but the focus of that service is not specifically on the poor and uninsured. Locating a service locally will increase utilization, eliminating the barrier of travel into Bexar County that prevents the economically disadvantaged from accessing care.

According to the Community Needs Assessment of RHP 6, eleven to twenty percent of the population of Guadalupe County is below the poverty level. Additionally, 24% of the people in the RHP 6 region are without insurance or any third party coverage. The entire county has been designated a mental health provider shortage area according to US Department of HHS, HRSA. The challenges for the people living in Guadalupe County are that there is only one licensed treatment provider in the County, the Teddy Buerger Center associated with Guadalupe Regional Medical Center. The Center accepts third party payments and operates on a sliding fee scale for those unable to pay, but it cannot meet the need of all the citizens of the County. It is especially not equipped to meet the needs of the poor and uninsured. Some services available in the adjacent Bexar County and frequently when there is a life threatening or dire crisis of some sort, people travel from Guadalupe County to Bexar county and access the ED’s and detoxification facilities. According to the Bexar County Consortium Report of 2012, the ED’s in Bexar County are over utilized by persons presenting with behavioral health conditions. That includes a substantial number of people from other counties. Once the crisis is over and the person is medically stable they return to Guadalupe County but are unable to access ongoing outpatient treatment to remain free of alcohol and drugs. The result is relapse and a return to ED’s and detoxification facilities.

Even though there are no Core Components associated with this option, but we plan to use the guidance found in other Options. We expect to carefully develop the project and then to adjust based on a rapid cycle quality improvement model. The development of this project will begin by reconvening community stakeholders during the remainder of FY 2013 to gather support for and assess the barriers to access to outpatient substance abuse services. With these stakeholders, we will identify tools to provide data to get current utilization of ED and residential services in Bexar County as well as ED use at the Guadalupe Regional Medical Center in Seguin and to assess the demand for outpatient services in Guadalupe County. BTCS operates a mental health clinic in Guadalupe County and is in process of building a new facility to co-locate services with
the Community Centers of South Central Texas, the FQHC in that County. We will use the staff and community resources we have in the county to assess current needs of those who are now accessing EDs and detoxification and then returning to the County. Using the information from stakeholders, from capacity and utilization tools, from further literature reviews and from assessment of those potential referrals, we will assess the intervention we are planning to provide. As we establish the new service within our outpatient site, we will plan a rapid cycle quality improvement component through our Quality Management Department at BTCS. We plan to continuously improve the program over the next 4 years as we adjust the volume of interventions and service array and make changes based on lessons learned. Those changes may include adjustments to the model with respect to interventions, intensity and population.

**This project addresses Community Needs Assessment needs:** CN. 3 Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages; and CN. 4 There is a shortage of high quality mental and behavioral health services that are integrated with physical health care services.

This project will enhance the current delivery system reform initiatives by establishing this new community setting within the FQHC and improving access to behavioral health care while integrating that care with primary care. BTCS currently receives funds from US Department of HHS to operate substance abuse screening and referral service, OSAR in other counties. Those HHS funds are not used for direct outpatient services and are allocated in a different RHP. No other federal funding sources are used in this project.

**Related Category 3 Outcome Measure(s):**

The Category 3 Outcome Measure that we selected is “OD-3 Potentially Preventable Re-Admissions- 30 day Readmission Rates (PPRs ); IT-3.8 Behavioral Health /Substance Abuse 30 day readmission rate.” This is a stand-alone measure. We selected this measure because the goal of this project is to help people who have been in some inpatient or other detoxification program to transition to stable living in the community by providing access to community outpatient services. The cycle of relapse and return to hospital or residential detoxification services is a major disruption for individuals seeking to achieve recovery. It is also costly to the health care system and devastating to individuals and families. We believe that measuring the reduction in re-hospitalization will be a good indicator of success for the program and a good indicator of success on a personal basis for those enrolled in the program. Low income individuals cannot now access outpatient care and are left in this cycle of relapse. Extended sobriety and productivity will improve their health outcomes.

**Relationship to other Projects:**

BTCS has also proposed in Category 2, Project 1268443-05.2.1. This project is the establishment of a patient navigator program for high utilizers of the ED at Guadalupe Regional Medical Center. The project to establish a new outpatient substance abuse service in the county supports the patient navigator project by creating new opportunities for referral and care.
**Relationship to Other Performing Providers’ Projects in the RHP:**

This project supports and enhances CHCS projects 3 and 4 by reducing the burden of homeless substance abusing individuals who are in need of the Haven for Hope services. We hope to participate with CHCS in coordinating care and learning from their approach to these vital services.

**Plan for Learning Collaborative:**

BTCS will participate in all learning collaboratives organized or sponsored by University Health System that are relevant to our projects. We believe it is important to improving and adjusting the care provided.

**Project Valuation:**

The project reduces inappropriate use of ED by this population which improves their lives through stable services in a medical home; and improves community health by opening access for those who truly need of ED. The project seeks to provide outpatient substance abuse services to 200 people in DY 4 and 400 people in DY 5. The valuation calculated for this project used cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units that were applied to the factors existing in this underserved area, including: limited access to primary care and to behavioral health care, poverty and the link between chronic health conditions and chronic behavioral health conditions. The valuation study was prepared by professors H. Shelton Brown, Ph.D. and A. Hasanat Alamgir, Ph.D. both of the UT Houston School of Public Health and Thomas Bohman, Ph.D. of the UT Austin Center for Social Work Research based on a model that included quality-adjusted life-years (QALYs) and an extensive literature of similar interventions and cost savings and health outcomes related to those interventions. The QALY index incorporates costs averted when known (e.g., emergency room visits that are avoided). We valued this project at $1,387,058 through DY 5. Complete write-up of project will be available at performing provider site.

<table>
<thead>
<tr>
<th>Project Summary:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Provider Description:</strong> Camino Real Community Services is a Local Mental Health Authority that provides outpatient mental health services to child, adolescent, and adult patients with severe and persistent mental illness. The provider is located in a 10,000 square mile rural service area with a total population of approximately 206,777. In 2012, the Center provided services to 3,538 adults and children that met criteria for services. The Mental Health Operating budget is approximately 6.9 million dollars. The programs work closely with schools, health centers, hospitals, law enforcement, judiciary and local elected officials to coordinate the provision of services.</td>
</tr>
</tbody>
</table>

**Intervention(s):** The project is to establish Crisis Stabilization Services in the service area. More specifically, it is the Center’s intent to provide a minimum of a 10 bed Crisis Residential Facility. |

**Need for the project:** Camino Real Community Services’ area is challenged by its extremely rural nature where there is limited access to community based options that provide readily accessible crisis interventions. The designation as a historically health care professional shortage area and mental health professional shortage area reflects the great challenge this area has with accessibility to needed services. There are no local psychiatric hospitals or crisis stabilization facilities in the service area. The center provided 413 crisis assessments (January 2012 – August 2012) to individuals in the service area. Of the 413 approximately 140 patients were sent to inpatient psychiatric hospitals between January 2012 – August 2012. Currently there are no Federal Funds utilized for any Crisis Stabilization services in the Camino Real service area. |

**Target population:** The target population is individuals of all ages experiencing a psychiatric crisis and requiring crisis residential treatment. The center’s current behavioral health population is comprised of individuals who are indigent or Medicaid and/or Medicare eligible. It is anticipated that once the facility is fully operational, the expected service volume will be 108 persons per 12 month period. This assumes an average stay of 30 days per patient and a 90% occupancy rate. |

**Category 1 or 2 expected patient benefits:** The project intends to benefit patients by providing crisis residential services including psychiatric intervention, 24 hour active treatment by mental health professionals and rehabilitation and education services that enhance patient skills. It is the performing provider’s expectation that this model will improve access to the appropriate level of care for patients. The other benefits include decreasing travel for patients needing crisis stabilization services. |

**Category 3 outcomes:** OD-9, IT 9.4 Decrease Behavioral Health/Substance Abuse admissions and readmissions to institutional facilities including local emergency departments and psychiatric facilities.
Project Description:

When a consumer lacks appropriate behavioral health crisis resolution mechanisms, first responders are often limited in their options to resolve the situation. Sometimes the choice comes down to the ER, jail, or an inpatient hospital bed. Unfortunately, a worst case scenario occurs when even these undesirable options fail, and the consumer is left to the care of family/friends until transportation and availability of an in-patient placement can be arranged. It leaves the person in crisis and the family at great risk and feeling frustrated with the system they turn to for help.

Crisis stabilization services can be developed that create alternatives to these less desirable settings. Building on existing systems, communities can develop crisis alternatives such as sobering units, crisis residential settings and crisis respite programs with varying degrees of clinical services based on the needs of clients. While hospitalization provides a high degree of safety for the person in crisis, it is very expensive and is often more than what is needed to address the crisis. Community-based crisis alternatives can effectively reduce expensive and undesirable outcomes, such as preventable inpatient stays. For example, state psychiatric hospital recidivism trended downward coincident with implementation of crisis outpatient services in some Texas communities. The percent of persons readmitted to a Texas state psychiatric hospital within 30 days decreased from 8.0% in SFY2008 (before implementation of alternatives) to 6.9% in SFY2011.1

The Camino Real Community Services area is vastly rural and has been designated as a Medically Underserved Area, Health Professional Shortage Area and Mental Health Shortage Area by the US Department of Health and Human Services Health Resources and Services Administration division. There are many challenges that accompany these designations. For instance, in the 10,000 square miles that comprise the portion of Region 6 that Camino Real is responsible for, none of the inpatient hospitals have a psychiatric unit to address the needs of the community. The lack of resources in the local community requires extensive travel into San Antonio for access to a private or public psychiatric facility in order to stabilize the person in crisis. Typically, local law enforcement provides transportation to these distant locations. The cost to the community is not only in the man hours and mileage costs associated with the transport, but the risk to the community when the peace officer is diverted from the responsibility of protecting the community to provide the needed transportation. The emotional cost to the person in crisis and their family/friends who wait for hours for logistics to be worked out in order to finally get to the help they need is immeasurable.

The project proposed by Camino Real is to develop local crisis stabilization services for persons in psychiatric crisis. This program will be designed and staffed to provide acute psychiatric intervention comparable to that received at remote psychiatric inpatient hospitals. This community based alternative will have a dramatic impact on frequency, duration and cost associated with usage of local hospital Emergency Rooms.

The local crisis stabilization services will assure that the right care is being provided in the right setting (OD-9.4.1). There should be a corresponding decrease of mental health admissions and re-admissions of persons needing crisis stabilization services to institutional facilities.

The target goal is to decrease use of higher cost services in Emergency Rooms and/or Inpatient Facilities. Additional goals would be to decrease travel for patients needing crisis stabilization
services. Inherent to the program design will be the provision of responsive psychiatric intervention, active treatment by mental health professionals and rehabilitation and education services that enhance consumer skills as they return to their homes.

By the end of the 5 year period and the establishment of crisis stabilization services, consumers in need, will be able to receive these services in their community. On average, drive times to services will be non-existent or would be no more than one hour. Response times to consumers will be significantly reduced ending long wait times in emergency rooms and/or long transport times to State Hospitals and other facilities. The efficacy of treatment will be significantly improved and overall costs to the total care system (not just hospitals) would be significantly reduced.

The project responds to needs as compiled in the RHP 6 Needs Assessment particularly CN 4 which states “There is a shortage of high quality mental and behavioral health services that are integrated with physical health care services and/or provide crisis stabilization”. Further the project meets the following regional goals:

- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system; and
- Develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient needs throughout the entire region, and improves health care outcomes and patient satisfaction.

**Starting Point/Baseline:**

No local 24 hour crisis stabilization services are available to community members who are in psychiatric crisis; persons either stay in hospital emergency rooms or are transported long distances to more restrictive inpatient service environments. In DY 2 and DY 3 planning and implementation processes will be in place to establish the project. DY 4 will see the hiring of staff and the initial provision of services with full services in place in DY 5. The Category 3 outcome measure baseline will be determined in years DY4 and DY 5 when program is implemented.

**Rationale:**

Camino Real has selected Project **Option #1.13.1**, Development of Behavioral Health Crisis Stabilization Services as alternative to hospitalization, with all the required core components. These are as follows:

a) Convene community stakeholders who can support the development of crisis stabilization services to conduct a gap analysis of the current community crisis system and develop a specific action plan that identifies specific crisis stabilization services to address identified gaps (e.g. for example, one community with high rates of incarceration and/or ED visits for intoxicated patients may need a sobering unit while another community with high rates of
hospitalizations for mild exacerbations mental illness that could be treated in community setting may need crisis residential programs).

b) Analyze the current system of crisis stabilization services available in the community including capacity of each service, current utilization patterns, eligibility criteria and discharge criteria for each service.

c) Assess the behavioral health needs of patients currently receiving crisis services in the jails, EDs, or psychiatric hospitals. Determine the types and volume of services needed to resolve crises in community-based settings. Then conduct a gap analysis that will result in a data-driven plan to develop specific community-based crisis stabilization alternatives that will meet the behavioral health needs of the patients (e.g. a minor emergency stabilization site for first responders to utilize as an alternative to costly and time consuming Emergency Department settings)

d) Explore potential crisis alternative service models and determine acceptable and feasible models for implementation.

e) Review the intervention(s) impact on access to and quality of behavioral health crisis stabilization services and identify “lessons learned,” opportunities to scale all or part of the intervention(s) to a broader patient population, and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations

Note a substantial number of the above Core Components are included in category 1 and category 3 milestones.

This selection is based on the fact that there are no local crisis stabilization services to persons in psychiatric crisis in the Camino Real service area. The population has a significant need as evidenced by the number of calls made to the local crisis hotline and the requests made for crisis assessment at local hospitals. It is responsive to Community Need #4 (CN4).

In 2008, Mental Health or Substance Abuse disorders were the principal reason for 1.8 million inpatient community hospital stays, accounting for 4.5 percent of stays in the U.S. This is according to Brief #117 (Agency for Healthcare Research and Quality, June 2011). It was also noted the MH and SA conditions most frequently treated in community hospitals were mood disorders (depression and bipolar disorder), schizophrenia and other psychotic disorders, alcohol-related disorders and drug-related disorders. These MHSA hospital stays cost $9.7 billion ($7.7 billion for MH; $2.1 billion for SA) accounting for 2.7 percent of all inpatient community hospital costs. Nationwide, the MH average length of stay was 8.0 days and the SA average length of stay was 4.8 days with an average cost $5100. In another publication (Kaiser Family Foundation, 2010) the prevalence of many serious health conditions such as cognitive or mental impairments, depression, and diabetes is significantly higher for dual eligible individuals. They are also some of the sickest and poorest individuals covered by either Medicare or Medicaid. Approximately 31% of the individuals served by the Performing Provider are dual eligible (Medicaid & Medicare).
This is a new initiative for the Performing Provider since there are no local crisis stabilization services available to persons in psychiatric crisis as an alternative in the local communities. Based on data reviewed from the provider’s local database the local population has a significant need as evidenced by the number of calls made to the provider’s crisis hotline and requests for crisis assessments by local hospitals. This results in a significant financial impact on local resources including law enforcement, judicial system and hospital emergency rooms. In addition, availability of inpatient psychiatric hospital beds in public and private facilities has been significantly reduced due to the demands of the forensic population. In Fiscal Year 2012 the center crisis hotline received 3016 calls with over 1000 of these requiring crisis assessments that resulted in 28% needing stabilization at higher cost inpatient facilities. The community needs cost effective local option for residents in crisis. In Texas the average cost of an Emergency Room visit is approximately $996 and an average stay at a state funded mental health facility is $400/day according to the 2011 report by Health Management Associate on “The Impact of Proposed Budget Cuts to Community Based Mental Health Services”. Furthermore the report supports the model of community based services as a better option for treating persons with mental illness in a more cost-effective local environment. In the Texas Fact Sheet-2011 Psychiatric Hospitals there were a total of 5391 psychiatric beds in the state with 49.3% of the beds being public beds, 14.4% were nonprofit beds, and 36.3% were for-profit beds. Two hundred and twelve counties in Texas do not have a psychiatric hospital and most hospitals are located in metropolitan areas. The Performing Providers Service area reported earlier has no psychiatric hospital available; therefore, individuals in crisis do not have access to a local option with regards to alternative crisis stabilization services.

Citations:

Directory of Active Hospitals, 2011, Health Facility Licensing and Compliance Division, Texas Department of Stated Health Services; Hospital Tracking Database, Hospital Survey Unit, Center for Health Statistics, Texas Department of State Health Services.

Related Category 3 Outcome Measure(s):

The Category 3 Outcome measure selected for the Camino Real Community Services Development of Behavioral Health Crisis Stabilization Services as alternatives to Hospitalization Project is OD-9, Decrease Mental Health Admissions and Re-Admissions of persons needing crisis stabilization services to institutional facilities.

The reason for selecting this measure is that it captures the impact of having a local, cost effective alternative to higher costs systems such as jail, emergency room, or inpatient hospitalization when addressing crisis situations that can be quickly resolved. The project will track the number of admissions to the crisis facility and compare to historical data kept by the Center regarding the number of admissions to public and private in-patient psychiatric institutions to calculate cost avoidance. As the community becomes familiar with the crisis stabilization unit and diverts persons in psychiatric crisis from the jails and Emergency Room, crisis stabilization admission data will be tracked and calculation of cost avoidance to the ER and jails will be maintained to substantiate the cost effectiveness of this alternative.

Health Management Associates, in their March 2011 Impact of Proposed Budget Cuts to Community-Based Mental Health Services presented to the Texas Conference of Urban Counties, reported the average per day cost of community based services is $12 for adults and $13 for children, as compared to $401 for a State Hospital bed, $137 for a jail bed for an inmate with mental illness, and $986 for an emergency room visit. Camino Real anticipates that development of a crisis stabilization unit in the local community will also reduce costs to other stakeholders involved in the crisis response system which includes the local sheriff’s department and the judicial system.

Relationship to other Projects:

Camino Real is proposing one project in Region 6. It is category 1.13 Development of behavioral health crisis stabilization services as alternatives to hospitalization with Quality Improvement 3.IT-9.4 Right Care, Right Setting.

It relates to other projects in the region by addressing the need for a local alternative for stabilization of crisis situations that are benign and are more appropriately addressed in a facility located within the service area. Hospital emergency rooms, law enforcement personnel, jails, programs of the center and other affiliated agencies will have the capability to place individuals in this facility. This project will compliment other activities and will be a clear alternative to options that are costly, involve extended wait times for consumers, use great amounts of local resources and involve long travel distances for people that are needing services.
### Relationship to Other Performing Providers’ Projects in the RHP:

By establishing crisis stabilization services as a local option, Camino Real Community Services supports the effort to have better outcomes for persons with mental illness in the service area in line with RHP Regional Goals:
- Triple Aim: assuring patients’ receive high quality and patient centered care, in the most cost effective ways.
- Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our counties.
- Further develop and maintain a coordinated care delivery system
- Improve outcomes while containing cost growth

### Project Valuation:

Project valuation takes into consideration:
1) Costs for both State operated Psychiatric Hospitals
2) Cost of private Psychiatric Hospitals
3) Local Emergency Room and Hospital costs
4) Cost of local Judicial systems
5) Cost of local City and County law enforcement systems both in their intervention activity as well as the provision of transportation for consumers needing treatment.

Significant value will be given to a program that can provide services much more responsive to consumer needs with significantly reduced time frames and efficient use of limited resources!

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $6,232,135
Identifying Project and Provider Information:
Title: 1.12.3 Enhance service availability (i.e., hours, locations, transportation, mobile clinics) of appropriate levels of behavioral health care: mobile clinics
Unique RHP ID#: 121990904.1.2 – PASS 2
Performing Provider: Camino Real Community Services
Performing Provider TPI: 121990904

Project Summary:
Provider Description: Camino Real Community Services is a Local Mental Health Authority that provides outpatient mental health services to child, adolescent, and adult patients with severe and persistent mental illness. The provider is located in a 10,000 square mile rural service area with a total population of approximately 206,777. In 2012, the Center provided services to 3,538 adults and children that met criteria for services. The Mental Health Operating budget is approximately 6.9 million dollars. The programs work closely with schools, health centers, hospitals, law enforcement, judiciary and local elected officials to coordinate the provision of services.

Intervention(s): The project is to establish two (2) Mobile Crisis Outreach Teams (MCOT) in the service area.

Need for the project: Camino Real Community Services’ area is challenged by its extremely rural nature where there is limited access to community based options that provide readily accessible crisis interventions. The designation as a historically health care professional shortage area and mental health professional shortage area reflects the great challenge this area has with accessibility to needed services. There are no local psychiatric hospitals or crisis stabilization facilities in the service area. The center provided 413 crisis assessments (January 2012 – August 2012) to individuals in the service area. Of the 413 approximately 140 patients were sent to inpatient psychiatric hospitals between January 2012 – August 2012. Currently there are no Federal Funds utilized for any Mobile Crisis services in the Camino Real service area.

Target population: The target population is individuals of all ages experiencing a psychiatric crisis. The center’s current behavioral health population is comprised of individuals who are indigent (52%) or Medicaid eligible (48%). The expected patient volume this project expects to serve is as follows: DY3 100 patients, DY4 120 patients and by DY5 144 patients.

Category 1 or 2 expected patient benefits: The project intends to benefit patients by providing crisis services to individuals at their place of residence, school and/or other community-based safe locations, 24 hours per day, 365 days per year. Services include the provision of responsive psychiatric intervention, active treatment by mental health professionals and rehabilitation and education services that enhance patient skills. It is the performing provider’s expectation that this model will improve access to the appropriate level of care for patients. The other benefits include decreasing travel for patients needing crisis stabilization services.

Category 3 outcomes: IT-9.2. ED appropriate utilization. Our goal is to Reduce Emergency Department visits for target conditions: Behavioral Health/Substance Abuse. The actual target is to be determined.
**Project Description:**

The project is to increase the capacity of its crisis services by establishing 2 Mobile Crisis Outreach Teams (MCOT) in the service area. The goal of this project is to enhance access to crisis services, while reducing the need for local Emergency Departments (ED) in Camino Real’s catchment area and reducing the number of individuals sent to more expensive mental health inpatient beds for crisis resolution services that could be provided to these individuals in a less restrictive environment.

The Camino Real Community Services area is challenged by its extremely rural nature where there is limited access to community based options that provide readily accessible crisis interventions. The designation as a historically health care professional shortage area and mental health professional shortage area reflects the great challenge this area has with accessibility to needed services. The lack of robust social agencies or organizations geared towards addressing behavioral health crisis shifts the burden to the public community mental health system that has not been funded to develop dedicated Mobile Crisis Outreach teams in this area.

Through this project, Camino Real Community Services (CRCS) will implement clinically staffed mobile treatment teams that provide prompt face-to-face crisis assessment, crisis intervention services, crisis follow-up, and relapse prevention services for individuals in the community. These services intend to reach individuals at their place of residence, school and/or other community-based safe locations, 24 hours per day, 365 days per year. It is the performing provider’s expectation that this model will improve access to the appropriate level of care for patients in the provider’s service area, reduce the need for utilization of local EDs, and provide an alternate and more expedient option for law enforcement when encountering individuals in the community suffering from psychiatric disorders or experiencing a crisis. The program will also be designed to interface with CRCS’s outpatient mental health clinics to ensure that all behavioral health issues are treated in the most therapeutic manner possible.

The target goal is to decrease use of higher cost services in Emergency Rooms and/or Inpatient Facilities and get people timely access to needed services. Additional goals would be to decrease travel for patients needing crisis stabilization services. Inherent to the program design will be the provision of responsive psychiatric intervention, active treatment by mental health professionals and rehabilitation and education services that enhance consumer skills. This project is responsive to RHP Community Need #4.

By the end of the 5 year period and the establishment of Mobile Crisis Outreach Teams, consumers in need will be able to access these services in their community. Response times to consumers will be immediate and lead to significantly reduced wait times in emergency rooms and/or long transport times to State Hospitals and other private psychiatric facilities. The efficacy of treatment will be significantly improved and overall costs to the total care system (not just hospitals) would be significantly reduced.
**Starting Point/Baseline:**

The baseline is zero. No local 24 hour Mobile Crisis Outreach Teams exist in the community for persons who are in psychiatric crisis; persons either stay in hospital emergency rooms or are transported long distances to more restrictive inpatient service environments. The baseline will be determined in year DY3 when program is implemented.

**Rationale:**

Camino Real has selected Project **Option #1.12.3.** Develop and staff a number of mobile clinics that can provide access to care in very remote, inaccessible, or impoverished areas of Texas. This selection is based on the fact that there are no local Mobile Crisis Outreach Teams, no local psychiatric hospitals nor local crisis stabilization services available to persons in psychiatric crisis in the Camino Real service area. The population has a significant need as evidenced by the number of calls made to the local crisis hotline and the requests made for crisis assessment at local hospitals. Development of Mobile Crisis Outreach Teams/Services offers an alternative to costly hospitalization that may occur if crisis situations escalate due to lack of immediate intervention. It is responsive to Community Need #4.

In 2008, Mental Health or Substance Abuse (MHSA) disorders were the principal reason for 1.8 million inpatient community hospital stays, accounting for 4.5 percent of stays in the U.S. This is according to Brief #117 (Agency for Healthcare Research and Quality, June 2011). It was also noted the MH and SA conditions most frequently treated in community hospitals were mood disorders (depression and bipolar disorder), schizophrenia and other psychotic disorders, alcohol-related disorders and drug-related disorders. These MHSA hospital stays cost $9.7 billion ($7.7 billion for MH; $2.1 billion for SA) accounting for 2.7 percent of all inpatient community hospital costs. Nationwide, the MH average length of stay was 8.0 days and the SA average length of stay was 4.8 days with an average cost $5100.

This project represents a significantly enhanced initiative for the Performing Provider since there are no local mobile crisis outreach teams; although, there is a 24-Hour crisis hotline available to persons in psychiatric crisis and a limited response system in place for purposes of determining recommendations for placement of persons in a more restrictive environment. Based on data reviewed from the provider’s local database the local population has a significant need as evidenced by the number of calls made to the performing provider’s crisis hotline and requests for crisis assessments by local hospitals. In Fiscal Year 2012 the center crisis hotline received 3016 calls with over 1000 of these requiring crisis assessments and 28% of those assessed needing stabilization at higher cost inpatient facilities. This results in a significant financial impact on local resources including law enforcement, judicial system and hospital emergency rooms. In addition, availability of inpatient psychiatric hospital beds in public and private facilities has been significantly reduced due to the demands of the forensic population. In Texas the average cost of an Emergency Room visit is approximately $996 and an average stay at a state funded mental health facility is $400/day according to the 2011 report by Health Management Associate on “The Impact of Proposed Budget Cuts to Community Based Mental Health Services”. Furthermore the report supports the model of community based services as a better option for treating persons with mental illness in a more cost-effective local environment. In the Texas Fact Sheet-2011 Psychiatric Hospitals there were a total of 5391 psychiatric beds in the state with 49.3% of the beds being public beds, 14.4% were nonprofit beds, and 36.3% were
for-profit beds. Two hundred and twelve counties in Texas do not have a psychiatric hospital and most hospitals are located in metropolitan areas. The Performing Provider Service area has no psychiatric hospital available; therefore, individuals in crisis do not have immediate access to a local option with regards to alternative crisis resolution services. When a consumer lacks appropriate behavioral health crisis resolution mechanisms, first responders are often limited in their options to resolve the situation. Sometimes the choice comes down to the ER, jail, or an inpatient hospital bed. Unfortunately, a worst case scenario occurs when even these undesirable options fail, and the consumer is left to the care of family/friends until transportation and availability of an in-patient placement can be arranged. It leaves the person in crisis and the family at great risk and feeling frustrated with the system they turn to for help.

Mobile Crisis services can be developed that create alternatives to these less desirable settings. While hospitalization provides a high degree of safety for the person in crisis, it is very expensive and is often more than what is needed to address the crisis. Community-based crisis alternatives can effectively reduce expensive and undesirable outcomes, such as preventable inpatient stays. A major challenge is related to the fact that the service area is vastly rural and has been designated as a Medically Underserved Area, Health Professional Shortage Area and Mental Health Shortage Area by the US Department of Health and Human Services Health Resources and Services Administration division. In the 10,000 square miles that comprise the portion of Region 6 that Camino Real is responsible for, none of the inpatient hospitals have a psychiatric unit to address the needs of the community. The lack of resources in the local community requires extensive travel into San Antonio for access to a private or public psychiatric facility in order to stabilize the person in crisis. Typically, local law enforcement provides transportation to these distant locations. The cost to the community is not only in the man hours and mileage costs associated with the transport, but the risk to the community when the peace officer is diverted from the responsibility of protecting the community to provide the needed transportation. The emotional cost to the person in crisis and their family/friends who wait for hours for logistics to be worked out in order to finally get to the help they need is immeasurable.

Related Category 3 Outcome Measure(s):
The Category 3 Outcome measure selected is OD-9, Right Care Right Setting: ED appropriate utilization. The reason for selecting this measure is that it captures the impact of having a local, cost effective alternative to higher costs systems such as jail, emergency room, or inpatient hospitalization when addressing crisis situations that can be quickly resolved. The project will track the number of persons served by the Mobile Crisis Outreach Teams and compare to historical data kept by the Center regarding the number of admissions to public and private in-patient psychiatric institutions to calculate cost avoidance. As the community becomes familiar with the MCOT services and these teams divert persons in psychiatric crisis from the jails, Emergency Room, and inpatient hospitals, data will be tracked and calculation of cost avoidance to the ER and jails will be maintained to substantiate the cost effectiveness of this alternative.

Health Management Associates, in their March 2011 Impact of Proposed Budget Cuts to Community-Based Mental Health Services presented to the Texas Conference of Urban Counties, reported the average per day cost of community based services is $12 for adults and $13 for children, as compared to $401 for a State Hospital bed, $137 for a jail bed for an inmate with mental illness, and $986 for an emergency room visit. Camino Real anticipates that development of a mobile crisis outreach teams in the local community will also reduce costs to other stakeholders involved in the crisis response system which includes the local sheriff’s department and the judicial system.

Relationship to other Projects:
Camino Real is proposing one other project in Region 6. It is category 1.13 Development of behavioral health crisis stabilization services as alternatives to hospitalization with Quality Improvement 3.IT-9.4 Right Care, Right Setting. The unique RHP # is 121990904.1.1

The proposed project for the development of Mobile Crisis Outreach Teams compliments the proposal for development of crisis stabilization services and allows for a strong continuum of care in the most cost effective environments.

It relates to other projects in the region by addressing the need for a local alternative for stabilization of crisis situations that are benign and are more appropriately addressed in a facility located within the service area. Hospital emergency rooms, law enforcement personnel, jails, programs of the center and other affiliated agencies will have the capability to place individuals in this facility. This project will compliment other activities and will be a clear alternative to options that are costly, involve extended wait times for consumers, use great amounts of local resources and involve long travel distances for people that are needing services.

Relationship to Other Performing Providers’ Projects in the RHP:
NON APPLICABLE

Plan for Learning Collaborative:
NON APPLICABLE
# Project Valuation:

Highest cost for stabilization services occur when crises escalate and require an inpatient/institutional solution due to lack of options in the local community. Mobile Crisis Outreach services create immediate alternatives to individuals who are in a mental health crisis and otherwise may be responded to by local Law Enforcement and taken to Emergency Departments. Cost avoidance is the basis for development of crisis mobile outreach teams in this region.

This project valuation has taken into consideration:
1) Costs for both State operated and private Psychiatric Hospitals: **EXAMPLE:** $5,100 (avg. inpatient cost) X 100 individuals = $510,000 per year
2) Costs of Local Emergency Department Visits: **EXAMPLE:** $996 ED cost X 100 individuals = $99,600 per year
3) Cost of local Judicial systems
4) Cost of local City and County law enforcement systems both in their intervention activity as well as the provision of transportation for consumers needing treatment.

The implementation of a local mobile crisis outreach teams will result in significant cost savings to various entities locally and at the state and federal levels through basic cost avoidance. Health Management Associates, in their March 2011 *Impact of Proposed Budget Cuts to Community-Based Mental Health Services* presented to the Texas Conference of Urban Counties, reported the average per day cost of community based services is $12 for adults and $13 for children, as compared to $401 for a State Hospital bed, $137 for a jail bed for an inmate with mental illness, and $986 for an emergency room visit. This project will produce the outcomes desired in a transformation initiative!

### Project Summary:

**Provider Description:** Center for Health Care Services (CHCS) is the Local Mental Health Authority for Bexar County (population 1.75M). CHCS provides behavioral health services and treatment to children, adolescents and adults.

**Intervention(s):** CHCS seeks to establish a residential crisis and respite center for children with severe emotional disturbance that will include a total of 16 beds, eight reserved for children in crisis and eight for children whose families require a brief respite from the overwhelming, 24-hour per day responsibilities of delivering care. The availability of this new community resource will enable children to reach and maintain their highest level of functioning while minimizing further crisis and hospitalization. In the crisis service component, children will receive comprehensive psychiatric assessment and treatment as needed to restore stability as well as residential care, e.g., meals, nursing care, etc. Children in the respite care service component will receive residential care, psychiatric treatment and support as needed. A primary care physician will be available to conduct routine diagnostic work ups and check for developmental disabilities and other co-occurring conditions. When appropriate, children served in either the crisis or respite components will be connected to community based outpatient care through CHCS’ Children’s Mental Health Services program and/or Early Childhood Intervention services. The assignment of Family Partners from CHCS will be a critical ingredient to the success of this approach as they have the experience and empathy required to effectively connect families to resources and support positive parenting and decision-making.

**Need for the project:** Children with serious emotional disturbance, especially those involved with multiple systems (juvenile probation, schools, child welfare), and those with developmental disabilities and delays (including those where those disabilities or delays are attributed to their mothers use of substances while they were in utero) often experience periods of crisis and require specialized supports if they are to regain stability and avert longer-term placement. The significant requirements of delivering care to these children can be draining to their families and can result in inadequate care or even abuse or neglect. Bexar County does not currently have a facility designed to deliver needed supports to children in crisis or their families.

**Target population:** Children with serious emotional disturbance. Based upon current service statistics, it is anticipated that 44% will be indigent and uninsured and 46% will be covered by Medicaid.

**Category 1 or 2 expected patient benefits:** The project seeks to realize an increase in the utilization of appropriate crisis and respite alternatives in DY4 and in DY5. The project plans to serve 100 children in its first full year of operation (DY4) and 150 in DY5, a 50% increase. Significant cost savings will result from community-based care in lieu of
inpatient or emergency care as well as better ED appropriate utilization. 

**Category 3 outcomes:** IT-9.2 Our first goal is to achieve an improvement, in appropriate utilization of crisis services. IT-5.1 Our second goal is to achieve a 5% cost savings as a direct result of efficient care delivery.

**Project Description:**

The Center for Health Care Services (CHCS) seeks to establish a residential crisis and respite center for children with severe emotional disturbance. The center would include a total of 16 beds, eight reserved for children in crisis and eight for children whose families require a brief respite from the overwhelming, 24-hour per day responsibilities of delivering care. The availability of this new community resource will enable children to reach and maintain their highest level of functioning while minimizing further crisis and hospitalization. Children in the crisis service component will receive comprehensive psychiatric assessment and treatment as needed to restore stability as well as residential care, e.g., meals, nursing care, etc. Children in the respite care service component will receive residential care, psychiatric treatment and support as needed. A primary care physician will be available to conduct routine diagnostic work ups and check for developmental disabilities and other co-occurring conditions. When developmental disabilities are diagnosed, the child also will be connected to the Early Childhood Intervention program. Finally, all children served in either the crisis or respite components will be connected to community based outpatient care through CHCS’ Children’s Mental Health Services program. The assignment of Family Partners to families accessing services from the center will be a critical ingredient to the success of this approach as they have the experience and empathy required to effectively connect families to resources and support positive parenting and decision-making.

Another critical component of the new program will be the availability of comprehensive assessment services. Evidence-based pediatric diagnostic tools will be used to develop a precise diagnosis and to advise the types of services that will benefit the child, e.g., residential placement or outpatient care. It is anticipated that the new center will meet a wide variety of needs ranging from children in active crisis who may or may not have a psychiatric diagnosis to those who are leaving longer-term hospitalization and require step-down care or to families who need a break from their child’s care requirements. The availability of this new resource also is expected to divert children from further involvement with or referral to Bexar County Juvenile Probation or Child Protective Services.

**Goals.** Establish a single location offering a continuum of care for children with acute or chronically severe behavioral health needs. Use the center as a site for training staff from a variety of disciplines to increase the availability of pediatric specialists with behavioral health competencies.

**Challenges addressed by the project.** Children with serious emotional disturbance, especially those involved with multiple systems (juvenile probation, schools, child welfare), and those with developmental disabilities and delays (including those where those disabilities or delays are attributed to their mothers use of substances while they were in utero) often experience periods of crisis and require specialized supports if they are to regain stability and avert longer-term placement. The significant requirements of delivering care to these children can be draining to their families and can result in inadequate care or even abuse or neglect. Bexar County does not currently have a facility
designed to deliver needed supports to children in crisis or their families.

5-year expected outcomes for CHCS. 1) Development of Residential Crisis/Respite Center for Children and Adolescents in Bexar County. 2) Expanded hours of operation for crisis services. 3) Expanded respite home providers.

5-year expected outcomes for persons served by the project. 1) Improved access and availability to crisis services for children and adolescents through extended hours of operation for nights/weekends. 2) Reduced waiting time during a psychiatric crisis. 3) Reduced inpatient admissions for children and adolescents in crisis. 4) Diversion from referrals to juvenile justice and child welfare for children and adolescents with behavioral health issues during a psychiatric crisis.

Relation to Regional Goals. As there are no similar services available to Bexar County children and their families, the proposed Bexar CARES Crisis and Respite Center will support the regional goal of “Improving the infrastructure for delivery of behavioral health services”. It also meets the CMS three part aim, by improving population care with increased patient satisfaction by filling an existing gap in care and improving the existing behavioral health infrastructure to better serve Medicaid and uninsured children in Bexar County in individualized and patient centered settings. The program offers step down care for children discharged from hospitals and establishes a coordinated care delivery system and step-down care. D) The program will reduce hospital re-admissions, which will improve outcomes while containing cost growth.

Starting Point/Baseline:
This is a new project. There are currently 0 clients served. However, the Children’s Mobile Outreach Team (CMOT) responded to 615 crisis calls for children during the last nine months of Program Year 2012.

Rationale:
The project option (1.13.1 Develop and implement crisis stabilization services to address the identified gaps in the current community crisis system), process milestone (P-3 Develop implementation plans for needed crisis services and P-6 Evaluate and continuously improve crisis services) and improvement milestone (I-12 Utilization of appropriate crisis alternatives) were selected in correspondence to existing, unmet community needs for children’s crisis and respite services. The current service continuum for children does not include either crisis or respite care services, both of which are known to prevent re-admission. This project builds upon existing and planned behavioral health system enhancements and will assist Bexar County in developing crisis alternatives, which will reduce utilization of emergency departments and preventable inpatient stays.

Project Components: Through the development of the Crisis stabilization unit we propose to meet all required project components. a) Convene community stakeholders who can support the development of crisis stabilization services to conduct a gap analysis of the current community crisis system and develop a specific action plan that identifies specific crisis stabilization services to address identified gaps. b) Analyze the current system of crisis stabilization services available in the community including capacity of each service, current utilization patterns, eligibility criteria and discharge criteria for each service. c) Assess the behavioral health needs of patients currently receiving crisis services in the jails, EDs, or psychiatric hospitals. Determine the types and volume of services needed to resolve crisis in community-based settings. By developing this crisis
stabilization unit dedicated to children and adolescents. We will be able to baseline and assess health needs and begin to set up a system for delivery of care and determine needed types and volume of services. d) Explore potential crisis alternative service models and determine acceptable and feasible models for implementation. Although there are no similar services in this community we will explore other models offered throughout the country. e) Review the intervention(s) impact on access to and quality of behavioral health crisis stabilization services and identify “lessons learned,” opportunities to scale all or part of the intervention(s) to a broader patient population, and identify key challenges associated with expansion of the intervention(s) including special considerations for safety-net populations. With this being a new service we will be able to assess barriers, risks, and opportunities and document this as lessons learned whereby implementing necessary changes to ensure access and quality of services are maximized.

**Unique community need identification numbers the project addresses:**
- CN.1 - Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.
- CN.4 There is a shortage of high quality mental and behavioral health services that are integrated with physical health care services and/or provide crisis stabilization.

The proposed project will positively impact issues identified by University Health System as the Mental and Behavioral Health Unique needs identification numbers: 1. Inadequate and fragmented continuum of care for children with behavioral health diagnoses. 2) Inadequate access to care management and resource navigation. 3) How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative: New initiative.

Related initiatives funded by U.S. Department of HHS. None.

**Related Category 3 Outcome Measure(s):**
- OD-9 Right Care, Right Setting
- IT-9.2 ED appropriate utilization
- 1) OD-5 Cost of care, IT-5.1 Improved cost savings: demonstrate cost savings in care delivery.

**Reasons/rationale for selecting the outcome measures:**
These measures are indicative of children finding the right care in an easily accessed setting, which will diminish crises, improve behavioral health status, reduce the inappropriate use of emergency departments and reduce cost of care.

**Relationship to other Projects:**
There is one related project proposed for implementation in RHP 6: establishment of a children’s mental health emergency room in Bexar County (1.12). It is unclear whether this is a supportive service for the Crisis Respite Center. A new treatment project for children with ADHD is being proposed for RHP 6 (2.15). Because the Crisis Respite Center will include services for children with both a serious emotional disturbance and a developmental disability, it is possible that the children served in the new ADHD project will also receive services from the Crisis Respite Center. CHCS will coordinate service availability and innovative ways of meeting the shared target population’s needs with the Performing Provider.
**Relationship to Other Performing Providers’ Projects in the RHP:**

Clarity is proposing establishment of the Children’s Mental Health Emergency Room. CHCS will join Clarity in any University Health System-organized learning collaborative dedicated to sharing best practices and service solutions for children’s mental health. If there is a collaboration opportunity with the ADHD project proposed by UTHSCSA, CHCS will join key UTHSCSA staff in any learning community organized by University Health System.

**Plan for Learning Collaborative:**

CHCS will participate in any and all relevant learning collaborative organized by University Health System.

**Project Valuation:**

The value for this project is $1,998,596 for DY 2 and $8,809,554 for all years. By DY5, the project proposes to serve 150 children in community-based crisis and respite care. The establishment of a Children’s Crisis Respite Center fills an existing gap in the local continuum of behavioral health care for children. The availability of this new resource will ensure children in a behavioral health crisis are stabilized, connected to systems of care that will support community living and prevent or reduce costly, avoidable hospitalization, lengthy stays in institutions, further crises and the inappropriate use of emergency departments as well as providing respite for them and their families to prevent destabilization. This also will be a critical resource and a new option for police departments, schools and child protective services, making it an alternative to more costly and restrictive institutional care. CHCS has a significant amount of existing infrastructure from which this project can be launched; only site preparation is required; thereby driving down the required investment and increasing the cost effectiveness of the approach.

The annual value of benefits provided to those served at full implementation considered several factors in valuing this project such as reducing costs at hospitals, costs for emergency detention and use of psychiatric institutions. This information was based on extensive literature as well as a valuation study completed and prepared by professors of the Houston School of Public health and of the UT Austin Center for Social Work Research that was based on the cost utility model, usage of extensive literature of similar interventions, costs savings and health outcomes related to those interventions.

The annual value of benefits provided to those served at full implementation was calculated by multiplying the annual value of a single successful intervention by five. The rationale for selection of a multiplier of five was that to overcome resistance to change in a hard-to-serve population, both in the delivery and payment systems, five years of benefits would be needed. This assumption was verified as valid after an extensive literature review.

Cost-utility analysis (CUA) also was used to measure the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state. Cost-utility analysis is a useful tool for assessing the value of new health service interventions because it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs...
averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across different types of interventions, the common health goal, or outcome, is the number of life-years added.

The CUA calculations indicate that the availability of a dedicated Children’s Crisis Respite Center has the potential to increase QALY among those it serves.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $8,809,554**
Identifying Project and Provider Information:

Title: 1.12.1 Establish extended operating hours at a select number of Local Mental Health Center clinics or other community-based setting in areas of the State where access to care is likely to be limited: Expanded OP Capacity
Unique RHP ID#: 137251808.1.2 – PASS 1
Performing Provider: The Bexar County Board Of Trustees for Mental Health Mental Retardation Services, d/b/a/ The Center For Health Care Services
Performing Provider TPI: 137251808

Project Summary:

Provider Description: Center for Health Care Services (CHCS) is the Local Mental Health Authority for Bexar County (population 1.75M). CHCS provides behavioral health services and treatment to children, adolescents and adults.

Intervention(s): The Center For Health Care Services (CHCS) seeks to expand access to mental health services in Bexar County. This will include: new clinical locations, longer service hours and evening and weekend coverage at new and existing locations; utilization of a behavioral health care manager model to align case management and wellness education with treatment services to more rapidly improve outcomes; and increased training opportunities to support the expanded workforce needs. Telemedicine will be used in the near term to augment the available behavioral health workforce until such time as the number of skilled clinicians increases. Finally, a Psychiatric Urgent Care Clinic will be opened to dispense medications and connect consumers in crisis to durable community-based care. Services available from the clinics will include psychiatry, labs and medication, mental health treatment ancillary to psychiatric care, peer recovery services, and substance abuse counseling and treatment for individuals with co-occurring disorders. All new facilities will be located in Mental Health Professional Shortage Areas, per the U.S. Health Resources and Services Administration. This project is in direct response to significant gaps identified in community needs assessments and other planning documents that have verified the insufficiency of outpatient care for the target population. Improved access to care reduces symptomology and crises and improves functioning, which are known correlates to improved quality of life, greater retention in and compliance with care recommendations, and cost reductions attributable to unnecessary utilization of acute and sub-acute services.

Need for the project: Resource limitations for outpatient psychiatric care in Bexar County, triggered by state funding cuts, have greatly diminished access to needed services, especially for persons with severe and persistent mental illness, the elderly and adults with co-occurring mental illness and substance abuse disorders. Also, state funds must only be used for priority populations, i.e., persons diagnosed with severe depression, schizophrenia or bi-polar disorder. Individuals with diagnoses that do not meet one of these classifications, e.g., major depression, anxiety disorders, post-traumatic stress disorder, are forced to wait for care and, when their symptoms escalate beyond their capacity for self-management, most are reliant upon urgent or acute care from the most costly providers, e.g., emergency departments, hospitals. Many of these individuals cannot maintain their stability through available resources and do not get their medications refilled or managed in a consistent manner, further triggering decompensation and the need for acute care.

Target population: Adults with severe and persistent mental illness, substance abuse
disorders and/or co-occurring disorders. Based upon current service statistics, it is anticipated that 46% of those served will be indigent and uninsured and 50% will be covered by Medicaid.

**Category 1 or 2 expected patient benefits:** The project seeks to realize a 20% increase or 7,002 individuals from a baseline of 5,835 in the utilization of community behavioral health care services in DY4, and a 30% or 1,750 increase in DY5 with an overall goal of 7,585 utilizing community behavioral healthcare.

**Category 3 outcomes:** IT-10.1. Our goal is to demonstrate improvement in quality of life (QOL) scores for DYs 4 and 5.

### Project Description:

The Center For Health Care Services (CHCS) seeks to expand access to mental health services in Bexar County. This will include both new clinical locations, longer service hours and evening and weekend coverage at new and existing locations, utilization of a behavioral health care manager model to align case management and wellness education with treatment services to more rapidly improve outcomes, and increased training opportunities to support the expanded workforce needs. Also, telemedicine will be used in the near term to augment the available behavioral health workforce until such time as the number of skilled clinicians increases. Finally, a Psychiatric Urgent Care Clinic will be opened to dispense medications and connect consumers in crisis to durable community-based care. Services available from the clinics will include psychiatry, labs and medication, mental health treatment ancillary to psychiatric care, peer recovery services, and substance abuse counseling and treatment for individuals with co-occurring disorders. All new facilities will be located in Mental Health Professional Shortage Areas, per the U.S. Health Resources and Services Administration.

**Goals.** Improve access to behavioral health care and reduce unnecessary hospitalizations resulting from lengthy waiting lists for care. Increase utilization of community behavioral health services, reducing inappropriate use significantly more costly care, i.e., institutional and crisis care.

**Challenges addressed by the project.** Resource limitations for outpatient psychiatric care in Bexar County, triggered by state funding cuts, have greatly diminished access to needed services, especially for persons with severe and persistent mental illness, the elderly and adults with co-occurring mental illness and substance abuse disorders. Also, state funds must only be used for priority populations, i.e., persons diagnosed with severe depression, schizophrenia or bi-polar disorder. Individuals with diagnoses that do not meet one of these classifications, e.g., major depression, anxiety disorders, post-traumatic stress disorder, are forced to wait for care and, when their symptoms escalate beyond their capacity for self-management, most are reliant upon urgent or acute care from the most costly providers, e.g., emergency departments, hospitals. Many of these individuals cannot maintain their stability through available resources and do not get their medications refilled or managed in a consistent manner, further triggering de-compensation and the need for acute care.

**5-year expected outcomes for CHCS.**

1) New outpatient clinic site developed in downtown the San Antonio "Corridor of Care" offering integrated behavioral and primary health care. 2) New urgent care medication management clinic services. 3) Expanded hours access for psychiatric and related clinical services to include evenings and weekends.
5-year expected outcomes for persons served by the project.
Improved access to services, including: a) Significantly reduced waiting time for physician appointments. Currently, new psychiatric evaluation appointments are scheduled 10-14 weeks from date of intake. Reduced waiting times will improve patient satisfaction and reduce adverse outcomes caused by the lack of timely access to care. b) Improve compliance with scheduled appointments. The new availability of evening and weekend hours will support consumers in keeping appointments and accessing routine care. c) Urgent care for medication management and related crisis resolution.

Relation to Regional Goals. Expanding resource availability to address the dearth of outpatient mental health services is a key means of achieving the regional goal of “Improving the infrastructure for delivery of behavioral health services”. It also meets the CMS three part aim, as follows. 1) The program fills an existing gap in care and improves the existing behavioral health infrastructure to better serve Medicaid and uninsured adults in Bexar County. 2) The program will support lasting community living and reduce hospital re-admissions, which will improve outcomes while containing cost growth.

Starting Point/Baseline:
The baseline for the proposed project is the number of adults served in CHCS’ existing adult outpatient clinics (Harvard Place, Zarzamora, Northwest) in FY 2012, or 5,835.

Rationale:
The project option (1.12.1 Establish extended operating hours at a select number of Local Mental Health Center clinics or other community-based setting in areas of the State where access to care is likely to be limited Expand the number of community based settings where behavioral health services may be delivered in underserved areas), process milestones (P-3 Develop administrative protocols and clinical guidelines for projects selected and P-6 Establish behavioral health services in new community-based settings in underserved areas) and improvement milestone (I-11 Increased utilization of community behavioral healthcare) were selected in correspondence to existing, unmet community needs for outpatient care and treatment. Positive behavioral health outcomes are contingent upon the availability of the consumer to obtain services as soon as possible after a need has been identified. However, adults with mental illnesses who are reliant upon public mental health services often face significant wait times before they can access care, e.g., the wait for a psychiatric examination currently averages 14 weeks. Waiting for care can be especially detrimental to the target population, who may be easily discouraged and opt out of care seeking, worsening symptoms and heightening functional loss.

The project also seeks to expand the availability of appropriate, credentialed mental health professionals to provide optimal treatment to the target population. A March 2011 report published by the Hogg Foundation for Mental Health and Methodist Healthcare Ministries warns the most severe health profession shortages are in mental health services, with Texas ranking far below the national average in number of mental health professional per 100,000 residents. Further, less than 33% of the state’s 48,700 practicing doctors accept Medicaid patients and nearly every county in RHP 6 is designated as a
Health Provider Shortage Area for mental health. Inadequate mental health services results in avoidable costs to hospital and criminal and juvenile justice systems.47

**Project Components:** Through expansion of outpatient capacity, we propose to meet all required project components. a) Evaluate existing transportation programs and ensure that transportation to and from medical appointments is made available outside of normal operating hours. If transportation is a significant issue in care access, develop and implement improvements as part of larger project. b) Review the intervention(s) impact on access to behavioral health services and identify “lessons learned” opportunities to scale all or part of the intervention(s) to a broader patient population, and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations.

**Unique community need identification numbers the project addresses:**
- CN.1 - Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.
- CN.4 There is a shortage of high quality mental and behavioral health services that are integrated with physical health care services and/or provide crisis stabilization.

More specifically, the proposed project will also positively impact the following:
1. Inadequate access to care management and resource navigation
2. Inadequate services for individuals who have been arrested or incarcerated either as a result or precipitated by unmet behavioral health needs
3. Inadequate resources for special needs populations (e.g., homeless adults, sex offenders) including efficiencies such as integrated behavioral and primary care, pharmacy services, telemedicine, and physician extenders
4. Inadequate outpatient care for adults with moderate acuity behavioral health needs to support reductions in hospital readmissions and the inappropriate use of emergency departments

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative: Significant enhancement. Currently, our outpatient clinics are limited in location and hours. The initiative will improve access, reduce wait times and provide services where access to care is currently limited. As more adults are stabilized through consistent, timely outpatient care, their use of inappropriate crisis services, i.e., emergency departments, will decrease.

Related initiatives funded by U.S. Department of HHS. The Outpatient Clinics currently receive funding from HHS, via Texas Department of State Health Services for Adult Outpatient Services.

**Related Category 3 Outcome Measure(s):**

OD-10 Quality of Life/Functional Status
IT-10.1 Quality of Life.

**Reasons/rationale for selecting the outcome measures:** This measure is indicative of consumer retention in care and enhanced stability, both of which are critical means of reducing unnecessary hospitalizations and the inappropriate use of emergency departments.

569 ★ RHP 6 Plan ★ March 8, 2013 Center for Health Care Services
Relationship to other Projects:
The proposed project will address significant behavioral health care resource insufficiency in Bexar County. As such, it is an integral component of this County’s health care infrastructure. Another proposed project seeks to establish research-based care for a segment of the population of adults with mental illness. These resources will be coordinated with CHCS’s proposed outpatient expansion, if appropriate, to build a more durable continuum of care.

Relationship to Other Performing Providers’ Projects in the RHP:
UTHSCA is proposing a potentially similar project. CHCS will join any collaborative learning communities with UTHSCA or other providers dedicated to serving adults with mental illness.

Plan for Learning Collaborative:
CHCS will participate in any and all relevant learning collaboratives organized by University Health System.

Project Valuation:
The value for this project is $3,997,191 for DY 2 and $17,619,107 for all years. By DY5, 7,585 adults with serious mental illness will receive outpatient behavioral health services every year. The expansion of Adult Outpatient Services will increase accessibility of behavioral health care and will ensure expedient treatment and rapid connection to systems of care that support community living and prevent or reduce costly, avoidable hospitalization, lengthy stays in institutions, further crises and the inappropriate use of emergency departments. CHCS has a significant amount of existing infrastructure from which this project can be launched and only site preparation is required; thereby driving down the required investment and increasing the cost effectiveness of the approach.

The annual value of benefits provided to those served at full implementation considered several factors in valuing this project such as reducing costs at hospitals, costs for emergency detention and use of psychiatric institutions. This information was based on extensive literature as well as a valuation study completed and prepared by professors of the Houston School of Public health and of the UT Austin Center for Social Work Research that was based on the cost utility model, usage of extensive literature of similar interventions, costs savings and health outcomes related to those interventions.

The annual value of benefits provided to those served at full implementation was calculated by multiplying the annual value of a single successful intervention by five. The rationale for selection of a multiplier of five was that to overcome resistance to change in a hard-to-serve population, both in the delivery and payment systems, five years of benefits would be needed. This assumption was verified as valid after an extensive literature review.

Cost-utility analysis (CUA) also was used to measure the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state. Cost-utility analysis is a useful tool for assessing the value of new health service interventions because it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs.
averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across different types of interventions, the common health goal, or outcome, is the number of life-years added.

The CUA calculations indicate that the availability of expanded Adult Outpatient Mental Health Services has the potential to increase QALY among those it serves.

**Identifying Project and Provider Information:**

| Title: 1.13.1 Develop and implement crisis stabilization services to address the identified gaps in the current community crisis system: Crisis Transitional Residential Services |
| Unique RHP ID#: 137251808.1.3 – PASS 1 |
| Performing Provider: The Bexar County Board Of Trustees for Mental Health Mental Retardation Services, d/b/a/ The Center For Health Care Services |
| Performing Provider TPI: 137251808 |

**Project Summary:**

Provider Description: Center for Health Care Services (CHCS) is the Local Mental Health Authority for Bexar County (population 1.75M). CHCS provides behavioral health services and treatment to children, adolescents and adults.

**Intervention(s):** The Center For Health Care Services (CHCS) seeks to establish crisis transitional residential options, up to 32 beds, for adults. Available service will include: 1) crisis respite and a continuum of care (e.g., psychiatric care, medication management, nursing services, intensive case management, peer support) for individuals with complex treatment issues, including those who are chronically mentally ill, homeless and alcohol or drug dependent and have chronic medical conditions; and, 2) transitional residential services, including medication assistance, support for activities of daily living and connection to supported housing and employment services, to assist individuals with complex treatment issues move to greater independence and community living. These new resources will provide the most appropriate, least restrictive care and are cost effective alternatives to longer-term hospitalization (on the front end) or subsequent, rapid re-hospitalization. The variety of available service options will enable individualized care in correspondence to patient needs.

**Need for the project:** Following crisis stabilization, adults with persistent mental illness often benefit from transitional or step-down care designed to support their effective adjustment to community living. There are no such resources in Bexar County, thereby hindering successful community reintegration and increasing the potential for cycling back into costly inpatient care.

**Target population:** Adults with persistent mental illness. Based upon current service statistics, it is anticipated that 21% will be covered by Medicaid and 58% will be indigent and uninsured.

**Category 1 or 2 expected patient benefits:** The project seeks to realize a 20% increase or 270 individuals from a baseline of 1,353 in the utilization of appropriate crisis alternatives in DY4 and a 35% or a 475 increase in DY 5 that will access appropriate crisis care through the unit.

**Category 3 outcomes:** IT-3.8 Our goal for reducing the behavioral health/substance abuse 30-day re-admission rate will be determined in DY4.

**Project Description:**

The Center For Health Care Services (CHCS) seeks to establish crisis transitional residential options, up to 32 beds, for adults. Available service will include: 1) crisis respite care and a continuum of services (e.g., psychiatric care, medication management, nursing services, intensive case management, peer support) for individuals with complex treatment issues, including those who are chronically mentally ill, homeless and alcohol or drug dependent and have chronic medical conditions; and, 2) transitional residential services, including medication assistance, support for activities of daily living and
connection to supported housing employment services, to assist individuals with complex
treatment issues move to greater independence and community living. These new
resources will provide the most appropriate, least restrictive care and are cost effective
alternatives to longer-term hospitalization (on the front end) or subsequent, rapid re-
hospitalization. The variety of available service options will enable individualized care in
correspondence to patient needs.

The Crisis Transitional Residential Services approach meets an identified need for high
acuity, secure beds and will enable the more efficient use of scarce inpatient psychiatric
care. Special, high-risk populations, e.g., sex offenders, ex-offenders, could be assisted
without compromising public safety.

Goals: Reduce the per capita cost of care and improve health outcomes, including
lengthening time spent living productively in the community, of patients with significant
behavioral health needs and frequent hospitalizations. Reduce potential hospital
readmissions among a targeted post-acute population.

Challenges addressed by the project. Following crisis stabilization, adults with persistent
mental illness often benefit from transitional or step-down care designed to support their
effective adjustment to community living. There are no such resources in Bexar County,
thereby hindering successful community reintegration and increasing the potential for
cycling back into costly inpatient care.

5-year expected outcomes for CHCS. 1) Development of new Crisis Transitional Services
for adults in Bexar County. 2) Expanded hours of operation for crisis services. 3)
Expanded crisis transitional options.

5-year expected outcomes for persons served by the project. The proposed new
alternative crisis services will expand opportunities available to individuals with serious
mental illness, increasing the number accessing appropriate care by 35% in DY5.

Accessing appropriate care will improve treatment compliance and retention in care and
will support a stronger, more durable transition into the community after extended
hospitalization. Other related outcomes include: 1) Improved access and availability to
crisis services for adults through extended hours of operation for nights/weekends and
assistance with crisis transportation. 2) Reduced waiting time during a psychiatric crisis.
3) Reduced potentially avoidable re-admissions for adults. 4) Diversion from emergency
departments. 5) Availability of new step-down care.

Relation to Regional Goals. As there are no similar services available to Bexar County
residents, the proposed Crisis Transitional Residential Services support the regional goal
of “Improving the infrastructure for delivery of behavioral health services”. It also meets
the CMS three part aim, as follows.

- The program enables and ensures individualized, patient-centered care.
- The program fills an existing gap in care and improves the existing behavioral
  health infrastructure to better serve Medicaid and uninsured adults in Bexar
  County.
- The program offers step down care for individuals discharged from hospitals and
  supports their re-integration into daily living, thereby establishing a coordinated
  care delivery system.
- The program will support lasting community living and reduce hospital re-
  admissions, which will improve outcomes while containing cost growth.
## Starting Point/Baseline:
CHCS currently operates a 16-bed crisis transitional unit. The proposed facility and project will serve a different and more complex target population.

## Rationale:
The project option (1.13.1 Develop and implement crisis stabilization services to address the identified gaps in the current community crisis system), process milestone (P-3 Develop implementation plans for needed crisis services and P-6 Evaluate and continuously improve crisis services) and improvement milestone (I-12 Utilization of appropriate crisis alternatives) were selected in correspondence to existing, unmet community needs for crisis services. Specifically, the crisis continuum does not contain after-care or step-down services that are known to support community re-integration or assimilation post-hospitalization and prevent re-admission. This project builds upon existing and planned behavioral health system enhancements and will assist Bexar County in developing crisis alternatives, which will reduce utilization of emergency departments and preventable inpatient stays.

### Project Components:
Through the Crisis Transitional Residential Services, we propose to meet all required project components. a) Convene community stakeholder who can support the development of crisis stabilization services to conduct a gap analysis of the current community crisis system and develop a specific action plan that identifies specific crisis stabilization services to address identified gaps. b) Analyze the current system of crisis stabilization services available in the community including capacity of each service, current utilization patterns, eligibility criteria and discharge criteria for each service. c) Assess the behavioral health needs of patients currently receiving crisis services in the jails, EDs, or psychiatric hospitals. Determine the types and volume of services needed to resolve crisis in community-based settings. By developing this crisis stabilization unit dedicated to children and adolescents. We will be able to baseline and assess health needs and begin to set up a system for delivery of care and determine needed types and volume of services. d) Explore potential crisis alternative service models and determine acceptable and feasible models for implementation. Although there are no similar services in this community we will explore other models offered throughout the country. e) Review the intervention(s) impact on access to and quality of behavioral health crisis stabilization services and identify “lessons learned,” opportunities to scale all or part of the intervention(s) to a broader patient population, and identify key challenges associated with expansion of the intervention(s) including special considerations for safety-net populations. With this being a new service we will be able to assess barriers, risks, and opportunities and document this as lessons learned whereby implementing necessary changes to ensure access and quality of services are maximized.

Unique community need identification numbers the project addresses:
- CN.1 - Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.
- CN.4 There is a shortage of high quality mental and behavioral health services that are integrated with physical health care services and/or provide crisis stabilization.
More specifically, the proposed project will positively impact the following issues:
1. Inadequate access to care management and resource navigation
2. Inadequate resources for special needs populations (e.g., homeless adults, sex offenders) including efficiencies such as integrated behavioral and primary care, pharmacy services, telemedicine, and physician extenders
3. Inadequate outpatient care for adults with moderate acuity behavioral health needs to support reductions in hospital readmissions and the inappropriate use of emergency departments

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative: New initiative.

Related initiatives funded by U.S. Department of HHS. None.

### Related Category 3 Outcome Measure(s):

<table>
<thead>
<tr>
<th>OD-3 Potentially Preventable Re-admissions</th>
</tr>
</thead>
<tbody>
<tr>
<td>IT-3.8 Behavioral Health/Substance Abuse 30-day re-admission rate.</td>
</tr>
</tbody>
</table>

Reasons/rationale for selecting the outcome measures:
This measure is indicative of adults finding the right care in an easily accessed setting, which will diminish crises, improve behavioral health status, reduce the inappropriate use of emergency departments and reduce cost of care.

### Relationship to other Projects:
There are no similar services proposed in RHP 6. As such, the Crisis Transitional Residential Services project will fill a critical gap in Bexar County’s behavioral health continuum of care.

### Relationship to Other Performing Providers’ Projects in the RHP:
There are no similar projects proposed.

### Plan for Learning Collaborative:
CHCS will participate in any and all relevant learning collaborative organized by University Health System.

### Project Valuation:
The value for this project is $1,598,877 for DY 2 and $7,047,642 for all years. By DY5, 475 adults will receive appropriate crisis care each year from the proposed project. The establishment of a Crisis Transitional Residential Services program fills an existing gap in the local continuum of behavioral health care for adults with mental illness. The availability of this new resource will ensure the target population of high need adults is stabilized, connected to continuity care to support community living and prevent or reduce costly, avoidable hospitalization, lengthy stays in institutions, further crises and the inappropriate use of emergency departments. CHCS has a significant amount of existing infrastructure from which this project can be launched; only site preparation is required; thereby driving down the required investment and increasing the cost effectiveness of the approach.

The annual value of benefits provided to those served at full implementation considered
several factors in valuing this project such as reducing costs at hospitals, costs for emergency detention and use of psychiatric institutions. This information was based on extensive literature as well as a valuation study completed and prepared by professors of the Houston School of Public health and of the UT Austin Center for Social Work Research that was based on the cost utility model, usage of extensive literature of similar interventions, costs savings and health outcomes related to those interventions.

The annual value of benefits provided to those served at full implementation was calculated by multiplying the annual value of a single successful intervention by five. The rationale for selection of a multiplier of five was that to overcome resistance to change in a hard-to-serve population, both in the delivery and payment systems, five years of benefits would be needed. This assumption was verified as valid after an extensive literature review.

Cost-utility analysis (CUA) also was used to measure the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state. Cost-utility analysis is a useful tool for assessing the value of new health service interventions because it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across different types of interventions, the common health goal, or outcome, is the number of life-years added.

The CUA calculations indicate that the availability of a dedicated Crisis Transitional Unit will provide a cost effective alternative to current over-reliance on emergency departments and providers of tertiary care and also has the potential to increase QALY among those it serves.

Identifying Project and Provider Information:

Title: 1.12.2 - Expand the number of community based settings where behavioral health services may be delivered in underserved areas: Children's Mental Health
Unique RHP ID#:137251808.1.4 – PASS 1
Performing Provider: The Bexar County Board Of Trustees for Mental Health Mental Retardation Services, d/b/a/ The Center For Health Care Services
Performing Provider TPI: 137251808

Project Summary:

Provider Description: Center for Health Care Services (CHCS) is the Local Mental Health Authority for Bexar County (population 1.75M). CHCS provides behavioral health services and treatment to children, adolescents and adults.

Intervention(s): The Center For Health Care Services (CHCS) seeks to establish a centralized, accessible campus from which systems or families can obtain care for children and adolescents (0 to 17 years old) with a serious emotional and/or behavioral problem or developmental delays. Services will include: comprehensive treatment planning, wraparound care, mental health interventions, coordination of care among all interested systems (schools, juvenile justice, child protective services), substance abuse counseling, group counseling for children, parents or caregivers and siblings, recreational therapy, ROPES course, connection to in-home services (occupational therapy, physical therapy, nutritional counseling, medication education, in-home nursing care), therapeutic foster care, and diversion services for youth involved with the juvenile justice system. Also, an on-site model classroom and learning lab will assist children with the transition to school environments and will support their academic achievement. And safe rooms and relaxation areas will be available for all ages, making the campus a trusted and valued resource for children and their families. To facilitate service coordination, staff from all child-serving systems, i.e., schools, juvenile probation, child protective services, Medicaid, sexual abuse services, will have on-site representatives.

As a result of the proposed project, in DY2, clinical operations will be manualized to enhance efficiency and accessibility to coordinated care. In DY3, the new and expanded campus will open. In DY4, the number of Bexar County children utilizing coordinating community behavioral health services will increase whereby in DY5, the volume of Bexar County children utilizing coordinating community behavioral health services will continue to increase.

Need for the project: Families of children with serious emotional disturbance, especially those involved with multiple systems (juvenile probation, schools, child welfare), and those with developmental disabilities and delays (including those where those disabilities or delays are attributed to their mothers use of substances while they were in utero) have difficulty accessing coordinated care. In the absence of a single site from which multi-faceted, multi-partner care is available, families often have to work with four or more entities and these entities often do not communicate with one another or efficiently share information.

Target population: Children with serious emotional disturbance. Based upon current service statistics, it is anticipated that 45% will be indigent and uninsured and 35% will be covered by Medicaid.

Category 1 or 2 expected patient benefits: The project seeks to increase utilization of community-behavioral healthcare. In DY4 an initial baseline of 460 will be served with a goal of 115 or 25% increase in access and utilization and in DY5 an increase of 230 or 50% of baseline will access and increase utilization. The proposed project will serve approximately 805 children by end of DY5.

Category 3 outcomes: IT-10.1 Quality of Life. Our goal for improvement in quality of life will
be determined in Year 4.  

**Project Description:**

The Center For Health Care Services (CHCS) seeks to establish a centralized, accessible campus from which systems or families can obtain care for children and adolescents (0 to 17 years old) with a serious emotional and/or behavioral problem or developmental delay. Services will include: comprehensive treatment planning, wraparound care, mental health interventions, coordination of care among all interested systems (schools, juvenile justice, child protective services), substance abuse counseling, group counseling for children, parents or caregivers and siblings, recreational therapy, ROPES course, connection to in-home services (occupational therapy, physical therapy, nutritional counseling, medication education, in-home nursing care), therapeutic foster care, and diversion services for youth involved with the juvenile justice system. Also, an on-site model classroom and learning lab will assist children with the transition to school environments and will support their academic achievement. And safe rooms and relaxation areas will be available for all ages, making the campus a trusted and valued resource for children and their families. To facilitate service coordination, staff from all child-serving systems, i.e., schools, juvenile probation, child protective services, Medicaid, sexual abuse services, will have on-site representatives. 

The Center for Health Care Services will fill an existing void in Bexar County by becoming the community’s primary resource regarding children’s mental health. Families will be able to visit the new campus to obtain information about their children’s mental health and available treatment options. Older youth will engage in scheduled and organized peer activities and community service projects, a new opportunity for most. Family Partners will be available to help parents and other caregivers identify resources designed to assist their children and strengthen their parenting skills. Parents will attend regularly scheduled training classes in becoming an effective advocate for their children. School staff and other community providers will be invited to specialized professional development opportunities regarding children’s mental health and the evidence-based practices that are available. Special populations also will be served. For example, children with developmental disabilities and a mental health diagnosis will be able to receive single-site occupational and physical therapy and continuity care after they age-out of the Early Childhood Intervention system. Also, children leaving the crisis and respite center or longer-term hospitalization will have the opportunity to continue treatment at the campus.

**Goals.** Establish a single location offering a continuum of care for children with behavioral health needs. Use the campus as a site for training staff from a variety of disciplines to increase the availability of pediatric specialists with behavioral health competencies.

**Challenges addressed by the project.** Families of children with serious emotional disturbance, especially those involved with multiple systems (juvenile probation, schools, child welfare), and those with developmental disabilities and delays (including those where disabilities or delays are attributed to their mothers use of substances while they were in utero) have difficulty accessing coordinated care. In the absence of a single site from which multi-faceted, multi-partner care is available, families often have to work with four or more entities and these entities often do not communicate with one another or efficiently share information.

**5-year expected outcomes for CHCS.** 1) Development of Children’s Behavioral Health Campus. 2) Expanded hours of operation for services. 3) Expanded continuum of services for children and adolescents and their caregivers. 4) Integration of Behavioral Health and Primary Health Care.

**5-year expected outcomes for persons served by the project.** 1) Improved quality of life and
functioning for children at school and at home. 2) Integration of primary care services into behavioral health setting so behavioral health services are an integral part of overall healthcare for children and adolescents. 3) Development of a continuum of care to include services and supports to help caregivers improve their abilities to successfully parent children and adolescents with behavioral health issues. 4) Establish comprehensive mental health services for children and adolescents including opportunities to connect to peers with similar experiences to promote improved family functioning and the ability to remain in their own home and community.

Relation to Regional Goals. Expanding resource availability to address the dearth of children’s mental health services is a key means of achieving the regional goal of “Improving the infrastructure for delivery of behavioral health services”. It also meets the CMS three part aim, as follows.

- The program fills an existing gap in care and **improves the existing behavioral health infrastructure** to better serve Medicaid and uninsured children in Bexar County.
- The program will meet children’s needs in an outpatient setting, which will reduce crisis and the need for hospital admissions and will **improve outcomes while containing cost growth**.

Starting Point/Baseline:
Children’s Mental Health currently is funded to serve 460 children per year.

Rationale:
The project option (1.12.2 Expand the number of community based settings where behavioral health services may be delivered in underserved areas), process milestones (P-3 Develop administrative protocols and clinical guidelines for projects selected and P-6 Establish behavioral health services in new community-based settings in underserved areas) and improvement milestone (I-11 Increased utilization of community behavioral healthcare) were selected in correspondence to existing, unmet community needs for children’s outpatient mental health services.

Project Components: There are no project components for this option.

Unique community need identification numbers the project addresses:
- CN.1 - Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.
- CN.4 There is a shortage of high quality mental and behavioral health services that are integrated with physical health care services and/or provide crisis stabilization.

More specifically, the proposed project will positively impact the following issues:
- Inadequate and fragmented continuum of care for children with behavioral health diagnoses.
- Inadequate access to care management and resource navigation

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative: New initiative.

Related initiatives funded by U.S. Department of HHS. CHCS does not receive direct HHS funding for the Children's Outpatient Clinic. State mental health block grant funding is received via Texas Department of State Health Services but is insufficient to meet current needs. The proposed new initiative also will significantly enhance and expand and existing delivery system of the Children's Outpatient Clinic.
Related Category 3 Outcome Measure(s):

| OD-10 Quality of Life/Functional Status: |
| IT-10.1 Quality of Life. |

Reasons/rationale for selecting the outcome measures: This measure is indicative of consumer retention in care and enhanced stability, both of which are critical means of reducing unnecessary hospitalizations and the inappropriate use of emergency departments.

Relationship to other Projects:
There is one related project proposed for implementation in RHP 6: establishment of a children’s mental health emergency room in Bexar County. The children served in the emergency room could receive continuity care from CHCS from the proposed Children’s Mental Health campus.

Relationship to Other Performing Providers’ Projects in the RHP:
Clarity is proposing establishment of the Children’s Mental Health Emergency Room. CHCS will join Clarity in any University Health System-organized learning collaborative dedicated to sharing best practices and service solutions for children’s mental health.

Plan for Learning Collaborative:
CHCS will participate in any and all relevant learning collaborative organized by University Health System.

Project Valuation:
The value for this project is $1,758,764 for DY 2 and $7,752,406 for all years. By DY5, the proposed project will serve approximately 805 children per year. The expansion of Children’s Mental Health increases accessibility of behavioral health care for children. The availability of this new resource will ensure children are treated expediently, connected to systems of care that will support community living and prevent or reduce costly, avoidable hospitalization, lengthy stays in institutions, further crises and the inappropriate use of emergency departments. CHCS has a significant amount of existing infrastructure from which this project can be launched and only site preparation is required; thereby driving down the required investment and increasing the cost effectiveness of the approach.

The annual value of benefits provided to those served at full implementation considered several factors in valuing this project such as reducing costs at hospitals, costs for emergency detention and use of psychiatric institutions. This information was based on extensive literature as well as a valuation study completed and prepared by professors of the Houston School of Public health and of the UT Austin Center for Social Work Research that was based on the cost utility model, usage of extensive literature of similar interventions, costs savings and health outcomes related to those interventions.

The annual value of benefits provided to those served at full implementation was calculated by multiplying the annual value of a single successful intervention by five. The rationale for selection of a multiplier of five was that to overcome resistance to change in a hard-to-serve population, both in the delivery and payment systems, five years of benefits would be needed. This assumption was verified as valid after an extensive literature review.

Cost-utility analysis (CUA) also was used to measure the cost of the program in dollars and the
health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state. Cost-utility analysis is a useful tool for assessing the value of new health service interventions because it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across different types of interventions, the common health goal, or outcome, is the number of life-years added.

The CUA calculations indicate that the availability of expanded Children's Outpatient Mental Health Services has the potential to increase QALY among those it serves.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $7,752,406**
Identifying Project and Provider Information:
Title: 1.12.2 Expand the number of community based settings where behavioral health services may be delivered in underserved areas: Dual Diagnosis Clinic
Unique RHP ID#: 137251808.1.5 – PASS 2
Performing Provider: The Bexar County Board Of Trustees for Mental Health Mental Retardation Services, d/b/a/ The Center For Health Care Services
Performing Provider TPI: 137251808

Project Summary:
Provider Description: Center for Health Care Services (CHCS) is the Local Mental Health Authority for Bexar County (population 1.75M). CHCS provides behavioral health services and treatment to children, adolescents and adults.
Intervention(s): CHCS seeks to establish a comprehensive continuum of services, across the life span for individuals with co-occurring intellectual developmental disability (IDD), mental illness and substance use disorders. Services for individuals with co-occurring illnesses will include: medication management, comprehensive treatment planning, wraparound care, mental health interventions, skills development through in-home or clinic based services for occupational therapy, physical therapy, speech therapy, recreational therapy, and primary care access for routine medical services. Support services will be provided to caregivers by family support specialists. Telemedicine may be used to deliver medication management services to individuals with transportation challenges or whose disabilities prevent them from participating from clinic activities. To facilitate service coordination, wraparound care will be coordinated with staff from other systems also serving the IDD population, e.g., schools, Child and Adult Protective Services, Juvenile and Adult Probation, the local authority for IDD, and service providers. Finally, the addition of an on-site primary health care provider will give consumers access to integrated behavioral health and primary health care, increasing the possibility of treatment adherence. Continuity of care will be a primary focus for children with a dual diagnosis as they transition from Early Childhood Intervention Services. This clinic will be operated contiguous to the Children's Outpatient Clinic to achieve maximum efficiencies. However, evidence based practices demonstrate maximum benefit when these services are self-contained and adults served in this program do not interact with children served by the Outpatient Clinic.

Need for the project: Individuals with IDD experience a full range of psychiatric disorders similar to the general population; however, the occurrence of adjustment, anxiety, and impulse-control disorders or the need to complete a psychiatric consultation to rule them out, is higher. Individuals with dual diagnosis are frequently ostracized and often have limited support systems. Additionally, as they physically age out of childhood these individuals have difficulty adjusting to societal expectations of their physical age. Creating relationships with new providers and new care teams can be marked with anxiety, regression and acting out behaviors. Because of limited cognition, language skills, and social experiences as well as increased stress and anxiety related to overall functioning, it is critical that this population be cared for in a continuum of care with the same team and as little change as possible in the team of experienced professionals who can provide appropriate interventions, i.e., the right care in the right setting including transitional support services for aging caregivers. However, interest lists for Medicaid Waiver programs dedicated to these services are 2 to 10 years long.
Target population: Children, adolescents and adults with an existing determination of IDD or an IQ below 70, adults and children on the Autism Spectrum, and children and adults with an existing DSM mental health diagnosis and either Autism or an IDD. Based upon current service statistics, it is anticipated that 10% will be indigent and uninsured and 74% will be covered by Medicaid.

Category 1 or 2 expected patient benefits: The project seeks to increase utilization of community behavioral healthcare for this dual diagnosis population by increasing by 48 individuals (20%) in DY4 and 62 individuals 30% in DY5.

Category 3 outcomes: IT-10.1 Our goal, which will be quantified in DY4, is to improve quality of life for the children and families we serve.

Project Description:

The Center For Health Care Services (CHCS) seeks to establish a centralized, accessible clinic for children and adolescents (0 to 17 years old) with a co-occurring intellectual developmental disability (IDD) and mental illness and expand services to adults with a similarly co-occurring intellectual developmental disability (IDD) and mental health diagnosis. Services for individuals with co-occurring illnesses will include: medication management, comprehensive treatment planning, wraparound care, mental health interventions, skills development through in-home or clinic based services for occupational therapy, physical therapy, speech therapy, recreational therapy, and primary care access for routine medical services. Support services will be provided to caregivers by family support specialists. Telemedicine may be used to deliver medication management services to individuals with transportation challenges. To facilitate service coordination, wraparound services will be coordinated with staff from other systems also serving the IDD population, e.g., schools, Child and Adult Protective Services, Juvenile and Adult Probation, the local authority for IDD, and service providers. Finally, the addition of an on-site primary health care provider will give consumers access to integrated behavioral health and primary health care, increasing treatment compliance.

The population to be served will include children and adults with an existing determination of intellectual developmental disability (IDD) or an IQ below 70, adults and children on the Autism Spectrum, and children and adults with an existing DSM mental health diagnosis and either Autism or an intellectual developmental disability (IDD). Continuity of care will be a primary focus for children with a dual diagnosis who are transitioning out of Early Childhood Intervention (ECI) Services.

Individuals with IDD experience a full range of psychiatric disorders similar to the general population; however, the occurrence of adjustment, anxiety, and impulse-control disorders or the need to complete a psychiatric consultation to rule them out, is higher. These individuals reside in a range of settings, e.g., residential facilities, group homes, supported living programs, and with family or friends, but public policy continues to promote the least restrictive setting with appropriate medical and mental health services. Individuals with dual diagnosis are frequently ostracized and often have limited support systems. As such, indicators of a mental health problem may be ignored or mistaken for “acting out”. Because of limited cognition, language skills, and social experiences as well as increased stress and anxiety related to overall functioning, it is critical that this population be evaluated by experienced professionals who can provide appropriate interventions, i.e., the right care in the right setting.

Goals. Increase access for children and adults with a dual diagnosis of mental illness and
intellectual developmental disability to a continuum of co-located services, including psychiatric, medication evaluation and management, and primary health care.

**Challenges addressed by the project.** Individuals with the dual diagnosis of mental illness and IDD typically have resided in institutional settings. Today, a growing number reside in the community, often with family, and rely on community resources for treatment; however, interest lists for Medicaid Waiver programs dedicated to these services are 2 to 10 years long. Effective mental health treatment for this population requires two key components: 1) utilization of an interdisciplinary team aware of the complexity of mental health issues among individuals with IDD, including how symptoms can be masked by the behaviors intrinsic to the intellectual disability, and 2) routine integration of caregiver feedback, insights from those who know and understand the consumer the best and can accurately communicate symptoms and daily functioning.

**5-year expected outcomes for CHCS.** 1) Expanded provision of dual diagnosis services. 2) Expanded hours of operation. 3) Effective continuum of services for dually diagnosed children, adolescents, adults, and their caregivers. 4) Integrated behavioral health and primary health care for individuals with dual diagnosis.

**5-year expected outcomes for persons served by the project.** 1) Increased access to services to promote improved functioning and the ability to remain in-home and community. 2) Improved physical and behavioral health as a result of integrated, single site primary care and behavioral health services. 3) Development of a continuum of care that includes essential services and supports from a single site. 4) Improved quality of life and functioning.

**Relation to Regional Goals.** Expanding resource availability to address the unmet needs of individuals with dual diagnosis is a key means of achieving the regional goal of “Improving the infrastructure for delivery of behavioral health services”. It also meets the CMS three part aim, as follows.

- The program fills an existing gap in care and **improves the existing behavioral health infrastructure** to better serve Medicaid and uninsured children and adults in Bexar County.
- The program will meet the needs of dually diagnosed children and adults in an outpatient setting, which will reduce the need for hospital admissions and will **improve outcomes while containing cost growth**.

**Starting Point/Baseline:**

CHCS currently provides psychiatric services to approximately 40 dually diagnosed clients per month.

**Rationale:**

The project option (1.12.2 Expand the number of community based settings where behavioral health services may be delivered in underserved areas), process milestones (P-3 Develop administrative protocols and clinical guidelines for projects selected and P-6 Establish behavioral health services in new community-based settings in underserved areas) and improvement milestone (I-11Milestone: Increased utilization of community behavioral healthcare) were selected in correspondence to existing, unmet community needs for services to individuals with dual diagnosis of mental illness and intellectual developmental disability.

The proposed project addresses the following community need identification numbers:
• **CN.4** – Shortage of high quality mental and behavioral health services that are integrated with physical health care services and/or provide crisis stabilization.

More specifically, the proposed project will positively impact:

- Inadequate and fragmented continuum of care for children with behavioral health diagnoses.
- Need for integrated behavioral health and primary care services.
- Inadequate resources for special needs populations, including efficiencies such as integrated behavioral and primary care, pharmacy services, telemedicine, and physician extenders.
- Inadequate outpatient care for adults with moderate acuity behavioral health needs to support reductions in hospital readmissions and the inappropriate use of emergency departments.

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative: Expansion of an existing initiative.

Related initiatives funded by U.S. Department of HHS. CHCS does not receive direct HHS funding for this program.

**Related Category 3 Outcome Measure(s):**

<table>
<thead>
<tr>
<th>OD-10 Quality of Life/Functional Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>IT-10.1 Quality of life</td>
</tr>
</tbody>
</table>

**Reasons/rationale for selecting the outcome measures:** These measures are indicative of consumer retention in care and enhanced stability.

**Relationship to other Projects:**

There is one children’s project proposed for implementation in RHP 6 that is related: establishment of a children’s mental health emergency room in Bexar County. The children served in the emergency room could receive continuity care from CHCS through the proposed Dual Diagnosis Program. CHCS’s Adult Outpatient Services program also will be a referral source for dually diagnosed adults in their caseload.

**Relationship to Other Performing Providers’ Projects in the RHP:**

Clarity is proposing establishment of the Children’s Mental Health Emergency Room. CHCS will join Clarity in any University Health System-organized learning collaborative dedicated to sharing best practices and service solutions for children’s mental health.

**Plan for Learning Collaborative:**

CHCS will participate in any and all relevant learning collaboratives organized by University Health System.
### Project Valuation:

The value for this project is $1,653,898 for DY 2 and $7,287,006 for all years. By DY5, 62 dually diagnosed patients will be receiving highly specialized project services. The proposed expansion of a Dual Diagnosis clinic for children and adults with co-occurring mental illness and intellectual developmental disability will increase accessibility of behavioral health care and will integrate primary care for this unique, underserved population. The availability of this expanded resource will ensure dually diagnosed children and adults are treated expeditiously, connected to systems of care that will support community living and prevent or reduce costly, avoidable hospitalization, lengthy stays in institutions, further crises and the inappropriate use of emergency departments. CHCS has a significant amount of existing infrastructure from which this project can be launched and only site preparation is required; thereby driving down the required investment and increasing the cost effectiveness of the approach.

The annual value of benefits provided to those served at full implementation considered several factors in valuing this project such as reducing costs at hospitals, costs for emergency detention and use of psychiatric institutions. This information was based on extensive literature as well as a valuation study completed and prepared by professors of the Houston School of Public health and of the UT Austin Center for Social Work Research that was based on the cost utility model, usage of extensive literature of similar interventions, costs savings and health outcomes related to those interventions.

Cost-utility analysis (CUA) also was used to measure the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state. Cost-utility analysis is a useful tool for assessing the value of new health service interventions because it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across different types of interventions, the common health goal, or outcome, is the number of life-years added.

The CUA calculations indicate that the availability of expanded services for dually diagnosed individuals, i.e., children, adolescents and adults with an existing determination of IDD or an IQ below 70, adults and children on the Autism Spectrum, and children and adults with an existing DSM mental health diagnosis and either Autism or an IDD, has the potential to increase QALY among those it serves.

This valuation used cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). The QALY index incorporates costs averted when known (e.g., emergency room visits that are avoided). The proposed program’s value is based on a monetary value of $50,000 per QALY gained due to the intervention multiplied by number of participants. (Eichler, H. G., et al. (2004). "Use of cost-effectiveness analysis in health-care resource allocation decision-making: how are cost-effectiveness thresholds expected to emerge?" Value Health 7(5): 518-528.; http://download.journals.elsevierhealth.com/pdfs/journals/1098-
A description of the method used, titled ‘Valuing Transformation Projects,’ has been posted on the performing provider website which will be linked to www.bbtrails.org under the Medicaid 1115 Transformation Waiver tab. Complete write-up of the project will be available at performing provider site.

Identifying Project and Provider Information:

Title: 1.8.9 – The implementation or expansion of school-based sealant and/or fluoride varnish programs that provide sealant placement and/or fluoride varnish applications to otherwise underserved children by enhancing dental workforce capacity through collaborations and partnerships with dental and dental hygiene schools, local health departments (LHDs), federally qualified health centers (FQHCs), and/or local dental providers.

Unique RHP ID#: 091308902.1.1 (PASS 1)
Performing Provider: San Antonio Metropolitan Health District
Performing Provider TPI: 082426001

Project Summary:

Provider Description: The San Antonio Metropolitan Health District (Metro Health) is the public health agency charged by State law, City code, and County resolution with the responsibility for providing public health programs in San Antonio and unincorporated areas of Bexar County. Services include health code enforcement, food inspections, immunizations, clinical services, environmental monitoring, disease control, health education, dental health, and emergency preparedness. As a public health department Metro Health provides services to all residents, but has a particular focus on underserved populations and those experiencing health disparities which often include a higher representation of Medicaid funded individuals.

Intervention(s): The project will improve access to preventive dental services (dental sealants and fluoride varnish applications) by providing preventive oral health services in non-traditional settings to include early childhood education settings and economically disadvantaged public schools. The project also supports early identification of children with unmet dental needs, and reinforces the importance of linking families to a “main dental home” in the community where they may receive comprehensive oral health services. These services will be available to children not enrolled in the Head Start program that already receive federal funding for oral health services provided by Metro Health.

Need for the project: Development of an alternative means to deliver preventive care in alternative settings has become increasingly important with the transition of Texas Medicaid from a fee-for-service model to a managed care model. Under the new plan, all dental services must be provided through a “main dental home” or through specialist referral coordinated through the main dental home. This model can be enhanced through the use of complementary community-based preventive services in non-traditional settings which can help reach children that are not currently being served. The strongest predictor of future dental decay is a history of previous decay (caries experience).

Using a population-based approach to risk assessment, the rate of caries experience (62.2% in elementary school-aged participants), combined with other risk factors such as low socioeconomic status of target sites and schools (all 70% or greater economically disadvantaged) and race/ethnicity of target population must all be considered in development of a treatment/services plan for target schools.

These community-based interventions do not conflict with the “main dental home” model, but, rather provide an opportunity to identify Medicaid beneficiaries that have not accessed dental services covered under the plan and facilitate referral to their designated dental home. A review
of the data collected by Metro Health for 6,344 children enrolled in the City of San Antonio’s Head Start Program revealed that 95% of enrolled children are also enrolled in the Texas Medicaid Program and have a “main dental home”. However, upon examination, Metro Health dentists identified one in four children that had obvious clinical signs of untreated decay. Similarly, preliminary data collected for elementary school-aged children in Bexar county suggests that approximately 48% have untreated dental disease.

Target population: The project aims to improve access to preventive dental care for economically disadvantaged children attending early education pre-kindergarten programs (other than Head Start) and elementary schools in Bexar County. School campuses with an enrollment of at least 70% economically disadvantaged children will be eligible for participation. Children enrolled in Texas Medicaid and CHIP as well as those who are not eligible for public insurance will be served through the project. In this way, a greater number of children with needs will be identified sooner and can be linked to either a “dental home” or provider that can take care of these needs in a more timely fashion, lessening the likelihood of further breakdown of the dentition or loss of teeth. Referrals for follow up care will be coordinated with the child’s main dental home, if applicable, or another community provider. The focus is on preventive services for children with documented limited access to a dental home and/or a long delay since their last evaluation for health services.

Category 1 or 2 expected patient benefits: Project goals include volume incremental increases in DY3, DY4 and DY5; which will be measured by the number of unduplicated patients that access one or more oral health services through the project during the measurement period. Ultimately, the expected outcome is to expand the reach of Metro Health’s existing safety net dental programs for Head Start children to serve additional pre-school and elementary school-aged children which would result in improved access to preventive dental care for approximately 32,500 children in Bexar County over the course of the waiver. The table below outlines the age appropriate services for each group of children and the expected volume of services for DY3-5:

Category 3 outcomes: OD- 7 Oral Health

These selected outcome measures demonstrate both the provision of needed preventive oral health services for children served through the project (IT-7.1 and IT-7.3) as well as ultimate reductions in adverse oral health outcomes (IT-7.6) for the populations served.

- IT-7.1 Dental Sealants – % of children age 6-9 with a dental sealant on a permanent first molar tooth
- IT-7.3 Early Childhood Caries – Fluoride varnish applications
- IT-7.6 Urgent Dental Care Needs in Children – % of children with urgent dental care needs

Project Description:

Project Overview

Currently, the City operates community-based prevention programs that provide access to early diagnosis, fluoride varnish and dental sealants for more than 15,000 children at high risk for dental decay. These programs have included services for nearly 7,000 Head Start children (federally funded) and over 8,000 students through a school-based sealant grant (federal pass through) which will end in August 2013. These programs have been developed and implemented using the most current evidence-based strategies to prevent dental disease and reduce oral health disparities. Programs provide case management support for children identified with urgent dental conditions including those who are uninsured or underinsured for required treatment. Additionally, Metro Health provides oral health education, training and technical assistance for Head Start and Early Head Start faculty and staff, and serves as a resources for school nurses in local districts served by the programs. As a Region 6 performing provider, Metro Health will expand the reach of early childhood services beyond the Head Start population and will be able to reinitiate school based sealant services for elementary children to serve children with unmet dental needs.

Dental caries is the most common chronic disease of childhood. Children living in poverty are disproportionately affected, and experience nearly 12 times as many restricted-activity days compared to their higher income counterparts. Nationwide, an estimated 51 million school hours are lost each year due to dental-related illness. Poor oral health has been related to compromised nutritional intake, decreased school attendance and performance, poor social relationships and reduced self-esteem.

School based sealant programs and fluoride varnish preventive treatments are among the strongest evidence-based interventions for prevention of dental caries and adverse oral health outcomes for children. These interventions, in a context of preventive oral health assessments and follow up treatments will be expanded in local schools and non-traditional settings to prevent future adverse oral health outcomes for Medicaid and other underserved populations. The use of non-traditional settings is critical to reaching underserved children that are not being served in a main dental home.

Additionally this project will seek to develop and refine progress in serving the oral health needs of children through participation in a variety of Continuous Quality Improvement activities including participation in a regional learning collaborative, partnership with the UTHSCSA on program improvement analysis and activities and work with other Metro Health projects on CQI
as outlined in milestones 2, 4, 6 and 8.

**Goals and Relationship to Regional Goals**

**Project Goals:**
1. Providing preventive oral health services in non-traditional settings such as early childhood centers to non-Head Start children and to economically disadvantaged public schools.
3. Linking children to comprehensive oral health services through private, public and other community partners within the context of the main dental home model.

This project meets the following regional goals:
This project directly addresses the RHP 6 need to expand access for dental services within the region (CN.3).

**Project Goals and 5 Year Expected Outcome for Performing Provider and Patients:**
Project goals include volume incremental increases in DY3, DY4 and DY5; which will be measured by the number of unduplicated patients that access one or more oral health service through the project during the measurement period. Ultimately, the expected outcome is to expand the reach of Metro Health’s existing safety net dental programs to serve additional preschool and elementary school-aged children which would result in improved access to dental care for approximately 32,500 children in Bexar County over the course of the waiver.

These community-based interventions do not conflict with the “main dental home” model, but, rather provide an opportunity to identify Medicaid beneficiaries that have not accessed dental services covered under the plan and facilitate referral to their designated dental home. A review of the data collected by Metro Health for 6,344 children enrolled in the City of San Antonio’s Head Start Program revealed that 95% of enrolled children are also enrolled in the Texas Medicaid Program and have a “main dental home”. However, upon examination, Metro Health dentists identified one in four children that had obvious clinical signs of untreated decay. Similarly, preliminary data collected for elementary school-aged children in Bexar county suggests that approximately 48% have untreated dental disease.

Project metrics will include collection of oral health surveillance data using the appropriate module of the Basic Screening Survey. Key oral health status indicators will be captured directly on site on elementary school campuses for children enrolled in Pre-K, Kindergarten, second and third grade. Direct data entry will be performed in the school-based sealant program using the SmilesMaker software, a modified version of the CDC’s S.E.A.L.S. data collection tool. In both modules of the Basic Screening Survey, the assessment includes age-appropriate oral measures of oral health status including: untreated decay, urgency of care, caries experience, dental sealants and early childhood caries.

**Challenges/Opportunities:**
According to the Centers for Medicare and Medicaid Services 2010 Annual EPSDT Participation Report (CMS-416), 1,429,066 children (47.3%) enrolled in Texas Medicaid did not receive a single preventive service during a 12 month period. Provision of preventive dental services in
non-traditional settings, will remove barriers to care for children living in poverty and improve oral health outcomes for children at high risk for disease. Specific programs for consideration target provision age-appropriate preventive interventions including fluoride varnish and dental sealants in outreach locations. Development of an alternative means to deliver preventive care in alternative settings has become increasingly important with the transition of Texas Medicaid from a fee-for-service model to a managed care model. Under the new plan, all dental services must be provided through a “main dental home” or through specialist referral coordinated through the main dental home.

The goal of this program is to address these challenges by providing a complementary service to the main dental home. The Metro Health dental program has consistently identified children that are covered by Texas Medicaid and CHIP with untreated dental decay and helped them obtain access to a main dental home through a variety of special projects and grant funded programs. 

**Starting Point/Baseline:**

**School-Based Oral Health Prevention Program-Children (Children ages 6-9)**

Metro Health provides diagnostic and preventive services on the campuses of local elementary schools with the highest concentration of children living in poverty. During the 2011-2012 academic school year, the City’s previously grant funded school-based sealant program reached 69 elementary school campuses in 5 school districts. A total of 8,961 children received one or more diagnostic and/or preventive service during the previous program period, with 1,760 second grade students received dental sealants. A total of 8,961 fluoride varnish applications and 5,291 dental sealants were applied for participating children. However with the loss of these grant funds the program will not be able to provide school-based exams and sealants without 1115 funding. The project table is set at zero for DY3.

**Early Childhood Oral Health Program (Children ages birth through 5)**

Metro Health provides diagnostic and preventive services on site in Head Start Centers throughout Bexar County for approximately 7,000 children ages 3-5 enrolled in the local program. During the 2011-2012 academic school year, Metro Health served 6,897 children ages 3-5 years enrolled in Head Start. In addition to a limited oral examination performed by a dentist, program staff administered 12,135 applications of fluoride varnish. These Head Start services are supported by federal funds and will not be counted as part of this proposed project. The baseline for non-Head start services is set at zero and this project will seek to expand services to children not funded by Head Start, many of which are co-located in the same classrooms and schools as children that do receive Head Start services.

**Rationale:**

Community water fluoridation and school-based sealant programs are the foundation of dental caries prevention of and reduction of oral health disparities. Community assessment data collected from the City’s oral health outreach programs serve as evidence of the need for new and innovative solutions to eliminate barriers to accessing preventive dental care such as fluoride varnish applications and dental sealants. The strongest predictor of future dental decay is a history of previous decay (caries experience). Using a population-based approach to risk assessment, the rate of caries experience (62.2% in elementary school-aged participants), combined with other risk factors such as low socioeconomic status of target sites and schools (all 70% or greater economically disadvantaged) and race/ethnicity of target population must all be
Unique community need identification number the project addresses:
This project directly addresses the RHP 6 need to expand access for dental services within the region (CN.3).

Provide services to economically disadvantaged elementary schools through the Metro Health School-Based Oral Health Prevention Program
Rationale/Evidence:
- School-based dental sealant programs have been identified by the CDC as a preventive measure that has strong evidence demonstrating effectiveness in the prevention of dental caries and allow for low-income high risk children to receive dental sealants that otherwise may not have the opportunity to receive them.
- Measuring increase in special high risk populations accessing dental services reflects the goals of addressing health disparities in access to dental care.

Expand the reach of Metro Health’s current oral health prevention for economically disadvantaged pre-kindergarten children (ages birth through 5) to children not enrolled in Head Start
Rationale/Evidence:
- Identified by the CDC as a preventive measure that has strong evidence demonstrating effectiveness in the prevention of dental caries and allow for low-income high risk children to receive fluoride varnish applications that otherwise may not have the opportunity to receive them.
- Measuring increase in special high risk populations accessing dental services reflects the goals of addressing disparities in access to dental care
- Children who have regular access to a dental provider are more likely to have received dental services such as fluoride varnish applications.
- Children are less likely to suffer from more severe, urgent oral health problems with adequate and regular access to dental care

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project would allow for a significant expansion of the number of children served through the Metro Health preventive oral health program. Funding for this project would be utilized to reach new school and community locations not previously served by the Metro Health program and to reinstate services in elementary schools which have lost funding for school based oral health services.

Related Category 3 Outcome Measure(s):
OD-7 Oral Health
- IT-7.1 Dental Sealants – % of children age 6-9 with a dental sealant on a permanent first molar tooth
- IT-7.3 Early Childhood Caries – Fluoride varnish applications
### IT-7.6 Urgent Dental Care Needs in Children – % of children with urgent dental care needs

#### Reasons/rationale for selecting the outcome measures:
These selected outcome measures demonstrate both the provision of needed preventive oral health services for children served through the project (IT-7.1 and IT-7.3) as well as ultimate reductions in adverse oral health outcomes (IT-7.6) for the populations served. These measures closely align with the RHP 6 goals in terms of both expanded oral health services and reductions in adverse oral health outcomes.

#### Relationship to other Projects:
Metro Health and the UT Health Science Center Dental School have a long-standing community partnership. In addition to collaborative efforts in support of community water fluoridation, the local health department and dental school work closely to ensure access to quality dental care is available in Bexar County and that future oral health training programs include relevant community health experiences for students.

In 2010, the UT Health Science Center Dental School was granted a 3 year award through the Health Resources and Services Administration that included a sub contractual agreement with Metro Health to develop and implement a model school-based oral health prevention program.

In addition to the Texas Oral Health Workforce Grant, contractual agreements between these two entities are in place that allows Metro Health to provide direct reimbursement to the University for provision of comprehensive dental care for income-eligible children referred for comprehensive care. The UT Health Science Center clinics serve as the primary referral source for children who are uninsured or underinsured for the care needed to be restored to health. Specifically, the University’s Ricardo Salinas Clinic provides approximately 5,000 patient visits for low income children on an annual basis, many of which are not eligible for Medicaid or CHIP.

The UT Health Science Center Dental School’s community-based clinical activities at the Ricardo Salinas Dental Clinic and the San Antonio Christian Dental Clinic at the Haven for Hope campus serve as key components of the local dental safety net. Both pre-doctoral students and pediatric dentistry residents gain hands-on experience working with at-risk populations by providing care in these sites. In addition to the training experiences gained through the University’s traditional clinic rotations, community health rotations have also been established for students to work with Metro Health to provide fluoride varnish and dental sealants in non-traditional settings.

#### Relationship to Other Performing Providers’ Projects in the RHP:
Relative to the UT Health Science Center Dental School DSRIP project proposals, preliminary discussions have taken place regarding linkage of community-based patient encounters with certified electronic health records. The University’s proposal also seeks to establish emergency dental clinics, which could serve as a vital referral source for the residents that contact Metro Health for assistance in locating emergency dental services.
## Plan for Learning Collaborative:

Metro Health will foster Continuous Quality Improvement (CQI) through active participation in the RHP 6 learning collaborative working groups to support and enhance project quality improvement, evaluation and achievement of outcomes. CQI elements are specifically included through milestones 2, 4, 6 and 8 beginning in DY2. Additionally, Metro Health will seek out project specific opportunities to collaborate with regional maternal and child health as well as other local health department performing providers in other Texas regions.

## Project Valuation:

Numerous studies have documented the value of preventive oral health services, specifically school-based sealants and fluoride varnish applicants in reducing subsequent dental visits, restorative care and emergency visits. Overall children receiving preventive services incur lower dental costs.

Utilizing the methodology provided by the RHP 6 anchor, Metro Health assessed the following factors in assigning a value to this preventive oral health project: achievement of waiver goals, community need, project scope and the level of project investment.

- This project was ranked high on achievement of waiver goals given the strong research and high potential for reduction of oral health costs for Medicaid and other underserved populations of children in Bexar County. This project will expand access to oral health services, emphasize effective evidence-based preventive services, provide opportunities for coordinated care between community based preventive services and follow up care through the main dental home model, and reduce costs.
- This project was ranked moderately in regards to addressing a community need. While this project is consistent with the RHP need to expand dental services other community health needs have been more prominent in public surveys and community planning efforts.
- This project was ranked low on project scope in that services will be focused on children only in specific community settings which is a more narrow target population than other Metro Health proposed projects.
- This project was ranked moderately in regards to program investment in that the selected project requires individual screening and case management of patients rather than population-based approaches which will be more resource intensive for both project implementation and evaluation.

Identifying Project and Provider Information:

Title: 2.8.1 Design, develop and implement a program of continuous, rapid process improvement that will address issues of safety, quality and efficiency
Unique RHP ID#: 159156201.2.1 – PASS 1
Performing Provider: VHS San Antonio Partners, LLC d/b/a Baptist Health System
Performing Provider TPI: 159156201

Project Summary:

Provider Description: Baptist Health System includes five acute- (Baptist Medical Center (623 beds), Mission Trail Baptist Hospital (110 beds), North Central Baptist Hospital (280 beds), Northeast Baptist Hospital (379 beds), and St. Luke’s Baptist Hospital (282 beds)) which offer 1,674 licensed beds. In 2011, Baptist Health System was recognized by U.S. News and World Report for earning more, high performing specialty rankings (5) than any other health system in the San Antonio metropolitan area. All five hospitals have earned Accredited Chest Pain Center designation, as well as Primary Stroke Center Certification. Medicare has designated each as Texas’ only Medicare Value Based Care Centers. The system also includes Baptist Regional Children’s Center, Baptist Breast Center, HealthLink wellness and fitness center, Baptist M&S Imaging Centers, community health and wellness programs, ambulatory services, rehabilitation services, air medical transport, School of Health Professions, and other health-related services and affiliations. It is part of the Nashville, Tennessee-based Vanguard Health Systems.

Intervention(s): Using the enhanced Performance Improvement capacity created with Project 1.10, Baptist will apply these tools to identify clinical care areas and processes to conform to current best practices and reduce variation in treatment plans and health outcomes. Baptist will drive process improvement in at least the following specific clinical areas:
1. Bowel Surgery- Utilization of TPN and ICU
2. Congestive Heart Failure LOS and utilization of pharmaceuticals, imaging and lab diagnostics
3. Variation in diagnostics and treatment patterns among ED practitioners for #1 presenting complaint of abdominal pain

Need for the project: The five year goal is to improve patient care and outcomes, reduce cost and variation in processes while improving clinical care, patient outcomes and improving the total patient experience. We will target specific clinical processes already identified and continue a similar process to improve additional clinical areas which will improve patient care and experience. Healthcare quality in Texas overall is low, there are critical shortages in providers and access, high indigent and Medicaid populations, widespread chronic disease in diabetes and cardiac illness, so focusing on targeted clinical conditions with high volume and/or wide variation, narrows the gap in all of these areas of need. Improving the care and quality also improves access to restricted resources for other patients. These goals meet Triple Aim, the RHP 6 Regional Goals and our RHP Community Needs.

We have already evaluated the three clinical conditions noted above and found wide variation in significant volumes of patients.

Target population:
The current Baptist Health System annual volumes for these three clinical initiatives:
Bowel Surgery = 610 surgeries
CHF = 1309 admissions
Abdominal pain upon presentation to ED = 16,245 patients or 7.3% of all Baptist ED visit
Surgical Operations improvements will have widespread impact as BHS performs almost 34,000 annual surgeries. Over 26% of BHS’ Inpatient population is Medicaid or Uninsured indigent and another large % have Medicaid supplemental to Medicare. Over 43% of BHS’ Outpatient population is Medicaid or Uninsured indigent and another large % have Medicaid supplemental to Medicare. The impact of these quality and cost improvements through standardization and reduction in variation will greatly benefit this patient population.

Category 1 or 2 expected patient benefits:
The expected benefit of this project to patients is improved quality of services. Specifically, BHS expects patients having bowel surgery to have reduced length of stays, reduced usage of TPN, and reduced ICU utilization. BHS also expects patients with chronic heart failure to have reduced length of stays and reduction in variation in usage of pharmaceuticals, imaging and lab diagnostics during treatment of CHF. For Surgical Operations Improvements the focus with quantifiable impact will be reduction of surgical site infections, reduction in supply cost per case through standardization and improved first case on time starts. By DY 5, the goal is to have 20% improvement in measure outcomes for bowel surgery and CHF identified. However, because of the nature of this project, BHS cannot identify the actual reductions in length of stay until DY 2, when the process improvement tools have been developed.

Category 3 outcomes:
Congestive Heart Failure 30 day readmission rate
Acute Myocardial Infarction (AMI) 30 day readmission rate

Project Description:
Building on the infrastructure of performance improvement that will be established under project 1.10, BHS will implement lean and six sigma performance improvement methodology to improve the safety, quality, patient experience, and efficiency in targeted service areas. Specifically, the infrastructure built under 1.10 will give BHS the tools to identify service areas that are in need of performance improvement and an evidence-based methodology to address those clinical deficiencies.

The goal of this project is to apply these tools to identify clinical care areas and processes to conform to current best practices and reduce variation in treatment plans and health outcomes. The tools used under the lean and six sigma methodology include, FMEA, value stream mapping, process mapping, identification and elimination of waste and non-value added processes. Using these tools, BHS will drive process improvement in at least the following specific clinical areas:

1. Bowel Surgery—we have identified wide variation in the use of TPN (Total Parenteral Feeding) post bowel surgery. Using the Aspen Association for Parenteral Feedings best practice guidelines we will implement best practices for TPN usage post bowel surgery. This will reduce variation, improve patient quality and reduce costs. We have also found wide variation in ICU utilization post bowel surgery. Using APACHE criteria we will work to ensure ICU utilization is per evidence based medicine.
2. Similarly we are in the analysis stage for CHF LOS variances as well as wide variation in the utilization of pharmaceuticals, imaging and lab diagnostics and identify and report on processes for improvement in quality and efficiency/cost.

3. Our third area under analysis for improvement is the variation in diagnostics and treatment patterns among ED providers for patients who present to the ED with a chief complaint of abdominal pain—which is BHS’ largest volume presenting condition in the ED.

Other areas scheduled for in depth analysis include variation in C Section and Vaginal delivery hospital care.

**Challenges** center on changing physician practice patterns. BHS will use the PI tools, include physicians and other practitioners, access Evidence Based Medicine (EBM) studies and protocols or maps and address the challenges with targeted data and analysis that will lead the involved physicians to common solutions reducing variation and improving care.

The **five year goal** is to improve patient care and outcomes, reduce cost and variation in processes while improving clinical care, patient outcomes and improving the total patient experience. We will target specific clinical processes already identified and continue a similar process to improve additional clinical areas which will improve patient care and experience.

This **project meets the RHP Regional Goals**:  
- Triple Aim: assuring patients receive high-quality and patient-centered care, in the most cost effective ways  
- Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our counties  
- Further develop and maintain a coordinated care delivery system  
- Improve outcomes while containing cost growth

This project **meets the following RHP identified Community needs**:  
CN.1 Texas ranks last in the nation on health care quality

BHS Operational improvement Office will use P-3 Quality Improvement Milestone to further enhance the PI impact on improving care, quality and cost for our patients.

**Starting Point/Baseline:**

BHS has identified three clinical focus areas to target for reducing variation in process and/or clinical variation as compared to DY1 outcomes: bowel procedures, congestive heart failure, and top volume ER diagnosis. We will measure progress on these projects over DY3-5 and will identify additional clinical areas to target in DY3.

**Rationale:**

Variation exists within health care practices across the RHP 6 area and even within healthcare facilities. This is indicative that evidence based practices are not used consistently.

Through project 1.10 BHS will develop the infrastructure, provide training to all levels of staff, and establish a mechanism for employee input. In project 2.8, BHS will define key safety, quality and
Identifying and improving processes that reduce clinical variation supports the goals of Texas Waiver 1115, specifically, improving outcomes and containing costs, health systems can identify and eliminate waste and non-value added steps. Applying lean concepts, these goals can be achieved.

Based on data assimilated and evaluated in DY1, BHS will prioritize to reduce variation in process and/or clinical variation including bowel procedures, congestive heart failure, and top volume ER diagnosis. Reduction in variation as compared to DY1. Each year additional clinical process or practices will be analyzed through lean infrastructure and employee/physician suggestions.

This project certainly is in accord with national initiatives such as Accountable Care organizations. This project is aligned with the Triple AIM Goals:

- Improving patient flow and infrastructure processes increases access for all patients including Medicaid and uninsured patients
- Improving flow and processes contributes to a more coordinated delivery system
- Improving flow and processes, reducing variation and increasing care reliability improves patient safety and outcomes and reduces costs, eliminating waste from system

The project will involve the following core components:

a) Provide training and education to clinical and administrative staff on process improvement strategies, methodologies, and culture.

b) Develop an employee suggestion system that allows for the identification of issues that impact the work environment, patient care and satisfaction, efficiency and other issues aligned with continuous process improvement.

c) Define key safety, quality, and efficiency performance measures and develop a system for continuous data collection, analysis, and dissemination of performance on these measures (i.e. weekly or monthly dashboard).

d) Develop standard workflow process maps, staffing and care coordination models, protocols, and documentation to support continuous process improvement.

e) Implement software to integrate workflows and provide real-time performance feedback.

f) Evaluate the impact of the process improvement program and assess opportunities to expand, refine, or change processes based on the results of key performance indicators

This project also aligns with the RHP 6 Community Needs Assessment by improving access, outreach and care for the areas’ underserved, diseased patient population by equipping BHS leaders and staff and improving the care provided and reduce clinical and process variation while reducing the cost of care. This supports CN1 as noted above and will provide eventual benefit to the other community needs.

**Related Category 3 Outcome Measure(s):**

IT- 3.2 Congestive Heart Failure 30 day readmission rate (Stand Alone Measure)
IT- 3.5 Acute Myocardial Infarction (AMI) 30 day readmission rate (Stand Alone Measure)

Cardiovascular disease is the largest cause of preventable death in Texas in RHP6. Texas is rated “weak” in heart disease.
**Relationship to other Projects:**

This project is related to project 1.1.0, Enhance Performance Improvement and Reporting Capacity. Performance improvement tools can also be used to analyze the data collected as well as develop an improvement plan for improving patient access to Primary Care (1.1), Specialty Care (1.9). Project 2.8 could support 2.3 to redesign primary care, as well as 2.4 redesign to improve patient experience. Lean tools can be utilized to improve cycle times in facilities and clinics and improve patient flow and experience by identifying constraints, wastes, and non-value-added steps as viewed from the patient’s perspective.

This project supports the goals of Texas Waiver 1115, specifically to Improve outcomes while containing cost growth. It is aligned with category 4 projects in that both congestive heart failure and the emergency department are areas of focus to reduce variation in care processes. Lean tools focus on reducing undesirable variation in clinical practices which supports the triple aim concept of optimizing the health system and system integration.

**Relationship to Other Performing Providers’ Projects in the RHP:**

University, Baptist, Methodist Health systems have all cited 2.8 Apply Process Improvement Methodology as a DSRIP Initiative. Material opportunity exists to share findings and results and work collaboratively to improve clinical care and patient outcomes in RHP 6.

**Plan for Learning Collaborative:**

Following completion of the RHP plan, University Health System (anchor) will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include goals, regular meetings, site visits, conference calls, communication plan development, organizing learning event, and adopt metrics to measure success.

**Project Valuation:**

Baptist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

In valuing this project, Baptist took into account the extent to which Apply Process Improvement Methodology would potentially meet the goals of the Waiver (improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.

The use of PI to improve patient outcomes and experience will help address a substantial need in the community since Texas quality of care has been rated as weak particularly in cardiac care is the #1 cause of death in. It also advances the Waiver goal of improving outcomes while curbing the risk of healthcare costs, because early intervention and chronic disease management are cost effective methods to increase health outcomes.
### Pass 1

**Related Category 3 Outcome Measure(s):**
- 159156201.3.6
- 159156201.3.7

**Goal:** Design, develop and implement a program of continuous, rapid process improvement that will address issues of safety, quality and efficiency

#### Year 2 (10/1/2012 – 9/30/2013)

**Milestone 1**
- Milestone 1 Estimated Incentive Payment: $1,137,296

**Metric 1 [P-4.1]: [Report on at least two operational procedures needed to improve overall efficiencies in care management]

**Baseline is identify two procedures each for bowel surgery and CHF**

**Data Source:** Avega, Crimson, Operational Improvement Department Tracking Tool

**Milestone 2**

**Metric 1 [P-3.1]: [Submission of analysis findings/summary and identification of target area]

**Baseline is identification of an incremental clinical area, procedure or process for improvement to DY2 procedures (bowel surgery and CHF)**

**Data Source:** Avega, Crimson, Operational Improvement Department Tracking Tool

#### Year 3 (10/1/2013 – 9/30/2014)

**Milestone 3**
- Milestone 3 Estimated Incentive Payment: $2,481,459

**Metric 1 [P-3]: Compare and analyze clinical/quality/data and identify at least one “additional” area for improvement**

**Baseline is compare and analyze clinical/quality/data and identify at least one “additional” area for improvement**

**Data Source:** Avega, Crimson, Operational Improvement Department Tracking Tool

#### Year 4 (10/1/2014 – 9/30/2015)

**Milestone 4**
- Milestone 4 Estimated Incentive Payment: $1,244,336

**Metric 1 [I-13.1]: [Number of relevant clinical cases at target] Goal is 10% improvement in measure outcomes for bowel surgery and CHF identified in DY2**

**Data Source:** Avega, Crimson, Operational Improvement Department Tracking Tool

#### Year 5 (10/1/2015 – 9/30/2016)

**Milestone 5**

**Metric 1 [I-13]: [Number of relevant clinical cases at target] Goal is 20% improvement in measure outcomes for bowel surgery and CHF identified in DY2**

**Data Source:** Avega, Crimson, Operational Improvement Department Tracking Tool

**Milestone 6**
- Milestone 6 Estimated Incentive Payment: $2,055,860

**Metric 1 [I-13]: [Number of relevant clinical cases at target] Goal is 20% improvement in measure outcomes for bowel surgery and CHF identified in DY2**

**Data Source:** Avega, Crimson, Operational Improvement Department Tracking Tool
| [P-6] Implement a program to improve efficiencies and/or reduce program variation |
| Metric 1 [P-6.1]: (Performance improvement events for surgical services) Baseline is incremental events for surgery performed in DY2 |

### Project Summary:

**Provider Description:** CHRISTUS Santa Rosa Health System (CSRHS) is a Catholic, non-profit health and wellness system with three adult acute care hospitals, one short-stay surgical hospital, two free standing emergency departments and several physician joint-venture ambulatory surgery centers. With a combined total of 496 beds, CSRHS currently serves the San Antonio and New Braunfels markets which has a total population of 1.9 million.

**Intervention(s):** This project will increase access to primary care and improve the management of chronic diseases in the community by contributing to the expansion of medical homes. The innovative nature of this project centers on the fact that this PCMH involves the integration of multiple, small practices who together act as a single, large integrated PCMH.

**Need for the project:** CSRHS is currently piloting a medical home model with nine practices for its employees. This project will allow CSRHS to increase the number of medical homes and improve access and quality for the targeted patient population.

**Target population:** The target population is ethnically diverse, low-income Medicare and Medicaid beneficiaries who have significant impediments to accessing primary care. Hospital utilization data from the previous two fiscal years reveals that almost 39% of inpatient admissions for CSRHS are from the Medicare fee-for-service population. Furthermore, this target population is a key driver for CSRHS’ 30-day readmissions: 62% of all heart failure readmissions, 57% of acute myocardial infarction readmissions and 39% of pneumonia readmissions are Medicare beneficiaries. In fact, this target population is a substantial driver for 30-day readmissions for any diagnosis. While the target population only accounts for 10% of Emergency Department visits, almost half (46%) of those visits become inpatient admissions. The Bexar County Community Needs Assessment revealed that almost one-third (33%) of Bexar county residents do not have a medical home or even a primary care physician that oversees their care. Data from internal hospital registrations during 2011 revealed that 1,475 Medicare inpatients did not have a primary care physician or medical home.

**Category 1 or 2 expected patient benefits:** This project seeks to increase the number of medical homes available to Medicare and Medicaid beneficiaries by 8 between DY2 and DY5 (2 per year). Additionally this project will increase the number of patients assigned to medical homes by 24% (2,136) over baseline in DY3; 19% (2,097) increase in DY4; and 15% (1,970) in DY5. Finally, all participating medical homes will seek NCQA medical home recognition, with the goal of having all medical homes established between DY2 and DY4 NCQA accredited by DY5. CSRHS expects that approximately 5% of the patients served by these medical homes will be Medicaid or indigent.
Category 3 outcomes: [IT-1.10] The goal is to improve HbA1c levels for the targeted population in DY4 and DY5. Targets will be determined based on the baseline established in DY3.

**Project Description:**
CHRISTUS Santa Rosa Health System (CSRHS) will take an innovative approach to the Patient-Centered Medical Home (PCMH) by partnering with small, independent, geographically distributed primary care practices to create an integrated care delivery model that improves access to primary care (CN.3) for this vulnerable population group. This project addresses demonstrated public health challenges in the community by catering to the complex, chronic care needs (CN.2) of the population 65 and older; improving patient adherence to care plans through comprehensive preventive and primary care services; providing active follow-up in-between office visits; and, promoting continuity of care. The target population is ethnically diverse, low-income Medicare beneficiaries who have significant impediments to accessing primary care.

**Goals and Relationship to Regional Goals:**
The goal of this project is to improve quality access to primary care in the community by contributing to the expansion of medical homes. The innovative nature of this project centers on the fact that this PCMH involves the integration of multiple, small practices who together act as a single, large integrated PCMH.

**Key Goals:**
1) Support the ongoing relationship between the patient a personal physician who provides continuous, comprehensive care;
2) Care to be provided by a team which includes primary care physicians, nurse practitioners, dieticians, care coordinators, mental health experts, who collectively take responsibility for patient needs, whether within the practice or through referral;
3) Care that is coordinated and/or integrated across all elements of the health care system and the patients community;
4) Care that is facilitated by the use of data registries, information technology, health information exchange, and other systems to assure that patients get care when and where they need it;
5) Expanded access to health practitioners through open scheduling and expanded hours;
6) Provide a reimbursement structure that supports and encourages this model of care.

This project meets the following regional goals:

- **Triple Aim:** assuring patients receive high-quality and patient-centered care, in the most cost effective ways.
- **Improve the healthcare infrastructure to better serve Medicare, Medicaid and uninsured residents of our counties.**
- **Further develop and maintain a coordinated care delivery system**
- **Improve outcomes while containing cost growth.**

**5-Year Expected Outcome for Provider and Patients:**
As a result of this project, we expect to see a marked increase in access to primary care for this population and a significant improvement in the management of chronic conditions over the next 5 years.

In the implementation of this project, CSRHS will endeavor for continuous quality improvement by monitoring the patient volumes and patient utilization to ensure that progress is being made towards meeting the project milestones. Additionally, CSRHS will ensure that all medical homes make ongoing efforts to meet or exceed all nationally recognized protocol or quality benchmarks for patient-centered medical homes.

**Starting Point/Baseline:**

As of December 1, 2011, nine medical home participating groups were identified as a starting point to develop this project. The nine medical homes currently serve approximately 8,900 active Medicare beneficiaries. The plan is to expand this PCMH network by 4-6 practices.

*Source: CHRISTUS Santa Rosa Internal Data*

**Rationale:**

According to the Region 6 Community Needs Assessment, limited access to primary care (CN.3) and chronic disease management (CN.2) are amongst the major challenges facing the population. These challenges will be exacerbated as the population continues to grow and more Texans gain access to health care coverage under the Affordable Care Act. There is a growing body of research that concludes that PCMHs deliver more affordable, better quality primary care. Recent evaluations conducted across 20 states shows evidence of better outcomes, reduced mortality, fewer preventable hospital admissions, lower acute care utilization, improved patient compliance with recommended care and lower spending.

As previously stated, the target population for this project is ethnically diverse, low-income and has significant impediments to accessing comprehensive primary care. Hospital utilization data from the previous two fiscal years reveals that almost 39% of inpatient admissions for CSRHS are from the Medicare fee-for-service population. Furthermore, this target population is a key driver for CSRHS’30-day readmissions: 62% of all heart failure readmissions, 57% of acute myocardial infarction readmissions and 39% of pneumonia readmissions are Medicare beneficiaries. In fact, this target population is a substantial driver for 30-day readmissions for any diagnosis. While the target population only accounts for 10% of Emergency Department visits, almost half (46%) of those visits become inpatient admissions. The Bexar County Community Needs Assessment revealed that almost one-third (33%) of the Bexar county residents do not have a medical home or even a primary care physician that oversees their care. Data from internal hospital registrations during 2011 revealed that 1,475 Medicare inpatients did not have a primary care physician or medical home.

The PCMH Project involves the collaboration of affiliated patient-centered medical homes to integrate care management and coordination for shared, high-risk patients. The core project components include:

a) **Improve data exchange between hospitals and affiliated medical home sites:** hospital affiliated medical home sites will implement a common data exchange process where practice performance relative to agreed upon quality metrics and protocols can be monitored to ensure compliance.

b) **Develop best practices plan to eliminate gaps in the readiness assessment:** As part of achieving NCQA certification for each practice, a readiness assessment will be completed...
and any gaps identified in the assessment will be addressed as part of the process to meet the required NCQA criteria.

c) *Hire and train team members to create multidisciplinary teams including social workers, health coaches, care managers, and nurses with a diverse skill set that can meet the needs of the shared, high-risk patients:* The medical home project will be hiring and/or leveraging other allied health providers to support the needs of each medical home practice to assure that identified high risk patients are appropriately managed to reduce unnecessary utilization of healthcare resources and to improve patient outcomes.

d) *Implement a comprehensive, multidisciplinary intervention to address the needs of the shared, high-risk patients:* The medical home project will have a comprehensive care coordination program, the purpose of which is to identify high risk patients in each practice, establish a relationship with each high risk patient, assure that each identified patient is following the medical intervention plan, the result of which will be to reduce unnecessary utilization, and improve the health of the patient.

e) *Evaluate the success of the intervention at decreasing ED and inpatient hospitalization by shared, high-risk patients and use this data in rapid-cycle improvements to improve the intervention:* The medical home network will be collecting data on all medical home patients for all participating practices on utilization of services, both outpatient and inpatient, and these data will be compared to establish baseline utilization to determine whether improvements have occurred in the utilization of healthcare services for high risk patients.

f) *Conduct quality improvement for project using methods such as rapid cycle improvement.* Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned,” identifying opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations. We will implement a system that allows us to track the number of patients, types of patients, utilization of inpatient and outpatient resources, patient outcome measures, which will provide us data to measure performance and initiate rapid cycle changes to continually improve our processes.

Three major milestones were selected to ensure that this project achieves the intended results:

1) **Implement the medical home model in primary care clinics:** Increasing the number of PCMHs to serve this project is critical to the goal of expanding primary care access.

2) **Improve the number of eligible patients that are assigned to the medical homes:** Increasing the number of patients enrolled in this project will be critical to having a true impact on managing this population.

3) **Implement PCMH NCQA standards into every medical home:** Achieving NCQA recognition will ensure that this model delivers high quality and efficient care.

This project meets the Triple Aim goals of the Waiver by promoting better health, better patient experience of care, and ultimately better cost-effectiveness. The PCMH model is a foundation for the ability to accept alternative payment models under payment reform and deliver care aligned with payment reform models. By providing the right care at the right time and in the right setting, patients not only have better access to primary care, they may see their health improved, will rely less on costly ED visits, will incur fewer avoidable hospital stays and report greater
patient satisfaction.

Unique community need identification numbers the project addresses:

- CN.2 – High prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions.
- CN.3 – Lack of access to medical and dental care due to high rates of uninsurance and health care providers shortages.

How the project represents a new initiative or significantly enhances an existing deliver system reform initiative:

CSRHS is currently piloting a medical home model with nine practices for its employees. This project will allow CSRHS to increase the number of medical homes and improve access and quality for the targeted patient population.

<table>
<thead>
<tr>
<th>Related Category 3 Outcome Measure(s):</th>
</tr>
</thead>
<tbody>
<tr>
<td>OD-1 Primary Care and Chronic Disease Management</td>
</tr>
<tr>
<td>IT-1.10 Diabetes Care: HbA1c Poor Control</td>
</tr>
</tbody>
</table>
  - Percentage of patients 18-75 years of age with diabetes (type 1 or type 2) who had hemoglobin A1c (Hba1c) control >9.0% |

Reasons/rationale for selecting the outcome measures:

Diabetes is one of the most costly and highly prevalent chronic diseases in the United States. According to the RHP community needs assessment (CN.2); a high prevalence of chronic disease and related health disparities requires greater prevention efforts and improved management of patients with chronic conditions. A major goal of this project is to improve adherence to care plans by offering comprehensive preventative and primary care services that cater to the complex, chronic care needs of the population 65 and older. By using the HbA1c improvement target for this project, providers can focus on controlling this population’s diabetes; will drastically improve the health of this population, while also helping to reduce costs.

Relationship to other Projects:

Through the PCMH model, primary care office hours are expanded, which helps to expand Primary care capacity (1.1); The PCMH focuses on chronic disease management, which reinforces project Expand Chronic Care Management Models (2.2); The basic concept behind the PCMH is to redesign how primary care is delivered, which reinforces project Redesign Primary Care (2.3); a direct outcome of the PCMH is patient satisfaction, which support project Redesign to Improve the Patient Experience (2.4); and through the implementation of standard protocols and achieving NCQA recognition, the PCMH model will improve quality and efficiency (2.8).

Relationship to Other Performing Providers’ Projects in the RHP:

Nix Healthcare System
Plan for Learning Collaborative:

Following completion of the RHP plan, University Health System (anchor) will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include goals, regular meetings, site visits, conference calls, communication plan development, organizing learning event, and adopt metrics to measure success.

Project Valuation:

The valuation of CHRISTUS projects use a method which ranks the importance of each project based several key factors. First, CHRISTUS considered the extent the project helps further the goals of the Waiver, which are to (a) enhance access to health care, (b) increase the quality of care, and (c) improve the cost-effectiveness of care provided in the community. Next, CHRISTUS considered the degree of need for the project in the community as addressed and identified in the Community Needs Assessment. The size of the required investment was also considered, which included considerations of personnel, equipment, time and complexity as well as the cost of the time, effort, and clinical resources involved in implementing the project. Finally, CHRISTUS reflected on the scope of the project: the number of patients that would be affected, including the type of patients; the number of patient visits or encounters; how many providers or staff members would be added; the costs that would be avoided as a result of the project; and the ripple effect the project would have on all members of the healthcare system. These factors were weighed against the amount of funding available. We believe this approach is the best methodology available to assess the impact of the project, the investment of the performing provider and the overall value to the community to the extent community resources are available to help fund DSRIP projects. Final project valuation and funding distribution across categories was then determined based on the valuation provisions in the Program Funding and Mechanics Protocol.

Medical homes are one of the most effective and proven methods to coordinate primary care and lower costs by reducing unnecessary or duplicative medical procedures - thus medical homes will allow CHRISTUS Santa Rosa to directly address one of the three main goals of the Waiver. Additionally, Region 6 has a demonstrated need for an increase in primary care capacity, which is mitigated by the establishment of medical homes.

</tbody>
</table>

### Project Summary:

**Provider Description:** CHRISTUS Santa Rosa Health System (CSRHS) is a Catholic, non-profit health and wellness system with three adult acute care hospitals, one short-stay surgical hospital, two free standing emergency departments and several physician joint-venture ambulatory surgery centers. With a combined total of 496 beds, CSRHS currently serves the San Antonio and New Braunfels markets which has a total population of 1.9 million.

**Intervention(s):** The goal of this project is to implement a post-discharge transitions program to help patients make a smooth transition from the inpatient to the post-acute setting. This project will create smooth transitions of care from inpatient to outpatient settings or to alternative post-acute settings so that patients being discharged understand the care regimen, have follow-up care scheduled, and are at reduced risk for avoidable readmissions.

**Need for the project:** Currently, this program does not exist at CSRHS. By implementing this intervention, CSR will improve care transitions by providing patients with tools and support that promote knowledge and self-management of their condition as they move from hospital to home.

**Target population:** This project will focus on patients with the Principal diagnosis of congestive heart failure (CHF), pneumonia (PN) and acute myocardial infarction (AMI). Nearly 11% of the population in this service area is over the age of 65, which is the age cohort most often diagnosed with these conditions.

**Category 1 or 2 expected patient benefits:** In the most recent 12 months, CSRHS has had an estimated 3,692 patients grouped under one of these principle diagnosis codes. This will be a new project that seeks to have 74 patients participating in the discharge planning program by in DY3, an additional 75 in DY4, and an additional 77 in DY5. CSRHS expects that approximately 10% of the patients served will be Medicare, Medicaid or indigent.

**Category 3 outcomes:** [IT-3.2] The goal is to decrease the Congestive Heart Failure 30 day re-admission rate. Targets will be determined based on the baseline established in DY3.

### Project Description:

The goal of this project is to implement a post-discharge transitions program to help patients make a smooth transition from the inpatient to the outpatient setting. This project will create smooth transitions of care from inpatient to outpatient settings or to alternative inpatient settings so that patients being discharged understand the care regimen, have follow-up care scheduled, and are at reduced risk for avoidable readmissions.

There is a growing body of evidence that suggests discharge planning that begins at the time of admission to the hospital, coupled with customized, focused education and programmatic follow up for 30 days post discharge, will prevent or reduce the number of unplanned re-admissions to...
the hospital. Ineffective discharge planning, instruction and follow up for the inpatient population results in patient non-compliance with prescribed care regimen and often results in re-admission to the hospital. There are a number of well designed, proven discharge planning/care transitions programs available for use in the hospital setting. This project will utilize the Care Transitions Intervention designed with funding from the John A Hartford and the Robert Wood Johnson Foundation. The Care Transitions Intervention was designed in response to the need for a patient-centered, interdisciplinary intervention that addresses continuity of care across multiple settings and practitioners.

The model is composed of the following components: A patient centered record that consists of the essential elements for facilitating productive interdisciplinary communication during the care transition referred to as the "Personal Health Record." A structured checklist, the "Discharge Preparation Checklist" of critical activities designed to empower patients before discharge from the hospital. A patient self-activation and management session with a "Transitions Coach" in the hospital, designed to help patients and family understand and apply the first two elements. And, finally Transition Coach follow up visits to the home and/or Skilled Nursing Facility as well as accompanying phone calls to sustain the first three components and provide continuity across the transition.

The Care Transitions Intervention focuses on four conceptual areas, referred to as the Four Pillars: 1. Medication Self-Management 2. Dynamic Patient Centered Record 3. Follow-up and 4. Red Flags. The Transitions Coach is an RN trained in the Care Transitions Intervention program to be adept at the use of the tools and the process.

Goals and Relationship to Regional Goals

The overall goal will be to reduce unplanned re-admissions for targeted patient populations, specifically congestive heart failure, pneumonia and acute myocardial infarction. Unplanned re-admissions are costly to the provider, our government and to the patient/consumer. Unplanned, avoidable re-admissions consume a significant amount of healthcare resources and can be reduced if discharge planning is done in a comprehensive, coordinated manner in which the patient and family are empowered through knowledge to successfully manage their disease. The successful implementation of the Care Transitions Intervention will reduce health care costs for the RHP, CHRISTUS Santa Rosa and the patient and family.

This project meets the following regional goals:

- Triple Aim: assuring patients receive high quality and patient-centered care, in the most cost effective ways
- Further develop and maintain a coordinated care delivery system
- Improve Outcomes while containing cost growth.

5-Year Expected Outcome for Provider and Patients:

As previously stated, the primary goal of this project is to significantly reduce unplanned re-admissions for targeted patients populations. The project will be piloted at the CHRISTUS Santa Rosa New Braunfels campus with a focus on patients with the Principal diagnosis of congestive
heart failure (CHF), pneumonia (PN) and acute myocardial infarction (AMI). Once successfully implemented at New Braunfels, this program will be implemented at each adult campus.

In the implementation of this project, CSRHS will endeavor for continuous quality improvement by monitoring the patient volumes and patient utilization to ensure that progress is being made towards meeting the project milestones. Additionally, CSRHS will ensure that its care transitions program makes ongoing efforts to meet or exceed all nationally recognized protocol or quality benchmarks for care transitions/discharge planning.

### Starting Point/Baseline:

As of June 30, 2012 the regional, "predicted" re-admission rate (as provided and calculated by CMS as part of the Value Based Purchasing reporting) is as follows: AMI - 19.7%  CHF - 22.3%  PN - 15.6%. As the number of patients receiving enhanced, appropriate discharge and follow up care increases, it is anticipated that these readmission rates will decrease.

### Rationale:

When a patient’s transition from the hospital to home is less than optimal, the repercussions can be far-reaching – hospital readmission, an adverse medical event, and even mortality. MedPAC estimates that the US spends $17.4 billion annually for Medicare re-admissions. Of that amount, an estimated $14 billion is attributed to avoidable re-admissions. It is estimated that 18% of Medicare patients are re-admitted within 30 days.

According to the Community Needs Assessment, the state of Texas ranks last in the nation on health care quality. Furthermore, RHP 6 has identified chronic disease as a key issue that must be addressed. The evidence demonstrates that re-admissions in these patient populations can be prevented when patients and families are appropriately educated, when patients and families participate in the creation of their discharge plan, when assistance is provided to assure that the necessary post discharge services are available to the patient and family and when follow - up assistance is provided to assure that the discharge plan is being followed. With an organized and consistent approach to discharge in these populations deteriorating conditions can be identified early and appropriate interventions can be utilized to improve condition and prevent expensive re-admission. Additionally, beginning in federal FY 2013 hospitals will be at risk for up to a 1% reduction in all Medicare payments if they fail to reduce re-admission rates in the heart failure, pneumonia and heart attack patient populations. From a quality of care perspective, low re-admission rates correlate with overall clinical excellence as evidenced in a number of studies and databases. A focus on a well planned, well coordinated and well communicated discharge plan will improve the coordination and effectiveness of care and care transition from hospital to home or skilled nursing facility.

This project will involve the development, implementation and evaluation of standardized protocols and evidence-based care delivery to improve care transition. The core components are as follows:

a) **Review best practices from a range of models (e.g. RED, BOOST, STAAR, INTERACT, Coleman, Naylor, GRACE, BRIDGE, etc.);** the proposed program adapt evidence-based best practices from other similar programs to assure smooth program implementation and to achieve improvements in readmission rates.

b) **Analysis of the key drivers of 30-day readmissions using a chart review tool (e.g. the**
Institute for Healthcare Improvements (IHI) State Action on Avoidable Re-hospitalizations (STAAR tool) and patient interviews: This program will build in a comprehensive data collection and review process to allow us to assess adherence to program objectives and to monitor impact to readmissions on an ongoing basis.

c) Integration of information systems so that continuity of care for patients is enabled: The program will utilize the hospital’s existing information systems to coordinate the inpatient and post acute care process, so that all caregivers are aware of the patient’s status and compliance with discharge instructions.

d) Development of a system to identify a patient being discharged potentially at risk of needing acute care services within 30-60 days: The program will utilize the hospital’s existing information systems to coordinate the inpatient and post acute care process, so that all caregivers are aware of the patient’s status and compliance with discharge instructions.

e) Implementation of discharge planning program and post discharge support program: the program contemplates developing a comprehensive discharge planning and post discharge support component, which will use information systems to maintain patient data and monitor results.

f) Development of a cross-continuum team comprised of clinical and administrative representatives from acute care, skilled nursing, ambulatory care, health centers, and home care providers: program will put in place a full continuum of post acute services where post and hospital caregivers can effectively communicate about patient status post discharge to avoid potential readmissions to the hospital.

g) Quality improvement for using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned”, opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations: we will implement a system that allows us to track the number of patients, types of patients, utilization of inpatient and outpatient resources, patient outcome measures, which will provide us data to measure performance and initiate rapid cycle changes to continually improve our processes.

Three major milestones were selected to ensure that this project achieves the intended results:

1) Implement standardized care transition process: The goal is to implement this process in a total of three hospitals between DY2 through DY5. The first implementation will occur in DY2, with the next two occurring in DYs 4 and 5.

2) Develop a staffing and implementation plan to accomplish the goals/objectives of the care transitions program: a critical component to the success of this project will be staff training. This metric will ensure that an appropriate plan is established and implemented to ensure successful project implementation.

3) Implement standard care transition process in specified patient populations: this metric will provide the number of patients in a defined populations receiving care according to the implemented protocol.

Unique community need identification numbers the project addresses:

- CN.1 – Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.
• CN.2 – A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions. Leading causes of death in RHP 6 include cardiovascular disease, cancer, and diabetes.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

Currently, this program does not exist at CSRHS. By implementing this intervention, CSR will improve care transitions by providing patients with tools and support that promote knowledge and self-management of their condition as they move from hospital to home.

Related Category 3 Outcome Measure(s):

OD-3 Potentially Preventable Re-admissions – 30 day readmission rates

IT-3.2, Congestive Heart Failure 30 Day Readmission Rate

• The number of readmissions (for patients 18 years and older), for any cause, within 30 days of discharge from the index HF admission.

Reasons/rationale for selecting the outcome measures:

The relationship between hospital readmission rates and quality of care is well-documented. This project is focused on improving care transitions by providing patients with tools and support that promote knowledge and self-management of their condition as they move from the hospital to home. There is a growing body of evidence that suggests discharge planning that begins at the time of admission to the hospital, coupled with customized, focused education and programmatic follow up for 30 days post discharge will prevent or reduce the number of unplanned hospital re-admissions. Congestive Heart Failure is one of the principal diagnoses that will be targeted in this program, which makes this improvement target a suitable measurement.

Relationship to other Projects:

The Care Transitions – Intervention Nurse Program supports/reinforces several Category 1 and 2 projects: there is a significant focus on chronic disease management (1.3 & 2.2); this project will create smooth transitions of care from inpatient to outpatient settings or to alternative inpatient settings so that patients being discharged understand the care regimen, have follow-up care scheduled, and are at reduced risk for avoidable readmissions; which supports the primary goals of project (2.4) Redesign the Patient Experience and (2.8) Apply Process Improvement Methodology to Improve Quality/Efficiency, and it helps patient become more involved in their own health care which reinforces the primary objective of (2.14) Implement person-centered wellness self-management strategies and self directed financing models that empower consumers to take charge of their own health care.

Relationship to Other Performing Providers’ Projects in the RHP:

Guadalupe Regional Medical Center
Plan for Learning Collaborative:

Following completion of the RHP plan, University Health System (anchor) will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include goals, regular meetings, site visits, conference calls, communication plan development, organizing learning event, and adopt metrics to measure success.

Project Valuation:

In valuing this project, CHRISTUS Santa Rosa took into account the extent to which a transition of the care program would potentially meet the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it would address the community needs, the population served, and resources and cost necessary to implement the project.

A program to support discharge planning will meet one of the three main goals of the Waiver by coordinating care. This type of coordination has the long term goal of reducing unnecessary healthcare costs by preventing future hospitalization due to inappropriate post-discharge placement. This project would also meet a specific need in the community to coordinate care and promote primary care.

Identifying Project and Provider Information:

| Title: 2.12.2 Implement/Expand Care Transitions Program |
| Unique RHP ID#: 138411709.2.1 –PASS 1 |
| Performing Provider: Guadalupe Regional Medical Center |
| Performing Provider TPI: 138411709 |

Project Summary:

Provider Description: Guadalupe Regional Medical Center is a 125 bed facility in Seguin, Texas serving a population of approximately 100,000 in 8 counties. Intervention(s): The project would implement improvements in transitioning patients and coordination of care from inpatient to outpatients, post-acute care, and home care settings. The Transitional Care Program will institute an evidence based risk assessment tool to identify patients who are at highest risk for 30 Potentially Preventable Re-admissions/Admissions (PPR/PPA). The Transitional Care program will provide for a trained Transitional Care Coordinator as well as established policies and procedures. The goal will be to proactively educate the targeted population, monitor and support them through the discharge process to the home, and ensure necessary resources are referred.

Need for the project: There is currently no existing community program with dedicated resources designed to act as a patient advocate and liaison in transition from acute care to the home. The Transitional Care Program will improve the quality of life of the service area as well as reduce costs by implementing strategies to promote both wellness and patient empowerment. These initiatives will reduce the financial impact of potentially preventable admissions, potentially preventable re-admissions, and ER visits.

Target population: GRMC has a CHF readmission rate in the fourth (worst) quartile in the state of Texas for the period of 2006-2009, as publicly reported by CMS. GRMC will develop a Transitional Care Program to assist with care transitions and medication management Targeting patients with a primary diagnosis of CHF, COPD, DM, Pneumonia, as well as being highly sensitive to those uninsured, covered by Medicaid, or at / below the 2012 HHS poverty level. Based on the capture diagnosis listed above we anticipate serving approximately 540 patients. The high risk patients, as determined by completion of a High Risk Assessment Tool, will add approximately 220 patients per year. An estimated 15-20% of patients served are expected to be Medicaid/Indigent.

Category 1 or 2 expected patient benefits: The project seeks to develop and institute a Transitional Care program, establish baselines, and utilize an evidence based screening tool by DY2. By DY 5 we also seek to increase patients enrolled and served by the GRMC Transitional Care Program by 35% from the year 2 baseline.

Category 3 outcomes: IT-3.1- All cause 30 Day readmission Rate - Our goal is to Achieve a 5% reduction from baseline in unplanned all-cause readmissions for patients 18 years and older as a percentage of total admissions for same age group by DY5.
Project Description:

**Guadalupe Regional Medical Center seeks to implement / expand a Care Transitions Program**

The project would implement improvements in transitioning patients and coordination of care from inpatient to outpatient, post-acute care, and home care settings. The Transitional Care Program will institute an evidence based risk assessment tool to identify patients who are at highest risk for 30 Potentially Preventable Re-admissions/Admissions (PPR/PPA). The Transitional Care program will provide for a trained Transitional Care Coordinator as well as established policies and procedures. The goal will be to proactively educate the targeted population, monitor and support them through the discharge process to the home, and ensure necessary resources are referred.

The Transitional Care Team has the potential to institute the LACE risk assessment tool on all target population patients. The Transitional Care program will ensure identified target population high risk patients are referred to the Transitional Care Program. Through the intervention of the program via the dedicate health care worker ((Transitional Care Coordinator) we will have a material positive effect on the PPA and PPR.

GRMC has a CHF readmission rate in the fourth (worst) quartile in the state of Texas for the period of 2006-2009, as publicly reported by CMS. GRMC will develop a Transitional Care Program to assist with care transitions and medication management of CHF, COPD, DM, and Pneumonia patients. This program will include: a dedicated resources which will utilize and/or facilitate:

- Discharge checklists
- Hand off communication tools
- Pre and post-discharge medication reconciliation/management plans
- Weight and blood pressure monitoring
- A focus on health literacy and teach back
- Physician appointment assistance and monitoring
- Coordination of community resources
- In home and phone follow-up
- Quarterly meetings with local nursing homes and assisted living facilities in order to discuss identified problems
- Solve issues related to avoidable hospital admission/readmission

We propose to target the communities serviced by Guadalupe Regional Medical Center. This has historically been Seguin and adjacent communities with Guadalupe and Adjacent Southern county populations.

**Goals and Relationship to Regional Goals:**

The Transitional Care Program at Guadalupe Regional Medical Center seeks to promote the Triple Aim of improving the health of our population, enhancing the patient experience of care, and reducing the per capita cost of care. Through the development of a Transitional Care program, targeting patients with a primary diagnosis of CHF, COPD, DM, Pneumonia, as well as being...
highly sensitive to those uninsured, covered by Medicaid, or at / below the 2012 HHS poverty level, GRMC will have a positive material effect on said Triple Aim goals. GRMC has identified a gap in care transitions that create potentially preventable readmissions. Through a Transitional Care Coordinator and established policy and procedures GRMC will educate the targeted population, monitor and support through the discharge process to the home, and ensure necessary resources are referred.

Project Goals:

- As this project moves forward GRMC will identify and implement appropriate best practices from the Partnership for Patients (P4P) initiative- Texas Healthcare Engagement Network (HEN) as well as from other programs and models of care documented in the literature.
- Increase number of patients enrolled in Transitional Care Program
- Reduce % of target population PPA and PPR

This project meets the following regional goals:

- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system; and
- Develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient needs throughout the entire region, and improves health care outcomes and patient satisfaction.
- This project address RHP 6 goals by: “serving those who are low income or without insurance and or Suffering with a chronic disease which increases the likelihood of preventable admissions and preventable re-admissions”. The transitional Care Program will also address the goal of improving access to primary and specialty care, as well as improving the management of patients with chronic disease. This will be accomplished by having dedicated resources, evidence based identification tools, established policy and procedures, and post hospital follow up / monitoring protocols.

Challenges:

Communication of patient needs between the acute care setting and post-acute care setting is challenging. Additionally, patients discharged home may have difficulty following discharge instructions due to lack of understanding and/or a lack of resources and access. Focus on Health literacy within the service area has not been traditionally targeted. The primary challenge for this project will be to engage and build trust with patients. Targeted communities have historically been difficult to penetrate, but with proper interdisciplinary training, and oversight by a dedicated team, the project has a high likelihood of success. In particular, cultural competency training and the involvement of a variety of innovative provider types within the care team will ensure GRMC addresses the full spectrum of the participants’ needs.

5-Year Expected Outcome for Provider and Patients:
- The 5 year expected outcome is a 35% increase from year 2 baseline in patients enrolled and served by the GRMC Transitional Care Program.
- Decrease the number of PPA and PPR by 5% in year 5.

**Starting Point/Baseline:**

The pilot Transitional Care Program began on July 17, 2012 and as of October 3rd there were 21 patients being followed by the Transitional Care Coordinator. The patients were referred to this program through the GRMC Inpatient Case Management Department. During this time period the Transitional Care Coordinator has performed the following patient encounters: 10 visits in the hospital setting, 6 post-hospitalization visits in the home, and 50 post-discharge phone calls. To date (9/24/12) there have been no readmissions among this group of patients.

The GRMC Transitional Care Program currently consists of one RN who reports to the Director of Home Health Services. Due to the infancy status of this program less than 2% of the hospital nurses have been educated about the process. Likewise, less than 2% of the hospitalists and primary care physicians have been educated to date.

**Rationale:**

Guadalupe County has a largely rural service area with an established population possessing morbidities and co-morbidities which have significant potential for causing unnecessary utilization of Emergency Room and inpatient services. These morbidities include (but are not limited to) CHF, COPD, DM and pneumonia. In addition, limited public transportation, a high number of un/under-insured, and serious gaps in health literacy increase the potential for non-compliance with medication regimens and follow-up care. Also, The Transitional Care Programs at GRMC will serve to compensate for the health provider shortage identified in Guadalupe County. The GRMC Transitional Care program is starting in the early stages of development.

GRMC will develop a Transitional Care Model (TCM) which will address Unique Community Need CN.2 - A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions. Leading causes of death in RHP 6 include cardiovascular disease, cancer, and diabetes. The model will integrate transitional care into the discharge process thereby ensuring the identified population is proactively educated on their chronic disease and prepared prior to discharge home. Patients identified as high risk for readmission or Emergency Room visits will be referred to the Transitional Care Coordinator who will monitor the patient for at least thirty days after discharge from the hospital. This intervention may involve phone calls and/or home visit follow-up and assistance with medication management and the scheduling of primary care appointments based upon individual patient situation and need.

The GRMC Transitional care model is in its early stages of development. There is currently no existing community program with dedicated resources designed to act as a patient advocate and liaison in transition from acute care to the home. The Transitional Care Program will improve the quality of life of the service area as well as reduce costs by implementing strategies to promote both wellness and patient empowerment. These initiatives will reduce the financial impact of potentially preventable admissions, potentially preventable re-admissions, and ER visits. These
reductions will contribute to improvement in the quality of life for the patients served. Guadalupe County is expected to recognize continued population growth, which will likely exacerbate current health challenges. These challenges include limited access to primary and specialty care, unmet mental and behavioral health needs, and high prevalence of chronic disease. The projected Medicaid expansion and use of health insurance exchanges may have significant impact on the health status of residents and related outcomes of RHP 6 initiatives. The opportunity to implement transformative projects through the 1115 waiver funding will help RHP 6 address the needs of the GRMC served community.

As part of the CQI core component GRMC will seek to work collaboratively with other providers. Sharing ideas and improving existing practices will be the primary focus of the collaborations. This will be noted in the Year 4 Milestone 3 (P-12.1). In addition, as part of the CQI component, GRMC plans to conduct bi-weekly meetings, conference calls, or webinars organized by the RHP. All webinars, meetings, conference calls etc. will be documented to include copies of agendas, power point slides etc. The investment in learning and sharing of ideas will be central to our goal of continuous learning and improvement.

**Related Category 3 Outcome Measure(s):**

- IT-3.2 Congestive Heart Failure 30 Day readmission rate-Stand-alone measure.

**Reasons/rational for selecting outcome measures**
Demographically the GRMC service area has modest to high incidence of primary and secondary DX of CHF and morbidities relating to complications of CHF. As evidenced by Coleman ("Falling Through the Cracks: Challenges and Opportunities for Improving Transitional Care for Persons with Continuous Complex Care Needs" and Coleman, Parry et al ("The Care Transition Intervention: a patient centered approach to ensuring effective transfers between sites of geriatric care"), best practices have been identified which contribute to the triple aim when applied to patients transitioning from the hospital to their residence. Focusing on this outcome will ensure our target population, with particular interest in those at/below the 2012 HHS poverty line or who are under / uninsured, are appropriately educated, monitored, and connected to applicable and required resources. This will decrease PPA and PPR, thereby reducing cost, increasing patient satisfaction, and improving long term outcomes.

**Relationship to other Projects:**

The implementation of a Transitional Care program will provide the organization with the structure and processes needed to address many key issues related to quality patient care, patient satisfaction, and healthcare cost containment. The Transitional Care Program at GRMC will support the goals identified in the following RHP projects:

- 1.3 – Implement a Chronic Disease Management Registry
- 2.2 – Expand Chronic Care Management Models
- 2.4 – Redesign to Improve Patient Experience
- 2.5 – Redesign for Cost Containment
- 2.6 – Implement Evidence-based Health Promotion Programs
- 2.8 – Apply Process Improvement Methodology to Improve Quality/Efficiency
- 2.10 – Use of Palliative Care Programs
- 2.11 – Conduct Medication Management
- 2.14 – Implement person-centered wellness self-management strategies and self-directed
financing models that empower consumers to take charge of their own health

Furthermore the GRMC Transitional Care plan will support and reinforce the following category 4 population focused measures:

RD-1 - Potentially preventable readmissions-Done through a comprehensive pre-discharge education and post-discharge interaction with emphasis on medication management and physician follow up.
RD-2-Potentially Preventable Admissions-Through community outreach and education provided by the Transitional Care Coordinator we will minimize the likelihood of PPA.
RD-3 -Potentially Preventable Complications- Through follow-up, monitoring, and education pre and post-discharge GRMC will proactively identify and address any areas that may lead to PPC.
RD-4 - Emergency Department-A comprehensive Transitional Care program will ensure the ER is utilized in appropriate fashion. Through the efforts of the transitional care program, mainly in the areas of medication management, resource identification, and appropriate physician follow-up, a reduction in ER utilization is projected.
RD-5 -Patient Centered Care- The transitional care program will support Patient Centered Healthcare by ensuring the needs of the patient are prioritized in the transition from hospital to home. This will be noted by the improvement in patient satisfaction scores and outcomes.

Relationship to Other Performing Providers’ Projects in the RHP:

Two CHRISTUS Santa Rosa hospitals in our region will be focusing on Implementing / expanding Transitional Care. GRMC will reach out to these facilities to establish a collaborative support network. In fact we have identified milestone which will require face to face collaboration with another facility. This metric is: **Milestone 4** [P-12-Participate in face-to-face learning at least twice per year with other providers in the RHP to promote collaborative learning around similar projects. At each face-to-face meeting, all providers should identify and agree upon several improvements. Each provider should publicly commit to implementing these improvements.]

Plan for Learning Collaborative:

GRMC and RHP 6 are committed to transforming health care in our region and throughout the service area. University Health System, as the RHP 6 anchor, will promote and facilitate learning collaboratives.
GRMC will propose projects and provide feedback throughout the development of the RHP Plan which will supports and reinforce related projects and interventions within the RHP Plan.
Following completion of the RHP Plan, University Health System will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include the following:
Identify participants
Establish Learning Collaborative goals
Develop a calendar of regular meetings, site visits, and/or conference calls
Develop a plan to communicate ideas, data, and successes across the region and state
Organize a learning event and invite experts and other Performing Providers from outside the region to share knowledge and best practices

Adopt metrics to measure success

University Health System will seek to provide facilitation and administrative assistance as needed to ensure the success of these endeavors. The RHP 6 website will be available to the Learning Collaboratives to network and share ideas, challenges, and success stories with colleagues. RHP 6 hopes to make significant transformational progress on its project milestones to achieve waiver goals and share what we learn with the rest of the State.

**Project Valuation:**

Project 2.12.2- Implement/Expand a Care Transitions was assigned high value through consideration of the following criteria:

- Achieve Waiver Goals: The project will address triple aim, further develop and maintain a coordinated care delivery system, improve outcomes while containing costs, and improve the healthcare model which serves uninsured, Medicaid, and low income residents of the GRMC service area.
- Address Community Need-The project will address multiple community needs with high impact results.
- Project Scope-The project will touch numerous patients whose healthcare can be improved through the tenets designed into the program. As such, multifaceted benefits will be recognized to include but not limited to: cost savings, patient centered care, improved quality of life, and reduction in PPA and PPR.

### Project Summary:

**Provider Description:** Guadalupe Regional Medical Center is a 125-bed hospital in Seguin, Texas serving Guadalupe and the surrounding counties; serving a population of approximately 100,000.

**Intervention(s):** The Patient Navigation project will identify patients with high utilization of ED services, and assist to match resources; such as physicians, clinics, teaching, behavioral health and prescription assistance. Through decreasing overutilization of chronic issues, the ED will be freed up to care for patients with acute illness and injury.

**Need for the project:** Currently the ED is over utilized by patients with chronic medical conditions that could be stabilized through education and ongoing medical care through a clinic or PCP, as well as those patients that frequently utilize the ED for non-emergent care.

**Target population:** The target populations are those patients with high frequency use of the ED for chronic medical conditions, non-emergent medical needs and behavioral health.

**Category 1 or 2 expected patient benefits:** In calendar year 2012, the Emergency Department saw 36,433 patients of which 30% were classified as either Medicaid or Indigent. Also out of those 36,433 patients, approximately 35% of those visits were classified as non-urgent. There were also approximately 9,500 patient encounters that didn’t have a primary care physician identified. This project expects to enroll 50% of identified patients in the Patient Navigation System and increase the number of referrals to a PCP for patients without a PCP by 50%.

**Category 3 outcomes:** IT-9.2 - The focus is on Reducing Emergency Department visits for target conditions, behavioral health/substance abuse. By implementing the Patient Navigation System, GRMC ED would like to decrease the unnecessary ED visits for behavioral health/substance abuse by 3% by year 5. This will provide patients with behavioral health/substance abuse issues the resources needed to effectively manage their conditions.

### Project Description:

Guadalupe Regional Medical Center seeks to establish a patient navigation system to assist high utilizers of the ED to receive coordinated, timely and appropriate healthcare services.

Development of the Navigation Program will identify high utilizers of ED services. A multidisciplinary care team will be developed for patients enrolled in the program, care plans will be developed and each patient will be assigned a patient navigator to assist patient in obtaining PCP, behavioral healthcare, specialty care as needed and community resources. The role of the multidisciplinary team is to review potential enrollees, review needs and develop and implement care plans. The team is made up ER staff & Medical Director, Case Management, and a Licensed Clinical Social Worker. The goal of this project is to utilize community health workers and case managers to provide enhanced social support and culturally competent care to
vulnerable and/or high-risk patients, to divert non-urgent care from the Emergency Department to site-appropriate locations. The program would also meet regional goals, along with the RHP and CMS’s triple aims to improve care for individuals; improve health for the population; and lower costs through improvements.

The current challenges are high utilizers are given referrals for community resources and follow up care; many do not follow up with the referral and continue to receive care through the ED. GRMC believes that a patient navigation system will allow for timelier ED services for emergency situations, reduce costs and decrease the amount of financial loss due to inappropriate and possibly unfunded ED visits.

The program’s 5-year expected outcome is to increase patient enrollment in patient navigator system by 50% of identified patients of the targeted population, as well as a 50% increase in the number of ED patients referred to a PCP who are documented as not having a PCP. The program also hopes to have a reduction in unnecessary ED use related to behavioral health/substance abuse by 3% of baseline by DY5 as referenced in the Category 3 Outcome Measure.

**Starting Point/Baseline:**

In August 2012, the preliminary workgroup that included ER staff, Case Management, and Social Services met to discuss ideas geared towards decreasing unnecessary ER visits by identifying high utilizers of the ED.

Through Meditech reports, chart review, and as well as staff education of navigation project, patients are being identified as potential enrollees in the navigation system.

To date a policy and procedure has been drafted to identify and enroll patients. As of October 2012, 4 patients have been identified as frequent utilizers of emergency services for chronic pain management. 1 patient has been enrolled in the program with an identified care plan in place.

**Rationale:**

Guadalupe County has a largely rural service area with an established population possessing morbidities and co-morbidities which have significant potential for causing unnecessary utilization of the ED. Patient navigators will help patients and their families navigate the healthcare system and the obstacles that it entails. Services provided by the ED patient navigators will include: facilitating more appropriate care options, coordinating care among providers, assisting with obtaining follow up care and maintaining relationships with providers. Community health care workers and the ER Case Manager will have close ties to the community and serve as a liaison between the community and the healthcare system. They will also possess the linguistic and cultural skills needed to connect with patients from underserved communities. Patient navigators will be: compassionate, sensitive, and culturally attuned to the people; knowledgeable about the environment and healthcare system, and connected with critical decision makers inside the system.

**Project Components:**

Through the ED Patient Navigation Program, we propose to meet all required project components.

a. Identify frequent ED users and use navigators as part of a preventable ED reduction
program. Train health care navigators in cultural competency. Patients using the emergency department for primary care services, behavioral healthcare services, patients without a designated PCP or medical home, and patients with social or economic barriers to accessing primary care will be offered navigation services. Patient Navigators will create care plans that will be associated with the patients’ medical record by medical record number. These notes will include sections on reason for services, assessment, subsequent referrals and follow-up activities. Patient navigators will review the care plan with the patient and provide a copy. All of our navigators will undergo training in providing culturally competent care and receive education regarding disparities and social determinants of health, community outreach, chronic disease management, and recognizing behavioral healthcare crisis.

b. Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators. We plan to hire Patient Navigators with a background in community health, social services, mental health, or public health with experience providing direct care to disadvantaged populations. Ideally these individuals will be bilingual, from our community, and experienced in identifying community resources.

c. Connect patients to primary and preventive care

d. Increase access to care management and/or chronic care management – We will have regular contact with area primary care providers and behavioral health for care management services, preventive care, and other educational and social services. Navigators will be available to meet with providers to answer any specific questions.

e. Conduct quality improvement for project using methods such as rapid cycle improvement – The navigation workgroup will design a reporting template for the Patient Navigator notes. We will create a data registry for enrolled patients to facilitate follow-up and effectiveness analysis. Reports will be run weekly by the program and shared monthly with ED staff and participating primary care providers. We will hold bi-weekly meetings with navigation workgroup and with ED providers quarterly to discuss opportunities for program improvement and expansion.

GRMC will develop and expand a patient navigation system which will address Unique Community Needs:

- **CN.3** – Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsured people and health care provider shortages.
- **CN.4** – There is a shortage of high quality mental and behavioral health services that are integrated with physical healthcare services.

Currently, a patient navigation program does not exist to guide and connect patients to more appropriate care for the non-urgent medical needs.
**Related Category 3 Outcome Measure(s):**

GRMC has chosen the stand-alone Category 3 Outcome Measure IT-9.2: ED Appropriate Utilization. We are going to focus on reducing Emergency Department visits for the target condition of Behavioral Health/Substance Abuse. The ED sees many patients who utilize the ED for non-emergent conditions such as medication refills, behavioral health problems, lack of resources relating to substance abuse, etc. The hope is that by implementing the Patient Navigation system, along with the other projects (1.1.2 and 2.12) being proposed by GRMC, the amount of unnecessary visits to the ED relating to behavioral health/substance abuse will decrease.

- **Numerator:** Number of patients enrolled in the navigator program who have had an ED visit or an inpatient admission
- **Denominator:** Total number of patients enrolled in the navigator program

A study completed by the Association for Community Affiliated Plans in April 2007, at least 1/3 of all ED visits are avoidable, meaning non urgent, and therefore treatable in primary care centers. Over 18 billion dollars are wasted annually on avoidable ED visits. In addition, it is shown that emergency departments serving higher proportions of patients that are Medicaid eligible or uninsured have 25% more non urgent cases presenting.

In addition, Guadalupe County is federally designated as a mental health professional shortage area. According to a study completed by Salinski and Loftis (2007), Mental health related ER visits increased 75% from 1992 to 2003. An additional example provided by MSNBC in 2009, reported in Austin Texas showed that only 9 patients accounted for 2700 ER visits in a one year period. Agency for Healthcare Research and Quality also completed a report in 2010 showing that mental disorders/substance abuse related visits equal 1 of every 8 emergency department cases. Not only is this situation traumatic for the psychiatric patient, but it also takes scarce resources away from the patient with medical emergencies.

According to the Texas Department of State health services, 46% of all ER visits have a behavioral health issues as a basic or contributing factor.

**Relationship to other Projects:**

This Patient Navigator Project will work in close conjunction to the two other projects being proposed by GRMC. The first project is 1.1.2; expanding care with a free clinic that offers services to the uninsured population in Seguin, Texas and the surrounding areas. Through access to this clinic, patients who normally may have sought care in the ED for non-urgent conditions have another option to seek care. We will be working closely with the clinic for follow-up care.

The second project is 2.12; Implementing and Expanding a Transitional Care program. This program will be of great assistance to the population of patients with chronic illness who seek their primary care in the ED. By communicating with the Transitional Care program, the needs of these patients, there may be other resources that can be offered besides coming to the ED.

In addition, GRMC will also collaborate with Bluebonnet Trails Community Services to assist in providing mental health and substance abuse services. Through navigation services, GRMC with the help of Bluebonnet Trails Community Services will target persons with chronic mental
illnesses who are frequent users of the Emergency Department due to behavioral health disorders.

**Relationship to Other Performing Providers’ Projects in the RHP:**
Unknown at this time.

**Plan for Learning Collaborative:**
GRMC and RHP 6 are committed to transforming health care in our region and throughout the service area. University Health System, as the RHP 6 anchor, will promote and facilitate learning collaboratives. GRMC will propose projects and provide feedback throughout the development of the RHP Plan which will support and reinforce related projects and interventions within the RHP Plan.

Following completion of the RHP Plan, University Health System will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include the following:
- Identify participants
- Establish learning collaborative goals
- Develop a calendar of regular meetings, site visits, and/or conference calls
- Develop a plan to communicate ideas, data and successes across the region and state
- Organize a learning event and invite experts and other Performing Providers from outside the region to share knowledge and best practices
- Adopt metrics to measure success

University Health System will seek to provide facilitation and administrative assistance as needed to ensure the success of these endeavors. The RHP 6 website will be available to the Learning Collaboratives to network and share ideas, challenges, and success stories with colleagues. RHP 6 hopes to make significant transformational progress on its project milestones to achieve waiver goals and share what we learn with the rest of the State.

**Project Valuation:**
Project 2.9.1 Establish/Expand a Patient Care Navigation Program was assigned high value through consideration of the following criteria:
- Achieve Waiver Goals - The project will address triple aim, further develop and maintain a coordinated care delivery system, improve outcomes while containing costs, and improve the healthcare model which serves uninsured, Medicaid, and low income residents of the GRMC Service Area
- Address Community Need – The project will address multiple community needs with high impact on results, acting as a liaison between the under insured/uninsured patient and behavioral and medical healthcare.
- Project Scope – The project will touch numerous patients whose healthcare can be improved through access to appropriate resources.

**Milestone 1**
[P-1]: Conduct a needs assessment to identify the patient population (s) to be targeted with the Patient Navigator Program

**Metric 1** Metric P-1.1: Provide a report identifying the following:
- Targeted patient population characteristics i.e. frequent ED utilization
- Gaps in services and service needs
- How program will identify, triage and manage target population (i.e. policies/procedures, navigation protocols, flowcharts)
- Ideal number of patients targeted for enrollment in the patient navigation

**Milestone 2**
[P-3]: Provide care management/navigation services to targeted patients

**Metric 1** P-3.1: Increase the number or percent of targeted patients enrolled in the program-goal is to increase enrollment by 20% of identified patients

- **Numerator:** Number of targeted patients enrolled in the program
- **Denominator:** Total number of targeted patients identified

Data Source: Meditech reports and chart reviews

**Milestone 2 Estimated Incentive Payment:** $ 328,381

**Milestone 3**
[I-6]: Increase number of PCP

**Milestone 4**
[P-3]: Provide care management/navigation services to targeted patients

**Metric 1** P-3.1: Increase the number or percent of targeted patients enrolled in the program-goal is to increase enrollment by 35% of identified patients

- **Numerator:** Number of targeted patients enrolled in the program
- **Denominator:** Total number of targeted patients identified

Data Source: Meditech reports and chart reviews

**Milestone 4 Estimated Incentive Payment:** $ 330,504

**Milestone 5**
[I-6]: Increase number of PCP

**Milestone 6**
[P-3]: Provide care management/navigation services to targeted patients

**Metric 1** P-3.1: Increase the number or percent of targeted patients enrolled in the program-goal is to increase enrollment by 50% of identified patients

- **Numerator:** Number of targeted patients enrolled in the program
- **Denominator:** Total number of targeted patients identified

Data Source: Meditech reports and chart reviews

**Milestone 6 Estimated Incentive Payment:** $ 272,694

**Milestone 7**
[I-6]: Increase number of PCP

653 ★ RHP 6 Plan ★ March 8, 2013 Guadalupe Regional Medical Center
program

- Number of patient navigators needed to be hired
- Available site, state, county, and clinical data including flow patients, cases in a given year by race and ethnicity, number of cases lost to follow-up that required medical treatment, percentage of monolingual patients

Data Source: Program documentation, E.H.R., claims, needs assessment survey

Rationale: Patient care navigation has been established as a best practice to improve the care of populations at high risk of being disconnected from health care institutions.

Milestone 1 Estimated Incentive Payment $ 601,090

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $ 2,464,247**
Identifying Project and Provider Information:

Title: 2.7.1 Implement innovative evidence-based strategies to increase appropriate use of technology and testing for targeted populations: Health Screening and Education for the Uninsured
Unique RHP ID#: 136430906.2.1 – PASS 1
Performing Provider: Hill Country Memorial Hospital
Performing Provider TPI: 136430906

Project Summary:

Provider Description: Hill Country Memorial Hospital is an 88-bed medical center serving eight counties and a population of 140,000.

Intervention(s): This project will provide comprehensive health screening and wellness education for at least 500 uninsured (targeting Medicaid and Indigent individuals) employed residents of Hill Country Memorial Hospital’s service area by partnering with local businesses who are not able to offer insurance to their employees or whose employees are unable to afford the insurance offered due to cost and their low incomes.

Need for the project: All but one of the counties in Hill Country Memorial Hospital’s service area have a higher uninsured rate than the already-high Texas state rate. Gillespie County, in which the hospital is located, is home to more than 4500 uninsured individuals (27.5% of county residents), and the hospital’s 8 county service area has almost 30,000 without health insurance. The majority of the businesses in the county and region are small, with fewer than 50 employees, and many are farms. Of small businesses in Texas, only 37% offer health insurance to their employees, and this region is no different.

Target population: The uninsured employees (specifically targeting indigent and Medicaid-funded populations) of local businesses which are unable to offer health insurance as a benefit to their employees. We anticipate at least 500 of these individuals will be served.

Category 1 or 2 expected patient benefits:
At least 500 uninsured individuals (specifically targeting indigent and Medicaid-funded populations) have been screened for eligibility for the following screenings, and then received those as appropriate per USPSTF recommendations: Colorectal Cancer Screening, Screening and Brief Intervention for Alcohol Abuse, Cervical Cancer Screening, Screening for Diabetes, Blood pressure Screening, Screening for Lipid Disorders, HIV Screening, Breast Cancer Screening, BMI screening for Obesity, as well as Mobility/Strength Screening, Health Risk Assessment and recommendations, Customized healthy lifestyle consult, and Customized Community Resources Consult. Beyond this, patients may receive additional screenings as identified through ongoing program evaluation and target population needs assessments.

Category 3 outcomes:
- Screening for cervical cancer will be provided for 100% of the eligible target population of 500 uninsured individuals.
- Screening for colorectal cancer will be provided for 100% of the eligible target population of 500 uninsured individuals.
Screening for high blood pressure will be provided for 100% of the eligible target population of 500 uninsured individuals (specifically targeting indigent and Medicaid-funded populations).

**Project Description:**

**Goal:** Provide health screening and wellness education for underserved residents of Hill Country Memorial Hospital’s service area.

**Challenges**

Hill Country Memorial Hospital’s service area includes 8 counties, all but one of which have a higher uninsured rate than the already-high Texas state rate. Gillespie County, in which the hospital is located, is home to more than 4500 uninsured individuals (27.5% of county residents), and the hospital’s 8 county service area has almost 30,000 without health insurance. The majority of the businesses in the county and region are small, with fewer than 50 employees, and many are farms. Of small businesses in Texas, only 37% offer health insurance to their employees, and this region is no different.

Even if insurance becomes available to many more individuals in the years ahead, many in these underserved and remote counties will not have access to a local healthcare provider. It is already a major challenge for the community physicians to provide needed screening services to the currently-insured population. There are simply not enough licensed independent practitioners in this more-rural region of the state.

Preventive care and screenings are low on the priority list of many of these individuals, who are faced with more pressing current concerns and who do not typically seek medical care except in major illness.

**Addressing the Challenges**

Hill Country Memorial has begun to pilot a wellness education and screening program as an additional service of the hospital, available to businesses wishing to offer their insured employees an employment “perk”. The vision for the DSRIP project is to develop a companion program that is specifically targeted to the uninsured employed. This program would focus on the unique health needs and concerns of those who may have not had regular health care in many years. Screening services and wellness education would be offered by Hill Country Memorial Hospital staff members and closely linked to community resources through a strong case management component. It will be important to insure that this vulnerable population has ongoing access to any needed healthcare identified through the screening process. The goal of the program will be to provide United States Preventive Services Task Force-recommended screening services along with wellness education and support to employees of local businesses that have uninsured employees, as well as their spouses or partners. The program would be offered at a very low cost to the business owner to offer as a bonus or incentive to employees and their partners at no cost to them. The goal of the program is to start at least 500 individuals on the program by the end of the fifth demonstration year of the project.

This project targets low income, underserved and uninsured individuals who would not otherwise have access to preventive health care. It supports local businesses who would like to provide opportunities for their employees to receive healthcare services, but cannot provide health insurance options at all or those that are affordable to their low-income employees. Partnering with the hospital and DSRIP program will allow them to offer health screening and wellness counseling services to their employees and their families, and support them in connecting to ongoing care as needed in the community. It also encourages individuals who may not value preventive care to strongly consider it since it is being promoted by their employer and colleagues.
The five year expected outcome for our community is that at least 500 uninsured individuals have been screened for eligibility for the following screenings, and then received those as appropriate per USTPSTF recommendations:

- Colorectal Cancer Screening
- Screening and Brief Intervention for Alcohol Abuse
- Cervical Cancer Screening
- Screening for Diabetes
- Blood pressure Screening
- Screening for Lipid Disorders
- HIV Screening
- Breast Cancer Screening
- BMI screening for Obesity
- Additional screenings and services
  - Mobility/Strength Screening
  - Health Risk Assessment and recommendations
  - Customized healthy lifestyle consult
  - Customized Community Resources Consult

While the first year will be at a zero or nominal cost to the employer, businesses will be offered the opportunity to continue in the program at a low cost, providing needed screenings and wellness education to their employees annually.

Regional Goals

- Triple Aim: assuring patients receive high-quality and patient-centered care, in the most cost effective ways
- Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our counties
- Further develop and maintain a coordinated care delivery system
- Improve outcomes while containing cost growth

This project directly impacts all of the region 6 goals. First, the provision of needed screening services to the key target population in the region is being provided at a relatively low cost, given that much of the needed resources already exist within the hospital. Expanding staff hours, increasing use of existing space and equipment, and building on patient records systems that already exist allow for economies of scale. The services will be provided by highly-trained professionals with a reputation for quality and in a patient-centered way that also supports local businesses. Many of the target population will not have previously accessed the local resources for receiving healthcare in the safety net or for finding funding for their care. Care coordination will be a key service to get these individuals started in a patient centered medical home.

Starting Point/Baseline:

While Hill Country Memorial Hospital’s companion program for the insured employed of large businesses has had a number of patients complete the program, this program targeted to the uninsured population has not yet been started. Additional information acquired through outreach and implementation-planning efforts will be key to designing a program that meets this population’s unique and ongoing needs. No care providers have yet been trained as the program is still in development.
Rationale:

Reasons for Selecting the Project
The strength and productivity of our workforce and student population depends on the good health of all residents. Unfortunately, many have jobs where health insurance is not offered, and many Texas industries are reducing health care coverage. Texas has a large and diverse population of uninsured and underinsured individuals, 80 percent of whom work or have a working family member. Under the Affordable Care Act, many more people will have access to affordable coverage in 2014. However, due to gaps in programs and the supreme court ruling that a Medicaid expansion is not mandatory, a sizeable population of Texans will continue to be uninsured. The uninsured are less likely to receive adequate care and often when they do, it comes later, with serious consequences such as increased mortality and lower quality of life. Furthermore, the uninsured and underinsured are less likely to receive the preventive care they need.

In addition, small businesses with less than 50 employees constitute 73 percent of all businesses in Texas. Of these small businesses, only 37 percent offer insurance. This is significantly below the 45 percent national average. Furthermore, only 35 percent of employees in small businesses that offered insurance actually enrolled, in comparison with 63 percent of employees in large businesses (IOM, 2003). This could be a result of small businesses offering less appealing or more expensive packages.

The uninsured are more likely to be hospitalized for problems that could have been prevented had they received appropriate and timely outpatient care. In the end, the cost of not seeking preventive care to individuals, employers, and communities, is staggering. Uncompensated care provided by Texas hospitals increased to more than $7.7 billion in 2003 from $3 billion in 1993 (Center for Health Statistics, 2004).

Overall, the uninsured receive less preventive care, are diagnosed at more advanced stages of disease, and once diagnosed, receive less therapeutic care than do the insured. Thus, lack of adequate insurance leads to premature death. The case of cancer, the second leading cause of death in Texas, is illustrative of this point. Individuals who are poor, lack health insurance, or otherwise have inadequate access to quality cancer treatment experience higher cancer incidence, higher mortality rates and poorer survival rates (IOM, 2002).

Unique Community Need
This project addresses two key RHP community needs. The first is CN.2: “A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions. Leading causes of death in RHP 6 include cardiovascular disease, cancer, and diabetes.” The project will very directly affect the health disparity in prevention efforts, specifically by providing screening for chronic diseases, including cardiovascular disease, cancer, and diabetes. If these diseases are caught in the pre-disease or early stages, interventions and outcomes are much less costly to the individual and community. The second key RHP need that this project addresses is CN.3: “Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages.” The project is specifically targeted to populations who are uninsured and takes place within the context of a region that has a provider shortage in uninsured and publicly funded patient primary care. Because there simply are not other options at the moment, this program will be an important “first step” into preventive care and wellness education, followed by navigation to sources of care for the long-term.

New Initiative for the Performing Provider
While Hill Country Memorial Hospital’s companion program for the insured employed of large businesses has had a number of patients complete the program, this program targeted to the uninsured population has not yet been started. Additional information acquired through outreach and implementation-planning efforts will be key to designing a program that meets this population’s unique and ongoing needs.

The Quality Improvement process of the project will include a thorough evaluation of program, implementation, and outreach effectiveness to take place in DY4. In DY5, course corrections indicated by this evaluation (the “check” stage of the PDCA cycle) will be implemented. In DY5, expansion plans and long-term sustainability of the project will be finalized.

Related Category 3 Outcome Measure(s):
Projects 136430906.3.1, 136430906.3.2, and 136430906.3.3 have as their goal the completion of 3 specific preventive care screenings for the target population, uninsured employees of Gillespie County businesses. These screenings are for cervical cancer, colorectal cancer, and high blood pressure, respectively. These goals are directly related to the work of the program, as the plan is to provide these three screening services, among others, to as many of the uninsured target population as are eligible for them per USPSTF guidelines. We believe that the most effective means to do this within our community is to partner with local businesses, strengthening their employee health. In 2010, researchers reviewed 36 studies of corporate wellness programs. They calculated that employers saved an average of $6 for every $1 spent, including $3.27 saved in medical costs and an additional $2.73 gained because of reduced absenteeism. An earlier analysis of 56 studies found that health promotion programs in organizations of all sizes reduced sick leave, health plan costs, and worker compensation and disability costs by about 25 percent. A major meta-synthesis of studies on workplace screening and wellness programs found even greater impact in many cases. Eight studies evaluated the impact of wellness programs on healthcare cost and all but 1 study found significant decreases. Effects included a reduction in direct medical cost between $176 and $1539 per participant per year. Four studies evaluated absenteeism costs, as defined by the estimated cost of missed workdays. Each of these studies found significant effects, expressed as an ROI of $15.60 per dollar spent, $1350 saved per employee in short-term disability costs, 0.1% point risk reduction in illness days, and $180 saved per participant per year.
Since the individuals in our program’s target population are not insured, then we can imagine that the costs attributed to medical cost savings here would be absorbed by the community while
the increased employee productivity would benefit the company directly. This means, that for the 500 individuals involved in the program, we could expect a reduction in healthcare costs to the community of up to $1,077,300 per year of the program. In addition, the savings in prevented lost productivity would equal up to 5% of employee payroll, or around $1,125,000 for 500 employees. Also, these studies have shown that the program has positive impact beyond immediate medical cost savings. Long-term benefits include decreased severity of or prevention of chronic disease, improvement in exercise, healthy diet, and physiologic markers and a decrease in smoking and alcohol use. In the long-run, a single hospitalization for cancer, diabetes, hypercholesteremia, or any of the other conditions being tested for would cost about $10,000 (http://www.beckershospitalreview.com/lists/average-cost-per-inpatient-day-across-50-states-in-2010.html). By identifying these conditions early, at least 25 such hospitalizations are likely to be prevented in the years after the program, providing at a minimum $250,000 in additional community benefits.

References:

Relationship to other Projects:
This project is also related to Category 4 population-focused measures for Potentially Preventable Admissions, RD-2. It is very likely that, in the short-term and the long-term, uninsured patients with ambulatory care sensitive conditions will be less frequent visitors to both the emergency room and inpatient units. If these conditions are caught early in the disease process, then care can be received in an appropriate setting. If the conditions are not screened for and noted early, patients are more likely to end up in the emergency or inpatient setting in either more critical condition or because they have no medical home.

Relationship to Other Performing Providers’ Projects in the RHP:

Plan for Learning Collaborative:
Lessons learned will be shared in the RHP Learning Collaborative and in conferences and other settings which will be set up following completion of the RHP Plan. They will be working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include the following: Identify participants, establish Learning Collaborative goals, develop a calendar of regular meetings, site visits, and/or conference calls, develop a plan to communicate ideas, data, and successes across the region and state, organize a learning event and invite experts and other Performing Providers from outside the region to share knowledge and best practices, and adopt metrics to measure success.

A website will be available to the Learning Collaboratives to network and share ideas.
challenges, and success stories with colleagues. RHP 6 hopes to make significant transformational progress on its project milestones to achieve waiver goals and share what we learn with the rest of the State. Hill Country Memorial Hospital anticipates significant involvement in contributing to and learning from our learning collaborative. Lessons learned will be shared along the way, allowing others to make course corrections noted through the experience of other performing providers.

Project Valuation:

This Category 2 project is valued at $2,625,518 for demonstration years 2-5. It is perfectly in line with the Triple Aim, providing high-quality screening and preventive services as well as rich wellness support for uninsured residents of our community. The program is cost effective due to the ability to utilize many existing hospital services and facilities to provide this important service. In addition, utilizing individuals working at the top of their license will ensure that patients are receiving best care at lowest possible cost. Within only 3 years of implementation, it is our goal to provide a very comprehensive health screening to 500 individuals, or 16% of the uninsured population in our immediate community. Once they have been screened and educated, we will also be ensuring that they are connected to ongoing sources of care, helping our uninsured neighbors to navigate their way through the local health system and any funding opportunities for which they may be eligible. Because the program is ongoing, the 500 individuals will have the opportunity to come back year after year if the business finds that it is useful for their employees. This will multiply the impact of the program.

There is a wealth of literature supporting high value preventive care, and increased focus on preventive care has been a major part of health reform discussions. The Partnership for Prevention, who published the paper, “Greater Use Of Preventive Services In U.S. Health Care Could Save Lives At Little Or No Cost,” did a cost-benefit analysis of 20 preventive health care services and “estimated how much in health care costs would have been saved in a given year if 90 percent of the population had used those services. For 2006, the year selected, the savings were estimated at $3.7 billion” (Health Affairs, 2010). Workplace wellness programs have been shown to be so successful that the Centers for Disease Control has commissioned an entire program to provide basic toolkits for businesses interested in providing this key service to employees.

Though the impact of the program will be on the community as a whole through improved wellness, early disease intervention, and decreased healthcare costs, employers participating in the wellness intervention will likely benefit as well.

The program will require a number of human resources, including physician, nurse practitioner, navigator/health educator, outreach, and administrative. In addition, existing hospital resources and equipment, such as mammography equipment, building space, lab supplies and staff will be leveraged. Outreach will require significant time and cost as the target population will need to be reached in a variety of ways.

Identifying Project and Provider Information:

Title: 2.4.2 Redesign to Improve Patient Experience
Unique RHP ID#: TPI 094154402.2.1 – PASS 1
Performing Provider: Methodist Hospital
Performing Provider TPI: 094154402

Project Summary:

Provider Description: Methodist Hospital, 45-0388, includes the campuses of six acute care hospitals: Methodist Hospital, Methodist Children’s Hospital, Methodist Specialty and Transplant Hospital, Northeast Methodist Hospital, Metropolitan Methodist Hospital, and Methodist Texan Hospital. For more than 49 years Methodist has provided high quality care to patients from San Antonio and throughout South Texas.

Intervention(s): This project aims to improve how patients experience the care and the patient's satisfaction with the care provided. One large challenge we face is that positive outcomes in healthcare are dependent not only upon the clinical success of treatment, but also upon a patient's perception of the overall experience, which improves compliance and understanding. This experience is comprised, in part, of communication with the caregivers regarding different aspects of the process, as well as the level of service with respect to clean/quiet environment for healing and a responsive staff aimed at meeting needs in a timely manner. In order to better partner with our patients to round out this overall experience, focus upon patient satisfaction metrics and methods to achieve improvement thereof is necessary.

Need for the project: A review of Methodist Hospital’s patient satisfaction scores and the correlation to quality patient care has shown a need in the community for this project. This project was selected due to the identification of a gap in actual versus desired patient engagement, as positive experiences contribute to positive outcomes. We have a diverse community with specific needs across gender, age, race and religion. Identifying the needs and meeting them in a better fashion will help improve understanding and end results. In fact, the most recent CMS data uploaded in October, 2012 indicates that San Antonio is significantly lower in every category than both the Texas and the U.S. averages. While we considered addressing option 2.4.1 as well, we ultimately decided that it was less appropriate for Methodist Hospital as we feel that would be a step backward. The facilities have already initiated significant efforts toward identifying the need to focus upon patient experience, collecting the data, engaging a vendor, and identifying paths for improvement.

Target population: The project will benefit all patients who have services at Methodist Hospital and submit a patient satisfaction survey. Approximately 30% of the total patients seen at Methodist Hospital are either Medicaid and/or indigent patients and are expected to benefit from this project.

Category 1 or 2 expected patient benefits: This project seeks to improve patient satisfaction scores by 4% by DY 5. The patient experience assessed will allow our patients to actively participate in changing the culture of healthcare in our hospital. With improvements to the patient experience, we anticipate the quality of care and outcomes to improve in alignment with the patient experience. Approximately 7,000 patient satisfaction surveys are completed per year at MHS. MHS will establish a baseline for patient satisfaction sample size during DY 3. It is estimated that the sample size of patient satisfaction surveys will increase by 2% of baseline in DY 4 and 4% of baseline in DY 5. Methodist Hospital estimates that approximately 30% of these patient are indigent and Medicaid patients.

Category 3 outcomes: Our goal is to improve 4% over baseline for Customer
Engagement scores by DY5.

**Project Description:**

This project aims to improve how patients experience the care and the patient's satisfaction with the care provided. We utilize the patient satisfaction survey tools, as well as other internal, more real-time solutions in order to obtain feedback regarding all aspects of the patient experience. These combined sets of metrics will help us direct our dedicated executive to improve patient satisfaction scores by 4% by the end of 5 years. A newly created position will spend the next six months working with our current Coach to learn the skills and mechanisms they utilize to train our staff on customer engagement tactics. At the end of the training period, this person will be dedicated to the system, traveling among all our campuses to coach and train our staff and management toward better patient experiences.

One large challenge we face is that positive outcomes in healthcare are dependent not only upon the clinical success of treatment, but also upon a patient's perception of the overall experience, which improves compliance and understanding. This experience is comprised, in part, of communication with the caregivers regarding different aspects of the process, as well as the level of service with respect to clean/quiet environment for healing and a responsive staff aimed at meeting needs in a timely manner. In order to better partner with our patients to round out this overall experience, focus upon patient satisfaction metrics and methods to achieve improvement thereof is necessary.

Methodist understands that continuous quality improvement is at the heart of this project. Therefore, in the implementation of this project, Methodist will endeavor for continuous quality improvement by monitoring the patient volumes and patient utilization to ensure that progress is being made towards meeting the project milestones. Additionally, Methodist will ensure that all methodologies used will meet or exceed any applicable nationally recognized protocol or quality benchmarks.

This project is aligned with the following Region 6 goal:

- Triple Aim: assuring patients receive high-quality and patient-centered care, in the most cost effective ways

**Starting Point/Baseline:**

As of December 1, 2011, the MHS system averaged a 68.7 on the internal patient satisfaction metrics. There was no dedicated executive to improve these results.

**Rationale:**

This project was selected due to the identification of a gap in actual versus desired patient engagement. Our patients are telling us we can and should do better. As positive experiences contribute to positive outcomes, we think this is an important component of our plan. We have a diverse community with specific needs across gender, age, race and religion. Identifying the needs and meeting them in a better fashion will help improve understanding and end results.

The San Antonio area generally lags the national average in publicly available patient experience and engagement scores. In fact, the most recent CMS data uploaded in October, 2012 indicates that San Antonio is significantly lower in every category than both the Texas and the U.S.
averages. Additionally, Methodist is consistently on the lower end of the spectrum when compared to its local peers.

Our campuses of Methodist Hospital have most recently individually approached patient experience improvement efforts, with little result. Trends have been flat and unsuccessful at changing the overall tone of the patient’s care. We feel that adding a dedicated position with ownership in the system, rather than through a consulting arrangement, will increase buy-in and drive results in a timely and effective manner.

This project address the Community Needs Assessment for this item:

CN.1 - Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.

**Related Category 3 Outcome Measure(s):**

**TITLE OF OUTCOME MEASURE:** IT-6.1 Percent improvement over baseline of patient satisfaction scores

The intent of the HCAHPS initiative is to provide a standardized survey instrument and data collection methodology for measuring patients' perspectives on hospital care. The surveys are designed to produce comparable data on the patient's perspective on care that allows objective and meaningful comparisons between institutions on domains that are important to consumers. Public reporting of the survey results is designed to create incentives for institutions to improve their quality of care. Public reporting will serve to enhance public accountability in health care by increasing the transparency of the quality of institutional care provided in return for the public investment.

**Relationship to other Projects:**

This project is aligned with the wavier goals assuring patients receive high-quality and patient-centered care, in the most cost effective ways for all types of care. This project can interrelate with all Wavier projects.

**Relationship to Other Performing Providers’ Projects in the RHP:**

Unknown at this time.

**Plan for Learning Collaborative:**

Following completion of the RHP plan, University Health System (anchor) will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include goals, regular meetings, site visits, conference calls, communication plan development, organizing learning event, and adopt metrics to measure success.
**Project Valuation:**

In determining the value of this project, Methodist analyzed the needs of the community, the number of patients reached by the project, the value of the anticipated benefit to health outcomes in the community, the time, the effort, and clinical expertise involved in implementing the project, the clinical resources required to perform the project, and the anticipated value of the improvement of delivery of care to the community.

**Identifying Project and Provider Information:**

| Title: 2.8.11 Apply Process Improvement Methodology to improve quality/efficiency: Sepsis |
| Unique RHP ID#: 094154402.2.2 – PASS 1 |
| Performing Provider: Methodist Hospital |
| Performing Provider TPI: 094154402 |

**Project Summary:**

Provider Description: Methodist Hospital, 45-0388, includes the campuses of six acute care hospitals: Methodist Hospital, Methodist Children’s Hospital, Methodist Specialty and Transplant Hospital, Northeast Methodist Hospital, Metropolitan Methodist Hospital, and Methodist Texan Hospital. For more than 49 years Methodist has provided high quality care to patients from San Antonio and throughout South Texas.

Intervention(s): This project will improve process methodology for Sepsis Bundles. Sepsis is a leading cause of hospital mortality in Bexar County.

Need for the project: Rationale for selecting this sepsis project is the high mortality rate in this population and the known evidenced-based care bundles for decreasing mortality in this population. The improvement requires significant planning, development of metrics, tools and education of all stakeholders.

Target population: Low income patients often have a delay in seeking care for infections which increase the chance for sepsis, and difficulty obtaining antibiotic therapy initially as well as post discharge. These elements will be measured with protocols developed to minimize these outcomes. A significant percentage of patients are either Medicaid and/or indigent patients and are expected to benefit from this project.

Category 1 or 2 expected patient benefits: The expected patient benefit is to improve the number of eligible patients that receive at least one (Resuscitation or Maintenance) Sepsis Bundle by 25% of baseline by DY5. The benefit of this project is to decrease the amount of patients who expire with sepsis. Approximately, 2500 patients per year are diagnosed with sepsis. We estimate that 50% of these will be eligible for Sepsis Bundles given their blood pressure and initial lactate levels. Approximately 18% of the 2500 patients diagnosed with sepsis annually are Medicaid recipients or uninsured.

Category 3 outcomes: Category 3, IT-4.8 Sepsis Mortality. Outcome measure will be Number of patients expiring during current month with sepsis / Number of patients identified that month with sepsis. Goal is to improve the mortality of eligible patients by at or below expected (observed/expected mortality ratio to 1.0 or lower) by DY5.

**Project Description:**

Sepsis is a leading cause of hospital mortality at Methodist Hospital. Our sepsis mortality are not statistically different than the risk-adjusted expected mortality rates, yet there is still opportunity for prevention, early recognition and aggressive care by well-defined sepsis care bundles.

This project involves care in the Emergency Department (ED), Critical Care Units (CCU), and regular in-patient unit. It involves nursing, laboratory staff, physicians, patients and families.

Patients with a diagnosis of Sepsis have a significant mortality. Early diagnosis and aggressive intervention with evidence based care protocols (care bundles) have been proven to significantly lower these patient’s mortality. The challenge is to set up systems of care in the Emergency Room and in-patient hospital to implement these proven strategies. The structured education,
protocols and electronic health record interventions will greatly enhance this process. This requires systems of coordinated, multi-disciplinary care that have traditionally been difficult in “silos” of the acute care hospital. The proposed interventions listed in this improvement project will ensure that this evidence-based care is provided in a timely and appropriate manner. Methodist understands that continuous quality improvement is at the heart of this project. Therefore, in the implementation of this project, Methodist will endeavor for continuous quality improvement by monitoring the patient volumes and patient utilization to ensure that progress is being made towards meeting the project milestones. Additionally, Methodist will ensure that all methodologies used will meet or exceed any applicable nationally recognized protocol or quality benchmarks.

Challenge: Sepsis is a rapid killer affecting millions of human population worldwide and studies have recorded that the mortality rate due to sepsis has been as alarming as one in four (or even more). It is a complex disease which is difficult to identify and treat. A challenge will be the ability to clearly define the disease and identify the targeted population of patients who will specifically benefit from that intervention. MHS plans to develop management strategies to ensure compliance with the sepsis bundles in order to decrease hospital mortality due to severe sepsis.

This project is aligned with the following Region 6 goals:

- Triple Aim: assuring patients receive high-quality and patient-centered care, in the most cost effective ways
- Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our counties
- Further develop and maintain a coordinated care delivery system
- Improve outcomes while containing cost growth

**Starting Point/Baseline:**
Baseline will be developed in DY3.

**Rationale:**
Rationale for selecting this sepsis project is the high mortality rate in this population and the known evidenced-based care bundles for decreasing mortality in this population. The improvement requires significant planning, development of metrics, tools and education of all stakeholders. This is expected to be a multiple year process. This addresses Category 2.8.11, Applying Process Improvement methodology to Improve Quality/Efficiency. Subsection of Sepsis Mortality IT – 4.8 Sepsis Mortality. This project is timely for our Hospital and has been identified as a key element in our Clinical Efficiency (CE) hospital plan.

This project address the Community Needs Assessment for these items:

CN.1 - Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.

CN.2 - A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions. Leading causes of death in RHP 6 include cardiovascular disease, cancer, and diabetes.
CN.3 - Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages.

Related Category 3 Outcome Measure(s):

Category 3, IT-4.8 Sepsis Mortality. The primary metric is risk-adjusted sepsis mortality. The risk-adjusted expected values for mortality, length of stay, and cost are calculated through regression analysis. Components include patients age, sex, zip code, primary and secondary diagnoses. This is a well validated tool for risk adjustment.

In addition to risk-adjusted improvements in sepsis mortality, we will be measuring the use of specific bundles of care (early recognition tool, resuscitation bundle, and management bundle) in the Emergency Department, Critical care unit, and in-hospital units.

Low income patients often have a delay in seeking care for infections which increased the chance for sepsis, and difficulty obtaining antibiotic therapy initially as well as post discharge. These elements will be measured with protocols developed to minimize these outcomes.

In Category 2, MHS will be measuring patients using the Sepsis Management Bundle [Evidence-based goals that must be completed within 24 hours for patients with severe sepsis, septic shock and/or lactate > 4 mmol/L (36 mg/dl)] with at least one sepsis bundle- Early Recognition Tool, Resuscitation or Maintenance. In Category 3, MHS will be measuring the number of patients expiring from sepsis divided by total sepsis patients.

Relationship to other Projects:

This project is related to other RHP interventions MHS 094154402.1.1- Telemedicine (1.7) for early diagnosis and intervention opportunities at remote sites, and expanding Specialty Care Capacity for improved hospital care and outpatient infection management.

Relationship to Other Performing Providers’ Projects in the RHP:

Sepsis is a common project in other hospitals in the region. The practices and outcomes will be shared across the region as well as nationally in peer reviewed publications. Regional Chief Medical Officers have a regular meeting to discuss shared clinical improvements, and sepsis is a frequent topic because of its cost and clinical impact.

Plan for Learning Collaborative:

Following completion of the RHP plan, University Health System (anchor) will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include goals, regular meetings, site visits, conference calls, communication plan development, organizing learning event, and adopt metrics to measure success.

Through the regional Chief Medical Officers forum sponsored by the Texas Hospital association,
best practices are shared and published on the THA website. The region-wide EMS system can also be involved in pre-hospital diagnosis and urgent intervention in sepsis. The community can be informed about sepsis through local media public relations and hospital newsletters.

<table>
<thead>
<tr>
<th>Project Valuation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>In valuing this project, Methodist took into account the extent to which the Improvement in Sepsis would potentially meet the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.</td>
</tr>
</tbody>
</table>

The Improvement in Sepsis Mortality will **save lives of citizens in the community**. This directly addresses the goals by **implementing proven evidenced-based clinical methodology to improve care in this devastating illness**. Methodist took these factors into account when determine the incentive value of this project.”

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $9,680,200**
**Identifying Project and Provider Information:**

| Title: 2.1.1 Enhance/Expand Medical Homes: Nix Health Medical Homes |
| Unique RHP ID#: 112676501.2.1 – PASS 1 |
| Performing Provider: Nix Health Care System |
| Performing Provider TPI: 297342201 *(old TPI 112676501)* |

**Project Summary:**

**Provider Description:** Nix Health Care System is a 297 licensed bed (160 operating beds), multi-campus provider of inpatient and outpatient acute care services, psychiatric services, physical rehabilitation services and home care services. The primary service area is comprised of Bexar County, Texas and parts of the surrounding seven counties.

**Intervention(s):** This project will implement the Medical Home Model in at least 1 primary care clinic, to strengthen the clinician-patient relationship and replace the episodic care with coordinated care and long-term healing relationships.

**Need for the project:** Our region has identified community needs of (a) improved quality and patient satisfaction, (b) improved prevention and management of chronic diseases and (c) a documented health care shortage. We feel this project addresses each of these needs.

**Target population:** The clinic we have identified as being our first Medical Home is staffed by 2 Board Certified Geriatricians, as such, the target population of the clinic will be patients aged 55 and older. Most patients are expected to be Medicare-eligible patients, with approximately 15%-25% currently either Medicaid-eligible or dual-eligible. With the impending changes to the Medicaid eligibility, coupled with the increasing poverty rates among the elderly, this rate could be as high as 45-50% within the next few years.

**Category 1 or 2 expected patient benefits:** The project seeks to obtain Medical Home Accreditation by DY3 and achieve the goal of 85% of clinic patients being able to identify their usual source of care as being managed in a Medical Home by DY5. Since the physicians are new to the market, we expect the patient volume to grow over the next 3-5 years. We are expecting around 1,900 patients by the end of DY2, with a 10% increase annually over the next 3 years: 2,090 by end DY3, 2,299 by end DY4 and 2,529 by end DY5.

**Category 3 outcomes:**

- **IT.12.1** Our goal is to improve Breast Cancer Screening Rate (annual mammograms) for women aged 40 to 69 (improvement percentage TBD)
- **IT.12.3** Our goal is to improve Colorectal Cancer Screening Rate for adults aged 50 to 75 (improvement percentage TBD)
- **IT.12.4** Our goal is to improve Pneumonia Vaccination Status for adults aged 65 and older (improvement percentage TBD)
**Project Description:**

**Project Description**
Nix Health has recruited 2 new physicians to the market (Q4 DY1) and they plan to base their Provider Based Clinic around the Patient Centered Medical Home Model (PCMH). They are Family Practice physicians, and Board Certified in Geriatric Medicine. Their main clinic will be located in the medical offices of Nix Health in Downtown San Antonio, with some potential satellite locations throughout Bexar County. The physicians plan to center their practice around patients aged 55 and older. Due to the age of the expected patients for this clinic, we predict that a large percentage of patients will be Medicare-eligible, but we anticipate up to 25% of the patients to be Medicaid-eligible, dual-eligible or medically indigent. The patient navigator, which is a critical part of the PCMH Model, will help patients coordinate and receive the care they need in the most appropriate setting. This will be of particular importance for patients that may lack financial resources or family support.

The physicians are new to the market, and will be in a period of growth for 3-5 years while they build their patient base. For the valuation of this project, we are anticipating 1,900 unique patients by the end of DY2, with a 10% increase each year: 2,090 by end DY3, 2,299 by end DY4 and 2,529 by end DY5. Texas has one of the highest poverty rates in the nation, and the Supplemental Poverty Measure released by the U.S. Census Bureau in 2011 demonstrates that the official poverty measures drastically underestimate the poverty level for people aged 65 and older, as it does not take into account variations in health care spending across age groups despite differing health status, insurance coverage and rising medical costs in the elderly.

As we begin to implement the PCMH Model in this clinic, we will evaluate additional existing or new Provider Based Clinics for the PCMH model. The PCMH provides a “home base” for patients and a health care team tailors services to a patient’s unique health care needs, effectively coordinates the patient’s care across inpatient and outpatient settings, and proactively provides preventive, primary, routine, and chronic care. In RHP 6, quality improvements, patient satisfaction and the management of chronic diseases have been identified as key needs for the region (CN.1 & CN.2). The Nix Medical Homes will address all of these issues currently being faced within the region.

**Goals and Relationship to Regional Goals**
Over the course of the next 4 years, the Nix Medical Homes will improve patients’ access to care by striving to offer same-day appointments and will assist the patients in obtaining routine preventive care services, like annual wellness exams, vision screenings, mammograms, vaccines, etc. The Medical Home Care Team will also utilize alternative methods (telephone, group visits, etc.) to communicate with the patients.

**Project Goals:**
- Obtain medical home recognition by a nationally recognized agency
- Increase the percent of medical home patients that are able to identify their usual source of care as being managed in medical homes
- Expand interaction types between patients and healthcare team beyond on-to-one visits to include group visits, telephone visits, and other interaction types and focus these efforts on reaching patients within 2 business days of discharge to address any...
questions or concerns they have regarding their post-discharge medications and plan on care.

The project meets the following regional goals:
• Improve outcomes while containing cost growth
• Assuring patients receive high-quality and patient-centered care, in the most cost effective ways

Challenges
One of the biggest challenges we face in implementing a Medical Home Model is patient education regarding the differences between a Medical Home and a traditional primary care practice. This patient education will be an ongoing task.

5-year Expected Outcomes for Performing Provider and Patients
Nix Health expects to see a strengthened clinician-patient relationship that replaces episodic care with coordinated care and a long-term healing relationship. The physicians will lead care teams that take collective responsibility for patient care, preventive services, and making arrangements with other health care providers for specific needs. Expected outcomes will relate to the project goals described above.

Starting Point/Baseline:
Nix Health does not currently operate or partner with any Medical Homes, so this project will be a new undertaking with the patients currently served by the Medical Home model being zero. We plan to begin implementing the Medical Home methodologies and establish baselines and targets in DY2.

Rationale:
Reason for selecting this project
Primary care is a critical part of our healthcare continuum. Not only does primary care provide patients and physicians a preferred access point, it is critical to the patient’s ability to access needed services and other levels of care in an appropriate and efficient manner. Being underserved from a primary care standpoint (CN.3) creates barriers for patients, places undue burden on existing providers and encourages inappropriate utilization of health care resources which drives up health care costs and increases inefficiency. This fragmentation can be very confusing and burdensome to patients, especially those with chronic diseases (CN.2). The Nix currently does not operate any Medical Homes so we have elected Project Option 2.1.1.

While patients aged 55 and older are not typically the focus of Medicaid projects, it has been noted that Texas has one of the highest poverty rates in the nation at 17.8%. However, a recent report from the U.S. Census Bureau demonstrates that the official poverty measure drastically underestimates the poverty rate of the elderly, by not taking into consideration the rising medical costs, declining health status and insurance coverage. This report shows that the Supplemental Poverty Measure for the elderly was 75% higher than the Official Poverty Measure when these age variables were taken into consideration.
Project Components
Through the Nix Medical Home project, we propose to meet all of the required project components:

a) Utilize a gap analysis to assess and/or measure hospital-affiliated and/or PCP’s NCQA PCMH readiness
   Will compare NCQA PCMH requirements to the existing practices in place in the clinic and identify what would need to change within the existing clinic model in order to be compliant

b) Conduct feasibility studies to determine necessary steps to achieve NCQA PCMH status
   Once we understand the gaps that exist, we will outline the necessary steps in order to become compliant with NCQA’s recommendations

c) Conduct educational sessions for primary care physician practice offices, hospital board of directors, medical staff and senior leadership on the elements of PCMH, its rationale and vision
   We will educate all key stakeholders on the steps that are necessary and the elements of a PCMH, as well as the expected outcomes.

d) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.
   As we begin implementation we will continually review our results and identify opportunities to apply some or all of the Medical Home Models concepts to other primary care clinics in order to reach a broader patient population.

Milestones and Metrics Chosen
Since we are starting from a baseline of no Medical Homes, DY2’s milestones and metrics will focus on implementing the practices of a medical home, building our team, and educating our staff on PCMH change concepts. Once policies and practices are in place, we will begin some improvement milestones in DY3 which will also carry over to DY4 and DY5 with increasing targets in each subsequent year. The first improvement milestone we will track is the patient’s ability to identify the medical home as their usual source of care. The reason we selected this milestone is it speaks directly to the patient’s participation in the Medical Home concept. Without patient involvement, the model does not work as intended. Secondly, in DY3 we will implement a process milestone to track the current rate of identifying and reaching out to patients that need to be scheduled for preventive care. This milestone directly relates to our category 3 outcome improvement measures for DY4 and DY5. In DY5, an improvement milestone will be used to ensure we are reaching, at a minimum, the number of patients we expect to be reaching by that point in time. This milestone was chosen for DY5 since the clinic is still in its infancy and working to grow its patient base. And finally, we will also be tracking the process milestone of documented expanded interaction types beyond one-to-one visits as this is key to the patient feeling that they are getting the information and education in a format that is the most beneficial for them.
**Unique Community Needs Identification Numbers this project Addresses**

- CN.1 – Improve quality and patient satisfaction
- CN.2 – Improve prevention and management of chronic diseases
- CN.3 – Address health care shortage

The goal of the PCMH will be to improve quality (CN.1), improve patient satisfaction (CN.1), and improve prevention and management of chronic diseases (CN.2). Given that the physicians who are partnering with us for the implementation of the Medical Home are new to the region, we are also addressing the existing health care shortage (CN.3). We will identify lessons learned and opportunities to scale all or part of the medical home project to a broader patient population.

**How does this project represent a new initiative or significantly enhances an existing delivery system reform initiative.**

*Nix Health has not implemented or worked directly with any Medical Home Models in the past, so this is a new initiative.* This initiative, or related activities, is not being funded in whole or part by the U.S. Department of Health and Human Services.

**Related Category 3 Outcome Measure(s):**

OD-12 Primary Care and Primary Prevention

IT-12.1 Breast Cancer Screening: Number of women aged 40 to 69 that have received an annual mammogram during the reporting period

IT-12.2 Colorectal Cancer Screening: Number of adults aged 50 to 75 that have received one of the following screenings: Fecal occult blood test yearly, Flexible Sigmoidoscopy every five years, Colonoscopy every 10 years

IT-12.4 Pneumonia vaccination status for older adults: Number of adults aged 65 and older that have ever received a pneumonia vaccine

One of the primary functions of the Medical Home will be to proactively provide preventive, primary, routine and chronic care and tracking these preventive screening initiatives directly correlates to the goal of the PCMH.

**Reason/rationale for selecting these outcome measures:**

As is outlined in the RHP6 Community Needs Assessment, there is a high prevalence of chronic disease and one of the leading causes of death is cancer. Through IT-12.1 and IT-12.2, patients will be encouraged to be proactive in the screening for cancer to improve their outcomes by catching the cancer sooner. The Pneumonia vaccination provides protection for older adults whose health could be jeopardized by pneumonia due to other chronic health conditions. Focusing on prevention improves outcomes and reduces the burden (physical, emotional, and financial) of more extensive disease. This is particularly important in low-income populations.
**Relationship to other Projects:**
Given that the 2 physicians that will be operating the Medical Home are newly recruited to the region, this project also relates to projects that fall under Category 1.1: Expand Primary Care Capacity. The physicians were recruited in DY1 and relocated to the area in Q4 DY1. However, given the nature of their practice heading towards the Medical Home Model, we felt it was best represented as a Category 2.1 project and incorporated the value of the expanded capacity into our valuation methodology.

The Nix Medical Home project is directly related to several Category 4 measures:
- Potentially Preventable Admissions: Through increased access to Primary Care and better methods to monitor patients’ chronic conditions, preventable admissions will be reduced (CHF, diabetes, behavioral health, COPD, Asthma, etc.)
- 30-Day Readmissions: When a patient has access to outpatient care post-discharge, the rate of readmission decreases. It will be vital to ensure that patients are scheduled for a follow-up appointment with the Medical Home physician shortly after discharge to ensure the patient has all of their questions answered pertaining to at-home care.
- Patient-centered healthcare: The Medical Home Model is centered around the patient, so inherently patient satisfaction and medication management will be improved.

**Relationship to Other Performing Providers’ Projects in the RHP:**
Currently, for Pass 1 projects, both CHRISTUS Santa Rosa and University Health Systems have proposed projects that would allow them to expand their Medical Home Models. Nix Health will reach out to these other performing providers to share lessons learned and identify opportunities for improvement.

**Plan for Learning Collaborative:**
We plan to work with other Performing Providers from the region and participate in learning collaboratives, whether it be communicating via email, phone, webinars or face-to-face meetings.

**Project Valuation:**
The Medical Home Model will reduce the occurrence of duplicate tests and procedures and reduce overutilization of health care services and will reduce ER visits. A recent study on the outcomes of medical homes demonstration projects tracked the hospitalization reduction rate and ER visit reduction and estimated the total savings per patient enrolled in a medical home model being between $71 and $640, with some as high as $1,650 savings per year. For DY2 we have calculated this portion of the value as 1900 covered lives times $640 per year ($1,216,000 in DY2) and increasing 10% per year over the remaining years of the waiver.

Also, since these are new physicians to the market, and their clinic volume is not being valued separately in another DSRIP project, we can also assume value above and beyond the medical home model. Through adding Primary Care Clinics in underserved areas, access to quality care will be achieved. Currently, patients in underserved areas delay care until the condition worsens, and they seek care through Emergency Rooms which is more costly and less efficient. By adding physicians, separate and distinct from the medical home concept, we will be covering more lives and will see a reduction in ER visits. The geriatric patients they are serving are at
higher risk of ER visits and admissions so it is safe to assume each MD seeing patients would result in 20 fewer ER visits per month at a cost avoidance of $1,318\textsuperscript{2} per avoided ER visit by the end of DY5. Also, through expanded access to primary care on an outpatient setting, patients will be better able to manage their chronic diseases rather than delaying treatment and ultimately needing hospitalization. For each MD, we are conservatively estimating a reduction in need for admission by 10 per month by the end of DY5 at a cost avoidance of $5,359\textsuperscript{3} per avoided admission. We recognize that these physicians are new to the market and have not yet established a full patient panel so we have scaled back the valuation in DY2 to reflect only 4 avoided ER visits per month per MD and 2 avoided Med/Surg admissions per MD, for a DY2 value of $383,760. This, along with the valuation for Medical Homes brings the valuation for DY2 to $1,599,760 and this would increase to over $3.5M by DY5.

Footnotes:

### Identifying Project and Provider Information:

| Title: 2.8.1 Design, develop, and implement a program of continuous rapid process improvement that will address issues of safety, quality, and efficiency within the Nix Geriatric Med/Surg Inpatient Population |
| Unique RHP ID#: 112676501.2.2 – PASS 1 |
| Performing Provider: Nix Health Care System |
| Performing Provider TPI: 297342201 *(old TPI 112676501)* |

### Project Summary:

**Provider Description:** Nix Health Care System is a 297 licensed bed (160 operating beds), multi-campus provider of inpatient and outpatient acute care services, psychiatric services, physical rehabilitation services and home care services. The primary service area is comprised of Bexar County, Texas and parts of the surrounding seven counties.

**Intervention(s):** This project will utilize continuous rapid process improvement programs to identify and implement best practices that will help improve the safety, quality and efficiency of the care for our geriatric patients during hospitalization. Physicians will be educated on the findings, and encouraged to admit their medical/surgical elderly patients to the ACE Program (Acute Care for the Elderly) where these process improvement interventions will be applied and the patient will be cared for using an interdisciplinary team approach.

**Need for the project:** Texas as a whole ranks last in the nation in health care quality and our region in particular has a high prevalence of chronic disease in the elderly. This project will address the patient holistically during their hospitalization rather than focusing solely on the acute illness. And while patients age 65+ are not typically the focus of a Medicaid-related program, it cannot be ignored that Texas ranks as one of the highest in the nation for poverty, with the elderly being at great risk for poverty given their declining health status and increasing medical costs. A recent report from the U.S. Census Bureau in 2011 demonstrates that the official poverty measure drastically underestimates the poverty level of the elderly since age-related variables are not taken into consideration. The report indicates that the Supplemental Poverty Measure is 75% higher for the elderly than the official poverty measure.

**Target population:** This project targets mostly Medicare-eligible patients, but historically 15% to 25% of our medical/surgical admissions for patients aged 65 and older have been dual-eligible or medically indigent. However, the above-referenced U.S. Census Bureau report indicates that the percent of medically-indigent elderly patients may be much higher than the percentage that are Medicaid- or dual-eligible. The declining health status and increasing medical costs place the elderly at great risk of poverty and this project’s goal of improved health outcomes during hospitalization will help address some of the risk factors associated with poverty in the elderly. With the impending changes to the Medicaid program, coupled with the increasing poverty rates among the elderly, this rate could be as high as 45-50% within the next few years.

**Category 1 or 2 expected patient benefits:** The project seeks to have at least 55% of our medical/surgical (non-ICU) patients enrolled in the ACE Program by DY5. In DY1, Nix Health had 1,336 Med/Surg (non-ICU) patients that were aged 65+. This volume is expected to grow, but conservatively we expect to treat 735 patients using the ACE model annually in DY5.
Category 3 outcomes: IT.3.1 Our goal is to reduce all-cause 30-day readmission rates for patients admitted to the ACE Program (improvement target percentage TBD)

**Project Description:**

**Project Description**

In DY1, nearly half of the med/surg patients admitted to Nix Health that were not ICU patients were age 65 and older, and that percentage is expected to grow in the coming years. Recognizing this, and the challenges that are faced by elderly patients when they are hospitalized, we plan to test and implement measures related to this group of patients. Similar to the process improvement practices implemented by the NICHE program, we will identify evidence based practices that may help improve the safety, quality and efficiency of the geriatric patients during their hospitalization, and work to incorporate these practices into the care these patients receive during their stay and post-discharge.

Nix Health has begun testing some of these performance improvement initiatives in DY1 with a select group of patients. Internally these patients have been categorized as “ACE” patients, which stands for Acute Care of the Elderly. We have been operating a Virtual ACE Program (not tied to a specific physical location) for select physicians’ elderly patients during a trial period (DY1) and our plan is to expand and open the ACE Program to any physician for their Medical or Surgical patients aged 65+ while we continue to test and implement evidence-based practices to improve their quality and outcomes.

In DY1, Nix Health treated 1,336 Med/Surg, non-ICU patients that were aged 65+. As the elderly population grows and Nix development efforts successfully increase Med/Surg volume, we expect that number to increase over the next few years. However, conservatively holding that figure constant, we expect to treat 45% of these patient using these ACE protocols by DY3 (601 patients annually) and increasing to 55% by DY5 (735 patients annually).

While patients aged 65 and older are not typically the focus of Medicaid projects, it has been noted that Texas has one of the highest poverty rates in the nation at 17.8%. However, a recent report from the U.S. Census Bureau demonstrates that the official poverty measure drastically underestimates the poverty rate of the elderly, by not taking into consideration the rising medical costs, declining health status and insurance coverage. This report shows that the Supplemental Poverty Measure for the elderly was 75% higher than the Official Poverty Measure when these age-related variables were factored in.

**Goals and Relationship to Regional Goals**

Research has shown that the ACE model, which is dedicated to recognizing the unique needs of geriatric patients through a collaborative team-based approach, allows elderly patients to avoid the functional decline that can occur during hospitalization. The overarching goal of the ACE program is to allow patients to return to the living situation they had been in prior to entering the hospital.

Over the course of the next 4 years, Nix Health will implement evidence-based practices aimed at improving the quality, safety and efficiency of care given to these elderly patients.
Project Goals:

- In DY2, we will identify target metrics that we will be tracking, such as LOS, medication costs, falls, discharges to ‘home’, etc. and develop a dashboard to allow us to track these metrics effectively over time.
- Also, we will continue to engage our physicians in the concepts of affecting outcomes through evidence-based practices and encouraging them to utilize the ACE program for their elderly patients.
- We will continually review and analyze the data, and identify at least one area of improvement annually. We will then research and implement evidence-based approaches to impact the identified improvement target. We will subsequently report on our findings to our key stakeholder.
- To measure our progress toward goal, we will annually measure the percent of med/surg admissions (non-ICU) aged 65+ that are admitted through the ACE program as a measurement of our physician engagement with the program and its concepts.

The project meets the following regional goals:

- Improve outcomes while containing cost growth
- Assuring patients receive high-quality and patient-centered care, in the most cost effective ways

Challenges

The biggest hurdle we face in expanding the program is to educate the physicians on what the program is and how it can benefit their patients. During DY1 we have met with some resistance from physicians who feel that an interdisciplinary team approach to patient care can be intrusive into their thoughts on how to practice medicine, so we are continually educating our physicians on what the program is and the benefits it can have on their patients.

5-year Expected Outcomes for Performing Provider and Patients

Through increased physician education and improved understanding and by sharing the findings of our own internal process improvements, our goal over the 5 years is to have at least 55% (735) of the Med/Surg patients age 65+ admitted through the ACE program by DY5. This project is directly related to the regional goal of improving quality and patient satisfaction (CN.1)

Expected outcomes will relate to the project goals described above.

Starting Point/Baseline:

Using DY1 (Oct 2011-Sept 2012) as the starting point, Nix Health had 2,903 Med/Surg Admissions (all ages) and 134 of those were ICU patients. Of the 2,769 non-ICU patients, 1,336 were 65+ (48%). However, only 157 were admitted to the ACE program which equates to 12% of the age 65+ non-ICU admissions. Our goal for DY3 is to have 45% of the age 65+ non-ICU med/surg admissions be admitted to the ACE program, with that percentage increasing to 55% by DY5 (735 patients annually).
Rationale:

**Reason for selecting this project**

Nix Health feels this project is an integral part of addressing the needs of our community. As stated in the RHP6 Community Needs Assessment, Texas ranks last in the nation on health care quality (CN.1) and this project will improve both quality and patient satisfaction. Also, there is a high prevalence of chronic disease in our aging population (CN.2) and addressing the needs of the elderly during their hospitalization will assist them post-discharge as well. While this project could have been divided up into other smaller projects, like a stand-alone Care-Transitions Program Implementation, or Medication Management process improvement, we felt the initiatives being undertaken by Nix Health to improve the safety, quality and outcomes of the geriatric population were best suited to the Category 2.8 project of *Design, develop, and implement a program of continuous rapid process improvement that will address issues of safety, quality, and efficiency*. This project will allow us to incorporate medication management and care transitions programs, along with other interventions, to address multiple needs of the aging population.

And while patients aged 65 and older are not typically the focus of Medicaid projects, it has been noted that Texas has one of the highest poverty rates in the nation at 17.8%. However, a recent report from the U.S. Census Bureau demonstrates that the official poverty measure drastically underestimates the poverty rate of the elderly, by not taking into consideration the rising medical costs, declining health status and insurance coverage. This report shows that the Supplemental Poverty Measure for the elderly was 75% higher than the Official Poverty Measure when these age-related variables were factored in.

**Project Components**

Through this project, we propose to meet all of the required project components:

a. *Provide training and education to clinical and administrative staff on process improvement strategies, methodologies, and culture.*

   Will conduct training sessions with staff who will be involved in implementing, measuring and reporting performance improvement strategies

b. *Develop an employee suggestion system that allows for identification of issues that impact the work environment, patient care and satisfaction, efficiency and other issues aligned with continuous process improvement.*

   All employees will be empowered to provide suggestions for ways we could improve patient care or efficiencies in our workflow.

c. *Define key safety, quality, and efficiency performance measures and develop a system for continuous data collection, analysis dissemination of performance on these measures.*

   These key metrics will be identified in DY2 and will be used to build the monthly dashboard that will allow us to track our progress against our targets

d. *Develop standard workflow process maps, staffing and care coordination models, protocols, and documentation to support continuous process improvement.*

   This will be integrated into the training provided to clinical and administrative staff pertaining to the process improvement strategies

e. *Implement software to integrate workflows and provide real-time performance feedback.*

   As we are able, we will include information into our EMR and nurse documentation
system to prompt nursing staff with reminders for specific interventions to provide real-time feedback.

f. Evaluate the impact of the process improvement program and assess opportunities to expand, refine, or change processes based on the results of key performance indicators. Utilizing the dashboard and other tools to measure our progress, we will continually compare our outcomes to what we expected to see based on the evidence-based interventions implemented. As necessary, we will make modifications to our plan and will also continuously evaluate ways that the successful interventions can be applied to other patient populations.

**Milestones and Metrics Chosen**
While not a new program, the ACE Program has only been in a trial period for DY1 and expanding the program significantly enhances the reach and thereby the benefit it will offer to our patients. The milestones and metrics we have chosen are directly related to the core project components and goals we plan to achieve.

**Unique Community Needs Identification Numbers this project Addresses**
- CN.1 – Improve quality and patient satisfaction
- CN.2 – Improve prevention and management of chronic diseases

Texas ranks last in the nation on health care quality, and the very nature of this project is focused on improving quality and patient satisfaction. Also, there is a high prevalence of chronic diseases, particularly among the elderly, and through this project we will be address the patient as a whole during their hospitalization rather than only focusing on their acute ailment and this will help improve the management of chronic conditions.

**How does this project represent a new initiative or significantly enhances an existing delivery system reform initiative.**
While not a new initiative, the evidence-base components of the ACE program were just recently implemented at Nix Health during DY1 and the expansion from 12% to 55%+ signifies a significant enhancement to the existing delivery. Some of the patients currently admitted to the ACE program in DY1 have also been part of a Community-based Care Transitions Program that was funded by a grant from a CMS demonstration project. This funding ended in Sept 2012, so no other federal funds are being used for this project. Nix Health is considering implementing a Care Transitions Program internally for the ACE patients at high-risk for re-visitation.

**Related Category 3 Outcome Measure(s):**
- OD-3 Potentially Preventable Re-Admissions-30 day Readmission Rates (PPRs)
- IT-3.1 All cause 30 day readmission rate – NQF 1789 (standalone measure)

**Reason/rationale for selecting these outcome measures:**
Through the ACE program, a collaborative interdisciplinary team-based approach will be utilized (physician, case manager, physical and occupational therapy, pharmacy, etc.) to address the full spectrum of the patient’s needs during their stay. Through improved processes regarding patient and family education and post-discharge follow-up, the readmissions for this population should be reduced.
**Relationship to other Projects:**
This project is directly related to our Medical Home Project (Category 2.1) in that the patients of the Medical Home physicians will be admitted through the ACE program and will be managed during their stay by an interdisciplinary team.

Also, this project directly relates to several Category 4 projects:

- **Potentially Preventable Admissions:** By treating the whole patient, and not just the current alignment, we will be reducing the need for further hospitalization. Involvement of the family and care givers during the hospitalization and with the patient education is crucial to helping the patient stay healthy when at home post-discharge.
- **30-Day Readmissions:** During the admission to the ACE program, the interdisciplinary team will do a thorough review of the patient’s medication and will perform a ‘reset’ to ensure the patient is not discharged with duplicative or redundant medications. Research has shown that patients who are discharged on 5 or more medications have a higher rate of readmission, most likely due to the confusing nature of having to take multiple medications on various schedules.
- **Patient-centered healthcare:** By addressing the full needs of the patient and working diligently to ensure that they do not lose unnecessary daily living skills during their hospitalization, patient satisfaction will be increased.

**Relationship to Other Performing Providers’ Projects in the RHP:**
Other performing providers are planning projects that fit within Category 2.8, but the details of those projects are not yet fully disseminated. While performance improvement projects may be a shared theme, the details of the specific projects may not lend themselves as easily to learning collaborative opportunities within the region, but we will utilize other resources that are closely related to the ACE or NICHE type programs.

**Plan for Learning Collaborative:**
TBD

**Project Valuation:**
The Nix Health ACE program will coordinate treatment plan amongst providers and reduce LOS by 1 day (cost avoidance of $1,900\(^1\) per day) and through collaboration will result in a reduction of Adverse Drug events by 7 per 100 admissions (cost avoidance of $16,000\(^2\) per ADE). Improvement in patient satisfaction can be related to improvement in communication and increased patient/family involvement in their care. Patients that are more involved in their care and understand their discharge instructions will be less likely to be readmitted within 30 days. The use of the ACE model also reduces the incidence of delirium from 40.8% down to 26%\(^3\) with a savings of $2,181\(^3\) per case. In addition, the cost of caring for patients post-discharge (home medications, post-acute facility costs, etc.) will be decreased at an annual savings estimated at $500\(^4\) per patient.

Conservatively assuming volume is flat and meeting targets of ACE patients as percent of total age 65+:
- Reduced LOS by 1 day per patient enrolled in program ($1,900\(^1\) each)
- Avoid 7 ADEs per 100 admissions to the program ($16,000\(^2\) each)
- Reduce readmission rate through medication evaluation and total ‘reset’ and improved
communication with patient, family and care givers ($9,600 each\(^5\))
- Reduce delirium rate from 40.8% down to 26% ($2,181\(^3\) each)
- Reduce post-discharge costs (home medications, post-acute care facilities, etc. ($500\(^4\) per patient)

Goal for DY2 would be 40% of the age 65+ non-ICU med/surg admissions would be admitted through the ACE program (approximately 44 patients per month in DY2). Applying these values, the total value for DY2, would be $2,440,299 and this would increase as the volume of patients admitted through the ACE program continues to increases. The goal for DY3 would be 45%, DY4 50% and 55% by DY5. In order to align the milestones with the actual expected patient impact, we have converted these percentages to actual figures for DY3-DY5:
- 600+ patients in DY3
- 668+ patients in DY4
- 735+ patients in DY5

Footnotes
1 Internal Metric
2 Agency for HealthCare Research and Quality: Reducing and Preventing Adverse Drug Events To Decrease Hospital Costs http://www.ahrq.gov/qual/aderia/aderia.htm
4 Conservative estimate

**NOTE** – Through our estimation, this project could be valued as high as $3.3M per year by DY5, but in order to stay in line with our Pass 1 allocation, we have valued it at $2,440,300 in DY2, $2,655,113 in DY3, $2,662,831 in DY4 and $2,199,730 in DY5
### 2.8.1 DESIGN, DEVELOP, AND IMPLEMENT A PROGRAM OF CONTINUOUS RAPID PROCESS IMPROVEMENT THAT WILL ADDRESS ISSUES OF SAFETY, QUALITY, AND EFFICIENCY WITHIN THE NIX GERIATRIC MED/SURG INPATIENT POPULATION

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $9,957,974
Identifying Project and Provider Information:
Title: 2.9.1 Establish a Patient Care Navigation Program
Unique RHP ID#: 112676501.2.3 – PASS 2
Performing Provider: Nix Health Care System
Performing Provider TPI: 297342201 (old TPI 112676501)

Project Summary:
Provider Description: Nix Health Care System is a 297 licensed bed (160 operating beds), multi-
campus provider of inpatient and outpatient acute care services, psychiatric services, physical
rehabilitation services and home care services. The primary service area is comprised of Bexar
County, Texas and parts of the surrounding seven counties.

Intervention(s): This project will implement a Patient Navigator Program to assist patients in
taking control of their chronic diseases

Need for the project: Our region has a shortage of medical and mental health care providers, as
well as the lowest scores in the nation for healthcare quality. Through the Patient Navigator
Program, we will facilitate connections between patients and the resources they need, including
Primary Care Physicians, Specialists, Behavioral Health service and community programs.

Target population: This project targets patients with chronic diseases and those that are at
greatest risk of disconnect from the health care system. Our overall patient base is roughly 20%
Medicaid-eligible/medically indigent, but we anticipate that Medicaid and/or medically indigent
patients will comprise at least 50% of the patients enrolled in the program.

Category 1 or 2 expected patient benefits: The project seeks to have 600 unique patients enrolled
in the program by DY3, with that figure increasing to 900 by DY5

Category 3 outcomes: IT.9.2 Our goal is to reduce ED utilization for diabetes-related issues
among enrollees of the Patient Navigator Program (reduction percentage TBD)

Project Description:

Project Description
Nix Health plans to implement a Patient Navigator Program to help patients and their families
navigate the fragmented maze of the healthcare system, including primary care physician offices,
specialists, preventive screenings, diagnostic testing, inpatient admissions, payment systems, and
community resources. During DY2 we will conduct studies within our Provider-Based Clinic
offices to identify the targeted patient populations and chronic conditions that we will be
focusing on through the Patient Navigator Program.

Goals and Relationship to Regional Goals
Over the next 4 years, Nix Health will strive to serve our patients better through the Patient
Navigator Program to improve outcomes, increase patient satisfaction, and reduce fragmentation
of care. The primary goal of the Patient Navigator will be to allow the patient to focus on taking
charge of their chronic diseases rather than focusing their efforts on finding their way through
the health care system.
Project Goals:
- Define and implement a Patient Navigator Program
- Work with our physicians to educate them on the role of the Patient Navigators so they can understand who and when to refer to the program, thereby increasing enrollment and the number of lives we can impact through this initiative
- Monitor ED utilization and identify high ED utilizers or patients that are using the ED for episodic care and educate them on available Primary Care Physicians available to them

The project meets the following regional goals:
- Improve outcomes while containing cost growth
- Assuring patients receive high-quality and patient-centered care, in the most cost effective ways

Challenges
There are several patient populations that could be drastically improved by a Patient Navigation Program, so they first challenge we will face will be to identify how and where to start the program so we can be efficient and targeted. Patient Navigation is most predominant in cancer programs, but we plan on expanding it to other diseases, like diabetes or COPD. While it will be tempting to address all conditions, this would prove impractical and would spread our staff too thin and the assistance provided to patients would be less effective than if we take a targeted approach. As we learn about the implementation process, we can then roll the process out to other patient populations.

Another challenge we will face will be patient compliance. We will be working with patients that are highly vulnerable and at risk of being disconnected from the health care system. Our challenge and goal will be to get these patients engaged in their own health so that we can provide as much assistance as possible and make the most impact on their outcomes. However, due to their high risk and vulnerability, it may prove challenging to keep them engaged for the long term.

5-year Expected Outcomes for Performing Provider and Patients
Nix Health expects that this project will strengthen the relationship between patients and physicians and will allow physicians more time to dedicate to patient care by providing an extension of their practice to their patients. Expected outcomes will relate to the project goals described above.

Starting Point/Baseline:
Nix Health does not currently operate a Patient Navigator program, and plan to research and begin implementation during DY2

Rationale:

Reason for selecting this project
Fragmentation is prevalent in our region’s health care delivery system. Patients can easily get lost and overwhelmed by this fragmentation, which can create barriers to timely care, cause patients to delay seeking treatment, and ultimately result in poorer outcomes. Nix Health sees Patient Navigators as a way to reduce this fragmentation and allow patients to receive timely care and improve outcomes. Given that Nix Health does not currently operate a Patient Navigator Program, we have elected Project Option 2.9.1.
Project Components
Through this project, we propose to meet all of the required project components:

a. **Identify frequent ED users and use navigators as part of a preventable ED reduction program.** Train health care navigators in cultural competency
   Nix Health is opening an ED in late 2012 and will immediately begin tracking ED utilization rates. As we begin building the Patient Navigator Program, they will play a key role in helping these ED high utilizers understand the other primary care options that are available to them.

b. **Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators.**
   As we research and define our Patient Navigator Program, we will identify the types of care providers that will be needed for the program. We expect it will be a mix of types of health professions.

c. **Connect patients to primary and preventive care.**
   One of the main goals of the Patient Navigator Program will be to connect patients with primary care physicians and clinics and educate them about preventive care options. While we have not yet identified the patient population that the Patient Navigator Program will serve, it will undoubtedly be patients with some chronic conditions and primary and preventive care will play a key role in the outcomes for these patients.

d. **Increase access to care management and/or chronic care management, including education in chronic disease self-management**
   Chronic care management will be essential to helping the Patient Navigator Program enrollees take charge of their healthcare. We will work with community resources and our own internal resources to identify education opportunities for patients to meet their needs.

e. **Conduct quality improvement for project using methods such as rapid cycle improvement.** Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.
   As part of the implementation, and throughout the life of the Patient Navigation Program, we will continually assess the impacts our interventions are having and review the lessons learned. As necessary, we will make changes to our approach and look for ways to expand the project to reach a broader set of patients.

Milestones and Metrics Chosen
The milestones and metrics we have chosen are directly related to the core project components and goals we plan to achieve.

Unique Community Needs Identification Numbers this project Addresses
- CN.1 – Improve quality and patient satisfaction
- CN.2 – Improve prevention and management of chronic diseases
- CN.3 – Improve access to medical care for those underinsured by facilitating the
connection between patient and physician to minimize the impact of the provider shortage

• CN.4 – Minimize shortage of mental and behavioral health services by helping patients navigate to available services that meet their needs.
• CN.6 – connecting patient with preventive services, like screening and vaccinations, will help address the high rates of vaccine-preventable diseases

Our region has a shortage of medical and mental health care providers, as well as the lowest scores in the nation for healthcare quality. Through the Patient Navigator Program, we will facilitate connections between patients and their needed resources, ranging from Primary Care Physicians, Specialists, Behavioral Health service and community programs. This program will be targeted at patients that are at great risk of disconnect from the health care system.

**How does this project represent a new initiative or significantly enhances an existing delivery system reform initiative.**

Patient Navigators were introduced into the healthcare setting for patients that had been diagnosed with cancer as a way to help these patients deal with the complexities of their diagnosis and treatment options and with the goal of saving lives by ensuring barriers were eliminated and appropriate care was received timely. In that context, Patient Navigators have played a vital role in the lives of many cancer patients. Embracing that philosophy, Nix will embark on a new initiative of providing Patient Navigation Services to patients who are suffering from other chronic diseases that could also benefit from a personal “guide” to help them navigate through the maze of the health care system with the overall goal being to improve outcomes and patient satisfaction. This initiative, or related activities, is not being funded in whole or part by the U.S. Department of Health and Human Services.

**Related Category 3 Outcome Measure(s):**

<table>
<thead>
<tr>
<th>OD-9 Right Care, Right Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>IT-9.2 ED appropriate utilization (Standalone measure)</td>
</tr>
<tr>
<td>Reduce Emergency Department Visits for targeted conditions:</td>
</tr>
<tr>
<td>- Diabetes</td>
</tr>
</tbody>
</table>

**Reason/rationale for selecting these outcome measures:**

Through the Patient Navigator Program, patients will be aided in finding health care resources and providers for their needs, and they will be educated on the community resources that exist pertaining to their chronic diseases. Through this navigation assistance, patients will be less likely to need to present to the ED for treatment of their chronic diseases since these will be better managed on an outpatient basis proactively. Diabetes, in particular, is very prevalent in our patients and we expect to make a large impact with these patients through our Patient Navigator program.

**Relationship to other Projects:**

This project overlaps with our Medical Home Model Project and our Performance Improvement project for geriatric patients with respect to patients from either of those projects having the potential to be referred to the Patient Navigator Program.

Also, this project directly relates to several Category 4 projects:

• Potentially Preventable Admissions: By aligning the patients with resources to address
their chronic diseases, preventable admissions will be reduced.

- 30-Day Readmissions: During admission, if a patient is identified at high risk of readmission, they may be referred to the Patient Navigator program and post-discharge resources will be made available to the patient to reduce the likelihood or readmission within 30 days.

- Patient-centered healthcare: By addressing the full needs of the patient and working diligently to ensure that the patient’s needs are addressed, we are taking steps necessary to center health care around the patient

- Emergency Department: By assisting the patients with chronic conditions find help through other means besides the ED, the throughput in the ED will likely improve, and will benefit the patients in the ED and reduce the Admit-Decision time.

**Relationship to Other Performing Providers’ Projects in the RHP:**

Other performing providers are planning projects that will either Expand or Establish a Patient Navigation Program. As members of the RHP, we will work with these other providers to discuss our implementation initiatives, share best practices and new ideas, and work towards implementing solutions to identified problems.

**Plan for Learning Collaborative:**

TBD

**Project Valuation:**

The Patient Navigator Model, originally implemented for cancer patients, has proven invaluable as a way to help patients navigate through the health care system. Oftentimes patients need an advocate who understands the medical system and can help direct them to resources that they may otherwise be unaware of. The goal is to help and support patients in need of coordinated care navigate through the continuum of health care services so that patients can receive coordinated, timely services when needed with smooth transitions between health care settings. The Medical Home Model has incorporated the Patient Navigator into their model but we plan to take it a step further an off a Patient Navigator to patients of our health care system as a whole - a concierge of sorts. Someone who can assist patients in understanding each step on their road to recovery or help them better manage their chronic conditions.

The value of this coordinated effort is challenging to quantify since a large part of its value will be seen in the reduction of fragmentation and the improvement in patient satisfaction. However, for each patient that is enrolled into the Patient Navigator Program the value would be $1,200 per year minimum. Patients would be identified as being at the most risk by their PCP or attending physicians during an inpatient stay, and they would be enrolled in the Patient Navigation Program.

We anticipate that conservatively our provider-based primary care physicians cover nearly 30,000 patient lives and assuming 3% of the patients are referred to the Patient Navigator program each year, the value would be $1 M (0.03*30,000 = 900*$1,200 annually = $1,080,000). However, the referrals to the Patient Navigator Program would not be limited to only our Provider-Based PCPs. Patients identified through the ED or during inpatient admission
as being vulnerable or at high-risk could be referred to the program.

The $1,200 annual savings per enrollee is a conservative estimate taking into account reduced ED visits (estimated cost avoidance of $1,318\(^1\) per avoided ER visit), reduced admissions (estimated cost avoidance of $5,359\(^2\) per avoided admission), less fragmentation of care, and fewer life-years lost due to lack of access to care.

\(^1\)Agency for Healthcare Research and Quality Medical Expenditure Panel Survey: Emergency Room Services

\(^2\)Texas Health and Human Services Commission, Potentially Preventable Readmissions in the Texas Medicaid Population Fiscal Year 2010

NOTE – Through our estimation, this project could be valued as high as $1.5M per year, but in order to stay in line with our Pass 2 allocation, we have valued it at $1,075,916 in DY2, $1,175,566 in DY3, $1,183,167 in DY4 and $976,212 in DY5

Identifying Project and Provider Information:

Project: 2.12.1 Develop, implement and evaluate standardized clinical protocols and evidence-based care delivery model to improve care transitions
Unique RHP ID#: 127294003.2.1 – PASS 1
Performing Provider: Peterson Regional Medical Center
Performing Provider TPI: 127294003

Project Summary:

Provider Description: Peterson Regional Medical Center (PRMC) is the only community healthcare organization within Kerr County and is located in the town of Kerrville. The population for Kerrville (2011) was listed as 22,423 and the population for Kerr County (2011) was 49,783. Kerr County is a total of 1,108 sq miles (45 persons/sq mile) with only 20.3 (1,100.7 persons/sq mile) of that belonging to Kerrville. PRMC provides healthcare and medical resources to nine surrounding counties with a total population of 187,293. Kerr County has been listed as a Healthcare Provider shortage area; this however is magnified by the fact that the majority of surrounding counties is also listed as shortage areas, and/or is unable to provide any healthcare services at all. It was found in our Community Health Needs Assessment held in October of this year that 28% of Kerr County’s population is unfunded, which is much higher than the national average of unfunded population which was found to be 16% and the national benchmark 11%. Of PRMC’s total diabetic population visits, Medicaid/Indigent/Self-pay comprised 11%.

Intervention(s): This project will utilize recommendations from several evidence base practice models to implement a new discharge and care transition process for the targeted population (Diabetic patients) at PRMC. A Registered Nurse acting as the Discharge Advocate (DA) will coordinate the patient’s discharge education tailored to meet the needs of each individual patient, arrange follow-up appointments with primary care providers and specialists, and post hospital discharge follow-up calls. The DA will promote a patient/family-centered environment that will encourage the patients and their family members/caregivers to participate more in their health care and treatment plans. The goal of this project is to use the DAs, hospital medical staff, and pharmacists to provide collaborative patient and family-centered care during transition. This will be accomplished by enhancing care coordination, community outreach, social support, education using appropriate level of health care literacy, and culturally competent care to diabetic patients. The DA will ensure adequate planning and arranging of discharge needs has occurred, as well as confirming patient and family understanding of disease specific self management care at home. The DAs will also be required to participate in outreach activities and collaboration with multi-disciplined stakeholders from all over the county and any outside of the county that will be willing to collaborate with our organization.

Need for the project: This project was chosen to address PRMC’s currently fragmented discharge process, 19% of total diabetic population visits at PRMC were seen in our ED, and rapidly increasing population growth rate of diabetes in Kerr County. Kerr County went from being ranked 196th (out of 254 Texas Counties) in 2011 to 246th in 2012 in the diabetes category. Given shorter lengths of stay in acute care, the clinical team is pressured to prepare patients to perform more complex self-management tasks that are often difficult at best for patients to understand.

Target population: One of the nation’s leading killers, diabetes is a costly, chronic disease that, if not diagnosed and treated properly, over the course of time can lead to serious complications such as heart disease, stroke, blindness, lower-limb amputation, kidney failure, disability, and premature death. As stated in the above paragraph, Kerr County went from being ranked 196th (out of 254 Texas Counties) in 2011 to 246th in 2012 in the diabetes category. If that alone wasn’t
ample enough of a reason to target this population in our community, the reality of how many of our community residents are unfunded/underfunded compounds the complexity of being able to care for these patients with any kind of magnitude or degree of quality value extremely difficult. It was found in our Community Health Needs Assessment held in October of this year that 28% of Kerr County’s population is unfunded, which is much higher than the national average of unfunded population which was found to be 16% and the national benchmark 11%.

Category 1 or 2 expected patient benefits: This project seeks improve the percentage of patients in defined population receiving standardized care according to the approved clinical protocols and care transitions policies established in DY1-DY2. In DY4, we plan to improve percentage of the targeted population to reach 75%. In DY5, we anticipate meeting the discharge needs of 95% or more for this same group.

Category 3 outcomes: OD-9 Right Care, Right Setting IT-9.2 Reduce Emergency Department visits for target condition - Diabetes will be executed in DY4 and DY5. 19% of total diabetic population visits at PRMC were seen in our ED in calendar year 2012. DY4 improvement target is to reduce ED visits as a percentage of total diabetic population visits by 5%. DY5 improvement target is to reduce ED visits as a percentage of total diabetic population visits by 5% for a total of 10%.

Project Description:

Peterson Regional Medical Center proposes to improve the discharge planning and transitioning of care processes through applying an evidence-based best practice model for a targeted chronic disease population.

This project will implement a new discharge and care transition process. Recommendations of patient care guidelines were conquered from several evidence-based practice model sources. We have chosen to mirror the Project Re-Engineered Discharge (Project RED) model created by Boston University Medical Center. Founded on 11 discrete, mutually reinforcing components, Project RED has been proven to reduce rehospitalizations while also generating high rates of patient satisfaction. Components incorporate patient education, care coordination, primary care physician (PCP) prearranged follow-up, and telephone follow-up calls from both the Discharge Advocate (DA) and a Pharmacist. Improved patient understanding of discharge needs and timely follow-up care; we aim to decrease unnecessary emergency room usage and readmissions for patients of the targeted population. Chart reviews will be completed on all targeted patients readmitted to the hospital within 30-days, results from review will be utilized for process improvement activities.

A Registered Nurse will play the role of the DA. The DA will collaborate with other healthcare providers in caring for targeted population. These patients will also receive an ‘After-Hospital Care Plan’ folder. This folder will be tailored to meet the needs of each individual patient and their post hospital care and treatment plans. Information within the folder will be designed to clearly present the information patients need to prepare them for the days between discharge and the first visit with their PCP. The DA will oversee the discharge process to ensure relevant patient information has been entered into a dedicated, electronic program that will serve as the nexus of all information regarding patient discharge and follow-up care. The plan will contain information about the discharge diagnosis; a list of discharge medications, including why and when the patient needs to take each medication; a daily medication schedule that indicates visually what time medications should be taken; instructions about what the patient should do if his or her condition changes, including phone numbers of outpatient providers; a schedule indicating appointments with outpatient providers and/or follow-up tests;
information on diet, exercise, and home equipment; and information to enable the patient to take an active role in follow-up care.

Efforts will also be made to further prevent any medication related preventable patient harm by having a pharmacist call patients from this targeted group discharged using the RED process when appropriate. Pharmacist will review their medications, assess whether they are taking the medications as prescribed, determine whether they understand how and when to take them, verify the dosage and times of day the patient should take the medications, explain the potential for adverse events such as drug–drug or drug–food interactions, and intervene when necessary. Specific improvement targets are described in the table.

**Goals and Relationship to Regional Goals**

The goal of this project is to use Discharge Advocates, hospital medical staff, and pharmacists to provide collaborative patient and family centered care during transition. This will be accomplished by enhancing care coordination, community outreach, social support, education using appropriate level of health care literacy, and culturally competent care to diabetic patients. The DA will ensure adequate planning and arranging of discharge needs has occurred, as well as confirming patient and family understanding of disease specific self management care at home. Support will be given to these patients and their family members to navigate through the healthcare continuum in transition of care. By utilizing this DA as a transition specialist, the discharge process for the targeted group will increase patient safety and improve the quality of our discharge process.

**Project Goals:**

This project will not only meet the health need challenges of Kerr County but also hospital specific challenges such as a fragmented discharge process, unclear discharge instructions, staffing, and gap between healthcare providers during transition of care. Goals include:

- Creating a patient/family-centered environment that encourages participation in their health care and treatment plans; Improve the patients hospital and discharge experience
- Improve quality and safety of patient care; Promoting better health for beneficiaries
- Early collaboration with outside providers, especially for Medicaid, Indigent and Self-pay patients, to ensure all resources are arranged and post hospital needs are met
- Decrease the amount of wasted healthcare money and resources from readmissions and unnecessary Emergency Department visits caused by a lack of follow up, inability to obtain needed medications, etc.
- Implementing interventions that result in process improvements in medication management, post-discharge follow-up, communication and coordination of care
- Interacting with leaders and innovators in the field of Care Transitions during a statewide collaborative of providers sharing best practices
- Integration of an information system capable of securely and easily transfer important patient care and treatment documents to other healthcare providers across the continuum of care
- Encourage community collaboration with other agencies and influential leaders to meet the needs of our target population
- Increase patient understanding of post hospital care instructions, improve care transitions from hospital to home, and promote self-health management

**This Project Meets the Following Regional Goals:**

- Triple Aim: assuring patients receive high-quality and patient-centered care, in the most cost effective ways
- Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our counties; Improve outcomes while containing cost growth
- Further develop and maintain a coordinated care delivery system

Thus we expect to see improved patient satisfaction, better health outcomes, reduced healthcare cost, decreased readmissions, and prevent unnecessary emergency department use within the defined disease specific population group.

**Challenges**

Current challenges discovered in our Community Health Needs Assessment found that Kerr County has a much older population than the average for both Texas and United States. This older population is going to generate a higher demand for healthcare services. With Type II Diabetes being directly related to obesity, another challenge PRMC will face is that obesity is considered the top problem Kerr County faces (as reported by Stratasan in County Health Needs Assessment).

To address these challenges an action plan will be implemented to ensure all are considered during creation of Project RED’s policies and procedures that will include a comprehensive and reliable discharge plan that will help to reduce readmission rates plus unnecessary Emergency Department visits, improve health outcomes, and ensure quality transitions. A template for disease specific discharge education material will be created using appropriate literacy level for targeted population, which will allow for adjustments as needed. Information gained while collaborating with other stakeholders whom have had previous experience with making this type of process change will also be considered. Once policies have been approved, the positions will be opened up to those interested in applying, qualified applicants will be hired to fill role of the DA. Outreach and collaboration with multi-disciplined stakeholders from across the county will be of great importance over the next four years.

Diabetes is one chronic condition whose treatment and outcomes are heavily dependent on how well the patient monitors and manages the disease outside the health care setting. An important approach to quality improvement for diabetes is improving patient self-management. This project will include components of a diabetic specific ‘Self-management program’. The DA along with other Health care professionals will work with patients to build their confidence in managing their own disease, in working within the health care system and the community to have their needs met, and in managing the emotional effects of their illness. Patients are informed about their disease and trained using evidence-based information in how they should manage their condition.

**5-Year Expected Outcome for Provider and Patients:**

PRMC expects to see improvements in safety, quality of care and health care outcomes of diabetic patients that participate in the innovative discharge process. PRMC expects to see improve in the patient’s ability to maintain self management at home in their own environment and when/where they should seek care if conditions change; providers encouraging patient and family involvement in their care; a standardized discharge process that is closing the gaps during transition and preventing potential adverse outcomes, and/or patients falling through the cracks being forgotten about and never followed back up with. Expected outcomes will relate to the projects goals described above.
Starting Point/Baseline:

Currently there are no clients/patients served by the proposed project or any of the included process/improvement milestone interventions. At this current time, we also do not have any providers trained in this area/project. Therefore, the baseline for number of participants as well as the number of participating providers begins at 0 in DY2. PRMCs baseline diabetic population in calendar year 2012 is a total of 3,719 patients with 12% or 1,226 visits having an inpatient stay.

Rationale:

Option 2.12.1 was chosen to address currently fragmented discharge process, increased unnecessary ED visits within the high risk diabetic population group, and increasing population growth rate of diabetes in Kerr County. When a patient’s transition is less than optimal, the repercussions can be far-reaching — hospital readmission, an adverse medical event, and even mortality. Without sufficient information and an understanding of their diagnoses, medication, and self-care needs, patients cannot fully participate in their care during and after hospital stays. Additionally, poorly designed discharge processes create unnecessary stress for medical staff causing failed communications, rework, and frustrations. Expectations for self-care health management after hospitalization are becoming more challenging for patients. Given shorter length of stay in acute care, the clinical team is pressured to prepare patients to perform more complex self-management tasks that are often difficult at best for patients to understand. Therefore, it makes sense to develop a discharge process to efficiently and reliably provide a patient with the tools and understanding to comply with their healthcare needs.

Residents of rural counties tend to be older and less educated, experience lower per capita income and more poverty than the region as a whole, further compounding the healthcare challenges faced here (Stratasan, 2012). Kerr County has a much older population than the average for other counties across Texas. This alone generates a much higher demand for money spent on healthcare services (Stratasan, 2012). Inpatient services are being utilized more in Kerr County than any other county in Texas, while outpatient services are utilized less than the average utilized across the state of Texas (Stratasan, 2012). Kerr County provides clinical care to 28% of the population that are uninsured. The Texas average of uninsured population is 26% and the National Benchmark is 11% (Stratasan, 2012). Peterson Regional Medical Center alone provides on average $2 million a month in charity care to help meet the medical needs for this population.

One of the Nation’s leading killers, diabetes is a costly, chronic disease that, if not diagnosed and treated properly, over the course of time can lead to serious complications such as heart disease, stroke, blindness, lower-limb amputation, kidney failure, disability, and premature death. Texas ranks 34th of 50 states with 9.7% of the population suffering from diabetes, the national average is only 8.7% (Americas Health Rankings, 2011). Kerr county went from being ranked 196th (out of 254 Texas counties) in 2011 to 246th in 2012 in the diabetes category (County Health Rankings, 2012).

Project Components

Through the Discharge and Transition of Care Program, we propose to meet all required project components.

a) Review best practices from a range of models – Components from each RED, BOOST, and STAAR discharge and transition of care program will all be referred to during the planning stages. The DA will be trained to use components from each model. Implementation of evidence based elements within models will outline a safe discharge plan and supporting transitions of care which will help achieve improved patient satisfaction, patient outcomes,
decreased overall healthcare cost and reduced preventable readmissions.

b) **Conduct an analysis of the key drivers of 30-day hospital readmissions using a chart review tool** – The Care Coordination Department collects this readmission data during their assessment of the patient and their discharge needs and documents it within the organizations EMR. Meaningful data cannot currently be extracted at this time. In order for this information to be reported in a useful format PRMC will need to contract with an outside resource.

c) **Integrate information systems so that continuity of care for patients is enabled** – In the attempt to ensure a smooth transfer of data from provider-to-provider, and agency-to-agency a request has been made for a new software package. This software is the same that Home Health, Hospice, most of the PCPs in the community use, as well as each of the Nursing Homes. It is fully integrated; web-based solutions that simplify and consolidate utilization management, discharge planning, and outpatient care management, documentation integrity, quality management and risk management.

d) **Develop a system to identify patients being discharged potentially at risk of needing acute care services within 30-60 day** – All patients in the diabetic targeted population group will receive the discharge planning and transition of care process as implemented. PRMC will identify and collect data on all patients with diabetes as a primary diagnosis or co-complication. From this overall population group we will further separate data for patients with a payer source of Medicaid, Indigent and Self-pay. Adjustments to their discharge education and arrangements by the DA will be made as determined during patient assessment. Each of these targeted patients will also receive follow-up from several sources even after they are discharged, such as: the follow-up phone call from the DA, the follow-up phone call and medication education from the pharmacist, and the follow-up appointments and frequent communication from/with the Chronic Disease Management Nurse. All patients will be scheduled their follow-up appointment with their PCPs and any other specialists with-in 3-7 days after discharge. If it is still felt that the patient will need some additional follow-up from a medical provider, home health will be arranged to check in on patient the days that they are not being followed up with from any of the providers mentioned above.

e) **Implement discharge planning program and post discharge support program** – The DA will make their first contact with the targeted patient population within 24 hours after admission. Over the course of the patients stay, they will meet with the DA multiple times to discuss and plan for the patient’s discharge. The DA will also attend our daily multi-disciplinary meetings (which also includes all hospitalists) for further discussion of discharge needs with the rest of the medical team. During their orientation, the DA(s) will be introduced to outside community agencies and local community leaders. It will be important for them to start networking early to create these bonds with the people/agencies that will be assuming care of the patient once discharged home. When program is up and fully running the DA will continue to keep in close contact with these community providers and advocate for any additional patient needs as needed.

f) **Develop a cross-continuum team comprised of clinical and administrative representatives from acute care, skilled nursing, ambulatory care, health centers, and home care providers** – The Care Coordination Department currently holds quarterly collaboration meetings with the local Nursing Home Administrators. These meetings have created a partnership between these two groups and successfully improve patient care, safety, quality, and
transition of care. With the commencement of this new program, additional members will be invited to the meetings. New members will include administrators from the local home health and hospice agencies, as well as the practice managers from local primary care practices.

g) **Conduct quality improvement for project using methods such as rapid cycle improvement.** Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project. **Including special considerations for safety-net populations** - Collaborative self-management support (CSMS) means that everyone works together to help the patients manage their condition. CSMS is centered on the patient’s specific needs, abilities, values, and preferences. Families and others in their support network are welcomed to participate.

To maintain healthy lives, people with chronic or long-term conditions and their families have to manage their condition from day to day. Self-management often involves medical treatments and therapies. It can also mean making lifestyle changes, such as eating better, reducing stress, or increasing exercise. This care planning process is done together in a patient-centered environment.

**The unique community need identification numbers the project addresses are:**

- CN.1 - Deliver improved quality and patient satisfaction.
- CN.2 - Greater prevention efforts and improved management of patients with chronic conditions
- CN.3 - Access to medical care for patients regardless of payment status

**How the project represents a new initiative or enhances an existing delivery system reform initiative**

The project is not currently being used in clinical practice. All components (milestones and metrics) of this project represent new initiatives for the performing provider. It was also discovered that recently Project RED has lost their funding from AHRQ, which was caused by government budget cuts.

**Related Category 3 Outcome Measure(s):**

OD-9 Right Care, Right Setting and IT 9.2 was chosen as the projects outcome domain based on 19% of overall diabetic population visits were Emergency Department setting. High volumes of diabetic patients using the Emergency Department as their primary source of care increases health care cost and fragments continuity of care which should be provided in less costly settings. Proper implementation of Category 2 process improvements within the diabetic population group will improve transition of care resulting in an expected decrease in emergency department visits by 5% in DY4 and an additional 5% in DY5.

Recent studies evaluating hospital discharges have associated the risk of adverse events with deficiencies in health literacy, patient education, communication among health care providers within and between sites of care, appropriate medical follow-up, and any number of issues related to medications; all which also affect patient safety during transition of care. Components of the project will center attention on cost effective affordable care to include and not limited to post hospital follow-up, medications, supplies, and receiving the right care in the right setting at the right time.

**Relationship to other Projects:**

For Pass 1, PRMC was only required to complete one project for Category 1 and 2. Related Category 4 measures include Population-focused measures: RD-1.2 Potentially
Preventable Admissions - Diabetes Admission Rates; RD-2.2 Diabetes 30 Day Readmissions; RD-3 Potentially Preventable Complications; RD-4.1 Patient-centered Healthcare - Patient Satisfaction and Medication management; and RD-5 Emergency Department

**Relationship to Other Performing Providers’ Projects in the RHP:**

From the “draft” list provided, providers in the RHP that are establishing programs similar to ours are:

- UTHSCSA 2.2 Expand Chronic Care Management Models, and 2.4 Redesign to Improve Patient Experience
- University Health System 2.2 Expand Chronic Care Management Models, and 2.4 Redesign to Improve Patient Experience
- Methodist 2.4 Redesign to Improve Patient Experience
- Methodist 2.4 Redesign to Improve Patient Experience
- Bluebonnet 2.9 Establish/Expand Patient Navigation Program

**Plan for Learning Collaborative:**

University Health System, as the RHP 6 anchor, will promote and facilitate learning collaboratives. Following completion of the RHP Plan, University Health System will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include the following: Identify participants; Establish Learning Collaborative goals; Develop a calendar of regular meetings, site visits, and/or conference calls; Develop a plan to communicate ideas, data, and successes across the region and state; Organize a learning event and invite experts and other Performing Providers from outside the region to share knowledge and best practices; Adopt metrics to measure success.
**Project Valuation:**

Peterson Regional Medical Center is licensed for 125 acute care beds. The diabetic population in calendar year 2012 consisted of 3,719 patients. 11% of the visits were provided for the Medicaid/Indigent/Self-pay subpopulation. The implementation cost of this project for DY1-DY2 is estimated to be $434,292. Each year thereafter has an estimated cost of $267,272. In calendar year 2012 PRMC’s baseline diabetic population group had a total of 3,719 patients with 1,226 inpatient admissions for a total of $28.8 million in charges. Once project outcomes have been reached, we estimate an average annual community healthcare savings of $2.9 million by reducing the rate of inpatient admissions (as a percentage of the total diabetic population) by 10%. Currently, PRMC has 0 patients receiving standardized care processes related to project RED. In DY2 we will begin implementation of program for focused patient population and initial patients receiving standardized care processes related. In DY4 we will improve the % of patients in defined population receiving standardized care according to Policy & Procedure by 75% and to 95% in DY5.

This project will address many of the discovered community health care needs by strategically implementing components of an evidence-based care transition model. Project Re-engineered Discharge (Project RED) began at Boston University Medical Center and was designed to improve the hospital discharge process in a way that promotes patient safety and reduce re-hospitalizations. The Project Red model is supported by the Agency for Healthcare Research and Quality (AHRQ) and the National Institutes of Health (NIH).

This model will be used to assist in closing the gap in health care services of Kerr County residents causing them to utilize more costly inpatient services versus less costly outpatient services. The shortage of primary care physicians in Kerr County has contributed to an increase use of ED visits often resulting in inpatient services. Patients with chronic diseases who are not established with a primary care provider are more likely to show up in the emergency department in crisis, which often results in an inpatient admission. The components of Project Red will prepare patients to better understand their disease process and address individual needs enabling them to better care for themselves. After a patient has been admitted to the hospital they are usually motivated to learn more about their illness; it is crucial that healthcare providers take advantage of this opportunity to educate and coordinate care during and beyond the hospital setting. This will allow patients to feel more involved and increase potential compliance with their own healthcare needs. By utilizing a more patient-centered discharge model patients will experience more buy in to improve and maintain their own health at home.

Identifying Project and Provider Information:

Title: 2.6.4 Implement Evidence-based Health Promotion Program: Develop, implement, and evaluate an innovative evidence based health promotion strategy through the use of a mobile cardiovascular screening program.
Unique RHP ID#: 136491104.2.1 – PASS 1
Provider Name: Southwest General Hospital
TPI: 136491104

Project Summary:

Provider Description:
Southwest General Hospital is a 327-bed, acute care hospital in San Antonio, Texas serving residents of RHP 6 and surrounding areas. RHP 6 encompasses 20 counties and covers 24,734 square miles, comprising about 9.5% of the total land area of Texas.

Intervention(s):
The project encompasses the development, implementation, and evaluation of an evidence based health promotion strategy through the use of a mobile cardiovascular screening program for RHP 6 and surrounding rural community residents.

Need for the project:

- Currently at Southwest General Hospital, 45% of patients are Medicaid recipients or uninsured. The Mobile Cardiovascular Screening Program will assist with improving the early identification of cardiovascular health issues and the care delivery infrastructure to better serve the Medicaid and uninsured residents of South San Antonio and surrounding rural communities.
- Cardiovascular disease is one of the leading causes of death in RHP 6. Early disease identification, intervention and management are critical to reduce this potentially preventable disease.
- RHP 6 has a higher percentage of patients who are unable to access primary care due to the high cost, as compared to the Texas average from 2007-2010. Access to affordable care has been an issue within the region, leading to poor health outcomes and a high percentage of preventable hospitalizations.
- Healthcare impact of a major oil/gas play in a rural environment. Oil and gas business in South Texas to include South San Antonio, Atascosa, and Wilson counties, have presented a new, large population to the RHP 6 region. A large pool of uninsured workers will impact the numbers in need of cardiovascular screening. Excluding the oil and gas employees, 24% or 471,000 residents of RHP currently lack health insurance coverage. Small firms in rural areas cannot afford to insure employees or most are self employed. The potential numbers for cardiovascular screening is difficult to project based on the rapid population growth in the Eagle Ford Shale region of RHP 6. The shale activity is projected to create nearly 117,000 full time jobs by 2021.
- Nearly every county in RHP 6 is designated as a Health Provider Shortage Area for primary care.

Target population:
The target population is RHP 6 rural community residents with the focus on Medicaid and uninsured residents of South San Antonio and rural communities with unsuspected or
undiagnosed cardiovascular disease. As stated above, the rapidly increasing population of this area impacts the ability to project numbers benefitting from the screening project.

**Category 1 or 2 expected patient benefits:**
- Early identification of potential and/or actual cardiovascular disease processes requiring medical or surgical intervention.

**Category 3 outcomes:**
- Reduction of emergency department visits of targeted population by 5% from year 3 to year 4.
- Reduction of emergency department visits of targeted population by 7% from year 4 to year 5.
- Adequate blood pressure control demonstrated by 5% of patients on follow-up visits from year 3 to year 4.
- Adequate blood pressure control demonstrated by 7% of patients on follow-up visits from year 4 to year 5.

**Project Description:**
Southwest General Hospital proposes to implement an innovative evidence based health promotion strategy through the development, implementation, and evaluation of a mobile cardiovascular screening program.

Through the implementation of a mobile cardiovascular screening program, the surrounding rural communities will have the opportunity to access a vital health resource to identify potentially serious cardiovascular events in a timely and cost effective manner. The program will provide a mobile vascular screening service which will provide non-invasive screenings. Tests will be performed by vascular technologists with results and a follow-up plan, as necessary, provided at the time of screening.

Through the goal of improving cardiovascular health for the residents of RHP6 through a mobile screening program, the project will impact the following:

- Enhance availability of resources to assess and refer residents of rural communities for cardiovascular healthcare resulting from mobile screening assessment
- Establish referrals to cardiovascular specialists within the Southwest General physician community to provide specialty care to high risk residents
- Quality improvement efforts will focus on use of rapid cycle improvement methodologies to identify and quickly address project barriers and/or implementation barriers which would include the impact of marketing strategies on reaching target communities which will direct ongoing plan revisions and/or target market. CQI activities will also include weekly team huddles to identify areas of strength and weakness related to screening program operations and immediate revisions as necessary.

**Goals and Relationship to Regional Goals:**
The goal of this project to develop and implement innovative, evidence based screening program to identify high risk patients in need of specialty care services (Cardiovascular) and to provide
care for high risk cardiovascular problems identified by outreach vascular screening programs to RHP 6 rural communities.

**Project Goals:**

- Develop, implement, and evaluate a mobile Cardiovascular Screening Program for the RHP 6 region
- Increase access to care for RHP 6 rural community residents to identify potential and/or actual cardiovascular disease processes requiring medical or surgical intervention

**This program meets the following regional goals:**

- The Mobile Cardiovascular Screening Program will contribute to assuring patients receive high-quality, patient centered care with the goal of early disease identification and intervention for cardiovascular problems through improved access to care provided by the Mobile Cardiovascular Screening Program.
- The Cardiovascular Screening Program will assist with improving the health care delivery infrastructure to better serve the Medicaid and uninsured residents of South San Antonio and surrounding rural communities. Currently at Southwest General Hospital, 45% of patients are Medicaid recipients or uninsured.
- The program will build on the existing cardiovascular specialty service which is comprised of private and 501a employed cardiologists. Outreach efforts will serve to identify and reach key rural areas currently experiencing difficulty with access to care.

**Challenges/Issues Faced By Provider:**

- Identifying vendor most capable and compatible with existing resources – Southwest General Hospital currently contracts with a company for vascular ultrasound services. The contract will be reviewed to include the Cardiovascular Screening program in the services provided to SWG. In collaboration with this company the hospital will, in the near future, be evaluated for ICAVL accreditation. Also, an additional Cardiovascular Technologists will be hired to assist with program management.
- Vascular Technologist support – Through existing contracted vendor will negotiate for additional technologist support
- Cardiovascular specialist follow-up commitment – SWGH has a total of eight active Cardiologists working to improve the Cardiology program at the hospital. The physicians will serve as the referring physicians for the program.
- Identification of evidence based programs to serve as a model for mobile screening program development and implementation – AHRQ Clinical Practice Guidelines for Cardiovascular Screening will serve as the foundation of best practice for program development and screening guidelines. They will include the following guidelines: Atherosclerotic cardiovascular disease screening in adults: American College of Preventive Medicine position statement on preventive practice (Lim, 2011) and Screening for coronary heart disease with electrocardiography: U.S. (Preventive Services Task Force recommendation statement, 2012).

**Source:**

5-year Expected Outcome:

Early identification and management of potential life threatening cardiovascular conditions (Stroke; Carotid Artery Disease; Peripheral Vascular Insufficiency, as well as access for services and treatment otherwise not available.

Starting Point/Baseline:

Currently, a mobile cardiovascular screening program does not exist for patients at Southwest General Hospital. Therefore, the baseline for the number of RHP 6 residents eligible for screening at 0 for DY2.

The Cardiovascular Center at Southwest General Hospital has provided cardiovascular and peripheral vascular care to the South San Antonio area and surrounding communities with excellent outcomes. We have the ability and knowledge to provide outlying communities through early identification and referral to appropriate resources needed to manage Cardiovascular dysfunction identified through community screening.

The ability to establish mobile outreach screening programs served by cardiovascular specialty staff in key rural areas will provide improved access to care, and specialist management of cardiovascular diagnosis and symptoms, as required. Cardiovascular disease is one of the leading causes of death in RHP 6. Early disease identification and management is critical to reduce this potentially preventable disease. Early identification and intervention is a desired outcome of the proposed initiative. Through the implementation of a mobile screening strategy, it is projected the screening encounters will increase by 10% from Year 4 to Year 5 through expansion of rural counties in which screening program is provided.

Rationale:

RHP 6 has a higher percentage of patients who are unable to access primary care due to the high cost, as compared to the Texas average from 2007-2010. Access to affordable care has been an issue within the region, leading to poor health outcomes and a high percentage of preventable hospitalizations.

According to the Agency for Healthcare Research Quality’s 2011 report, Texas ranks last in the nation on health care quality. The report is based on 155 quality measures which include disease prevention measures. Texas scored weak on preventive measures and under the category of “care by clinical area, Texas scored weak on heart disease measures. The shortage of health care
providers has led to high emergency room utilization. This is a very costly means of health care delivery, and often results in a delay seeking treatment until the illness is severe and advanced. In addition, access to primary care has become increasingly difficult within the region, resulting in poor overall management of the population’s health.

This issue will only continue as the population increases at its current rate. Improving identification and early intervention of cardiovascular problems will decrease misuse of the ED and lower healthcare costs. Across the state of Texas, ED visits increased by 28.6% with RHP 6 following this trend.

Cardiovascular disease is one of the leading causes of death in RHP 6. Early disease identification and management is critical to reduce this potentially preventable disease. Early identification and intervention is a desired outcome of the proposed initiative.

RHP 6 encompasses 20 counties and covers 24,734 square miles, compromising about 9.5% of the total land area of Texas. In some areas, it may take patients hours to drive to Performing Provider facilities. Therefore, a mobile cardiovascular screening clinic offers the benefits of taking the services to the patients, which will help keep them healthy proactively. Establishing a mechanism for timely, affordable care would lead to improved outcomes and would provide patients with education on how to manage their condition.

**Unique community need identification number the project addresses:**

- **CN.1** - Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction
- **CN-2** – A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions. Leading causes of death in RHP 6 include cardiovascular disease.

As stated previously, the Cardiovascular Center at Southwest General Hospital has provided cardiovascular and peripheral vascular care to the South San Antonio area and surrounding communities with excellent outcomes. We have the knowledge and ability to provide outlying communities screening, early problem identification, and referral to appropriate resources to manage Cardiovascular dysfunction. Outcomes of the intervention will improve the care of residents and decrease the use of the Emergency Department for the first “screening” assessment for disease.

**Related Category 3 Outcome Measure(s):**

**Proposed Category 3 Outcome Measures:**
IT 9.2 - ED appropriate utilization
Reduce ED visits for target conditions: Cardiovascular Disease/Hypertension

The shortage of health care providers and the identification of early disease processes have led to high emergency room utilization. This is a very costly means of health care delivery, and often results in a delay seeking treatment until the illness is severe and advanced. In addition, access to primary care has become increasingly difficult within the region, resulting in poor overall management of the population’s health. Through the development of a mobile cardiovascular screening program by Southwest General Hospital, the surrounding rural communities will have the opportunity to access a vital health resource to identify potentially serious cardiovascular events in a timely and cost effective manner. Results and follow-up plan, as necessary, are to be provided at the time of screening. The proposed outcome of this project is early identification and referral of positive findings to a Cardiovascular specialist prior to acute manifestation of a clinical problem. The end measureable outcome being the decrease ED utilization for Cardiovascular symptoms due to early identification and management of potential life threatening cardiovascular conditions.

RHP 6 Community Needs Assessment, July 2012.

Relationship to other Projects:
A mobile cardiovascular screening program focused on health promotion, screening and access to disease management specialists would:

- 1.9: Expand our specialty care capacity along with several other initiatives pertinent to the RHP. The mobile unit would identify patients in need of further follow up with a specialty clinic.

The project aligns with Category 4 Population focused measures which are the following: RD-1 Potentially Preventable Admissions related to Congestive Heart Failure and Hypertension admission rate; and RD0-3 Potentially Preventable complications.

Relationship to Other Performing Providers’ Projects in the RHP:
Potential members of learning collaborative based on early review and identification of projects. Further detail required to assess comparability and potential for collaboration.

- CHRISTUS Santa Rosa Hospital – Implement Evidence based Health Promotion Programs; and Expand Specialty Care Capacity
- University Hospital; Baptist Medical Center; CHRISTUS Hospital of San Antonio; Methodist Hospital; Dimmitt County Memorial Hospital; Val Verde Regional Medical Center; and Connally Memorial Medical Center – Expand Specialty Care Capacity
- University Hospital; Hill Country Memorial Hospital – Implement evidence based disease prevention programs
**Plan for Learning Collaborative:**

At this time, without further background information and detail on projects for RHP 6, a plan for participation in a RHP-wide learning collaborative with other similar projects is not possible. The potential for collaboration with above identified projects and providers is critical to best practice identification and performance improvement projects.

<table>

<tr>
<th>Project Valuation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Achieve Waiver Goals: Waiver goals include increasing the capacity to provide specialty care services and the availability of targeted specialty providers to better accommodate the high demand for specialty care services so that patients have increased access to specialty services. In support of the goal, Southwest General Hospital will develop a mobile program dedicated to vascular screening. Through this service the surrounding rural communities will have the opportunity to access a vital health resource to identify potentially serious cardiovascular events in a timely and cost effective manner. The program will provide a mobile vascular screening service which will provide non-invasive screenings. Tests will be performed by vascular technologists. Results and follow-up plan, as necessary, provided at the time of screening.</td>
</tr>
<tr>
<td>• Addresses Community Needs: As previously stated, early identification and management of potential life threatening cardiovascular conditions (Stroke; Carotid Artery Disease: Peripheral Vascular Insufficiency, as well as access for services and treatment otherwise not available is critical to meeting the healthcare needs of RHP 6. The shortage of health care providers has led to high emergency room utilization. This is a very costly means of health care delivery, and often results in a delay seeking treatment until the illness is severe and advanced⁹. In addition, access to primary care has become increasingly difficult within the region, resulting in poor overall management of the population’s health. Through the development of a Mobile Screening Program by Southwest General Hospital, dedicated to vascular screening, the surrounding rural communities will have the opportunity to access a vital health resource to identify potentially serious cardiovascular events in a timely and cost effective manner.</td>
</tr>
<tr>
<td>• Project Scope: Southwest General Hospital has provided care to the residents of South San Antonio since 1978. In late 2012, the organization achieved Chest Pain Accreditation and currently is preparing for PCI Accreditation with the Center. The expansion of the program to outlying communities will further enhance care but also extend high quality preventive care and education for the region. The program framework for cardiovascular services is developed and supports acute care needs for the area. Program development requires the expansion and planning to serve and identify a larger patient base and establish outreach programs to impact care for the patient population. Through the development of a mobile cardiovascular screening program by Southwest General Hospital, the surrounding rural communities will have the opportunity to access a vital health</td>
</tr>
</tbody>
</table>

"Southwest General Hospital"
resource to identify potentially serious cardiovascular events in a timely and cost effective manner.

- **Project Investment:**
  Many of the resources required to support the physician component of the proposed project is in place. The need to recruit and hire midlevel care providers is a key investment in manpower to support the endeavor. The purchase of additional noninvasive diagnostic equipment and a van to support the program will be a $190,000 investment by Southwest General Hospital to launch the program for its current patient population and the RHP 6 proposed project.

**Identifying Project and Provider Information:**

Title: 2.7.6 – Implement other evidence-based prevention program in an innovative manner: TB prevention program  
Unique RHP ID#: 133257904.2.1 – PASS 1  
Performing Provider: Texas Center for Infectious Disease  
Performing Provider TPI: 133257904

**Project Summary:**

Provider Description: The Texas Center for Infectious Disease (TCID; 133257904) is a 75 bed facility that is currently the only inpatient facility dedicated to tuberculosis (TB) care in the U.S. TCID hospitalizes the most complicated and challenging TB patients in TX.

Intervention(s): This project will: a) increase targeted testing for latent tuberculosis infection (LTBI) in high risk minority communities, b) provide routine testing for LTBI with interferon gamma release assays (IGRAs) instead of tuberculin skin testing to minimize false positive tests in BCG vaccinated patients and avoid unnecessary LTBI therapy, c) provide routine treatment of LTBI through a 12 dose, 12 week regimen administered by DOT to improve patient adherence and completion of LTBI therapy, d) facilitate hospitalization for TB care of those few patients who cannot be successfully treated as outpatients.

Need for the project: TB continues to be a significant and expensive public health problem in TX. This project represents collaboration between three entities, TCID, University of Texas Health Science Center, Tyler (UTHSCT) and TX Department of State Health Services (DSHS), with renowned physician expertise that will deliver improved TB care for minority populations. The project includes targeted testing for LTBI, effective treatment of LTBI in order to prevent future cases, and case identification with referral for appropriate therapy (inpatient or outpatient). The project will be implemented in two public health regions of Texas, one urban and one rural in order to capitalize both on the expertise of providers and also to demonstrate a model of case identification and treatment delivery that is effective in reducing the spread of the disease while providing better health outcomes with improved patient satisfaction.

Target population: In 2011 in Public Health Regions 4 & 5N and 8, 1310 individuals underwent testing for LTBI including 833 as part of contact investigations which in the context of limited resources take priority over other recommended indications for LTBI testing. Only 573 received therapy with approximately 67% completing LTBI therapy. 178 patients were diagnosed with active TB with approximately 80% completing therapy. Economically disadvantaged minority populations suffer disproportionately from LTBI and active TB. Shorter, effective new LTBI treatment regimens are available however, not implemented broadly enough at this time to reduce the spread of the disease. People who do not have access to primary care services are the least likely to be diagnosed with LTBI and therefore, present a risk of developing and then spreading TB.

Category 1 or 2 expected patient benefits: Evidence-based CDC and DSHS treatment guidelines insure avoidance of unnecessary and costly diagnostic and treatment strategies while the application of new diagnostic (IGRA testing) and treatment strategies (12 week LTBI therapy) further reduce costs by focusing resources on interventions of proven public health value at a lower financial cost. This project will provide, a) enhanced access to a comprehensive fully integrated TB care process that utilizes the existing DSHS public health infrastructure and physician expertise from UT, b) implementation of universal LTBI testing with IGRAs thereby limiting the expense and potential drug toxicity of false + TSTs in BCG vaccinated populations, c) implementing universal 12 week, 12 dose LTBI therapy to improve LTBI treatment completion rates and decrease future TB burden. Of the 1310 individuals with LTBI in this clinical cohort we will utilize IGRA’s to improve specificity of identification of LTBI.
cases and with universal application of supervised 12 week, 12 dose LTBI therapy we will improve completion rates for LTBI therapy over baseline by 3% in DY 4 and 5% in DY 5. Of the 178 patients with active TB we will increase treatment completion rates over baseline by 3% in DY4 and 5% in DY5 with universal application of directly observed therapy and selective use of inpatient therapy. **Category 3 Outcomes:** Our goal in DY4 is a 3% improvement in LTBI treatment completion over baseline for LTBI and 3% improvement in therapy of active TB over baseline in urban and rural minority populations and in DY5 a 5% improvement in LTBI treatment completion over baseline and 5% improvement in therapy of active TB over baseline in urban and rural minority populations. The DY 4 and DY 5 targets for the proposed strategies were determined by considering recent trends in LTBI and TB disease epidemiology in Texas and the funding available for the state TB program, both of which have been relatively unchanged with a realistic assessment of the potential for any intervention to significantly improve in the context of these static trends.

**Project Description:**

Implement a strategy for comprehensive, cost-effective and integrated management of tuberculosis (TB) infection and disease in urban and rural minority communities through a partnership between the Texas Center for Infectious Disease (TCID), the Texas Department of State Health Services (DSHS) and the University of Texas Health Science Center, Tyler (UTHSCT).

**Goals and Relationship to Regional Goals:**

Collaboration between these 3 entities focuses a full scope of expert physician support of DSHS, with the goal of improved TB care for minority populations including targeted testing for latent TB infection (LTBI), effective treatment of LTBI for prevention of future TB cases, TB case identification with appropriate outpatient and/or inpatient TB therapy and aggressive contact investigation with treatment of LTBI associated with active TB cases. These goals will be accomplished according to CDC and DHHS evidence-based strategies with an emphasis on cost-effectiveness. These goals will be accomplished through the application of new and cost-effective diagnostic tests such as the interferon gamma release assays (IGRA) and the use of new cost-effective treatment strategies such as the 12 week, 12 dose treatment strategy for LTBI. The project will be guided by physicians with the most TB experience in the state. This comprehensive approach will not only improve outcomes long term, but will also decrease costs for TB management in both the short and long terms.

The project will take advantage of existing DSHS infrastructure and policy for basic public health functions, namely the use of directly observed therapy (DOT) for treatment of active TB disease, and contact investigation to identify LTBI cases associated with active TB disease cases. In addition all patients who otherwise would have been evaluated with a tuberculin skin test (TST) will be evaluated instead by an IGRA. The IGRA have been repeatedly shown to be more specific than TST when testing BCG vaccinated populations. Although the IGRA are somewhat more expensive than TSTs from the perspective of initial costs, they produce net savings long term by avoiding unnecessary therapy for patients with false positive TSTs due to previous BCG vaccination who represent the majority of patients diagnosed with TB in the U.S. The IGRA have no cross reactivity with BCG as do the TSTs. Additionally, for those patients who are found to have LTBI, the standard treatment will be a 12 dose, 12 week regimen with rifapentine and isoniazid (INH). Although the rifapentine is a relatively expensive medication, this regimen also produces long term net savings resulting from better patient adherence with the regimen compared to INH and, therefore, fewer cases of active TB in patients identified with LTBI. Treatment completion rates for INH regimens are routinely in the 60% range, whereas recent data utilizing the 12 week 12 dose regimen by DOT shows treatment completion in the 80% range. The logical anticipated outcome of improved LTBI adherence and treatment
completion would be decreased TB disease rates in the future. Overall, the combination of routine IGRA use and application of the 12 week LTBI treatment strategy offers the potential for significant cost savings without sacrificing benefit to individuals and the public health in general. Additionally, the expertise of the supervising UT physicians allows efficient and cost-effective diagnostic and therapeutic decisions throughout the course of TB disease or LTBI for all patients.

We propose that UT physicians coordinate all aspects of TB care in 2 DSHS Health Service Regions (Health Service Regions 8 and Region 4/5N) between DSHS personnel and UTHSCT physicians at two inpatient facilities, TCID (RHP 6) and UTHSCT (RHP 1). Close cooperation between UTHSCT, TCID, HNTC and DSHS promotes optimization of medically effective and cost-effective care and can serve as a model for management of TB throughout the state of Texas with partnerships between DSHS and other UT health components. The advantages of the system of cooperation between UTHSCT and DSHS include the following.

1) There is a central authority (i.e. UTHSCT) that DSHS personnel can access for questions regarding TB patients (either with active disease or LTBI). In emergency situations, UTHSCT physicians can be reached 24 hours per day, 7 days per week. A major problem throughout the state is the easy identification of a responsible physician for handling TB patients and difficult management questions. If this proposal is implemented, DSHS personnel will never be left without physician support or with the prompt identification of a physician responsible for a specific problem. When appropriate, the UTHSCT personnel also facilitate inpatient TB therapy.
2) There are identified and coordinated inpatient facilities (UTHSCT and TCID) for those few TB patients requiring referral or transfer on either an elective or emergency basis.
3) There are designated UTHSCT physicians, expert in the care of TB, available to support DSHS personnel in the management of any TB patient at all levels including telephone consultation, outpatient management and inpatient care if necessary. All patients with TB disease and LTBI are managed by a centrally located, expert staff according to national and DSHS guidelines. The physicians provide evidence based care consistent with national and state guidelines.
4) Statewide adoption of this model (DSHS management of TB and LTBI supported by UT faculty) would offer the same benefits described above to minority populations and DSHS personnel throughout the state. DSHS personnel would have rapid access to reliable and expert physician support and easily obtained admission of patients to respiratory isolation if necessary. There would be no ambiguity about the responsibility for management of the patient. The DSHS personnel could go directly to their designated UT facility for support including consultation and hospitalization. Access to the entire UT system would add a dimension missing in the current proposal that is limited to 2 DSHS regions, that is, access to multiple medical specialties (especially surgical subspecialties), and, therefore, the ability to provide total care to the patient with TB. The majority of hospitalized TB patients would still be treated at TCID after stabilization at local UT facilities.

Project Goals:
- Provide predictable and reliable expert physician support for DSHS personnel at all levels of TB care.
- Increase overall access to TB care in minority populations.
- Increase targeted testing for LTBI in high risk minority communities.
- Provide routine testing for LTBI with interferon gamma release assays instead of tuberculin skin testing to minimize false positive tests in BCG vaccinated patients and avoid unnecessary LTBI therapy.
- Provide routine treatment of LTBI through a 12 dose, 12 week regimen administered by DOT to improve patient adherence and completion of LTBI therapy.
• Provide expert consultation and direct patient oversight of all active TB cases.
• Facilitate continuity of TB care through all phases including LTBI therapy, outpatient TB therapy and, when necessary, inpatient therapy.
• Facilitate hospitalization for TB care of those few patients who cannot be successfully treated as outpatients.
• Provide a model for statewide TB management through complete integration of TB resources between DSHS (TCID) and UTHSCT, including HNTC.

This project meets the following regional goals:
• Further develop a coordinated care delivery system

**Challenges:** The high percentages of minority patients with TB compared to white, has remained stubbornly, frustratingly and consistently high. There are likely multiple explanations for this observation including distrust of the medical establishment, fear of legal reprisal for non-citizens and lack of culturally appropriate education and outreach materials. To some degree these challenges can be overcome with increased resources focused on the minority communities, and identification of the TB control effort with one trusted and non-threatening entity, the University of Texas. There are obstacles to the statewide application of this model that would need to be addressed. First, there are Texas Health Service Regions (HSRs) without a UT affiliated facility. Appropriate alternative treatment agreements would have to be made in those areas. Again, transfer of long-term care patients to TCID would be anticipated. Second, some HSRs have multiple (or complex) layers of Health Department authority that might thwart easy assignment of authority to UT. Third, some HSRs have long-term and ongoing associations with academic institutions other than UT (even in Regions with a major UT health care facility). Not all HSRs lack adequate physician support. These physicians would need to be covered under the broad umbrella of UT physician management oversight.

**5-Year Expected Outcome for Provider and Patients in HSRs 8 and 4/5N:**
1) Full integration of TB care at all levels (LTBI testing, LTBI treatment, TB case identification, TB case management) in HSR Regions 8 and 4/5N coordinated between DSHS and UT physicians (UTHSCT, TCID, HNTC)
2) Increased numbers of minority persons (Black and Hispanic) screened for LTBI
3) > 90% completion of therapy for active TB
4) > 95% therapy of active TB by DOT
5) >10% increase in identification of LTBI patients
6) >10% improvement in LTBI treatment completion
7) > 10% reduction in overall active TB disease rates

**Starting Point/Baseline:**
1385 cases of TB disease were reported in Texas in 2010, a rate of six per 100,000 population. The number of cases fell only to approximately 1300 cases in 2011. TB can strike anyone, but is more likely to be found in those born in a foreign country, people with diabetes, people with HIV/AIDS, the homeless, and those that work in health care. Alcohol abuse is associated with more than 21 percent of TB cases and 11 percent of cases are associated with detention facilities. For U.S. born citizens, there is an alarming disparity in TB incidence rates between whites and minority communities. In Texas, 51.3 percent of reported TB cases in 2010 were among Hispanics, 18.4 percent were among African Americans, 14.8 percent were among Whites, 14.8 percent were among Asians. As can be seen in the accompanying table, the TB case percentage among African Americans was considerably higher than the state average in Department of State Health Services (DSHS) Health Service Region (HSR) 4 while the TB case percentage for Hispanics was considerably higher than the state average for HSR 8. These two ethnic minorities are clearly disproportionately affected by TB compared with white Texans based
on their respective representation in the general Texas population. This disparity is magnified given the more robust declines in TB incidence in the white populations in the last decade compared with the minority communities.

An estimated 4.2% of the U.S. population or ~11 million persons have latent *M. tuberculosis* infection (LTBI) according to a 1999-2000 tuberculin skin test (TST) survey. Reactivation of LTBI accounts for ~70% of incident TB disease in the U.S. For each 1% lifetime risk of reactivation TB disease in this group, 110,000 TB cases might be expected from this reservoir of LTBI over the next 40 years (1/2 the population's life expectancy). Eliminating TB in the U.S. and Texas will require preventing these cases. Appropriate targeted testing of high risk populations including aggressive contact investigation around active TB cases is a vital part of the TB elimination strategy. The use of interferon gamma release assays (IGRAs) instead of tuberculin skin tests (TSTs) will eliminate the need to treat BCG vaccinated patients with false positive TSTs. In principle, treating LTBI with 6-12 months of isoniazid (INH) can substantially reduce TB incidence, however, patient adherence with INH self-administered regimens is poor so that avoidance of TB disease is suboptimal with this strategy. With the new 12 dose 12 week INH/rifapentine regimen, patient completion rates are significantly better than with INH alone due both to the need to administer the 12 week regimen by directly observed therapy (DOT) and because of better patient tolerance of the therapy. It is clear that aggressive identification of LTBI cases followed by effective LTBI therapy is an effective strategy for preventing new cases of active TB disease. Aggressive targeted LTBI testing strategies in high risk populations such as minorities (Black and Hispanic populations) are clearly effective in reducing TB case rates. Three entities have the most influence and impact on TB care in the state including UTHSCT, TCID and the Heartland National TB Center. Aside from unwavering dedication to TB control in Texas, the unifying factor for each of these organizations is that they are all staffed by UTHSCT faculty.

UTHSCT has been involved with TB care in Texas for more than a half century. UTHSCT maintains the capability to safely evaluate and if necessary hospitalize contagious TB patients in respiratory isolation. Currently, faculty at UTHSCT include 5 board certified pulmonary physicians (4 adult and 1 pediatric), and 2 board certified infectious disease specialists, each with decades of experience treating TB. UTHSCT is now also the home of a large Public Health Laboratory that performs interferon gamma release assays for diagnosis of LTBI.

The Texas Center for Infectious Disease (TCID) has provided inpatient TB care for nearly 60 years and is currently the only free standing inpatient facility dedicated to TB care in the U.S. TCID hospitalizes persons with the most complicated TB cases. TCID treats the majority of the 4-6% of TB patients in Texas who need hospitalization. Reasons for admission to TCID include non-adherence with outpatient therapy, court ordered (quarantined) TB treatment where a patient’s non-adherence...
with TB medication regimens has proven to be a threat to public health or safety, TB drug toxicity, management of co-morbidities such as HIV infection or diabetes and management of drug resistant TB cases. TCID is unquestionably the premier facility in the U.S. for inpatient management of patients with drug resistant TB. TCID is Texas’ designated hospital for TB. The 3 Infectious Diseases (ID) board certified physicians providing the inpatient TB care at TCID are UTHSCT faculty.

The Heartland National TB Center (HNTC) is a partnership between DSHS and UTHSCT and one of four national TB centers funded by the Centers for Disease Control and Prevention (CDC). HNTC was originally funded in 2005 to provide TB training, technical assistance, product development, and medical consultation to a 13-state region and two big cities from the border with Mexico to the border with Canada. The HNTC is housed at TCID in San Antonio, Texas. HNTC also supports CDC efforts to address health equity by researching and using information/data on health disparities and social determinates to identify communities disproportionately affected by TB. Therefore, training and product development, implementation, and evaluation include social determinates of health and ensure culturally appropriate interventions for target audiences. All employees at HNTC including the physician medical director and assistant medical director are UTHSCT faculty.

UTHSCT faculty has the most experience, the greatest expertise and the most influential positions related to TB care in the state. This project would bring about a direct line of shared responsibility between UTHSCT physicians and DSHS personnel on the front line of Texas TB care in two DSHS HSR regions. This project will hopefully serve as a model for TB care in the entire state.

Rationale:

This project will comprehensively improve TB control in urban (DSHS HSR 8) and rural (DSHS HSR 4/5N) minority communities in Texas. The current process for TB control is under the aegis of DSHS, but also involves multiple frequently over-lapping jurisdictional boundaries with roles and responsibilities not always clearly defined. Personnel from various components of the Texas public health system (city, county, state) can be faced with demanding responsibilities without the accompanying specific authority or support to adequately address those responsibilities. This proposal offers a clear and comprehensive mechanism for cost-effective management of all aspects of TB care in minority populations in the state, the most important demographic for TB in Texas, through a partnership between the three most experienced providers of TB care in the state, DSHS, TCID, UTHSCT. This project will fully integrate the core public health functions of DSHS, such as TB therapy by DOT and contact investigation, with the formidable and unparalleled TB expertise available under the aegis of UTHSCT.

Improving TB outcomes through existing agencies and relationships presents several challenges. The DSHS TB control funding has been essentially flat, in real dollars, for several years. In the context of attrition of experienced personnel through retirement etc. and flat funding, it is unlikely that DSHS can maintain its current level of TB expertise and experience much less significantly expand its effort with current resource levels. The TB case rate in Texas has been steadily declining for more than a decade, but in the last 2 years there has been only an anemic decline in TB incidence that may presage a plateau in the previously encouraging progress, or worse, a reversal of that progress. The number and availability of TB experts in the state is declining due to attrition (retirement, etc.), so that identification of these experts will only become more difficult. The percentages of minority patients (black and Hispanic) with TB and LTBI are also disturbingly high and consistently flat compared with white patients suggesting at least a relative lack of progress in these populations. Blacks and Hispanics have an approximately 8X higher TB rate than whites, clearly disproportionately high based on their respective percentages of the population. It would be difficult for DSHS with its present state of funding and staffing to dedicate the resources to narrow this gap. We will provide in DY3 the
necessary education and training for DSHS personnel to successfully implement the new and innovative LTBI diagnosis and treatment strategies through face to face trainings and web based education opportunities. We will also reinforce evidence-based and CDC/DSHS approved treatment strategies for TB disease.

**Unique community need identification numbers the project addresses:**
- RHP 6 CN.2- Chronic disease and related health disparities
- RHP 1 CN.1- Insufficient access to primary and specialty health care services

This project will implement a strategy for comprehensive management of TB infection/disease in DSHS HSR 8 and 4/5N.

**Related Category 3 Outcome Measure(s):**

OD-11 Addressing Health Disparities in Minority Populations:
IT-11.1 Improvement in Clinical Indicator in identified disparity group

**Reasons/rationale for selecting the two Outcome Improvement Targets:**

Category 3 process outcomes selected for DY2 and DY3 are directly related to initial components of the initiative to achieve comprehensive, evidence based TB care of TB for urban and rural minority communities in Texas. This initiative will undertake a series of steps which incorporate core project components to achieve this collaboration between DSHS, UTHSCT, TCID and HNTC. Category 3 process outcomes include project planning (P-1) in DY2, establishing baseline rates (P-2) in DY3, and conducting a PDSA cycle to improve data collection and intervention activities (P-4) as a quality improvement effort. In DY4 and DY5, the standalone measure selected is IT-11.1 Improvement in Clinical Indicator in identified disparity group. Two clinical indicators to be improved and disparity groups have been determined by the provider. The disparity group is minority (Black and Hispanic) urban and rural populations at risk for TB in DSHS HSR #8 and #4/5N. The clinical indicators to be improved include percentage of TB patients receiving therapy of active TB by DOT and improved LTBI treatment completion rates.

As a non-acute care hospital without an emergency department or intensive care unit TCID has no statistically significant data to report on any of the Outcome Domains 1-3 or 5 in Category 4.

**Relationship to other Projects:**

The project team will work with the anchors in both RHP regions (6 and 1) to share information about new treatment regimes for persons with active and LTBI as well as referral for specialty consultation and care with other performing providers.

**Relationship to Other Performing Providers’ Projects in the RHP:**

This project is a collaborative with an academic medical center performing provider in RHP1; it will serve as a referral destination for other projects in RHP 6 that provide primary and behavioral health care services.

**Plan for Learning Collaborative:**

The leadership team for this project will actively participate in the face-to-face meetings and other opportunities to share challenges and lessons learned with other health care providers in both RHP 6 and 1.

**Project Valuation:**

This represents an innovative and ambitious project to enhance and expand the control of TB in minority communities in 2 HSRs in Texas that encompass both urban and rural minority populations. This proposal incorporates the existing public health infrastructure of DSHS and the extensive TB expertise of UT physicians at UTHSCT, TCID and HNTC in a collaboration that promotes expert, cost-effective, evidence-based TB control with seamless continuity of care at every level. The expertise of
UT physicians with evidence-based CDC and DSHS treatment guidelines insures avoidance of unnecessary and costly diagnostic and treatment strategies while the application of new diagnostic (IGRA testing) and treatment strategies (12 week LTBI therapy) further reduce costs by focusing resources on interventions of proven public health value at a lower financial cost. Improved completion rates for LTBI therapy will also decrease the number of LTBI patients progressing to active TB and avoid the considerably higher costs associated with treating active TB. The value of this project is justifiable on the basis of:

1) Enhanced access to a comprehensive fully integrated TB care process that utilizes the existing DSHS public health infrastructure and physician expertise from UT.
2) Implementation of universal LTBI testing with IGRA thereby limiting the expense and potential drug toxicity of false + TSTs in BCG vaccinated populations.
3) Implementing universal 12 week, 12 dose LTBI therapy to improve LTBI treatment completion rates and decrease future TB burden.
4) Insure universal application of evidence based treatment guidelines from CDC and DSHS for LTBI and TB disease.
5) The ultimate value of this project is decreased TB morbidity in Texas with an attendant significant decrease in healthcare and public health costs.

Identifying Project and Provider Information:
Title: 2.12.1 Develop, implement and evaluate standardized clinical protocols and evidence-based care delivery model to improve care transitions
Unique RHP ID#: 136141205.2.1 – PASS 1
Performing Provider: University Hospital
Performing Provider TPI: 136141205

Project Summary:
Provider Description: University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access to primary, specialty the preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County.

Intervention(s): This project will implement a care transitions program specifically to improve access and will involve follow up calls to and/or home visits to better activate patient engagement by a transition coach following a routine visit and or discharge from an acute setting. This will be part of a broader model of care coordination tailored to improve and meet patient preferences and thus avoiding an emergency department visit. Currently, automated telephone calls post discharge are conducted through Illuminate, which will route the user to be contacted by a transition coach within 48 to 72 hours, if the user indicates dissatisfaction or a concern.

Need for the project: Currently there is no consistent process for identifying and addressing patients at risk for readmission. There is increasing evidence to support the need for immediate follow-up for patients post discharge from acute care, to address the needed education not heard or understood during the discharge process and to assure that services coordinated in the discharge process have been delivered. A sampling of data specific to all Medicare and Medicaid discharges between December 2010 and November 2011 reflects larger percentages of readmissions within the first 14 days post discharge, often times before the scheduled follow-up provider appointments.

Target population: The target population will include the Medicaid funded and uninsured patients who comprise 62% of patients who receive services at University Health System including those patients identified as high risk for readmission discharged from University Hospital

Category 1 or 2 expected patient benefits: In DY2, best practices (such as Partnership for Patients discharge checklists and protocols) will be implemented for effectively communicating with patients and families during and post discharge. Dedicated coaches to this program will be utilized to improve adherence to discharge and follow-up care instructions. In DY3 through DY5, care transitions processes will be reevaluated for improvement, hardwired and expanded resulting in improved care coordination and transition of patients.
Category 3 outcomes: 136141205.3.11 IT-2.13 Other Admission Rate (Stand-alone measure)

- **DY4** – Reduced rates of readmission by TBD% for patients identified and managed by the Transitions of Care Project.

- **DY5** - Reduced rates of readmission by TBD% for patients identified and managed by the Transitions of Care Project.

**Project Description:**

The goal of the project is to implement a care transitions program specifically to address the window of time between discharge and either a return EC visit and/or PCP clinic visit. It is during this window of time that patients struggle with discharge instructions, understanding and access to medications, and access to ambulatory clinic/provider visits. This project was selected for needed approaches to improving the patient experience and health outcomes by early/proactive identification of high risk populations for readmission before discharge, improving the discharge process, improving communication and handoffs with Ambulatory and post acute providers during the transition period, and assuring patient engagement especially within the first 48 hours of discharge, and, as necessary, making home visits.

The initiative/project will utilize all core project components (a-g) as follows:

a. Review and implement best practice models for the population served that addresses readmission rates, reasons and time frames for readmission and post discharge support/calls.

b. Utilize the IHI STAAR chart review tool to identify key drivers for readmissions.

c. Develop and utilize Allscripts™ (Care Coordination software), to facilitate continuity of care for patients across all settings.

d. Establish dedicated roles to design implement and hardwire processes including post discharge support to improve the window of time between discharge and access to providers.

e. Incrementally implement post discharge planning support based on select interventions from Project RED, the Coleman Model, and Boost based upon lessons learned.

f. Assemble and work with prioritized post acute providers to improve processes for patients in transition

g. Regularly identify lessons learned and, utilizing Lean processes, work to eliminate waste and improve transitions of care processes.

Five year expected outcomes include improved clinical outcomes for patients, and decreased EC visits, admissions, and readmissions. The organization will benefit through future cost avoidance and financial penalties.

Current challenges facing University Health System includes the lack of:

- A coordinated infrastructure to support the initiative
- Definition of roles and responsibilities with accountabilities specifically ingrained to support transitions of care
- Policies and procedures, and thus, variation in processes
- Limited patient engagement with unique socioeconomically challenged population
Starting Point/Baseline:

A Transitions of Care Committee was established in 2010 with the following results:

- Dedicated appointments can now be established within provider templates within the EMR as “post hospital discharge appointments.”
- Implementation of an automated message through the ADT system to advise providers via a secure health message of his/her hospitalized patients and discharges.
- Establishment of post discharge calls 24 and 72 hours post discharge. Post discharge calls at 24 and 72 hours have recently switched to the Illuminate automated telephone system.

Variation and inconsistency continue in these process flows. Currently, 35% of patients discharged from University Hospital receive a call to assess the patients understanding of the medical regimen, follow up appointments, and medication reconciliation; this number is based on one specific service line that aggressively inputs the consult needed for activation of the post discharge call. Presently, the follow-up discharge appointment has a 20% no-show rate, and there is no current understanding of the reasons for failure to keep appointments.

In 2012, acute care coordination staff became predominantly unit-based in order to better align with Nursing regarding plan of care and discharge processes. There were two Lean events dedicated to the discharge process. The first event was dedicated to the discharge process on one pilot unit with no evidence of house-wide impact to date. The second, a Value Stream Analysis, occurred in October to prioritize transitions of care needs and assign the type of Lean effort per project, accordingly:

- Standardization of the post discharge process for internal providers
- Improve Access to CareLink for acute population
- Standardize process between Ambulatory Connections and Access Plus
- Standardize post discharge paperwork, appointment information, letter, medical home.
- Develop a Care Coordination Clinical Summary in the EMR
- Develop and implement a post discharge call methodology with designated staff and support processes

Rationale:

The Transitions of Care project enables University Health System to continue to prioritize needed attention to processes from discharge until follow-up appointment in order to better engage the patient, coordinate care and improve clinical outcomes.

This project addresses a high prevalence of chronic disease and related health disparities that require greater prevention efforts and improved management of patients with chronic conditions, which is in line with community need, CN.2. The project also addresses the lack of access to medical care due to high rates of un-insurance, reflective of community need, CN.3.

The project will “significantly enhance” pre-existing efforts as stated per the baseline above. Although the work was thorough and fruitful, the following gaps remain, which will be rectified with the proposed program:
- how to better identify patients at high risk before discharge and at home
- education at discharge and via post discharge calls
- referral processes
- improved internal and external handoffs and communication, and
- patient engagement.

**Related Category 3 Outcome Measure(s):**

There is increasing evidence and logic to support the need for immediate follow-up for patients post discharge from acute care, not only for patient satisfaction, but more importantly to address the needed education not heard or understood during the discharge process and to assure that services coordinated in the discharge process have been delivered. A sampling of data specific to all Medicare and Medicaid discharges between December 2010 and November 2011 reflects larger percentages of readmissions within the first 14 days post discharge, often times before the scheduled follow-up provider appointments.

The purpose of selecting the outcome measure in category three will be to measure the impact of the transitions of care project on a decrease in admissions, EC utilization, and readmissions for patients impacted by the project.

**OD-2 Potentially Preventable Admissions**

- **IT-2.13 Other Admission Rate (Stand-alone measure)**
  a. Numerator: Readmitted patients managed by TOC project
  b. Denominator: All readmitted patients to University Health System within 30 days
  c. Data Source: EMR/IDX/Crimson/Truven Health/Allscripts

**Relationship to other Projects:**

The project is related to other projects within the DSRIP:
- 92414401.2.2 – Enhance/expand the medical home
Care Transitions will support the medical home by working to assure patient access and engagement
136141205.2.2– Redesign to improve patient experience
Improvements in patient experience and engagement will be a byproduct of transitions of care. The belief is that once the processes are put in place and the system is improved, patient satisfaction will improve.
136141205.2.3 – Apply process improvement methodology to improve quality/efficiency
Two Lean events specific to discharge and care transitions have or will soon occur.
136141205.2.4 – Establish/expand a patient care navigation program
The Care Navigation Program and overarching Care Coordination Plan will be impacted as needs continue to be assessed and prioritized.

**Relationship to Other Performing Providers’ Projects in the RHP:**
In addition to University Health System, CHRISTUS Santa Rosa and Guadalupe Regional Medical Center are also addressing the need for transitions of care programs. As projects evolve, there may be the opportunity for sharing best practices, ideas, and solutions across the RHP.

**Plan for Learning Collaborative:**
In addition to University Health System, CHRISTUS Santa Rosa and Guadalupe Regional Medical Center are also addressing the need for transitions of care programs. As projects evolve, there may be the opportunity for sharing best practices, ideas, and solutions across the RHP.

**Project Valuation:**
Project valuation for an efficient and comprehensive Patient Care Transition Program is prioritized as a Pass 1. As there are approximately 22,000 or more discharges a year, around 55,000 EC visits, and > 580,000 Ambulatory visits expected in 2013, better transitions of care impact is defined through cost avoidance, a reduction of admissions and readmissions as well as a decreased EC utilization.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $15,425,492**
Identifying Project and Provider Information:
Title: 2.4.1 Improve processes to measure and improve patient experience: University Hospital-The New “U”
Unique RHP ID#:136141205.2.2 – PASS 1
Performing Provider: University Hospital
Performing Provider TPI: 136141205

Project Summary:
Provider Description: University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access to primary, specialty the preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County.

Intervention(s): This project will develop and implement a comprehensive patient-centered training program based on Planetree/NRC Picker protocol. This protocol was developed based on responses by 90 anonymous focus groups (representing 35 hospitals and 645 patients). The program will build a culture centered on providing a positive experience for all patients cared for within the Health System.

Need for the project: Enhancing awareness and understanding, among University Health System staff regarding patient-centered care, are critical to delivering high quality care that is efficient, timely and safe. A review of University Health System’ patient experience scores demonstrate a need to develop and implement a comprehensive orientation on key aspects of patient-centered care.

Hospitals around the country have seen success from this type of approach:
- Arkansas Children’s Hospital now ranks in the 90th percentile in patient and employee satisfaction
- Florida Hospital for Children, a 1,200 bed facility, went from the bottom 10% in patient satisfaction into the high 90th percentile nationwide

Target population: The target population will include all University Health System patients who are economically underserved or uninsured. Medicaid-funded (19%) and uninsured (43%) persons represent 62% of the patient population served by the Health System. The target population and their families will benefit from this project by being empowered to participate in their care.

Category 1 or 2 expected patient benefits: Adopting a patient-centered approach to care at University Hospital will allow the patient and family to feel empowered and to more fully participate in treatment plans. University Health System will be providing high quality care at every encounter and will be meeting national patient safety guidelines. Patient-Centered Care strengthens relationships and collaboration between patients, their families and their caregivers. It actively promotes family involvement and sets the foundation for quality care delivered in a
safe environment.

Category 3 outcomes: - IT-6.1 – The goal is to increase patient satisfaction scores.

- DY4 – Increase patient satisfaction by 2%.
- DY5 – Increase patient satisfaction by 2%.

**Project Description:**

The goals of the program are to develop and implement a comprehensive patient experience training program for University Hospital. The Executive Director of Patient-Centered Care will write and disseminate a strategic plan on how the health system will be hard-wired towards a patient-centered approach. A steering committee will be created and comprised of health system leaders, staff, patients and their families. Monthly meetings will focus on directing this initiative using the *Patient-Centered Care Improvement Guide* (Planetree, Inc and Picker Institute). Patient-centered care will be coordinated and monitored on an on-going basis. Re-design to improve patient experience includes appointing an executive director to lead the health system through a culture change, by working in coordination with the Center for Learning Excellence department to develop and implement training programs focused on patient-centeredness.

Getting buy-in from all stakeholders and educating the new concept of patient-centered care is our primary challenge. Getting the right people on board will be crucial, as will having the right patients and family members on the steering committee team. Improving the patient experience is in actuality a re-orientation of the health care delivery system as it is practiced throughout our health system. The challenge comes not only with teaching and modeling the patient centered philosophy but in hardwiring all current staff and future employees. Each staff member must be willing to re-think and comprehend that being patient centric and delivering customer service excellence at the highest level is essential for both quality care and safety. The cost to educate staff (over 5,000 employees) and provide trainers will also be a challenge. This project will address these challenges by continuous process improvement of competencies, employee mentoring and training for new employees (Disney’s Model – Building a Culture of Healthcare Excellence).

The expected 5 year outcome will be a comprehensive customer service training program that is effective in shifting our culture and responsive to the training needs of current and new employees (5000 employees). With this accomplishment we expect improvements in patient satisfaction results by 2% annually from baseline.

Patient Centered Care aligns well with the Triple Aim Plus which is reflected in regional goals. The proposed program meets criteria for improving patient experience and improving quality outcomes.

**Starting Point/Baseline:**

Currently there is no program in place for training or educating staff on improving the patient experience. Roles and responsibilities are being developed and are expected to be established during DY2 along with a comprehensive strategic plan to shift our culture to a patient - centered model.
Rationale:
The reason for adding an executive director with a focus on patient-centered care and implementing on-going training may seem like an obvious approach. However, healthcare is a complex system that is often-times difficult for the community at large to access or even understand. This project represents a new initiative for our health system and a change from the culture of “we’ve always done it that way” to partnering with our patients and their families. With the development and introduction of HCAHPS and CGCAHPS there is now a tool to evaluate the way care is delivered using a philosophy that it is provided from the patient’s perspective. UT House Staff and Medical Students are all oriented on HIPAA regulations, Patient Centered, Cultural Diversity and Infection Control. UT Medicine – has recently engaged a consulting firm “Turning Point” to assist them in improving their customer service. UT Medicine physicians are also engaged in nursing shared governance as well as recently attending Patient Centered conference and HCAHPS boot camp.

Components:
- Organizational Integration and Prioritization of patient experience
- Data and Performance Measurement using HCAHPS
- Implement processes to improve patient experience accessing clinical practice
- Develop process to certify independent survey vendors

Implementation of the components will be done by writing and disseminating a patient/family experience strategic plan (P.2, DY2), developing a training program on patient experience (P-15,DY2), integrating the patient experience into employee training (P-4, DY3), developing a new patient experience tool or revising and improving the current one (P-8, DY3), develop a plan to roll out a the collection of patient experience information from an area in the organization that does not currently collect such data (P-9, DY4), and improving patient satisfaction improvement scores (I-16.3, DY5).

The project will guide us through those topics that are important to the healthcare consumers using our facilities. Using the HCAHPS and CGCAHPS tools to both guide and measure will be key to the program’s success. In healthcare where evidence-based practice is so important, we will be systematic and rigorous in the study and implementation of patient-centered care. Creating a positive patient experience will be a priority and will be implemented using the Patient Centered Care Improvement Guidebook as a road map to successfully improving patient experience. Progress will be measured and monitored using the NRC Picker (HCAHPS and CGCAHPS) surveys.

This project addresses CN.1 Improve quality of healthcare delivery and patient experience.

The University Health System provider group (Community Medicine Associates) as employed providers take part in all orientation and Customer Service training or initiatives. A new initiative will be to work with Federally Qualified Health Centers where University Health System providers and patients are assigned to roll-out the use of NRC Picker surveys to gather data on the patients experience served in the FQHC areas. University Hospital has begun and will continue to use a curriculum of Customer Service training focused on the Disney model of Customer Service – Building A Culture of Healthcare Excellence. This new initiative will be a
great start to get all University Health System employees on the same page by teaching the basics of Customer Service (required of all employees). The Executive Director of Patient Centered Care in collaboration with other departments (Learning Resources, Human Resources, Patient Care Services and Patient Satisfaction) will monitor and be accountable for the sustainability of this program. Historically, customer service programs have not sustained as there has been no one individual or department assigned to monitor. This will be the primary focus of the Executive Director of Patient - Centered Care. Key to this effort will be that employees have an understanding of the philosophy of Patient-Centered Care and that applicants with outstanding customer service skills are hired to fill vacancies. We will know that we are improving, when we become the health system of choice and our customer service scores continue to improve.

Related Category 3 Outcome Measure(s):

IT-6.1 Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAPHS survey may be used to establish if patients: are getting timely care, appointments, and information; how well their doctors communicate; patient’s rating of doctor access to specialist; patient’s involvement in shared decision making, and patient’s overall health status/functional status.

RHP Priority
This outcome addresses the triple aim plus as presented in the RHP, by improving patient experience and improving quality outcomes.

Evidenced Based Rationale
This category 2 project of improving the patient experience initiative is using evidenced based best practices learned from Disney’s Model-Building A Culture of healthcare Excellence and Patient Centered Care philosophy. The foundation developed in this project will help position the organization to drive the outcomes of improvement in NRC Picker outcomes in our category 3 project.

Relationship to other Projects:
This project inter-relates with all of the DSRIP projects as a part of our Triple Aim Plus model for patient-centered care and specifically RD-4. – Patient Satisfaction.

136141205.1.3 Implement a Chronic Disease Management Registry
This project will help monitor current and future patient population in University Health System medical homes to improve healthcare outcomes.
136141205.1.4 Introduce, Expand, or Enhance Telemedicine/Telehealth
Telemedicine can be utilized to expand services and access to new clinical sites.
136141205.1.5 Expand specialty care; Behavioral health services
Mental health conditions are prevalent among the population University Health System serves. Expanding Behavioral health services will give the providers access to refer patients in need of these services at new primary care sites.
92414401.2.2 Enhance/Expand Medical Homes
Increasing access to primary care will give patient access to other specialty and preventive services offered in the medical homes.
136141205.2.2 Redesign to Improve Patient Experience
Providing the ability to access healthcare in a timely manner and in locations where services are needed will to a better patient experience.

136141205.2.3 Apply process improvement methodology to improve quality and efficiencies: LEAN methodologies will assist all projects in developing tools and training for the staff as it relates to process improvements in the quality and efficiencies in the care provided to the community.

136141205.2.4 Establish/Expand a Patient Care Navigation Program
This project will link much needed care coordination, social support and culturally competent care to vulnerable patient populations at risk for admissions and re-admissions.

136141205.2.5 Use of Palliative Care Programs
Patients in the medical homes with chronic end of life conditions will have an avenue that addresses patient populations who are at risk for suffering, frequent emergency room visits, admissions and death.

**Relationship to Other Performing Providers’ Projects in the RHP:**

92414401.1.1 Expand training of the primary care workforce
Training future providers in primary will assist with filling the need to create more access for patients and having newly trained providers to staff additional clinical sites

**Plan for Learning Collaborative:**

This project lends itself to participation in learning collaborative as other Performing Providers in RHP6 seek to develop and expand customer satisfaction programs and measures in other parts of the region for similar patient populations. Processes and techniques developed and implemented during this project will be documented by the project team. Successes as well as lessons learned will be shared with regional collaborators who are also working to improve patient care experience.

**Project Valuation:**

The project achieves the waiver goal and meets community needs by measuring patient experience throughout the system as University Health System expands primary care in a predominantly Hispanic, underserved area of Bexar County. This program strengthens University Health System’s knowledge of patients’ perception of our new healthcare linkages with local community partners, defines barriers to care and assures improved quality care services to a target population that struggles with poverty, receive acute or emergency healthcare services only, and do not have usual providers. Patient satisfaction measures will be the predominant metric to understand how effective health system changes are being implemented and serve as the most useful tool to guide program improvement decision making.

<tr>
<td>Unique RHP ID#: 136141205.2.3 – PASS 1</td>
</tr>
<tr>
<td>Performing Provider: University Hospital</td>
</tr>
<tr>
<td>Performing Provider TPI: 136141205</td>
</tr>
</tbody>
</table>

Project Summary:

<table>
<thead>
<tr>
<th>Provider Description: University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access to primary, specialty and preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intervention(s): This project will establish new operational standards within each department based on transparent key performance indicators (KPIs). Visual management boards will be designed specifically for each department so that staff, administration, physicians, and even patients can understand and be encouraged to evaluate the performance for a given department. There will also be a continued focus on training staff/providers on Lean Healthcare Methodologies.</td>
</tr>
<tr>
<td>Need for the project: The National Strategy for Quality Improvement (developed under the Patient Protection and Affordable Care Act) has identified the current state of the American health care system as being highly fragmented due to poorly designed clinical care processes that has subsequently translated into unnecessary duplication of services, poor patient clinical care, and experience. As a result, the National Quality Strategy calls for health systems to deliver high quality, efficient, safe, patient-centered care.</td>
</tr>
<tr>
<td>Target population: The target population will include all UH patients and staff. Medicaid funded and uninsured patients comprise 62% of patients who receive services at UHS.</td>
</tr>
<tr>
<td>Category 1 or 2 expected patient benefits: This project will implement a quality improvement initiative to improve inefficiencies and/or reduce program variation in DY2. A series of rapid improvement projects will be implemented as well as recruitment of quality improvement champions in DY3 and DY4 culminating in the completion of at least 60 process improvement events by DY5. Patients and staff will directly benefit from quality improvement methodologies including Lean that will help to identify waste in the system resulting in enhanced quality of care, more efficient processes, and standardization of procedures.</td>

3.1T.6.1 Percent improvement over baseline of patient satisfaction scores

- **DY4** – Increase Patient Satisfaction Scores by TBD% over established baseline of patient satisfaction scores.
- **DY5** - Increase Patient Satisfaction Scores by TBD% over established baseline of patient satisfaction scores

**Project Description:**

The salience of making American healthcare more efficient and integrated was elevated by the passage of the Affordable Care Act (ACA). This in an era where the current state of health care delivery is considered to being highly fragmented due to poorly designed clinical care processes that has subsequently translated into unnecessary duplication of services, poor patient clinical care, and experience.

As part of an effort to enhance both quality care and the patient experience, University Health System will implement the Lean methodology to determine the use of materials and human resources, improve value to the patient, and distinguish how and why inputs into certain processes translate into value, and find ways to eliminate wasteful components.

University Health System’s Operational Excellence initiative will serve as the vehicle to drive continuous process improvement. Through application of the Lean methodology, staff will engage in problem solving techniques based on quantitative data aimed at improving day-to-day work processes that result in better patient care.

Target areas already identified are the surgical ICU, the discharge process, pharmacy, ED, and the OR. Projects include management excellence, patient throughput analysis, workflow improvement, and medication management.

**Goals and Relationship to Regional Goals**

The goal of this project is to establish new operational standards within each department based on transparent key performance indicators (KPIs). Visual management boards will be designed specifically for each department so that staff, administration, physicians, and even patients can understand and be encouraged to evaluate the performance for a given department.

**Project Goals:**

- Implement a quality improvement initiative to improve inefficiencies and/or reduce program variation.
- Implement a rapid improvement project using a proven methodology.
- Implement at least one patient care-centered process improvement project in the health system.

The project meets the following regional goals: CN. 1 – Improve quality of healthcare delivery and patient experience.

**Challenges:**
The primary challenge to this project will involve having the health system incorporate and adopt a new organizational ‘mindset’ that is focused on identifying and solving operational inefficiencies alongside intensive change management that is focused on improving processes that add value to patient care and experience.

Many processes are not centered on the patient but around antiquated workflows, physician preference and nurse preference. These have resulted in “workarounds” that have consequently lead to greater downstream inefficiencies resulting in disconnected and broken processes that introduce waste and diminish human potential. University Health System will progressively improve performance by evaluating human, process, and system performance to center around the patient’s overall health service experience.

Another challenge faced is the ability to collect data to sustain performance and measure success. Lean process improvement is metric and data driven and will create a more “date-driven” mindset. The health system will have to engineer new ways, either manual or automated, to gather data which grows are platform for data collection. The health system struggles with inconsistent data due to ineffective communication between the EMR and supporting programs. UH has adopted the “best of breed” approach with clinical programs. The health system has purchased specific operating suites for specific functions and has chosen not to stay uniform in vendor, where applicable. Monitoring data across multiple clinical departments will require increased awareness of its importance and diligence. UH will look into purchasing a project management program to keep data centralized and organized. Eventually, a comprehensive dashboard will be built to display a portfolio of all projects to track results on a global scale.

5-Year Expected Outcome for Provider and Patients

Through design, development and implementation of the Lean methodology, University Health System expects to see improvements in the quality and health service experience of its patients. Further, University Health System plans to have 30% of providers/staff educated in the Lean methodology, a total of 60 rapid process improvement events completed, and a culture that values taking initiative for continual problem solving. Expected outcomes related to project goals are described below.

**Starting Point/Baseline:**
Currently an orientation of the Lean methodology is underway at University Health System. University Health System will develop a new Lean department devoted to training staff to undertake performing process improvement within their respective areas. Therefore the starting point/baseline for implementing a program to improve inefficiencies and/or reduce program variation is 0 in DY2.

**Rationale:**
With roots in manufacturing, the Lean methodology requires all staff to be involved in helping to redesign processes to improve flow and reduce waste. Lean methodology also incorporates a patient focused approach by helping to identify and remove non-value added activities (waste), allowing more time for value added work (enhancing the patient experience of direct patient care). The rationale is to reduce variation in experience and treatment, focus more on quality and outcomes based on metrics and performance, and create a more efficient and satisfying working environment for staff and physicians. University Health System will also evaluate care patterns to find areas of underuse of services, overuse of services, misuse of services, and disparities in
quality of care delivered.

**Project Components**
The design and strategy of the proposed quality improvement process will be accomplished by meeting all required project components.

a. Provide training and orientation to the Lean methodology to clinical and administrative staff in order to elevate the importance of undertaking process improvement strategies, developing and utilizing metrics, methodologies, and culture change.

b. Develop an employee suggestion system that allows for the identification of issues that impact the work environment, patient care and satisfaction, efficiency and other issues aligned with continuous process improvement.

c. Define key safety, quality, and efficiency performance measures and develop a system for continuous data collection, analysis, and dissemination.

d. Develop standard workflow process maps, staffing and care coordination models, protocols, and documentation to support continuous process improvement.

e. Implement software to integrate workflows, performance metrics and provide real-time performance feedback.

f. Evaluate the impact of the process improvement program and assess opportunities to expand, refine, or change processes based on the results of key performance indicators.

Unique Community Need Addressed:

Implementation of this quality process improvement methodology responds to unique community need CN. 1 – Improve quality of healthcare delivery and patient experience.

As stated previously University Health System is currently developing the Lean program to include visual management boards for departments. The will be designed around key performance indicators selected by departmental leadership, operational dashboards, quality of care performance measures for staff to quickly review and understand the performance of the department.

This level of transparency is new to University Health System and will guide our process improvement initiatives. Process improvement events will focus on improving workflows, processes, and policies to bring more value to the patient. Process improvement events will also drive higher quality to the patients. As University Health System reduces waste and redesigns processes to streamline each patient experience, it allows for clinicians to focus more on direct patient care instead of being deterred by inefficiencies within each process or system. Being the lowest ranked state on healthcare quality, University Health System, as a county hospital, should be a leader in system redesign that strengthens quality care for patients and advances efforts to become a high performing healthcare delivery system.
### Related Category 3 Outcome Measure(s):

<table>
<thead>
<tr>
<th>OD-5 Cost of Care</th>
</tr>
</thead>
</table>

**IT-5.1 Improved cost savings: Demonstrate cost savings in care delivery** *(standalone measure for 2.5 only. For all other projects – Non-standalone measure)*

- **a. Numerator:** Type of analysis to be determined by provider from following list: Cost of Illness Analysis, Cost Minimization Analysis, Cost Effectiveness Analysis (CEA), Cost Consequence Analysis, Cost Utility Analysis, Cost Benefit Analysis
- **b. Data Source:** TBD by provider as appropriate for analysis type

**Reasons/Rational for Selecting the outcome measures:**
Lean process improvement initiatives will streamline processes. Part of reducing waste includes cost minimization because fewer resources are being devoted towards ‘non-value added’ activities. As processes are improved, employees will have more time to spend on value-added activities and focusing on maximizing the patient’s experience. There will be a reduction in the amount of time spent on inefficient or unnecessary steps in the process of caring for patients. Through the different type of cost studies, UH expects to see cost improvement in care delivery as Lean management philosophies are developed throughout the system. The process milestones for this category 3 outcome measure represent the build up to reaching the improvement target. Essentially, cost minimization adds value to the tax-paying citizens of Bexar county. As the county hospital, University Health System has a fiscal responsibility to use the resources given by the county as efficiently as possible. Lean process improvement focuses on reducing waste, one of which is unnecessary cost.

### OD-6 Patient Satisfaction

**IT-6.1 Percent improvement over baseline of patient satisfaction scores** *(all questions within a survey need to be answered to be a standalone measure)*

Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAHPS survey may be used to establish if patients:
- (1) are getting timely care, appointments, and information; *(Standalone measure)*
- (2) how well their doctors communicate; *(Standalone measure)*
- (3) patient’s rating of doctor access to specialist; *(Standalone measure)*
- (4) patient’s involvement in shared decision making, and *(Standalone measure)*
- (5) patient’s overall health status/functional status. *(Standalone measure)*

- **a. Numerator:** Percent improvement in targeted patient satisfaction domain
- **b. Data Source:** Patient survey
- **c. Denominator:** Number of patients who were administered the survey

**Reasons/Rational for Selecting the outcome measures:**
The patient satisfaction outcome measure was selected due to its consideration as a valid self-report rating by the patient in regards to the quality of care received during their most recent appointment.
Further, the intent of the HCAHPS initiative is to provide a standardized survey instrument and data collection methodology for measuring patients' perspectives on hospital care. The surveys are designed to produce comparable data on the patient's perspective on care that allows objective and meaningful comparisons between institutions on domains that are important to consumers. Public reporting of the survey results is designed to create incentives for institutions to improve their quality of care. Public reporting will serve to enhance public accountability in health care by increasing the transparency of the quality of institutional care provided in return for the public investment.

With a service catchment area of 1.7 million residents, University Health System is the major safety-net hospital for Bexar County, Texas. Ensuring that timely, efficient, equitable, high quality care is delivered to the population will be strengthen by taking into account and measuring the patient perspective thus translating into better health for the community.

**Relationship to other Projects:**

The project’s emphasis on implementation of continuous, rapid process improvement will strengthen University Health System’s mission to achieve best care by becoming cost-effective and efficient further reinforces and enables the following projects.

**Category 1:**
(Project ID: 92414401.2.2) Expand Primary Care Capacity – Improvement in patient flow and reducing waste in process will provide more minutes in every day for value-added activity (patient care). University Health System could expand capacity through efficiency.

**Category 2:**
(Project ID: 136141205.2.1) Enhance/expand medical homes – Lean methodologies will help create the new processes in the medical home model.

(Project ID: 136141205.2.8) Conduct medication management – This area is already indentified as a target for rapid process improvement.

**Category 4:**
RD-4 Patient-centered Healthcare
1. **Patient Satisfaction**

The reporting of the measures must be limited to the inpatient setting only. All of the HCAHPS’ questions included for the themes listed below are required to be included in RHP plans for PPs required to report for DY 2-5, or if HCAHPS not in place in DY 2, starting DY 3.

a. Each HCAHPS theme includes a standard set of questions. The following HCAHPS’ themes will be reported on:
   - Your care from doctors;
   - Your care from nurses
   - The hospital environment;
   - When you left the hospital.

b. Data Source: HCAHPS296
Relationship to Other Performing Providers’ Projects in the RHP:

Other systems are leading similar projects to expand specialty care. Baptist Medical Center, Methodist Hospital, and Nix Health Care System are systems within San Antonio that have targeted this for improvement. Targeted areas may be similar across each hospital. In the spirit of the waiver, University Hospital will work in conjunction with these health systems as they are serving the same targeted population. University Health System will attempt to collaborate and learn from these partnering projects.

Plan for Learning Collaborative:

Operational Excellence will be based on best practices developed outside our region that could be effectively implemented in our region. Lean incorporates best practices and national benchmarks to measure success. Most of these identifiers are standardized across the country lending this project to:

- Developing a plan to communicate ideas, data, and successes across the region and state
- Stay current on best practices and benchmarks to adopt pertinent metrics to measure success
- Organize and participate in learning events across the RHP to invite experts to share knowledge regarding quality improvement and patient safety.

Project Valuation:

Achieves waiver goals:

This is aligned with the overall strategy of the waiver by improving the healthcare infrastructure to serve the patients of Bexar county and surrounding areas. As University Health System reduces waste and redesigns processes to streamline each patient experience, it allows for clinicians to focus more on direct patient care instead of being deterred by inefficiencies within each process or system. It further maintains and supports a more coordinated delivery system bringing value to the patient.

Addresses community needs:

This will address community need 1 (as defined by RHP 6): “Texas ranks last in the nation on healthcare quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.” The impact will be to improve the patient experience as they receive care in a culture of continuous improvement focused on value-added activities.

Project scope:

The outreach of this project is large scope as it will affect all patients entering our system. University Health System is creating a culture of Operational Excellence that will provide consistency for the patient in all interactions and across the continuum of care – from direct clinical care, to the registration process, to nursing units to discharge.

Project investment:

The investment is considered a strategic imperative that addresses the triple aim in health care and so therefore this program will be extensive simply due to the time investment of leadership, physicians, and staff. Rapid improvements, while extremely effective, take considerable amounts of concentrated time. University Health System will hire a Lean Director and a Lean Data Analyst to help facilitate the different projects involved, which is a financial commitment from the Health System.
