**Identifying Project and Provider Information:**

| Title: 2.9.1 – Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care: Establish a Patient Care Navigation Program for University Health System |
| Unique RHP ID#: 136141205.2.4 – PASS 1 |
| Performing Provider: University Hospital |
| Performing Provider TPI: 136141205 |

**Project Summary:**

| Provider Description: University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access to primary, specialty the preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County. |
| Intervention(s): This project will establish a patient navigation model comprised of social workers and case managers within the ambulatory setting to enhance quality of care, and access to clinical and social support for medically complex patients. |
| Need for the project: The University Health System ambulatory network is comprised of regional developing patient-centered medical homes that are located in an area of the county where large segments of the population are economically underserved, uninsured and who have been diagnosed with multiple chronic health conditions. Medically complex patients in particular carry a higher burden of disease and require extensive care coordination support to ensure adherence to clinical preventive care and treatment. The proposed patient navigation model will enhance the system’s effort to redesign delivery of care in a manner that provides the right care in the right setting. |
| Target population: The target population will include the medically complex Medicaid funded and uninsured patients who comprise 62% of patients who receive services within the health system and who frequently utilize the emergency room. This segment of patient more often carry higher disease burden (clinical and behavioral) that with appropriately tailored patient-navigation interventions can benefit both in terms of access to appropriate clinical care and community resource support. |
| Category 1 or 2 expected patient benefits: Provision of patient navigation services tailored to medically complex patients will occur in DY2 to DY 4 resulting in a 15 percent reduction in EC utilization by patients enrolled in the patient navigation model by DY5. The secondary goals are to enhance care coordination and reduce overall emergency room visits, hospital admissions, and hospital readmissions. |
| Category 3 outcomes: 136141205.3.15 3.IT.9.2 ED appropriate utilization |

- **DY4** - Decrease ED visits by TBD% for targeted conditions
DY5 - Decrease ED visits by TBD% for targeted conditions.

Project Description:

2.9.1 - Implement and provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care (for example, patients with multiple chronic and behavioral health conditions, cognitive impairments and disabilities, limited English proficiency, recent immigrants, the uninsured, those with low health literacy, frequent visitors to the ED, and others).

The project will work towards establishing and enhancing patient navigators consisting of social workers and case managers beyond acute care and within the emergency center and defined ambulatory clinics to support the patients within the region. The project will work as a support network and educational system to aid and facilitate patient activation and empowerment.

The emergency room is the front door of acute care today for patients without funding and thus, access to health services. A bigger challenge for University Health System is that many patients who are hospitalized and who frequent the EC are considered high users. Data is plentiful via Crimson and IDX, and cross continuum collaboration is beginning to occur but the challenge remains that due to limited access to ambulatory primary and specialty services, high volumes of patients continue to seek care in the EC and hospital.

Goals of this project will be to provide a programmatic approach encompassing but not limited to:

- Stakeholder engagement per setting
- Education
- Identification and individual:
  - social support
  - culturally competent care
  - alternative resources to EC and acute hospitalization

The navigation team will work diligently to provide seamless, coordinated, timely, and site specific care for the patients in the program. We will continuously review our program for effectiveness and will incorporate changes as needed. We will develop various dashboards to track our progress.

The secondary benefit to University Hospital will be future cost avoidance.

**Relationship to Regional Goals**

This project will further achievement of the regional goals of the Triple Aim; improved health care infrastructure to better serve Medicaid and currently uninsured residents in RHP 6; reduce health disparities; further develop and maintain a coordinated care delivery system; and improve outcomes while containing cost growth.
**5 Year Expected Outcome for Provider and Patients:**
For patients identified and managed by the Patient Navigation/Care Coordination program, the goal is to decrease EC utilization by 15%.

**Starting Point/Baseline:**
Beginning in June 2012, the Department of Care Coordination added five RNs and four Social Workers to the Emergency Center for 24/7 coverage. University Hospital Emergency Department is a Level 1 Trauma Center with a 2012 volume of over 68,000 patient visits. Two RN case managers were initiated as a pilot in June, 2012, in two ambulatory settings. Four Social workers have been present and are centralized at the Robert B. Green Campus (the largest University Health System ambulatory site), providing telephonic support to other ambulatory clinics as needed. Initial reports have been run but baselines are still being defined for “high-utilizers.” Discussions are just beginning regarding possible tools for encounter captures in the EC and clinics via Allscripts, Care Coordination software. The baseline is 0 because it is still being defined.

**Rationale:**
This project was selected to significantly enhance the existing navigator/care coordination program that was established in mid 2012, as a means of expanding health care throughout the health continuum, reaching into the ED and out to other ambulatory settings and providers within the community. The expansion of the navigator/ Care Coordination program includes nurses, social workers, and other identified and trained healthcare workers who work collaboratively with clients/patients, and other healthcare workers to facilitate and coordinate care.

Through the Patient Navigation program, we propose to meet all required project components:

a. Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency.

b. Deploy innovative health care personnel, such as case managers/social workers, community health workers and others as patient navigators.

c. Connect patients to primary and preventative care.

d. Increase access for patients to care management and/or chronic care management, including education in chronic disease self-management.

e. Ongoing quality improvement such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned", opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

This project specifically addresses CN.3 which states many residents of RHP 6 lack access to medical care due to high rates of un-insurance and healthcare provider shortages.
Related Category 3 Outcome Measure(s):

OD-9 Right Care, Right Setting

IT-9.2 ED appropriate utilization (Stand-alone measure)
  d. Reduce Emergency Department visits for targeted conditions
  e. Data Source: EMR/IDX/Crimson/Truven Health/Allscripts

Reasons/rationale for selecting the outcome measure:
A recent study conducted at a university tertiary health care facility showed that 15.8% of patients presenting to the emergency center for care had no emergent needs and were misusing the emergency center. Other studies have reported that non appropriate patients present to emergency centers due to lack of resources, access to care, or have a misunderstanding or are unaware of other resources available. Because the ED at University Health System continues to experience high patient visits, this project outcome was selected with the intent to respond to the individual patient need(s) and optimally, decrease misuse of emergency center visits and hospitalizations for patients whose needs can be addressed otherwise. Patients will be identified as high-utilizers of the Emergency Center and will be targeted for navigation services.

Relationship to other Projects:

The project has multiple inter-relatedness to other projects within the RHP:

A. 92414401.2.2 – Enhance/expand the medical home
   a. The Navigation Program will support the medical home by navigating the patients in need of additional resources, specialty care, and appropriate resource utilization. The intent of the program will be to facilitate care throughout the care continuum while appropriately utilizing University Hospital resources.

B. 92414401.2.1 – Expand chronic care management models
   a. The Navigation Program is a component of the Care Management Model; as patient are identified as needing additional resources or education, the navigation program will aid in facilitating the necessary care.

C. 136141205.2.5 – Use palliative care programs
   a. Navigation Services will be supporting a Palliative Care program through the Emergency Department as well as through the primary care clinics. The navigation program will aid in identifying patients in need of those resources.

Category 4 measures include emergency department in RD-5 and patient-centered healthcare, including patient satisfaction and medication management in RD-4

Relationship to Other Performing Providers’ Projects in the RHP:

Bluebonnet trails and University of Texas Health Science Center at San Antonio are planning to establish or expand upon patient navigations services. As project definitions evolve, it is anticipated that even though the term “navigators” implies different roles per populations identified, there remains opportunities to share lessons learned, ideas, etc.
Plan for Learning Collaborative:

University Health System is very interested in sharing best practices, lessons learned, and other ideas to improve patient navigation services. We will participate in face-to-face meetings and/or conference calls to regularly share data related to the efficacy of various practices along with lessons learned as we implement this program.

Project Valuation:

Via the system created to weigh all University Health System projects, this project was rated very high (18) due to the anticipated volume of patients touched who will receive case management and social services support. Cost avoidance is the anticipated end result secondary to a reduction of admissions and readmissions as well as a decrease in EC utilization. This project achieves the Waiver goals by a) improving the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further developing and maintaining a coordinated care delivery system; c) contributing to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and serving as a powerful tool to help providers improve outcomes and reduce ED utilization (containing cost growth).

Identifying Project and Provider Information:
Title: 2.10.1 Use a Palliative Care Programs to address patients with end-of-life decisions and care needs: Lifelong Intensive Family Emotional (L.I.F.E.) Care/Palliative Medicine Service
Unique RHP ID#: 136141205.2.5 – PASS 1
Performing Provider: University Hospital
Performing Provider TPI: 136141205

Project Summary:
Provider Description: University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access to primary, specialty, and preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County.

Intervention(s): This project will increase the quality of palliative care services and expand education regarding palliative medicine among primary care providers at University Hospital. The project will improve the quality of life for patients and families facing serious illness through earlier advanced care planning, better communication, as well as improved pain and symptom management and coordination of care.

Need for the project: Currently, less than one-third of palliative medicine consultations occur early in the course of hospitalization (within 72 hours after admission) at University Hospital. Late consultation results in missed opportunities to improve pain and symptom management, to establish a relationship with patients and families, and to promote patient and family-centered goals that might prioritize comfort over aggressive therapy.

Target population: The target population comprises patients with life-threatening or chronic progressive illnesses who would benefit from palliative care services including those with cancer, brain injury, trauma, cardiovascular disease, dementia, COPD, cirrhosis, and end-stage renal disease. Medicaid funded and uninsured individuals represent 62% of the patient population served by the Health System.

Category 2 expected patient benefits: The project will provide training and education in palliative care services to over 150 primary care physicians by DY2, 300 by DY3, 360 by DY4, and 400 by DY5. The project will provide effective pain screening to over 158 patients by DY2, 319 by DY3, 382 by DY4, and 479 by DY5. Benefits to the patient population include an increased awareness and access to palliative care services and the standardization of effective screening tools that increase the quality of care and improve the patient experience.

Category 3 outcomes: IT-13.1; IT-13.2; IT-13.5. Provide comprehensive clinical assessments.
- **DY4**—Provide comprehensive clinical assessments, documentation of life sustaining preferences, and spiritual/religious concerns for at least 75% of eligible patients (479).
- **DY5**—Provide comprehensive clinical assessments, documentation of life sustaining preferences, and spiritual/religious concerns for at least 90% of eligible patients (574).
Project Description:

The purpose of implementing an expanded Palliative Care program within University Hospital is to provide access to comprehensive supportive care services for patients in Bexar County who are at risk for serious illness and to improve quality of life for patients and families facing serious illness through intensive communication, pain and symptom management, advanced care planning, and coordination of care. The high prevalence of chronic disease in the Bexar County and throughout RHP Region 6 results in patients with cancer and chronic progressive illness. University Hospital is implementing a Palliative Care program known as LIFE (Lifelong Intensive Family and Emotional) Care/Palliative Medicine. The LIFE Care/Palliative Medicine program seeks five-year expected outcomes that will serve to mend gaps in comprehensive supportive services for the most vulnerable patient populations including patients with cancer, brain injury, trauma, and chronic progressive illness such as diabetes, cardiovascular disease, dementia, COPD, cirrhosis, and end-stage renal disease. To meet the challenges of providing broad access to supportive services for these patient populations, the LIFE Care/Palliative Medicine program will build on existing resources while developing three interconnected and interdisciplinary service lines—inpatient care, outpatient care, and advanced care planning—with an emphasis on the following goals through quality improvement initiatives driven by data collected from the actual patient population: early identification, planning, and support for at-risk patients and families across University Health System facilities and beyond; enhanced assessment, management, and documentation of pain and other symptoms; increased patient safety through education and documentation related to coordination of care and safe uses of medications; improved patient outcomes including patient and family satisfaction, ICU and hospital mortality, hospital readmission, and hospice referral. Benefits to the patient population include increased awareness among providers and patients as well as better access to palliative care services and standardization of effective screening tools for pain and other needs. All of these initiatives will lead to improved continuity of care across settings, earlier and safer pain and symptom control, patient empowerment, increased access to sources of social and spiritual support, and higher patient and family satisfaction.

Starting Point/Baseline:

University Hospital started the inpatient and outpatient service lines for the LIFE Care/Palliative Medicine program in July 2011. The service is currently staffed by Hospice and Palliative Medicine Board Certified and Board Eligible (American Board of Internal Medicine) physicians and a Registered Nurse with advanced training in Palliative Care, as well as a dedicated Palliative Care Social Worker and Chaplain who joined during the spring and summer of 2012 respectively. During the calendar year 2012, the LIFE Care/Palliative Medicine program provided 638 inpatient consultations and over 120 outpatient clinic visits. Currently, education in Palliative Care for primary care providers is sorely lacking and education for physicians-in-training is neither systematic nor embraced as a central part of the core ACGME curriculum.

Rationale:

Palliative Care is an effective tool for meeting the needs of patient populations who are at risk for suffering and progressive illness. Hundreds of well-designed studies have demonstrated that
Palliative Care improves family satisfaction and patient quality of life while reducing symptom burden and costs associated with non-beneficial medical care. For this reason, many states are attempting to remedy the status quo through Palliative Care initiatives. Milestones and metrics for this project were selected according to the likelihood that they would promote awareness and access to supportive services, improve skills across the healthcare system, and ensure effective use of screening tools. Project Components (a) and (b) have been fulfilled during the first year of the LIFE Care/Palliative Medicine program through the following: development of a business case for a palliative care service and transitioning patients from the acute care setting into home care and hospice. Project Components (c) and (d) will be addressed through the implementation of a screening process regarding pain management as well as the implementation of quality improvement initiatives to identify project impacts, lessons learned, and key challenges associated with expansion of the project. Process Milestone 2.1 (Educate primary care specialties in Palliative Care) will be used for DY 2-5 and will engage clinicians and residents across primary care specialties. This strategy will allow the LIFE Care/Palliative Medicine team to focus on clinical care for patients with complex care needs while also influencing the next generation of practitioners. Improvement Milestone I-11.1 (Pain screening) will promote standardization of effective screening tools that improve safety and enhance patient experiences.

State report cards issued by the Center to Advance Palliative Care reveal that Texas improved from a “D” in 2007 to a “C” in 2011 as a result of more hospitals investing in palliative care services, University Hospital among them, but this still remains low.

This program addresses both Community Need CN.1 (poor health care quality) and Community Need CN.2 (high prevalence of chronic disease, including cancer) identified in the RHP 6 Community Needs Assessment. The LIFE Care/Palliative Medicine program was started in mid-2011, but continues to grow due to the demand for services. Analysis of an internally maintained database shows less than one-third of LIFE Care/Palliative Medicine consultations occur early in the course of hospitalization (within 72 hours after admission).

All of the patients who were consulted late in the course of hospitalization suffered from a set of comorbidities and acute conditions that were identifiable at the time of admission. Late consultation entails a missed opportunity to improve pain and symptom management, to establish a healthy rapport with patients and families, and to promote patient and family-centered goals that might include prioritizing comfort over survival-at-all-costs. When patients who received an inpatient LIFE Care/Palliative Medicine consultation are matched by diagnoses and severity of illness to patients who did not receive a consultation, a significant disparity is revealed: for every LIFE Care/Palliative Medicine consultation there are at least five equally ill and distressed patients and families who were not introduced to the LIFE Care/Palliative Medicine team.

**Related Category 3 Outcome Measure(s):**

For Category 3 outcomes, the three non-standalone metrics (chart documentation of pain assessment, treatment preferences, and documentation of spiritual concerns) reflect some of the core quality measures needed to achieve excellence in patient care. These metrics also correlate

---

with the selected Process and Improvement metrics. There is documented evidence of problems with hospital symptom management and continuity of care:

- 1 in 2 patients describe their hospital care as “suboptimal”\(^50\)
- 1 in 4 patients report inadequate treatment for pain and shortness of breath\(^51\)
- 1 in 3 families report inadequate emotional support\(^52\)
- 1 in 3 patients state they are poorly educated for pain and other symptom management after hospital discharge\(^53\)
- 1 in 3 patients are not provided plans for follow-care after hospital discharge\(^54\)
- Over 50% of deaths in America occur in the hospital setting.\(^55\)
- Over 70% of patients who die in the hospital were admitted to the hospital in the previous six months.\(^56\)
- Only 40% of public hospitals have access to Palliative Care specialists.\(^57\)
- About 33% of patients enrolled in hospice die within one week.\(^58\)

Improving access to LIFE Care/Palliative Medicine services involves implementation of a comprehensive supportive service that inevitably relies on changing the culture in which the service is practiced. Referring physicians and physicians-in-training need to understand and appreciate the role that Palliative Care can play in improving patient and family satisfaction, pain and other symptom management, and in promoting patient and family-centered care. Education of referring physicians, especially primary care physicians and physicians-in-training, can deepen the appreciation for supportive care. Education in Palliative Care can also promote best practices and broad patient access to competent delivery of basics in Palliative Care, such as the safe use of opioids, emotional and spiritual aspects of care, and ethical issues related to surrogate decision-making and withdrawing or withholding life-sustaining interventions.

**Relationship to other Projects:**

**136141205.1.2 Expand Primary Care Capacity:** Implementation of education for primary-care providers, expanded outpatient Palliative Care services, and advance care planning efforts will help to relieve the time and resource-intensive obligations that primary care clinics face when caring for seriously ill patients and their families. Enhanced knowledge about safe-prescribing practices and available resources such as hospice can help primary care physicians navigate more confidently through the plan of care for their most vulnerable patients.

**136141205.1.7 Enhance Interpretation Services and Culturally Competent Care:** Cultural competence in health care describes the ability of systems to provide care to patients with diverse values, beliefs and behaviors, including tailoring care delivery to meet patients’ social, cultural, and linguistic needs. Inpatient and outpatient Palliative Care services focuses on culturally competent communication among patients, families, and providers. Opportunities for patients and families to voice their questions and concerns, particularly during family meetings, are key elements of promoting education, understanding, and empowerment.

**92414401.2.2 Enhance/Expand Medical Homes:** Outpatient Palliative Care services staffed by

\(^{52}\) ibid.

\(^{54}\) ibid.

an interdisciplinary team that also provides supportive care during acute hospitalization and closely collaborates with primary care physicians and specialists such as oncologists and surgeons provide a genuine opportunity to support a medical home. The LIFE Care/Palliative Medicine team is tracking data related to patient encounters, hospitalizations and readmissions, and symptom management, all of which can be used to gauge the success of a supportive medical home model.

**92414401.2.1 Expand Chronic Care Management Models:** Chronic disease management interventions are geared toward improving effective management of chronic conditions and ultimately improving patient clinical indicators, health outcomes and quality, and reducing unnecessary acute and emergency care utilization. Outpatient Palliative Care helps promote continuity across settings and reduce medical errors by ensuring that patients with advanced illness are seen by Palliative Care specialists soon after hospital discharge or as needed when referred by other specialists such as cancer doctors or surgeons.

**136141205.2.2 Redesign to Improve Patient Experience:** The service lines for the LIFE Care program will improve how the patient experiences healthcare and the patient and family satisfaction with the care provided. Symptom management, communication, continuity of care, and respect for patient preferences are all primary targets for improved experiences.

**Related Category 4 measures include the following:**
- Potentially Preventable Admissions (RD-1)
- 30-Day Readmissions (RD-2)
- Patient-centered Healthcare (RD-4)

Advance care planning in patients with chronic progressive illness has been shown to improve patient and family satisfaction and is also likely to save medical costs by reducing the use of unnecessary medical treatments such as prolonged ICU stays at the end of life, and increase hospice utilization in patients with life-limiting illness.

**Relationship to Other Performing Providers’ Projects in the RHP:**

The LIFE Care/Palliative Medicine project serves a similar population found in other parts of our RHP 6. We will attempt to collaborate on the progress, learn from our mutual projects, and support a learning collaboration should one be formed on this topic. An analysis of regional projects submitted for RHP 6 includes the selection of project options by multiple performing providers which are related to the aims of palliative care program. These include:

1.1 Expand Primary Care Capacity
1.2 Increase training of Primary Care Workforce
2.1 Enhance/Expand Medical Homes
2.2 Expand Chronic Care Management Models
2.4 Redesign to Improve Patient Experience

Additionally, another performing provider has chosen the Use of Palliative Care Programs among their submissions and will be part of a regional learning collaborative to network and share ideas, challenges, and success stories with partner institutions.

**92414401.1.1 Increase training of Primary Care Workforce:** Implementing and developing the LIFE Care/Palliative Medicine service at University Hospital will provide opportunities for primary care physicians-in-training to rotate with Palliative Care specialists and promote skills that will be increasingly important as the population ages.
Project Valuation:

University Hospital has valued this project through its ability to achieve the waiver goals, meet community needs, meet the level of required investment, and include the value of palliative care in the context of both the inpatient and outpatient setting. In 2011, University Health System cared for over 233,000 unique patients, including about 67,000 Emergency Center visits, 400,000 outpatient clinic visits, and 20,000 inpatient discharges. The primary inpatient facility in University Hospital, which operates 496 beds and will expand to about 750 beds when the new University Tower is completed in 2014. South and Central Texas have some of the nation’s highest rates of diabetes and obesity. University Hospital is a Level One Trauma Center, a world-renowned solid organ transplant center, and a referral center for a broad array of life-threatening conditions including metastatic cancer, end-stage renal disease, cirrhosis, heart failure, AIDS, and vascular disease. During the calendar year 2012, the LIFE Care/Palliative Medicine program provided 638 inpatient consultations and over 120 outpatient clinic visits. Preliminary analysis from an internal database reveals that 50% of these patients suffered from advanced cancer, 30% had brain injury or polytrauma, and 30% faced end-stage organ disease such renal failure and cirrhosis, with some overlap among these groups. The ultimate goal for the LIFE Care/Palliative Medicine program is to support as many patients as possible early in the course of their life-threatening or disabling illnesses. In order to maximize the reach and impact, referring health care providers in both the outpatient and inpatient settings must (1) be capable of delivering excellent primary palliative care and (2) know when and how to refer to specialty services. Education is essential to success for both of these practices. As of 2012, approximately 300 primary care attending physicians and 300 primary care residents work within University Health System. The LIFE Care/Palliative Medicine aims to develop a comprehensive and effective educational program for as many of these providers as possible. While curriculum development will require time and energy on the front end, a strategic and sustained educational program can potentially improve the lifelong practices of the current and next generations of physicians. The value of education for improved health outcomes cannot be overstated: education represents a commitment to transforming the culture while yielding an immediate and sustained ripple effect of improved patient satisfaction, continuity of care, safe use of medications, and meaningful use of resources for the hundreds of thousands of patients who seek care from University Health System each year. Education can also improve outcomes related to the delivery of specialty services. Currently, less than one-third of palliative medicine consultations occur early in the course of hospitalization (within 72 hours after admission) at University Hospital. Late consultation results in missed opportunities to improve pain and symptom management, to establish a relationship with patients and families, and to promote patient and family-centered goals that might prioritize comfort over aggressive therapy. Teaching residents when to ask for specialty support can foster a culture of early collaboration and consultation. Additionally, pain control is increasingly recognized as a primary outcome in hospital care and this project offers strategies for demonstrating improvement in this area. The Agency for Healthcare Research and Quality suggests that patient safety and satisfaction cannot be optimized in hospital-based care without first raising the bar for pain assessment. The authors note that the scope of the problem is vast: 62% of the 35 million discharges from U.S. hospitals...
include surgery or interventional procedures, and over 80% of these patients experience post-operative or procedural pain.\textsuperscript{59} These patients are at risk for adverse cardiac events, swings in blood sugar, the development of chronic pain and addiction, and psychological distress such as anxiety and sleeplessness. The American Academy of Pain Medicine also notes that patients who experience uncontrolled pain experience higher absenteeism and lost productivity, with an annual estimated cost of about $300 billion.\textsuperscript{60} By combining targeted education with specialty symptom and decision support, the LIFE Care/Palliative Medicine team will help to ensure that the University Health System achieves its stated mission of “promoting the good health of community by providing the highest quality of care” and “teaching the next generation of health professionals.” Cost-savings or cost-avoidance is increasingly recognized as a secondary outcome associated with Palliative Care programs. When patients and families are provided early supportive care, the culture of automatic escalation of care is mitigated. This can result in cost-savings, improved quality of life, and even prolongation of life.\textsuperscript{61} One large multi-institutional study that matched patients by severity of illness (propensity scores) showed that inpatient Palliative Care consultation significantly reduced direct and variable costs.\textsuperscript{62} For patients who were discharged alive, Palliative Care consultation correlated with an adjusted net savings of $1,700 per admission. And for patients who died in the hospital, savings exceeded $4,900 per admission. When these savings are multiplied across hundreds of consultations per year, and increased ICU bed availability is included, the savings to the healthcare system are substantial. Those savings can be used to further improve and expand supportive care for all patients. At University Hospital, early analysis demonstrates similar cost-savings. One-hundred and seventy patients seen by the LIFE Care/Palliative Medicine team during a six month period were matched to about 9,000 patients with similar diagnoses and severity of illness. With conservative assumptions and excluding outliers, reduced direct and variable savings averaged $5,600 per admission. Consultations performed within 72 hours of admissions yielded an even higher cost-savings of $12,600 per admission, which further illustrates the need for early Palliative Care consultation. For the 638 consults performed in 2012, the estimated cost-savings exceeded $5 million. Opportunity costs not included in this analysis includes ICU bed days, which also decreased by an average of one day per admission and likely resulted in reduced ICU mortality and better Emergency Center throughput. Early palliative care involvement is the goal, which offers the greatest ability to improve health outcomes, patient experience, and cost avoidance. The project offers a synergistic strategy for optimizing local clinical practice guidelines through palliative care education for primary care physicians, pain screening for all palliative care patients, optimized pain management, documentation of life sustaining preferences and religious/spiritual concerns.

**Milestone 1**

Educate primary care specialties (family medicine, internal medicine, pediatrics, geriatrics, and other IM specialties) in providing palliative care including non-cancer training – P-2

**Metric 1:** Primary care specialties training and education in palliative care P-2.1:

- **Baseline:** Number of primary care specialty physicians educated in palliative medicine = 0
- **Goal:** Provide education to at least 25% of primary care specialty physicians (150).
- **Data Source:** Database that tracks type and number of training and education sessions by health

**Milestone 3**

Educate primary care specialties (family medicine, internal medicine, pediatrics, geriatrics, and other IM specialties) in providing palliative care including non-cancer training – P-2

**Metric 1:** Primary care specialties training and education in palliative care P-2.1:

- **Baseline:** Number of primary care specialty physicians at the beginning of DY3
- **Goal:** Provide education to at least 50% of primary care specialty physicians (300).

**Milestone 5**

Educate primary care specialties (family medicine, internal medicine, pediatrics, geriatrics, and other IM specialties) in providing palliative care including non-cancer training – P-2

**Metric 1:** Primary care specialties training and education in palliative care P-2.1:

- **Baseline:** Number of primary care specialty physicians at the beginning of DY4
- **Goal:** Provide education to at least 60% of primary care specialty physicians (360).

**Milestone 7**

Educate primary care specialties (family medicine, internal medicine, pediatrics, geriatrics, and other IM specialties) in providing palliative care including non-cancer training – P-2

**Metric 1:** Primary care specialties training and education in palliative care P-2.1:

- **Baseline:** Number of primary care specialty physicians at the beginning of DY5
- **Goal:** Provide education to at least 75% of primary care specialty attending

---

**Project Summary:**

**Provider Description:** University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access to primary, specialty and preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County.

**Intervention(s):** The Health System will enhance access to evidence-based preventive screenings for the residents of Bexar County, Texas by working with regional providers, health centers and community-based organizations to collaborate, coordinate and establish a strategy that encourages adherence to cancer prevention screening in under and uninsured segments of the population. The outlined intervention also directly responds to the Health System’s Triple Aim Plus objectives of improving access across the care continuum, quality and outcomes, efficiency and patient experience. **Need for the project:** In Texas, cancer remains the leading cause of cancer death for persons 85 years of age and younger. Screening and early detection continues to be the most effective method of reducing cancer mortality. In South Texas (Public Health Service Region 8), prevalence data indicates that only 67% of women age 40 and older have had a mammogram within the past two years, 74% of adult females reporting having a cervical screening within the past three years and 66% of adults ages 50 and older report ever having a Sigmoidoscopy or Colonoscopy. For example, while the overall average annual age-adjusted incidence and mortality rates per 100,000 for breast cancer for women in this region is slightly lower (113.1 and 20.8) than the rest of Texas (115.5 and 22.2, respectively), among Hispanic females both the incidence (98.3) and mortality (18.1) associated with breast cancer is higher when compared to Hispanic females living in the rest of the state (92.7 and 17.1, respectively). Therefore, despite the benefits of screening, economically vulnerable and uninsured and minority populations are less likely to be screened and therefore at risk for cancer.

The demand for primary care visits in the Health System’s service area has been growing at a rapid rate. This is also occurring in areas where a majority of low-income, under and uninsured residents are concentrated in sectors where access to primary care and social services are limited. The rate of uninsured in Bexar County is 23%, highlighting the need for increased access. In addition, access to timely clinical preventive screenings can prevent and detect illnesses and diseases in their earlier, more treatable stages, which can lead to reduced risk of illness, disability, early death, and medical care costs.

**Target population:** This project will focus on reaching various segments of eligible patients (i.e.,
economically underserved, uninsured, or working women) through screening/health education events held at community, workplace, and faith-based venues.

**Category 1 or 2 expected patient benefits:** The anticipated 5 year goal is to increase the number of individual that are screened through this innovative evidence-based program by 20% over baseline (or 6,029 individuals). The secondary goal is to support coordination of services that improve timely access related evidence-based cancer prevention screening (breast, cervical, colorectal).

**Category 3 outcomes:** IT-12.1 (Breast Cancer Screening), IT-12.2 (Cervical Screening) IT-12.2 (Colorectal Screening). **DY4 –** Increase number of eligible individuals who receive a preventive screening by TBD% from established baseline of DY 2; **DY5 –** Increase number of eligible individuals who receive a preventive screening by TBD% from established baseline of DY2

**Project Description:**

In Texas, cancer remains the leading cause of cancer death for persons 85 years of age and younger. Screening and early detection continues to be the most effective method of reducing cancer mortality. In South Texas (Public Health Service Region 8), prevalence data indicates that only 67% of women ages 40 and older have had a mammogram within the past two years, 74% of adult females reporting having a cervical screening with the past three years and 66% of adults ages 50 and older report ever having a Sigmoidoscopy or Colonoscopy. For example, while the overall average annual age-adjusted incidence and mortality rates per 100,000 for breast cancer for women in this region is slightly lower (113.1 and 20.8) than the rest of Texas (115.5 and 22.2, respectively), among Hispanic females both the incidence (98.3) and mortality (18.1) associated with breast cancer is higher when compared to Hispanic females living in the rest of the state (92.7 and 17.1, respectively). Therefore, despite the benefits of screening, economically vulnerable and uninsured and minority populations are less likely to be screened and therefore at greater risk for cancer.

The project will be to implement an innovative community-based intervention model to increase access to clinical preventive services throughout Bexar County, Texas. The primary objective will be to encourage regional providers, health centers and community-based organizations to collaborate and coordinate on cancer prevention approaches that will focus on reaching various segments of eligible patients (i.e., economically underserved, uninsured, or working women) through screening/health education events held at community, workplace, and faith-based venues.

Through this process vulnerable/uninsured or underinsured populations in need of evidence-based preventive screening will be referred to low-cost or free mammograms, cervical screenings and or colorectal screenings. Breast Health Services provides screening and diagnostic follow-up in women 40 years of age and older as well as women referred with a need for diagnostics who reside in economically underserved areas of Bexar County, Texas. Access to preventive screenings (cervical cancer screening, colorectal cancer screening) will be made possible through the introduction of a mobile mammography unit alongside patient navigation services and development of a coalition of community-based cancer prevention, screening and treatment partners located within the proposed target service area.

The project’s goal of implementing evidence-based strategies that address chronic disease risk and thereby increase delivery of clinical preventive services for targeted populations (e.g.,
mammography, cervical and colorectal screens, blood pressure, and immunizations, etc.) firmly coincide with national and regional health improvement goals (Healthy People 2020, Bexar County Community Health Improvement Plan, 2012). These goals aim to improve delivery of evidence-based clinical preventive services that consist of screening and immunizations that can prevent diseases and reduce mortality associated with chronic disease.

Advancement in health information technology alongside standardized documentation procedures provide clinical staff a much more accurate and updated profile in the delivery of clinical preventive services to patients. Therefore, project goals will be to implement and expand evidence-based population-focused interventions as outlined in published studies and reports that include the United States Preventive Taskforce Guide to Clinical Preventive Services and the National Prevention Council’s National Prevention Strategy. These clinical recommendations make evident the importance of enhancing access to clinical and preventive care and thereby create opportunities that engage and motivate individuals to make informed decisions about their health that include seeking and adhering to clinical preventive care. This includes utilizing technology to inform patients that they are due for a preventive health service through clinical reminder systems (e.g., electronic health records with reminders or cues, chart stickers, vital signs stamps, medical record flow sheets) for preventive services.

The Health System will monitor, evaluate, and adjust the project based on quality improvement activities throughout the development and implementation phases, offering “lessons learned” to our partners in RHP6 through the appropriate Learning Collaborative to be established.

Potential challenges faced by this project include ensuring access and delivery to clinical preventive screening to populations that are often confined by their socioeconomic position and therefore must navigate interpersonal, financial and geographic barriers to care. Another important element that providers consider a challenge is ensuring that resources are available to ensure treatment options for individuals who are diagnosed. Countermeasures to these challenges include implementing a culturally tailored patient navigation model that helps to ensure that barriers to seeking preventive care are reduced. Geographic barriers to care will be countered through expansion of mobile screening services that will target high economically distressed areas of the city. Further funding for treatment options will be strengthened by ensuring that patients are appropriately navigated into treatment.

**Relationship to Regional Goals:** This new project will further achievement of the regional goals of the Triple Aim; improve health care infrastructure to better serve Medicaid and currently uninsured residents in RHP 6; reduce health disparities by improving access to delivery of clinical preventive services (screening and immunizations); further develop and maintain a coordinated care delivery system; and improve outcomes while containing cost growth.

Five year expected outcomes include having an established mobile screening services program that strengthens patient-centered care and addresses the triple aim of health service delivery performance that includes improving the experience and quality of care, improving population health and delivering care in cost-effective manner.
Starting Point/Baseline:
The current baseline for cancer-related screening as of October 1, 2012 is:
Breast Cancer Screenings: 14,000
Cervical Cancer Screenings: 12,000

1,748 preventive screenings as of September 30, 2012.

Rationale:
Almost half of all Americans (or 133 million) suffer from at least one chronic health condition including heart disease, stroke, hypertension and diabetes. An estimated 57 million individuals of working-age (age 18 to 64) live with at least one chronic disease. Cumulatively, chronic diseases remain the leading causes of death (70%) in the United States; claim the lives of 1.7 million Americans each year and cost the U.S. economy $1.3 trillion and are expected to reach $6 trillion by the year 2050.

Further, less than half of all Americans receive the recommended levels of screening associated with clinical preventive care. Studies confirm the clinical and economic benefits of providing timely access to preventive services by significantly reducing the onset of chronic health conditions such diabetes, infectious disease such as flu and pneumonia and detecting cancer and other diseases at much earlier stages. In Bexar County, Texas, 22% of residents live at or below the poverty level ($22,557), 17% receive no medical care due to cost, and 21% have no form of health insurance coverage with a diabetes incidence that it twice the national average (14%).

This project specifically addresses community need identification number two (CN.2): Address the high prevalence of chronic disease and related health disparities in the community through greater prevention efforts that focus on addressing chronic disease.

The proposed model provides the opportunity to redesign delivery of health services at UHS. This project represents an effort to expand University Health System’s patient-centered medical home by providing care in the right setting and at the right time for patients who historically have been unable to access clinical preventive care, by providing earlier detection and treatment and potential cost avoidance of unnecessary hospitalizations and/or ER visits due to preventable conditions that include screening for receipt of clinical preventive care.

Related Category 3 Outcome Measure(s):

**IT-12.1 Breast Cancer Screening (HEDIS 2012) (Non-standalone measure)**

a) Numerator: Number of women aged 40 to 69 that have received an annual mammogram during the reporting period.

b) Denominator: Number of women aged 40 to 69 in the patient or target population. Women who have had a bilateral mastectomy are excluded

c) Data Source: EHR, Claims, Visit management system

d) Rationale/Evidence: Screening for cancer implies testing for early stages of disease before symptoms occur. It involves application of an early detection test to a large number of apparently healthy people to identify those having unrecognized cancer. People with positive screening tests are subsequently investigated with diagnostic tests and those with confirmed disease are offered appropriate treatment and follow-up. The objective of screening is to reduce incidence of and/or death from cancer by detecting
early preclinical disease when treatment may be easier and more effective. It is important to evaluate the efficacy of a given screening approach to reduce disease burden, harm and cost, as well as its overall cost-effectiveness, before it is considered for widespread implementation in large population settings. The only justification for a Category 1 Infrastructure Development screening program is early diagnosis that leads to a cost-effective and significant reduction in disease burden.

**IT-12.2 Cervical Cancer Screening (HEDIS 2012) (Non-standalone measure)**

a) Numerator: Number of women aged 21 to 64 that have received a PAP in the measurement year or two prior years.
b) Denominator: Women aged 21 to 64 in the patient or target population.
c) Women who have had a complete hysterectomy with no residual cervix are excluded.
d) Data Source: EHR, Claims, Visit management system
e) Rationale/Evidence: Screening for cancer implies testing for early stages of disease before symptoms occur. It involves application of an early detection test to a large number of apparently healthy people to identify those having unrecognized cancer. People with positive screening tests are subsequently investigated with diagnostic tests and those with confirmed disease are offered appropriate treatment and follow-up. The objective of screening is to reduce incidence of and/or death from cancer by detecting early preclinical disease when treatment may be easier and more effective. It is important to evaluate the efficacy of a given screening approach to reduce disease burden, harm and cost, as well as its overall cost-effectiveness, before it is considered for widespread implementation in large population settings. The only justification for a screening program is early diagnosis that leads to a cost-effective and significant reduction in disease burden.

**IT-12.3 Colorectal Cancer Screening (HEDIS 2012) (Non-standalone measure)**

a) Numerator: Number of adults aged 50 to 75 that have received one of the following screenings. Fecal occult blood test yearly, Flexible sigmoidoscopy every five years, Colonoscopy every 10 years
b) Denominator: Number of adults aged 50 to 75 in the patient or target population. Adults with colorectal cancer or total colectomy are excluded.
c) Data Source: EHR, Claims, Visit management system
d) Rationale/Evidence: Screening for cancer implies testing for early stages of disease before symptoms occur. It involves application of an early detection test to a large number of apparently healthy people to identify those having unrecognized cancer. People with positive screening tests are subsequently investigated with diagnostic tests and those with confirmed disease are offered appropriate treatment and follow-up. The objective of screening is to reduce incidence of and/or death from cancer by detecting early preclinical disease when treatment may be easier and more effective than for advanced cancer diagnosed after the symptoms occur. It is important to evaluate the efficacy of a given screening approach to reduce disease burden, harm and cost, as well as its overall cost-effectiveness, before it is considered for widespread implementation in large population settings. The only justification for a screening program is early diagnosis that leads to a cost-effective and significant reduction in disease burden.
Relationship to other Projects:

This project is related to several other projects within the RHP plan:

92414401.2.2 Enhance/Expand Medical Homes
Increasing access to primary care will give patient access to other specialty and preventive services offered in the medical homes

92414401.1.1 (CMA) Expand training of the primary care workforce
Training future providers in primary will assist with filling the need to create more access for patients and having newly trained providers to staff additional clinical sites

136141205.2.2 Redesign to Improve Patient Experience
Providing the ability to access healthcare in a timely manner and in locations where services are needed will lead to a better patient experience.

Related Category 4 measures include RD-4, patient-centered healthcare, including patient satisfaction and medication management and RD-3 potentially preventable complications.

Relationship to Other Performing Providers’ Projects in the RHP:

N/A

Plan for Learning Collaborative:

This project lends itself to participation in learning collaborative as other Performing Providers in RHP6 seek to develop and expand clinical preventive services in other parts of the region for similar patient populations. Processes and techniques developed and implemented during this project will be documented by the project team. Successes as well as lessons learned will be shared with regional collaborators who are also working to improve preventive services.

Project Valuation:

1. This project achieves the Waiver goals by a) improving the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further developing and maintaining a coordinated care delivery system; c) contributing to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and serving as a powerful tool to help providers improve outcomes and reduce ED utilization (containing cost growth).

2. This project addresses community needs by improving quality of healthcare delivery and patient experience, enhancing access to health services and expanding clinical preventive efforts.

3. The scope of this project is large in that it includes expansion across the 14 school districts in Bexar County, Texas and is critical to ensuring a healthy population (children, adolescents, caregivers and the surrounding areas).

4. This project requires a large investment in terms of personnel, technology and
infrastructure to ensure a coordinated approach to clinical preventive cases taken across the service catchment of area of 1.7 million residents. The hardware, software applications, human resources and time elements required to implement this project are of the highest organizational priority for UHS which is to ensure timely receipt of screening and clinical preventive care to economically underserved populations in Bexar County, Texas.

**Milestone 1**
**P-1:** Development of innovative evidence-based project for target population.
**Metric 1 [P-1.1]:** [Documentation of innovational health service strategy/plan]
- Baseline: [N/A]
- Goal: Develop innovative/evidence-based health service intervention addressing improvement in clinical preventive care.
- Data Source: Documentation on innovational health service plan.

**Milestone 4**
**P-2:** Implement innovative evidence-based project for target population.
**Metric 1 [P-2.1]:** [Documentation of innovative health service strategy and testing outcomes]
- Baseline: [N/A]
- Goal: Implement an innovative patient-centered mobile preventive screening program that incorporates patient navigation, education with delivery of services that are held on-site and focus on community, workplace, and faith-based venues.
- Data Source: Documentation of implemented innovative health service plan in target population.

**Milestone 8**
**I-5:** Identify 1,400 patients in defined population receiving innovative screening intervention consistent with evidence-based model.
**Metric 1 [I-5.1]:** [Number of individuals from target population that received breast cancer screening through innovative health service intervention consistent with evidence-based model]
- Baseline: Baseline year of October 1, 2012 to September 30, 2013 (14,000) Total number of unique individuals from target population reached by project.
- Goal: Increase

**Milestone 11**
**I-5:** Identify 2,100 patients in defined population receiving innovative screening intervention consistent with evidence-based model.
**Metric 1 [I-5.1]:** [Number of individuals from target population that received breast cancer screening through innovative health service intervention consistent with evidence-based model]
- Baseline: Baseline year of October 1, 2012 to September 30, 2013 (14,000) Total number of unique individuals from target population reached by project.
- Goal: Increase
Metric 1 [P-2.1]: [Documentation of innovative health service strategy and testing outcomes]
  Baseline: [N/A]
  Goal: Implement innovative/evidence-based health service intervention addressing improvement in clinical preventive care.
  Data Source: Documentation of implemented innovational health service plan in target population.

Milestone 2 Estimated Incentive Payment: $979,965

Milestone 3
P-4: Execution of evaluation process for project innovation.
Metric 1 [P-4.1]: [Document evaluative process, tools and analytics.]
  Baseline: [N/A]
  Goal: Documentation of data collection tools and methodology.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $12,052,487**
Identifying Project and Provider Information:

Title: 2.11.2 Evidence-based interventions that put in place the teams, technology and processes to avoid medication errors: University Hospital
Unique RHP ID#: 136141205.2.8 – PASS 2
Performing Provider: University Hospital
Performing Provider TPI: 136141205

Project Summary:

Provider Description: University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access to primary, specialty, the preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County.

Intervention(s): The program will provide access to a clinical pharmacist in the ambulatory setting/medical home during the medical consult. This pharmacist will be dedicated to the provision of education and medication management for patients with chronic diseases (ambulatory care sensitive conditions) who are on multiple medications and whose disease process is not well controlled and/or patients who utilize the Emergency Department or are hospitalized for their chronic disease.

Need for the project: The University Health System dispenses approximately 800,000 outpatient prescriptions per year to the uninsured and Medicaid patients who utilize the Health System for their health care needs. Although patients have access to medications they often lack understanding of the importance of complying with the prescribed regimen or how their drugs, food and home remedies interact. It is believed that additional time spent with the higher risk patients will improve the health of the patient and reduce unnecessary expenses including visits to the Emergency Department and hospitalizations.

Target population: The target population will be patients who are on multiple drug regimens with a history of non-adherence to medication as reflected by the lack of progression in the improvement of their chronic disease, and those who have multiple emergency department visits/hospitalizations related to their chronic disease. The target population will include the Medicaid funded and uninsured patients who comprise 62% of patients who receive services within the Health System.

Category 1 or 2 expected patient benefits: Improves access to pharmacist counseling. Patient benefit is to increase the number of patients accessing the service by 10% over baseline for DY3, and then 10% each year over the previous year through DY5. These efforts will provide the opportunity to tailor medication education for patients and will benefit their healthcare experience through the provision of safe, timely and effective patient-centered care relative to their medications.

Category 3 outcomes: 136141205.3.24 3.IT.2.11 total acute care hospitalizations for ambulatory care sensitive conditions
Project Description:

University Health System (Health System) provides care primarily to the uninsured and Medicaid populations of Bexar County. In this role the Health System provides (1) outpatient pharmacy services for patients discharged from the hospital to ensure that regardless of funding source, the needed medications are available at discharge, and (2) ongoing outpatient pharmacy services. Overall, the Health System fills approximately 800,000 prescriptions per year to this group of patients. Medication counseling is available at the time a prescription is filled, but that encounter with a pharmacist or discharge nurse is failing to adequately address the educational needs of the patients relative to their medications, particularly in light of the diversity of culture and language in the patient population. This project dedicates one specially trained, culturally competent pharmacist to a selected Health System ambulatory “hub” clinic to implement chronic disease medication management among the patients assigned to that clinic.

Medication management is the monitoring of medications a patient takes to confirm that the patient is complying with a medication regimen, while also ensuring the patient is avoiding potentially dangerous drug interactions and other complications. This is especially important for patients taking large numbers of medications to address chronic illnesses and multiple diseases, which is particularly common among older adults, as they are more likely to need medications to manage an array of chronic conditions.

There are a number of aspects to medication management, all of which are focused on making sure that medications are used appropriately. The primary challenge we face in implementing this project include educating providers and patients about the importance of medication management, and assuring providers are aware of and refer patients to the medication counselor role. We expect to address these issues as well as changes to clinical work flow as part of our planning/expansion processes.

The overall goal of conducting pharmacist-led, chronic disease medication management in a defined population is to create a best-practices “model” of processes and information to facilitate appropriate use of medications to control illness and promote health across the Health System’s ambulatory settings. The goal beyond the five years will be to provide the model to conduct medication management so that patients receive the right medications at the right time, across Health System facilities, to reduce medication errors and adverse effects from medication use, and to improve the health of the patient population.

This project addresses Waiver goals of 1) the Triple Aim: assuring patients receive high-quality and patient-centered care, in the most cost-effective ways; 2) Improving the health care infrastructure to better serve the Medicaid and uninsured residents of the region; 3) furthering the development of and maintenance of a coordinated care delivery system; and 4) improving outcomes while containing cost growth.
### Starting Point/Baseline:

Currently, no Medicaid or unfunded patients receive the proposed service. The average “hub” clinic, into which smaller clinics feed, has approximately 60,000 visits a year and the average number of prescriptions per unique patient is two. This project will take place in one of the five hub clinics to be determined. Two new pharmacist FTEs will be required. The numerator and denominator for the outcomes measure will be determined in DY2 as the project baseline and processes are defined.

### Rationale:

The project was selected to benefit the majority of the Health System’s patient population who have limited resources and need additional support to understand and manage their medications due to chronic conditions such as diabetes and hypertension. Project option 2.11.2 (Core Component choice c) is addressed in this project as direct contact with a pharmacist in a clinical setting for all patients with multiple medications. Currently, University Health System has a computerized physician’s entry system in place, in which licensed providers can enter orders as appropriate, which facilitates the scope of this project and fulfills core component b. This will benefit those patients who are on multiple medications for the treatment of diabetes, hypertension, congestive heart failure or chronic obstructive pulmonary disease (core component a). Ensuring appropriate use of medication benefits the health care of the patient as well as reducing overall health care costs. A delivery system with a written medication management plan that is consistently followed by all providers can reduce medication errors. Targeted patients who consistently receive medication management are more likely to adhere to their medication regimen and receive the benefits. The plan for the project will be to improve compliance with medication therapy reducing ED visits and admissions and readmissions.

This project addresses CN.1 in general (Texas ranks last in the nation on healthcare quality) and CN.2 in particular (a high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions). The Health System’s experience with the high prevalence of chronic disease and the overwhelming evidence of health care disparities provides the opportunity and the imperative to implement improvements in the management of patients with chronic conditions so prevalent in RHP6.

This project is a new initiative for the Health System. According to the Agency for Healthcare Research and Quality’s 2011 report, Texas ranks last in the nation on health care quality. The report is based on 155 quality measures which include disease prevention efforts, deaths from various conditions, cancer treatment, and how well health care providers manage chronic conditions such as diabetes. Under the category of “Types of Care,” Texas scored “weak” on preventive measures, acute care measures, and chronic care measures. Under the category of “Care by Clinical Area,” Texas scored “weak” on diabetes, heart disease, and respiratory measures, and “average” on cancer measures. The Texas Health and Human Services Commission (HHSC) published various reports related to potentially preventable hospitalizations and readmissions. Between 2005 and 2010, HHSC found that RHP 6 had 125,090 potentially preventable hospitalizations, about 8.5% of the entire state. The conditions studied include bacterial pneumonia, dehydration, urinary tract infection, angina, congestive heart failure, hypertension, asthma, chronic obstructive pulmonary disease, and diabetes. The hospitalizations...
are considered “potentially preventable” because “if the individual had access to and cooperated with appropriate outpatient health care, the hospitalization would likely not have occurred.”

This project will create a pharmacist-led, chronic disease medication management model program for the Health System that will be shared with provider partners in the region. The program will have a direct impact on these quality measures by reducing medication errors and adverse effects from medication use.

**Related Category 3 Outcome Measure(s):**

**OD-2: Potentially Preventable Admissions**

**3-IT-2.11 – Ambulatory Sensitive Conditions Admissions Rate**

a). Numerator: Total number of acute care hospitalizations for ambulatory care sensitive conditions under age 75 years

Inclusions: Total number of acute care hospitalizations for ambulatory care sensitive conditions* under age 75. This is based on a list of conditions developed by Billings et al., any one most responsible diagnosis code of: Grand mal status and other epileptic convulsions; Chronic obstructive pulmonary diseases; Asthma; Heart Failure and pulmonary edema; Hypertension; Angina; Diabetes

Note: Refer to the Technical Note: Ambulatory Care Sensitive Conditions(ASCS) document listed in the "Companion Documents" field for codes used.

Exclusions: Individuals 75 years of age and older; Death before discharge

b) Denominator: Total mid-year population under age 75.

c) Data source: EMR/IDX

d). Reasons/Rationale for selecting the outcome measures: Lack of access to medication or non-compliance with medication instructions are 2 key contributors to increased hospital admissions. Reducing unnecessary admissions benefits the patient and lowers costs for the hospital and the state. A potentially avoidable hospitalization a chronic health condition is commonly associated with a lack of access to appropriate ambulatory care. While not all admissions for chronic conditions are avoidable, it is assumed that appropriate ambulatory care can prevent avoidable admissions through more effective disease management, and control of acute episodes. A high rate of avoidable admissions reflects problems in obtaining access to appropriate primary care.

This pharmacist-led, chronic disease medication management program will have a direct impact on reducing avoidable admissions by reducing medication errors and adverse effects from medication use. Culturally competent pharmacists can effectively remove barriers and communicate with patients to educate them about medications, assure proper usage, answer questions, and provide social and emotional support to patients and their families.

**Relationship to other Projects:**

136141205.1.1 Expand Primary Care Capacity
136141205.1.3 Implement a Chronic Disease Management Registry;
Mental health conditions are prevalent among the population University Health System serves. Providing medication management for patients is critical to avoid complication and avoidable hospitalizations.

**136141205.2.2 Redesign to Improve Patient Experience**

Medication management will provide many patients with information they need in a timely and effective manner. This will improve health outcomes and improve patient satisfaction. Providing the ability to access healthcare in a timely manner and in locations where services are needed will to a better patient experience.

**92414401.2.2 Enhance/Expand Medical Homes –** The PCMH is designed to increase access to primary care through the presence of a medical home model, and access to specialty, preventive services, and medication management offered in one location, in close proximity to patient homes and communities.

**92414401.2.1 Apply evidence-based care management model to patients identified as having high-risk care needs: Implement Care Model for University Health System Clinic settings.**

Medication management is a primary element of a care management model.

**Category 4:**

Related Category 4 measures include potentially preventable admissions measures in RD-1, 30 day readmissions in RD-2, and Patient Satisfaction in RD-4.1 and RD-4.2.

**Relationship to Other Performing Providers’ Projects in the RHP:**

The medication management project has implications and benefits for all Performing Providers in RHP6. Results from this project include a viable model that can be replicated in similar care settings throughout south Texas.

**Plan for Learning Collaborative:**

This project naturally lends itself to participation in a learning collaborative dedicated to care coordination as other Performing Providers seek to develop pharmacist-led, chronic disease medication management programs to reduce avoidable admissions and erase disparities in care. The Health System will actively pursue opportunities to share with interested Performing Providers information and best practices on at least a semi-annual basis.

During model development and implementation of the medication management model we will capture lessons-learned. These will be shared with regional partners who are interested in implementing similar strategies.

**Project Valuation:**

Valuation is based on Achievement of Waiver Goals, Community Needs, Scope of Project, and Project Investment. The addition of a pharmacist to the ambulatory team in a specified Health System “hub clinic” will benefit the community patient, while reducing costs for unnecessary admissions. This program is an essential element in building cost-effective community health care. It strengthens healthcare linkages with local community partners and enhances access to health care services to a target population who struggle with poverty, receive acute or emergency healthcare services only, and do not have usual providers, or access to medication education and
support. In addition, many in the target population have chronic disease and are taking multiple medications. Access to medication counseling will reduce confusion, clarify the best way to manage medications at home and support patients on becoming self-sufficient in caring for themselves and their families.

Identifying Project and Provider Information:
Title: 2.12.2 Implement a Care Transitions Project for the CHF Population
Unique RHP ID#: 136141205.2.9 – PASS 3
Performing Provider: University Hospital
Performing Provider TPI: 13614205

Project Summary:
Provider Description: University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access to primary, specialty the preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County.

Intervention(s): The project involves the implementation of a care transitions program for patients identified as having congestive heart failure as a primary or secondary diagnosis. A core component of this program is the training of primary care physicians in a patient centered medical home by a culturally competent, board certified cardiology specialist regarding treatment guidelines, algorithms, and other specialty care for CHF patients that can be delivered during routine primary care, which expands the benefit of a patient centered medical home. Within the project the target population and existing pre and post acute services will be identified for more comprehensive engagement, and protocols will be established to prevent hospitalization and/or readmissions.

Need for the project: Data shows approximately 15 trillion USD was spent over a 12-14 year span by CMS for Congestive heart failure and this diagnosis is one of the three most costly readmissions to hospitals across the nation. University Health System cares for approximately 800 patients annually with a primary diagnosis of CHF. Readmission data presented by CMS in 2010 showed a 30.1% readmission rate.

Target population: Patients admitted into University Hospital with primary or secondary diagnoses of congestive heart failure.

Category 1 or 2 expected patient benefits: DY2 and DY3 will be the years for identifying and establishing relationships with pre and post acute services whose interventions are targeted to this population for prevention of hospitalization. Protocols that are evidenced based will be implemented, training of primary care providers by a cardiology specialist will occur and processes will become documented and hardwired across the system.

Category 3 outcomes: IT-3.2 Reduce Congestive Heart Failure 30 day readmission rate by TBD% from baseline by DY5.
**Project Description:**

The project will work towards implementing a care transitions program for patients identified as having congestive heart failure as a primary or secondary diagnosis. The project will primarily help define the target population and the challenges with offering a more comprehensive approach to their specific disease process. The project will identify readmission rates and determine factors for readmission for the CHF population.

The team assigned to facilitate the project will target a patient care unit with a high number of patients admitted with CHF. The pilot program will utilize the tools in Project RED (Re Engineered Discharge) to aid in the reduction of readmission rates and improved clinical outcomes.

The initiative/project includes essential components as follows:

- Review and implementation of best practice models for the population served that addresses readmission rates, reasons and time frames for readmission and post discharge support/calls.
- Assemble, train and work with prioritized post acute providers to improve processes for patients in transition.
- Incrementally implement post discharge planning support based on select interventions from Project RED, the Coleman Model, and Boost based upon lessons learned.
- Regularly identify lessons learned and, utilizing Lean processes, work to eliminate waste and improve transitions of care processes.

The pilot is ambitious and multiple challenges include:

- The availability of ambulatory resources to support the needs of the predetermined population of patients with CHF
- Lack of cultural understanding of the health care needs and expectations of the community
- Lack of infrastructure (staffing) to coordinate the care needed.
- Timely data to address the needs of the patient in order to implement interventions in a timely manner.

The goal of the program will be to reduce readmissions rates for patients diagnosed with congestive heart failure. The benefit for the patient will be improved clinical outcomes due to improved education, better understanding of system utilization, training of health care providers, additional ambulatory support, and post discharge services offered by the Care Coordination department.

The secondary benefit to University Hospital will be future cost avoidance.
Starting Point/Baseline:

Beginning in early 2012, an interdisciplinary committee was established to develop a program using the Project RED guidelines to reduce CHF readmission rates specific to one pilot nursing unit. The team began by identifying the baseline population, establishing the reasons for readmissions and defining the barriers to appropriate post discharge services. Current data from 2011 through the third quarter of 2012 shows 1,205 patients presented to University Hospital with a primary or secondary diagnosis of CHF. Of these patients, 199 returned to the hospital within 30 days. The data was not differentiated by payer, as the project will target Medicare, Medicaid, and the CareLink population. Several tasks accomplished by the group included advancing the education of the nursing staff about CHF education and post discharge education, standardizing national evidence-based CHF education, increasing pharmacy disbursement of 30 day medications, and incorporating downstream providers as part of the committee.

Rationale:

As The Centers for Medicare and Medicaid Services strives to become better stewards of tax payer dollars and simultaneously improve clinical outcomes, a shift in health care has resulted. The responsibility of patient care has begun to transition from being the patient’s responsibility to a partnership between the patient and the health care team. Readmission penalties have placed financial strains on acute providers. Data reflects that approximately 15 trillion USD was spent over a 12-14 year span by CMS for one specific DRG. The data showed that congestive heart failure is one of the three most costly readmissions to hospitals across the nation. University Health System cares for approximately 800 patients annually with a primary diagnosis of CHF; the readmission data presented by CMS in 2010 showed a 30.1% readmission rate. Changes in work patterns in 2012 have shown improvements and decreased the rate for all payers to 14.69%, specifically, 14.5% for Medicare Beneficiaries. Although the data supports improvements in 2012 and the adjustments to clinical practice have shown some benefits, it is difficult to correlate the reduction in readmission rates solely on the clinical practice. “Observation” data for 2012 reflects that an additional 131 patients returned to the hospital for complications related to CHF. Therefore, the data showed a higher than reported readmission rate based on observation visits. The goal of the project will be to reduce the readmission rate by 13% for all payers regardless of geographic location within University Health System.

This project addresses a high prevalence of chronic disease and related health disparities that require greater prevention efforts and improved management of patients with chronic conditions. One of the leading causes of death in RHP 6 includes cardiovascular disease; the pilot will address this population. (CN2)

The project will enhance efforts to date with the Project Red CHF pilot to decrease admissions, decrease readmission, decrease EC utilization, improve patient clinical outcomes, enhance disease specific education, and improve patient satisfaction.
Related Category 3 Outcome Measure(s):

This Outcome Measure was chosen specifically due to supporting facts as follows:
A report written by the CDC on Preventing Chronic Diseases stated, “During 1995-2009, there were 121,741 records with preventable hospitalizations for CHF among adults…this translates to a weighted number of 15,208,518 hospitalization…an average of 1,013,091 readmissions annually” (Will, Valderrama, Yoon, 2012). Based on the State Health Facts, the average cost for admission in the nation is approximately 1798.51/day; this translates to over 27 trillion dollars in 14 years.
The goal will be to reduce CHF readmission rates below the national standard of 24% to 14%.

OD-3 Potentially Preventable Re-Admissions – 30 Day Readmission Rates (PPRs)

IT-3.2 Congestive Heart Failure 30 day readmission rate (Stand-Alone Measure)

   a) Numerator: The number of readmissions (for patients 18 years and older), for any cause, within 30 days of discharge from the index HF admission. If an index admission has more than 1 readmission, only first is counted as a readmission.
   b) Denominator: The number of admissions (for patients 18 years and older), for patients discharged from the hospital with a principal or secondary diagnosis of HF and with a complete claims history for the 12 months prior to admission.

Relationship to other Projects:

The project has multiple implication on other projects within the DSRIP:

A. 2.1 – Enhance/expand the medical home
   a. Care Transitions will support the medical home by coordinating all efforts associated with patient care throughout the care continuum. Care Transitions looks at caring for the patient in an acute setting through the ambulatory resources.
B. 2.3 – Redesign Primary Care
   a. Primary care will be impacted by looking at multiple factors of transitions of care to include education, specialty appointments, referrals, post discharge calls, etc.
C. 2.4 – Redesign to improve patient experience
   a. Improvements in patient experience will be a byproduct of transitions of care. The belief is that once the processes are put in place and the system is improved, patient satisfaction will improve.
D. 2.8 – Apply process improvement methodology to improve quality/efficiency
   a. November 2012, a Lean event is scheduled to assess the level of importance tied to the specific target areas identified within the Transitions of Care Implementation Team.
E. 2.9 – Establish/expand a patient care navigation program
   a. The Care Navigation Program will be impacted by the efforts associated with the transitions of care team.

### Project Summary

**Provider Description:** University Hospital (UH) is the 496-bed acute care hospital of University Health System, owned by the people of Bexar County. It serves as the primary teaching hospital for the University of Texas Health Science Center San Antonio, and the lead Level I Trauma Center and safety net provider for the estimated 2 million residents of Bexar County and South Texas. Over the past two decades University Health System has expanded access to primary, specialty and preventive health care services, and currently operates 19 health centers and clinics throughout Bexar County. The Texas Diabetes Institute is University Health System’s specialty clinic which combines 5 centers of excellence for comprehensive diabetes education and care.

**Intervention(s):** Primary care physicians from 4 primary care Community Medicine Associate (CMA) sites at University Health System will receive specialized training under a board-certified endocrinologist for evidence-based, culturally appropriate guidelines for diabetes management and specialty care, including the use of treatment algorithms for low to medium complicated cases, standard guidelines, etc. A diabetes nurse educator from each of these sites will maintain a constant relationship with these patients to act as a resource for education, information, and to ensure adherence to medical advice.

**Need for the project:** About 9.3% (1.7 million) people in Texas have been diagnosed with diabetes. In Bexar County a far greater percent of the population are affected by this disease at 11.8% (137,009). Diabetes is also the 4th leading cause of death in Bexar County. According to statistics from the Behavioral Risk Factor Surveillance system, those at highest risk of developing diabetes are adults, 20 years and older, that make an annual income of less than $50,000 and have an educational attainment of a high school diploma or less. This demographic includes mostly Medicaid and Medicare and uninsured patients. The CMA patient population is comprised of 32.4% CareLink (University Health System’s medical financial aid program), 31.9% Medicaid, 12.6% HMO/PPO, 12.1% Medicare, and 10.9% self pay.

**Target population:** The target population includes all patients diagnosed with diabetes, roughly 12,283. The majority of patients diagnosed with diabetes live in the southern and north central areas of San Antonio. This affects the determination of the 4 primary care clinic sites for the project intervention.

**Category 1 or 2 expected patient benefits:** The anticipated 5 year goal is to increase primary care encounters by 20% over baseline (or 30,000 encounters) by enhancing access to managed diabetes health care at the primary care clinic.

**Category 3 outcomes:** IT-1.10 Diabetes care: $HbA1c$ poor control ($>9.0\%$)- *NQF 0059 (Standalone measure)*; IT-1.11 Diabetes care: BP control ($<140/80\text{mm Hg}$), IT-1.6 Cholesterol management for patients with cardiovascular conditions (NCQA-HEDIS 2012)
Project Description:

This project takes a two prong approach using the evidence-based Chronic Care Model at helping patients manage their diabetes through providing training of their primary care providers to stratify the risk of their condition and recommending appropriate treatment, and allowing the patient to receive all necessary care through their usual place of healthcare. The goal of this project is to empower both newly diagnosed and low to medium risk patients and their primary care team to successfully manage their diabetes. By establishing a relationship with their usual primary care team at their usual place of healthcare, patients are more likely to adhere to medical recommendations, which will reduce unnecessary emergency department (ED) visits and improve the overall health indicators and patient outcomes, while lowering the cost of treatment through the prevention of serious complications due to lack of effective diabetes management (Piatt et. al, 2006), (Siminerio, et. al, 2004).

The current multiple challenges include:

- The availability of ambulatory resources to support the needs of the predetermined population of patients with diabetes.
- Lack of cultural understanding of the health care needs and expectations of the community.
- Lack of infrastructure (staffing) to coordinate the care needed.
- Timely data to address the needs of the patient in order to implement interventions in a timely manner.

The proposed program will address these challenges by increasing access to specialty medicine within the confines of the primary care setting, enhancing the relationship between patient and primary care teams, and empowering both to have successful interactions.

The 5 year goal is to expand comprehensive care for diabetes, keeping patients with their primary care team instead of shunting patients to specialty care after diagnosis, as is the current practice. The benefits to the patient including eliminating delays in scheduling appointments, and long wait times, while improving overall access to healthcare, and improvement in the management of diabetes.

The project addresses the following regional goals:

- Triple Aim: assuring patients receive high-quality, patient-centered care, in the most cost effective ways
- Further develop and maintain a coordinated care delivery system
• Improve outcomes while containing cost growth

**Starting Point/Baseline:**
As of September 30, 2011, there are 0 patients served by the project, 0 encounters, and 0 providers trained at these locations for base year.

**Rationale:**
In the United States, safety-net hospital systems remain essential to providing access to health services for over 50 million uninsured Americans as well as other underserved populations. In the era of healthcare reform, safety-net hospitals will remain critical to responding to the mandate of providing medical care that is accessible, integrated, and patient-centered. In addition, the evidence makes clear that carefully tailored health services interventions can lead to the establishment of a usual source of care, improve adherence to clinical care and treatment, and strengthen evidence-based clinical preventive service delivery to economically vulnerable, uninsured or underinsured populations. As reported in 2011 by the Agency for Healthcare Research, Texas ranks last in health care quality, specifically scoring “weak” on preventive measures and chronic care measures, including diabetes measures.

In Bexar County 11.8% (137,009) have been diagnosed with diabetes, which is in vast contrast to 9.3% (1.7 million) diabetes in the state. Diabetes is also the 4th leading cause of death in Bexar County. According to statistics from the Behavioral Risk Factor Surveillance system, those at highest risk of developing diabetes are adults, 20 years and older, that make an annual income of less than $50,000 and have an educational attainment of a high school diploma or less. This demographic includes Medicaid and Medicare and uninsured patients. The rate of uninsured in Bexar County is 23% further highlighting the need for increased access. The CMA patient population is comprised of 32.4% CareLink (University Health System’s medical financial aid program), 31.9% Medicaid, 12.6% HMO/PPO, 12.1% Medicare, and 10.9% self pay.

To combat these disparities and increase healthcare access, University Health System; the major safety-net hospital for South Central Texas proposes to follow the Chronic Care Model, and expand the role of primary care providers at four patient-centered medical home sites. This is considered an integrated model of health service delivery that focuses on providing high quality, affordable, accessible, and culturally appropriate health care alongside a clinical practice that is efficient, evidence-based and utilizes inter-operable information systems to address primary, urgent and specialty care needs.

The project components are to:

a) Design and implement care teams that are tailored to the patient’s health care needs, which will occur through training by a board-certified, culturally competent endocrinologist regarding diabetes treatment and management, which include recommended guidelines for diabetes management, treatment algorithm, etc, and through the establishment of a relationship with a diabetes nurse educator so that diabetes management and overall health care can remain accessible to the newly diagnosed or moderate to low risk patient.
b) Ensure that patients can access their regular primary care teams, specifically the diabetes nurse educator, in person or by phone in the location of their usual care.

c) Increase patient engagement, by having the diabetes nurse educator provide the patient with educational material regarding diet, lifestyle, adherence to medication and coordination with community resources to help the patient maintain control over their overall healthcare and diabetes.

d) Implement projects to empower patients to make lifestyle changes to stay healthy and self-manage their chronic conditions

e) Conduct quality improvement by having the health teams meet bi-weekly to report and present any barriers, issues and lessons learned to the program manager, and other providers.

These program components reflect the project option’s core components, a through e.

This project addresses CN.2, improved management of patients with chronic conditions. Specifically, the local identified need of increased access to chronic health management.

Implementation of this program will ensure patients have access to improved management of their chronic conditions in an environment that they are familiar with, and with providers they are comfortable with. This is a change in the flow of usual care. Currently all diagnosed patients are referred by their primary care physician to receive specialty care at the Texas Diabetes Institute. Patients can be lost to care and result in low or no control of their diabetes, and other chronic illnesses because of barriers such as transportation to a more distant clinic, long wait times for an appointment, etc. Poor control over their diabetes results in unnecessary complications and visits to the ED.

Measures of performance will include both process and outcomes measures that assess progress towards implementation milestones. These include: 1) expanding the chronic care model to primary care sites, 2) integration and access (expanded services that address target population needs), and 3) quality of care and cost-effectiveness. In summary, establishing an expansion of the role of primary care providers responds to national health aims of delivering high quality care, improving population health and reducing healthcare costs.

**Related Category 3 Outcome Measure(s):**

In 2010, the Texas Chronic Disease Burden Report through the Texas Department of State Health Services established that the prevalence of diabetes in Texas surpasses that of the nation, and accounts for $1,075,284,123 per year in total hospital charges, in which 53.4% of the primary source of payment came from Medicaid or Medicare. Coupled with low scores for national health quality standards for chronic care, such as diabetes care, and the prevalence of poor control of diabetes management, University Health System proposes to adopt the Chronic Care Model in the primary care setting to empower the primary care and patient team to successfully manage the patient’s chronic conditions, thus improving the patient’s overall outcomes (Siminerio, Zgibor, Solano, 2004), (Stellefson, Dipnarine, Stopka, 2013). Focusing on Category 3 outcomes related to primary care and chronic disease management, such as the levels of HbA1c, blood pressure, and LDL, and short term complication admission rates will show the level of success that patients had with the program model. By improving diabetes management, long term complications can be avoided and overall reductions in costs from prevention of complications, as has been demonstrated throughout the literature.
Relationship to other Projects:
By utilizing the Chronic Care Model in the primary care setting, there is an opportunity to complement other projects within the RHP plan or to have other projects complement the goals and objectives of this project.

136141205.1.3- Implement and use chronic disease management registry functionalities
136141205.1.2- Expand existing primary care capacity: University Hospital expanding capacity
092414401.2.1- Apply evidence-based care management model to patients identified as having high-risk care needs: Implement Care Model for Clinic settings

Relationship to Other Performing Providers’ Projects in the RHP:
N/A

Plan for Learning Collaborative:

Project Valuation:
In Bexar County 11.8% (137,009) have been diagnosed with diabetes, which is in vast contrast to 9.3% (1.7 million) diabetes in the state. Diabetes is also the 4th leading cause of death in Bexar County. In face of such high prevalence of diabetes in Bexar County, effective management is necessary to reduce the burden of the disease and the cost of treatment of complications. Texas has failed to meet the national standards for health care quality measures regarding diabetes. This innovative, evidence-based approach will increase help meet the three part CMS aim of assuring patients receive high-quality, patient-centered care, in the most cost-effective ways, which translates to reducing the costs due to unnecessary hospitalizations and the treatment of complications related to poor control of diabetes.
Each project site has been chosen because of the proximity to areas where the majority of UHS’ diabetic population resides.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $12,052,487**
Identifying Project and Provider Information:
Title: 2.10.1 – Implement a Palliative Care Program to address patients with end of life decisions and care needs
Unique RHP ID#: 121782003.2.1 – PASS 2
Provider Name: Uvalde County Hospital Authority, DBA Uvalde Memorial Hospital (UMH)
TPI: 121782003

Project Summary:
Provider Description: Uvalde Memorial Hospital is a 66-bed sole community hospital located in Uvalde, TX serving approximately 47,000 individuals residing within 5 counties (7,000 square mile area).

Intervention(s): The project will offer palliative care services for patients and their families. It will emphasize the importance of comfort and quality of life for high risk patients who have late stage chronic illnesses.

Need for the project: A high percentage of palliative care appropriate patients are being transferred home without hospice or home health care services. Currently none of the neighboring hospitals in nearby counties offer palliative care services.

Target population: The target population is our high risk patients with late stage chronic illnesses. Our hospital operates with a Medicaid inpatient utilization rate higher than 50% and a low income utilization rate also higher than 50%. 32% percent of the population within our service region is uninsured.

Category 1 or 2 expected patient benefits: The project will increase the number of palliative care discharges to hospice from the DY 3 baseline by 60 patients in DY 4 and 120 patients in DY 5. These numbers are based on approximately 2,000 total hospital discharges in 2012. It is has been estimated that new palliative care programs can expect to see 1% of total discharges and well established programs can expect to see 10% of total discharges. We have set ambitious goals of 3% of discharges by DY 4 and 6% by DY 5. A goal of a 20% improvement over DY 3 baseline scores on the patient/family experience survey for palliative care services has been set for DY 5.

Category 3 outcomes: IT-13.4 Our goal is to reduce the percentage of patients admitted to the ICU in the last 30 days of life. Percent reduction goals TBD in DY 3.

Project Description:
Uvalde Memorial Hospital seeks to implement a palliative care program to address patients with end of life decisions and care needs
Currently, many hospice appropriate patients are being transferred home without care. This causes many of these patients to frequent the ICU in their last 30 days of life. This is costly for the patient’s family and is often not the most comfortable, pain free way to spend the last days of life. UMH will implement a new palliative care program in DY 3 while achieving milestones in DY 2 to DY 5. First, UMH will develop a hospital-specific business case for palliative care and conduct planning activities necessary as a precursor to implementing a palliative care program. Then we will develop an EHR/system (e.g. a rounding tool or a registry or software) that analyzes the palliative care system data to determine if the program is effective. These two steps will lay the groundwork for implementing the program.
Once the program is implemented, a record will be kept of the conditions for which palliative care is consulted (COPD, CHF, cancer, etc.). One of the goals of the program is to increase the number of palliative care discharges to home care, hospice, or a skilled nursing facility while minimizing transfers to ICUs, hospital stays and home discharges without services. UMH will set the goal of 60 new palliative care discharges from the DY 3 baseline in DY 4 and 120 new palliative care discharges in DY 5. Another goal will be to increase the number of patients who are not only screened for pain during their hospice admission evaluation and/or palliative care initial encounter but who also receive a comprehensive clinical assessment for pain within 24 hours of screening positive for pain. Patients and their families will be surveyed to measure satisfaction with the new palliative care program.

Goals and Relationship to Regional Goals:
Patients will receive dignified and culturally appropriate end-of-life care, which is provided for patients with terminal illnesses in a manner that prioritizes pain control, social and spiritual care, and patient/family preferences. This service will also greatly reduce return emergency room visits while also reducing hospital inpatient days for hospice appropriate patients.

Project Goals:
- Increase discharges to hospice and SNF while decreasing discharges home without services
- Substantially decrease the rate of potentially preventable re-admissions
- Decrease the proportion admitted to the ICU in the last 30 days of life (Cat. 3: IT-13.4)

This project meets the following regional goals:
- Work together to make significant progress towards the Triple Aim goals of assuring patients receive high-quality and patient-centered care, in the most effective ways.
  - Improve the health care infrastructure to better serve the Medicaid and uninsured residents of our region.
  - Further develop and maintain a coordinated care delivery system.
  - Improve outcomes while containing cost growth.

The project achieves an improved infrastructure for Medicaid and uninsured residents through ensuring quality care for hospice or SNF care for appropriate patients who are uninsured. The project develops and maintains a coordinated care delivery system through communicating with and educating patients, families, physicians and care givers. The project improves outcomes while containing cost growth by reducing PPRs and ICU admits in the last 30 days of life.

Challenges:
When starting any new program such as this there are always challenges, particularly with ensuring medical staff support. One of the key pieces to this program is presenting a solid business case to the medical staff for their review. Providing adequate palliative care training to ancillaries, physicians and primary care specialties will also build support for the program. This is vital to ensuring that hospice or SNF appropriate patients are given a palliative care consult and transferred into the care of one of these two services in our community.

5-Year Expected Outcome for Provider and Patients:
This service will greatly reduce return emergency room visits while also reducing hospital inpatient days for hospice appropriate patients. The patient will receive hospice care from highly trained specialists in palliative care. The patient will experience much better quality of life and...
their family will receive support as well while reducing the cost care and the burden on UMH.

**Starting Point/Baseline:**
The baselines for improvement milestones, [I-9] and [I-11], will be established in DY 3. This baseline is currently 0 or in other words, cannot be established until DY 3 because the palliative care program won’t be fully implemented until this year. Process milestones associated with this project have 0 baselines, again because this program represents an new service to our community.

**Rationale:**
This project also meets the regional goals and community needs of RHP 6 and fills a pressing need in our community. This project option was selected because it meets the Triple Aim goals of the waiver
- high-quality care
- patient-centered care
- most effective care

Specific project components that will address these goals and community needs are outlined below.

a. *Develop a business case for palliative care and conduct planning activities necessary as a precursor to implementing a palliative care program* – UMH will include this component into this palliative care project by achieving [P-1]. This component is essential to the project as it will garner support from the medical staff, primary care specialties and ancillary staff.

b. *Transition palliative care patients from acute hospital care into home care, hospice or a skilled nursing facility* – This component is the main focus of the project. It will be addressed by the achievement of improvement milestone [I-9]. This improvement milestone will increase palliative care discharges to home care and/or hospice and/or SNF by 60 patients in DY 4 and 120 patients in DY 5. Patient transfers will depend on what makes the most sense given each patient’s condition during the palliative care consult.

c. *Implement a patient/family experience survey regarding the quality of care, pain and symptom management, and degree of patient/family centeredness in care and improve scores over time* – This component will be addressed by the project through the achievement of improvement milestone [I-12]. The goal for this project is to improve scores by 10% in DY 4 and 20% in DY 5.

d. *Conduct quality improvement for project using methods such as rapid cycle improvement* This component will be addressed by the project through the achievement of improvement milestones [I-12] and [I-11]. The patient/family satisfaction survey results will give UMH valuable insight to what areas of the program require greater attention and quality improvement resources. The achievement of [I-11] targets (40% DY 4 patients, 60% of DY 5) will improve the quality of palliative patient care while also identifying areas within pain management that will be improved upon throughout the project.

**Unique community need identification numbers the project addresses:**
- CN.1 – Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.
- CN.2 – A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patient with chronic conditions. Leading causes of death in RHP 6 include cardiovascular disease, cancer and diabetes.

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
There is not currently a palliative care program in our service region or in any of the neighboring hospitals’ service region. This program would complement UMH’s pass 1 project, 121782003.1.1. Community health workers and an expanded primary care capacity will ensure regular follow up and will further promote the palliative care consults. The greatly improved communication channels between physicians, care givers and patients/families from this pass 1 project will facilitate the palliative care program.
*This initiative, and any related activities, is not being funded in whole or part by the U.S. Department of Health and Human Services.*

**Related Category 3 Outcome Measure(s):**

<table>
<thead>
<tr>
<th>OD-13: Palliative Care</th>
<th>IT-13.4 Proportion admitted to the ICU in the last 30 days of life (NQF 0213)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Percentage of patients who died from cancer admitted to the ICU in the last 30 days of life (stand-alone measure)</td>
<td></td>
</tr>
</tbody>
</table>

**Reasons/rationale for selecting the outcome measures:**
These outcome domains with their associated improvement targets were chosen after considering the outcomes most likely to be impacted the most by the project. These outcomes are also a priority for RHP 6 because they directly related to CN.1, and CN.2 in the RHP community needs assessment. Specifically, achieving improvement milestone [I-9] percentage improvements in discharges to hospice, SNF and other care will contribute towards the achievement of IT-13.4.

**Relationship to other Projects:**
The primary way this project supports, reinforces, enables and is related to other projects and interventions within the RHP plan are through contribution to RHP 6 goals. However, the RHP 6 anchor facility, University Hospital, is also implementing a palliative care program. We plan on being involved in learning collaboratives with University Hospital to facilitate discussion and improvement in palliative care services offered to our community.

**Relationship to Other Performing Providers’ Projects in the RHP:**
University Hospital, PA: 2.10

**Plan for Learning Collaborative:**
UMH plans to participate in an RHP-wide learning collaborative with other providers with similar projects. “RHP 6 is committed to transforming health care in our region and throughout the state. Given the large number and value of projects proposed for our region, University Health System, as the RHP 6 anchor, will promote and facilitate learning collaboratives.”
Following completion of the RHP Plan, University Health System will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include the following:
- Identify participants
- Establish Learning Collaborative goals
- Develop a calendar of regular meetings, site visits, and/or conference calls
- Develop a plan to communicate ideas, data, and successes across the region and state
- Organize a learning event and invite experts and other Performing Providers from outside the region to share knowledge and best practices
- Adopt metrics to measure success

UMH plans to be a significant part of learning collaboratives with other performing providers with similar projects.

<th>Project Valuation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>This project scored high in all categories used to assess project value to the RHP and to our community. Categories included in the valuation process included: project scope, achieves waiver goals, and addresses community needs and project investment. Uvalde Memorial Hospital also values each project based on the following factors: the potential impact on health of our population, the resources necessary to implement the project, and level of improvement anticipated in overall patient satisfaction. UMH also took into account the extent to which reducing 30 day PPRs, increasing transfers to hospice care for appropriate patients, and reducing the number of inpatient days will have on cost. Most importantly, this project was valued based on its potential impact on regional and Waiver goals.</td>

## Identifying Project and Provider Information:

| Title: 2.2.2 Apply evidence-based care management model to patients identified as having high-risk care needs: Implement Care Model for Clinic settings |
| Unique RHP ID#: 092414401.2.1 – PASS 2 |
| Performing Provider: Community Medicine Associates |
| Performing Provider TPI: 092414401 |

## Project Summary:

| Provider Description: Community Medicine Associates (CMA) is the primary care practice of University Health System, a publicly supported, academic medical center and safety net provider. CMA serves the San Antonio area with an estimated population of 1.7 million. CMA currently has approximately 100 providers who practice within an ambulatory network of 19-primary, specialty and preventive health clinics located throughout Bexar County. |
| Intervention(s): This project will establish an interdisciplinary care coordination team within its ambulatory network of care. These teams will be comprised of RN case managers, social workers, and patient educators to identify and support chronic and other health care needs and education of patients the receive services at respective regional medical home clinics. This interdisciplinary model of care will also be tailored to addressing the health needs and preferences of the patient population including appropriately accessing use of community and organizational resources, enhancing the patient’s knowledge of the disease process(es), and facilitate healthy decisions to reduce risk for chronic disease and or disease self-management. |
| Need for the project: The Community Needs Assessment reported that approximately 470,000 residents in RHP 6 remain uninsured (C.N.3) and the foundation for their care is dependent on the services offered by University Health System. Leading causes of death in RHP 6 include cardiovascular disease, cancer, and diabetes (C.N. 2). This project was selected because the incorporation and partnership of RN’s, Social workers, and patient educators (Care Management model) all working at the top of their skill sets can better assist provider shortages (C.N.3) will not only improve patient outcomes, provider and patient satisfaction, but reduce hospital admissions, EC visits. |
| Target population: The target population will include the CMA patient population, specifically those patients dealing with 2 or more chronic conditions (50%). CMA is comprised of 32.4% CareLink, 31.9% Medicaid, 12.6% HMO/PPO, 12.1% Medicare, and 10.9% self pay. |
| Category 1 or 2 expected patient benefits: This project will establish and expand a comprehensive care management program in primary care clinics in DY 2, DY 3 and DY4. This will result in improvements in clinical outcomes and reduced utilization for patients served under the care management model and 50 percent of eligible patients will have a documented self-management goal in the EMR by DY5. Patient benefits from established care coordinated processes and procedures will include enhanced quality of care and patient experience. |
| Category 3 outcomes: 3.1T-2.13 Other Admissions Rate |

- **DY4** – Decrease admission rate by TBD% for patients enrolled in care management program.
- **DY5** – Decrease admission rate by TBD% for patients enrolled in care management program.

**Project Description:**

Community Medicine Associates has identified the need to establish and align an interdisciplinary care coordination team including, but not limited to RN Case Managers, Social Workers, and Patient Educators to identify and support chronic and other health care needs and education. This model will educate the patient on the appropriate use of community and organizational resources, increase the patient’s knowledge of the disease process(es), and facilitate healthy decisions.

Project goals are: improved clinical outcomes, decreased hospital admission/readmissions, decreased EC utilization and increased patient and provider satisfaction. The anticipated 5 years goal is 50% of patients have a documented self management goal in the EMR.

The Health System will monitor, evaluate, and adjust the project based on quality improvement activities throughout the development and implementation phases, offering “lessons learned” to our partners in RHP6 through the appropriate Learning Collaborative to be established.

The project is ambitious and requires significant coordination at several levels within the organization. Current challenges:
- University Health System is a large system where coordination of services and patient education are prioritized due to current-state deficiencies, fragmentation, and silos
- The infrastructure and tools necessary to better coordinate the care needs and education of patient-specific populations need to be developed
- Finding the patient story in the EMR is very difficult
- Provider turnover has been high
- Access is not timely
- Patient engagement processes are limited
- There is significant variation in policies and procedures and workflow processes relative to Access and care coordination in the Ambulatory setting
- Existing care coordination roles have different reporting relationships, and
- Available data is often historical rather than timely
- Provider turnover has been significant

By addressing these needs within the RHP Plan, University Health System is placing more emphasis on a much needed model of improved communication and care coordination in the Ambulatory arena that addresses patient level interactions and education, individually and in aggregate.

**Relationship to Regional Goals**

This project will further achievement of the regional goals of the Triple Aim; improved health care infrastructure to better serve Medicaid and currently uninsured residents in RHP 6; reduce
health disparities; further develop and maintain a coordinated care delivery system; and improve outcomes while containing cost growth. The health system will monitor, evaluate and adjust the project based on quality improvement activities throughout the development and implementation phases.

**5 Year Expected Outcome for Provider and Patients:**
University Health System expects to see improvements in clinical outcomes and in reduced utilization of the ER for patients served under this care management model. The anticipated 5 years goal is that fifty percent of patients will have a documented self management goal in the EMR.

**Starting Point/Baseline:**
Prior to July of 2012, no patients within University Health System’s Ambulatory clinics were being served under a Care Management Model. In early 2012, a Director to implement and oversee a care management model was put in place. In mid 2012, University Health System hired, oriented and began piloting two Case Managers in two ambulatory clinics. Early active caseloads are approximately 42 patients per case manager. Four Social workers were pre-existing and support all of Ambulatory with a different reporting relationship. Patient educators are dispersed throughout the Ambulatory clinics. Discussions are just beginning to assess better alignment and the working relationships of case managers, social workers, and patient educator roles per setting. Encounter data is just occurring along with accompanying software capability. The organization has prioritized Exitcare as the predominant source of patient education materials and is in the early stages of organizational implementation.

**Rationale:**
The Community Needs Assessment reported that approximately 470,000 residents in RHP 6 remain uninsured (C.N.3) and the foundation for their care is dependent on the services offered by University Health System. Leading causes of death in RHP 6 include cardiovascular disease, cancer, and diabetes (C.N. 2).

This project was selected because the incorporation and partnership of RN’s, Social workers, and patient educators (Care Management model) all working at the top of their skill sets can better assist provider shortages (C.N.3) will not only improve patient outcomes, provider and patient satisfaction, but reduce hospital admissions, EC visits.

Unique community need identification numbers the project addresses:
CN.2 - Address the high prevalence of chronic disease and related health disparities in the community through greater prevention efforts that focus on addressing chronic disease.

CN.3 – Address the lack of medical and dental health services in the community due to high rates of uninsured and provider shortages.

This project will “significantly enhance” the current state by enlarging and establishing standardized processes for patient engagement and patient care management as needed for the population served. This project addresses a high prevalence of chronic disease and related health
disparities that require greater prevention efforts and improved management of patients with chronic conditions. Ultimately, 6 of the 15 sites will have an established Care Management Program, serving 600 patients in DY3 and 900 in DY4.

**Related Category 3 Outcome Measure(s):**

- OD-2 Potentially Preventable Admissions
- IT-2.13 Other Admission Rate (Stand-alone measure)
  - f. Numerator: Admissions to hospital
  - g. Denominator: Active panel of patients for Care Team
  - h. Data Source: EMR/IDX/Crimson/Truven Health/Allscripts

The purpose of selecting the outcome measure in category three is to measure the impact of a care management model on preventing admissions. Evidence has been evolving subsequent to recent demonstration projects that improved patient engagement and management in the community directly impacts reduced hospitalizations, mortality, and quality of life.

**Relationship to other Projects:**

- 092414401.1.1 Expand training of the primary care workforce
  Training future providers in primary will assist with filling the need to create more access for patients and having newly trained providers to staff additional clinical sites

- 092414401.2.2 Enhance/Expand Medical Homes – The PCMH is designed to increase access to primary care through the presence of a medical home model, and access to specialty and preventive services offered in one location, in close proximity to patient homes and communities.

Category 4 measures include emergency department in RD-5 and patient-centered healthcare, including patient satisfaction and medication management in RD-4

**Relationship to Other Performing Providers’ Projects in the RHP:**

- The project has multiple implications on other projects within our RHP.
  - 136141205.1.4 – Introduce, expand, or enhance telemedicine/telehealth
    o The Care Model will involve coordinating care, educating the patient, and addressing clinical needs via multiple modes of communication to include telephonic conversations and potentially secure web based face to face conversations.
  - 92414401.2.2 – Enhance/expand the medical homes
    o The Care Model will expand the medical home concept by offering services that would otherwise be unavailable. These services include, but are not limited to, case management, social services, and patient education.
  - 136141205.2.2 – Redesign to improve patient experience
    o Research has proven that patient satisfaction will increase as a result of the implementation of a Care Management Model. The expectation will also be to
improve provider satisfaction within our ambulatory clinics. A recent study completed with the Affinity Health System showed an increase in provider satisfaction and patient compliance.

- 136141205.2.4 – Establish/expand a patient care navigation program
  - Care Management Model is a method of navigating the patient throughout the health care continuum while simultaneously addressing chronic conditions identified by the patient’s provider.

There are a total of 3 organizations within RHP 6 who will address 2.2 Expand Chronic Care Management Models. As the focus of this project is predominantly the adult population, there may be opportunity to share best practices and lessons learned with UTHSCSA as these projects evolve.

**Plan for Learning Collaborative:**

University Health System is very interested in sharing best practices, lessons learned, and other ideas to improve chronic care management models. We will participate in face-to-face meetings and/or conference calls to regularly share data related to the efficacy of various practices along with lessons learned as we implement this program.

**Project Valuation:**

Project valuation for an efficient and comprehensive Care Model was rated at the highest valuation level and is defined predominantly through cost avoidance. Assuming the patients are receiving, case management support, social services support, and medically appropriate patient education, the result should be a reduction of admissions and readmissions as well as a decrease in EC utilization. Patient and provider satisfaction will be improved with projected valuation, as well. This project achieves the Waiver goals by a) improving the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further developing and maintaining a coordinated care delivery system; c) contributing to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and serving as a powerful tool to help providers improve outcomes and reduce ED utilization (containing cost growth).

Identifying Project and Provider Information:
Title: 2.1.1 - Develop, implement, and evaluate action plans to enhance/eliminate gaps in the development of various aspects of PCMH standards: Community Medicine Associates
Unique RHP ID#: 092414401.2.2 – PASS 2
Performing Provider: Community Medicine Associates
Performing Provider TPI: 092414401

Project Summary:
Provider: Community Medicine Associates (CMA) is the primary care practice of University Health System, a publicly supported, academic medical center and safety net provider. CMA serves the San Antonio area with an estimated population of 1.7 million. CMA currently has approximately 100 providers who practice within an ambulatory network of 19-primary, specialty and preventive health clinics located throughout Bexar County.

Intervention(s): This project will achieve Level 3 Patient Centered Medical Home (PCMH) recognition in order to provide improved quality, better access and more efficiency.

Need for the project: Many patients, specifically CareLink patients, are in need of chronic disease management, care coordination, and timely access to medical and social services. The PCMH will be built around this CareLink population and has been shown to improve chronic disease management, improve quality of care, and decrease costs associated with avoidable hospitalizations or emergency center visits (NCQA Patient-Centered Medical Home website). A major component of the PCMH model is patient self-management where patients take initiative to partner with providers to proactively manage their health.

Target population: This is a portion of the CareLink (Bexar County Indigent) patient population. In 2011, CareLink members averaged 4 primary care visits per year. 32% of CareLink members were seen at least once for hypertension, 22% were seen at least once for diabetes, and 18% were seen at least once for hyperlipidemia (high cholesterol). There were 580,234 prescriptions filled last year for CareLink members.

Category 1 or 2 expected patient benefits: This project will expand and re-organize primary care staff to more fully integrate elements of the PCMH. The Health System will continue to implement and integrate core elements of the PCMH between DY3 and DY5 resulting in an 8% increase in patient encounters over baseline year and NCQA/PCMH recognition by DY5. Expected benefits to the patient population include improved quality and increased access to primary care within a medical home setting.

Category 3 outcomes: 3.IT-9.2 ED Appropriate Utilization
- **DY4** – Decrease ED visits by TBD% for patients with COPD, behavioral health diagnoses, diabetes exacerbations, and asthma from baseline.
- **DY5** – Decrease ED visits by TBD% for patients with COPD, behavioral health diagnoses, diabetes exacerbations, and asthma from baseline.
Project Description:

Many patients at University Health System are not identified with one provider or care team. They may be seen by different personnel at every visit and therefore their health and health care are not well coordinated. This can result in frequent avoidable hospital stays and ED visits. The target population will include the CMA patient population which is comprised of 32.4% CareLink, 31.9% Medicaid, 12.6% HMO/PPO, 12.1% Medicare, and 10.9% self pay. CareLink is a financial assistance program for uninsured residents of Bexar County. The program was created in 1997 to help address the needs of Bexar County residents without health care coverage who were not eligible for Medicaid or other public or private funding. While CareLink is not an insurance product per se, it has many similar advantages in terms of promoting access to preventive health services, encouraging a long lasting relationship with a primary care provider, and instilling a sense of shared responsibility between member and staff for the member’s health. Due to high utilization of healthcare resources and an overall need for better health coordination, CareLink members would benefit from a Patient Centered Medical Home (PCMH) program.

In 2011, CareLink members averaged 4 primary care visits per year. 32% of CareLink members were seen at least once for hypertension, 22% were seen at least once for diabetes, and 18% were seen at least once for hyperlipidemia (high cholesterol). There were 580,234 prescriptions filled last year for CareLink members. The challenge will be to coordinate care for this large population while increasing quality and managing cost. There are so many touch-points where patients can access care, providing consistent, quality, coordinated care will challenging to implement and manage. A major component of the PCMH model is patient self-management where patients take initiative to partner with providers to proactively manage their health. Clinics will need to educate patients on value of self-management and encourage them to feel in control.

University Health System goals include: Preparation of a gap analysis to determine NCQA Patient Centered Medical Home readiness. Develop training and education for key stakeholders to the importance of NCQA certification and impact on quality of patient care. Develop plans and processes to connect patients to a medical home. Provide new patients assigned to a primary care medical home an appointment to be seen within 60 days of referral. By developing systems to identify and prioritize patients in need of medical home assignment, defining appropriate provider panel sizes, and criteria for prioritizing patients for medical homes, University Health System aims to have 50% of clinics using the medical home model by DY 5.

The 5-year expected outcome would be to improve access utilizing innovative methods like group and telephone visits and appropriately assigning patients to their medical home in order to impact costly visits to emergency rooms and potentially avoidable admissions.

This achieves the following regional goals:
- Triple Aim: assuring patients receive high-quality and patient-centered care, in the most cost effective ways
- Further develop and maintain a coordinated care delivery system
**Starting Point/Baseline:**

CareLink as well as established patients assigned to University Health System medical home will serve as our selected patient population. Our starting point will be to pilot a primary care medical home model at one of the major primary care clinics. New patients assigned to medical homes will receive their first appointment in a timely manner. Care teams will actively manage their patient panel so that patients are reminded of services needed and receive coordinated care based in a primary care setting. Patients will know the professionals on their care team and establish trusting, ongoing relationships to reinforce continuity of care.

For the baseline year of October 1st, 2011 through September 30th, 2012, there were 244,382 CMA primary care encounters.

Primary care encounters include: CMA primary care network (all locations that provide primary and preventive services)

**Rationale:**

In the United States, safety-net hospital systems remain essential to providing access to health services for over 50 million uninsured Americans as well as other underserved populations. In the era of healthcare reform, safety-net hospitals will remain critical to responding to the mandate of providing medical care that is accessible, integrated, and patient-centered. In Bexar County, Texas, 22% of residents live at or below the poverty level, 17% receive no medical care due to cost, and 21% have no form of health insurance coverage.

In addition, assessments of health behaviors in this area reveals that 49% of adults are physically inactive, 30% are either overweight or obese, 77% consume less than five servings of fruit or vegetables per day, and 33% have had one or more days where their mental health was poor.

This project specifically addresses community need two (CN.2) which finds a high prevalence of chronic disease and related health disparities in the region which require greater prevention efforts and improved management of patients with chronic conditions. RHP 6 has a high rate of mortality associated with chronic conditions including cardiovascular disease, cancer, and diabetes.

Evidence from demonstration PCMHs shows that carefully tailored health services interventions can lead to the establishment of a usual source of care, improved adherence to clinical care and treatment, and strengthen evidence-based clinical preventive service delivery to economically vulnerable, uninsured or underinsured populations.

The purpose of this program is to expand established patient assignment into medical homes to engage patients in a care setting where a continuous care plan can be put in place and to ensure that they have access to services that are targeted to their personal health needs. This will subsequently improve geographical coverage and access to clinical and community preventive services through expansion of the patient-centered medical home. This accountable model of care will focus on common aims, priorities, and goals to ensure that all patients receive the right care including recommended clinical preventive services, at the right time, in the right setting, every time. Since CareLink members are unfunded, and have high prevalence of chronic disease,
unmanaged healthcare will cost billions. Implementing the PCMH provides patients with access to care to control chronic conditions, reduce costly inpatients or ED visits, and ultimately improve patient health and satisfaction. Expanding the PCMH and the delivery clinical preventive care within University Health System ambulatory facilities will improve health, health care and reduce costs. The milestones selected for this program (e.g. P-3, P-9,P-10, I-13, I-18, and I-19) are centered on developing care teams aimed at clinical integration and access, thereby improving overall healthcare, reducing wait times and unnecessary hospitalizations, and improving patient satisfaction.

University Health System operates University Hospital, a 496 bed full service facility, including trauma and emergency services for the region, 19 health centers and clinics providing primary care and specialty care, as well as acute care and preventive services. University Health System will coordinate care between our facilities to establish patient centered services. The system will expand our primary care base, incorporate clinics using the medical home concept, and train staff on PCMH methodologies. This will open new channels of access for our community to comprehensive, managed healthcare. Implementation of this model ensures patients have access to a seamless system of care that focuses on reduced wait times, timely scheduling of appointments, advanced communication and e-messaging with health care teams, data systems to support population health, case management, care coordination, support for patient self-care and development of performance reporting and improvement plans to measure the medical and financial impact of care delivered.

Measures of performance as outlined include both process and outcomes measures that assess progress made towards implementation milestones including measures of clinical expansion (establishment of patient-centered medical home site) integration and access (expanded services that address target population needs), quality and cost-effectiveness. In summary, establishing this clinical preventive model of care strengthens the organizational mission and responds to national health aims of delivering high quality care, improving population health and reducing healthcare costs.

This project addresses the following core components:

a) Utilize a gap analysis to assess and measure NCQA PCMH readiness: University Health System anticipates utilizing the NCQA PCMH criteria for accreditation to develop the PCMH at University Health System and measure readiness through the development process.
b) Conduct feasibility studies to determine necessary steps to achieve NCQA PCMH status: University Health System will determine PCMH readiness and necessary steps during baseline assessment phase. Reorganization of staff into primary care teams (Milestone 1) is expected to occur during this time.
c) Conduct educational sessions for primary care physician practice offices, hospital boards of directors, medical staff and senior leadership on the elements of PCMH, its rationale and vision: University Health System anticipates the development of an online PCMH training program, and will train PCMH personnel on concepts (Milestone 5).
d) Conduct quality improvement for project using methods such as rapid cycle improvement: The University Health System will monitor, evaluate, and adjust the project based on quality improvement activities throughout the development and implementation phases. Because the PCMH is being piloted at a small number of sites
 Initially, a key focus will be on identifying “lessons learned” opportunities to scale the PCMH model to more sites and a broader patient population.

**Related Category 3 Outcome Measure(s):**

High emergency room (ER) utilization is a considerable concern for the increasing cost of health care. Frequent and inappropriate use of hospital ERs is extremely costly and care could be provided in a less expensive setting. Patients, when possible, should be treated by their primary care provider for non-emergency conditions in order to promote consistent, quality care. The target population will include the CMA patient population which is comprised of 32.4% CareLink, 31.9% Medicaid, 12.6% HMO/PPO, 12.1% Medicare, and 10.9% self pay. CareLink is a financial assistance program for uninsured residents of Bexar County. The program was created in 1997 to help address the needs of Bexar County residents without health care coverage who were not eligible for Medicaid or other public or private funding. While CareLink is not an insurance product per se, it has many similar advantages in terms of promoting access to preventive health services, encouraging a long lasting relationship with a primary care provider, and instilling a sense of shared responsibility between member and staff for the member’s health. As of December 31, 2011, there were 54,256 members enrolled in CareLink.

**IT-9.2 ED appropriate utilization (Standalone measure)**

- Reduce all ED visits (including ACSC)271
- Reduce pediatric Emergency Department visits (CHIPRA Core Measure)272
- Reduce Emergency Department visits for target conditions:
  - Chronic Obstructive Pulmonary Disease
  - Behavioral Health
  - Diabetes
  - Asthma

**Relationship to other Projects:**

092414401.1.1 (Pass 2 CMA): Expand training of the primary care workforce – Implementation of the PCMH will require all medical providers to be trained in updated clinical workflows. Also, the PCMH increases the need for mid-level providers, patient navigators and care coordinators. Training future providers in primary care will assist with filling the need to create more access for patients and having newly trained providers to staff additional clinical sites

092414401.2.1 (Pass 2 CMA): – Expand Chronic Care Management Models – implementing PCMH concepts in the ambulatory setting will be a more coordinated approach of managing a patient’s overall health. Many CareLink patients have chronic conditions that will benefit from this new connection with their provider(s).

**Category 4:**

Related Category 4 measures include potentially preventable admissions measures in RD-1, 30 day readmissions in RD-2, Patient Satisfaction in RD-4.1 and RD-4.2.
### Relationship to Other Performing Providers’ Projects in the RHP:

**Category 1:**
- 136141205.1.1: Expand Primary Care Capacity – higher enrollment in the medical home model will place a higher priority on maintaining a relationship with a primary care providers through other avenues than just clinic visits
- 92414401.1.1: Expand training of the primary care workforce – Implementation of the PCMH will require all medical providers to be trained in updated clinical workflows. Also, the PCMH increases the need for mid-level providers, patient navigators and care coordinators. Training future providers in primary care will assist with filling the need to create more access for patients and having newly trained providers to staff additional clinical sites

**Category 2:**
- 92414401.2.1: Expand Chronic Care Management Models – implementing PCMH concepts in the ambulatory setting will be a more coordinated approach of managing a patient’s overall health. Many CareLink patients have chronic conditions that will benefit from this new connection with their provider(s).
- 136141205.2.2: Redesign to Improve Patient Experience
  Providing the ability to access healthcare in a timely manner and in locations where services are needed will lead to better patient experience. This can also be replicated with local and regional partners.
- 136141205.2.3: Apply process improvement methodology to improve quality and efficiencies: LEAN methodologies will be used to develop and implement improved clinical workflows, provider tools and training for staff in process improvement, and efficient, quality care delivery to the community.

### Plan for Learning Collaborative:

This project lends itself to participation in learning collaboratives as other Performing Providers in RHP6 seek to develop patient-centered primary care services in other parts of the region for similar patient populations. Processes and techniques developed and implemented during this project will be documented by the project team. Successes as well as lessons learned will be shared with regional collaborators who are also working to improve primary care access and quality.

### Project Valuation:

The project achieves the waiver goal and meets community needs by expanding primary care in a predominantly Hispanic, underserved area of Bexar County. This program strengthens healthcare linkages with local community partners, enhances access to primary care and assures improved quality care services to a target population that struggles with poverty, receive acute or emergency healthcare services only, and do not have usual providers. In addition, many in the target population have chronic disease; with no primary care access these condition will become far more complicated and costly to treat. Access to a primary care medical home been has shown to improve health, improve health care, and lower care costs.

Identifying Project and Provider Information:

Title: 2.7.6 Implement innovative evidence based strategies to significantly reduce and prevent lead poisoning and asthma in children and adolescents by targeting environmental aspects of children’s health (TEACH). Unique Project ID: 085144601.2.1 – PASS 1
Performing Provider: The University of Texas Health Science Center at San Antonio
Performing Provider TPI: 085144601

Project Summary:

Provider Description: The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.

Division of Community Pediatrics (CP) is a division within the Department of Pediatrics. The CP division has over 25 professionals, organized into multi-disciplinary teams engaged in the provision of health care, translational health care research into the areas of respiratory and pulmonary health, research for children and families living with HIV/AIDS, early child growth and development, adolescents and adolescent pregnancy. The Department of Family Medicine provides medical care for children, adolescent and adults. Family Medicine conducts national and regional experiments regarding the building of medical homes.

Intervention(s): Integrate and coordinate health and behavioral health intervention/prevention as well as lung functioning tests to assess the severity of asthma and monitor the course of project interventions. Neuropsychological assessment and interventions, for lead and asthma exposed children will be accessed to evaluate physical, neuropsychological and parental health management services. This project will implement lead and asthma prevention and intervention services for children and families living in housing identified by City and HUD officials as having environmental contamination for lead or other respiratory hazards. Approximately 1488 children and families will receive treatment for lead poison and/or asthma.

Need for the project: Bexar County has the 3rd highest incidence rate for Elevated Blood Lead Levels (EBLLs) in Texas and among the worst 10% of U.S. cities for lead exposure risk (Environmental Defense Fund, 2011). Asthma, the most frequent chronic childhood illness affecting 12% of school-age children causes 23% of elementary school absences in Bexar County. In 2011, children in Bexar County (19,980) were screened for childhood lead, and 1000 qualified for chelation therapy. Of the 630,935 San Antonio children under age 18, 45,427 have been diagnosed with asthma. Asthma, the most frequent chronic childhood illness affecting 12% of school-age children causes 23% of elementary school absences in Bexar County (2011 Bexar County Community Health Assessment).

Target population: The San Antonio Empowerment Zone/Enterprise Community (EZ/EC) target area represents the highest lead exposure incidence rates, highest rates of abandoned housing, poverty, single mothers, teen births, and Sexually Transmitted Diseases (STD’s) within Bexar County. The EZ/EC target area has 59,732 low-income housing and 46% were built prior to 1978 and 12.8% were built prior to 1940. Approximately 22% of San Antonio’s children under the age of six live within EZ/EC area and 70% of the 3-5 years of age Head Start children in the area (5447) in the area are Medicaid recipients. Sixty-Five percent (65%) of all house members in the EZ/EC area live below the federally defined poverty level. Childhood blood lead level screening in 2012 identified 236 children with blood lead exposed and 120 (50.8%) had elevated blood lead levels (≥10 µg/dL). Children residing in the EZ/EC zone were
over represented for asthma hospitalizations with 17.76% of all asthma in San Antonio. In 2011 the City of San Antonio received Federal funds the U.S. Department of Housing and Urban Development program to support San Antonio’s Green and Healthy Homes Initiative (S.A.-GHHI) to implement lead, asthma and mold hazard remediation, asbestos removal, water conservation, fire prevention, integrated pest management and safety mitigation. This proposed 1115 grant initiative incorporates strong partnerships with the S.A. GHHI Collaborative Board which is composed of San Antonio’s Green and Healthy Homes (S.A. GHHI) (formerly the Lead-Based Paint Hazard Control Program), San Antonio Metropolitan Health District (SAMHD), San Antonio Fire Department, Code Enforcement Services, San Antonio Water System, Office of Environmental Policy, City Public Service, Family Service Association (a faith-based, 501(c)(3)), the University of Texas Health Science Center San Antonio Division of Community Pediatrics and the Department of Family Medicine. Community Pediatrics will provide leading screening and medical referral to a primary health provider. Community Pediatrics will provide lead and asthma education and medical consultation for children with asthma/lead for Medicaid enrolled children. Approximately 1488 Medicaid and indigent children manifesting lead/asthma symptoms, and who reside in substandard housing will receive project services. Project participants will receive medical and wrap-around psychosocial interventions by Community Pediatrics and Family Medicine staff. Community collaboration for project sustainability will be done with the City of San Antonio Planning and Community Development Department and S.A. GHHI partners.

Category 1 or 2 expected patient benefits: This project will use an empirically designed evidence based program (Krieger J. et al. “A Randomized Controlled Trial of Asthma Self-Management Support Comparing Clinic-based Nurses and In-home Community Health Workers,” Archives of Pediatric and Adolescent Medicine. 2009;163(2):141-149. Note: statistically significant differences in health outcomes were observed for only symptom-free days in the last 2 weeks and caregiver quality of life score.)

Category 3 outcomes: Reduction/prevention in Emergency room admission and sick days of Medicaid children with asthma/ elevated lead levels will be accomplished by: (a) primary medical intervention and preventive services to remediate environmental health problems by project staff. Collaborative neuropsychological assessments and environmental and psychosocial interventions will help address the medical and psychosocial needs of children and establish and sustain a City-wide program for respiratory and lead exposed children. This an evidenced based project, and is a multi-agency and county-wide, medical, bio-psychosocial initiative.

Project Description:

Purpose of the Project: Implement an innovative evidenced-based disease prevention program
for children diagnosed with lead poisoning and asthma, and children with asthma to Reduce Emergency room admissions. **Project Goal:** (1). Reduce the severity of childhood asthma and childhood lead symptoms that contributes to E.R visits, (2) Decrease preventable asthma morbidity, (3) Decrease the number of emergency room visits, school absents due to sick days, and decrease number of in home sick days, (4) Improved quality of life for lead/asthma children and parents.

- **Reduce the severity of asthma symptoms by 20%:** GGHI Collaborative Board of City of San Antonio Officials, Metropolitan Health District, Housing Authority, University Hospital and UTHSCSA Community Pediatrics and UTHSCSA Family Medicine will oversee and assure successful integration of (a) weatherization and, energy efficiency interventions for property remediation (b) environmental strategies to control asthma, allergens (mold, insects, dust mites, pet dander etc) and environmental irritants (tobacco smoke, indoor/outdoor fumes, sprays/scents, (c) Primary health lead /asthma education, health knowledge assessment, lead/asthma prevention and intervention instructions and medical referrals, (d) recommendations from home environmental assessment provide by professional environmental consultants will provide home energy assessment, health and safety checks and Indoor air quality testing to determine level of volatile organic compounds, allergens, mold, and formaldehyde with the participants home.

- **Improve Quality of Life of participants with lead/asthma by 20%:** Quality of life changes, improved patient access to coordinate health and behavioral health care, and health literacy will be accessed by standardized parent and child health quality of life surveys, psychological tests and pulmonary lung functioning tests results, especially from the asthma participants. Community Pediatrics will provide six in home education sessions to individuals with lead, lead and asthma or asthma only. Quarterly lead asthma education sessions will be offered to healthcare providers, school educators and other environmental health officials. Advanced statistical methods to access the rapid cycle of improvement between health literacy, health intervention and health prevention will be used.

- **Decrease the number of lead and or Asthma Morbidity/Severity by 15%:** UTHSCSA Community Pediatrics and Family Medicine in conjunction with Metropolitan Health District health staff will create a process for triage, referral, remediation, health education prevention and intervention to reduce the morbidity/severity of asthma /lead symptoms as assessed by (1) number of school absent,(2) number of parent reported sick days, and (3) number of routine hospital visits (4) episodic emergency room visits and (5) number of visits to a primary healthcare provider or school nurse. Unit cost of analysis of base line morbidity/severity variables in comparison to post intervention cost analysis will be conducted and a 15% morbidity/ severity reduction is expected.

**Background:** Asthma is the fourth most common reason for pediatrician office visits. Asthma affects over 1 million Texas children. The rates of asthma vary widely geographically in the county, with lower rates of diagnosis in low SES regions of the county. The Assessment notes that the Bexar County Physical Environment, including housing, can affect chronic conditions like asthma. Texas Hispanic children are more likely to be hospitalized due to asthma than non-Hispanic white children. Exposures that cause airway inflammation and trigger asthma include:
indoor irritants and allergens such as tobacco smoke, cockroaches, animal dander, dust mites, mold, and volatile organic chemicals (VOCs). Frequently, these exposures are associated with older housing stock where lead exposure may also be a concern. Children with blood lead levels of $\geq 0.5 \mu g/dL$ may suffer disproportionally from respiratory and immunological impairments as well as neurocognitive, developmental and mental health deficits later in life. Medicaid and uninsured children have less access to primary health preventive services due to low Medicaid reimbursement rates for asthma that fail to promote environmental interventions that have the potential to address the underlying causes of asthma. Most reimbursement goes toward medications, hospitalization, ER visits, with few, if any, resources directed toward reducing or eliminating contributory environmental exposures.

**Methodology:** How The Project Will Be Addressed: The Departments of Pediatrics and Family and Community Medicine will partner to coordinate comprehensive lead and asthma integrated “Primary and Behavioral health interventions and Prevention Services.” Medicaid-enrolled children presenting with lead exposure and or asthma will be enrolled in the proposed 1115 waiver project. Community Collaborative partners will include the San Antonio local Housing and Urban Development Green and Healthy Homes Division and the San Antonio Metropolitan District (SAMHD), who will make referrals of San Antonio children with documented elevated blood lead levels via blood screening and asthma for the duration of the project. The target population will consist of 1488 client’s residing in San Antonio’s public housing units. Based current S.A. Housing Authority housing census data and on previous HUD funded lead and asthma projects (2002-2005 and 2007-2009) conducted in San Antonio, we expect each home to consist of 4 individuals, with at least one child between the ages of 2 and 9 years, 11 months, and 29 days with diagnosed elevated blood lead levels and/or asthma. The overall population impact therefore would allow this study to reach approximately 1,488 individuals. Baseline respiratory health will be determined by caregiver report on a respiratory health-screening instrument.

**Family and Community Medicine (FCM) Scope of Work: Asthma Environmental Assessments and Recommendations for reducing E.R. visits and in-home sick days:**

**(A) Background, Medical, and Environmental Information:** FCM will work with Pediatrics to obtain basic medical information relevant to environmental medical exposures for each child including personal exposure history, total IgE, RAST tests for common allergens, blood lead levels, cotinine test, and pulmonary function test results.

**(B) Environmental House Calls (EHC):** FCM will implement a series of environmental house calls in each child’s home to evaluate salient residential exposures. These inspection tools, along with the EPA Asthma Home Environment Checklist, will guide the home evaluations. A series of three house call visits per family is necessary. A minimum of two community health professionals with prior training in environmental house calls will conduct each home visit. During the first visit the family will receive basic information about asthma and accompany the EHC team on a walkthrough visit to identify potential concerns. Two weeks later, at the second visit, family will receive an action plan and discuss recommended interventions environmental, housing remediation’s and personal changes i.e. smoking, pet’s and dust control.. The final house call will occur approximately 6 months later, to assess changes that were made in the home and changes in the child’s asthma control.

**(C) Assessment of EHC Intervention:** Each child’s medical history will be reviewed for the
following: hospital and ER records, doctor visits, medication requirements, days lost from school and family assessment (TRACK survey).

(D) Proposed Environmental House Call Intervention for Asthma: FCM will develop an intervention plan that marries environmental and medical concerns and interventions in a manner designed to complement and enhance the HUD-funded lead/asthma initiative.

- Homes evaluated for safety and environmental risk factors for children.
- Baseline environmental testing including CO/CO2, particulates, volatile organic compounds indoor and outdoor mold samples, and humidity will be assessed in each housing unit.
- Individual action plan developed to include: Interventions include education regarding integrated pest management (IPM), source control (such as removing candles; improving storage and use of cleaners), mold and relevant education on other allergens (cockroach, pet dander, and dust mite).
- Environmental assessment will be done during the 3rd (final) visit in an effort to assess the reduction of known asthma triggers made in the unit since the initial visit.

(E) Research Team: The team will consist of experienced FCM faculty and staff from the South Texas Environmental Education and Research (STEER) program who have conducted environmental house calls and asthma trainings for more than 15 years throughout South Texas (San Antonio, Laredo, Harlingen). FCM will provide training to FCM staff (community health workers) from San Antonio on the identification and management of indoor air asthma triggers.

Pediatrics Scope of Work—Medical Intervention and Prevention: Medical Evaluation:
The Pediatric Department will be responsible for the medical evaluation of children with environmentally induced illnesses, including asthma and lead toxicity. Pediatrics will recruit Medicaid enrolled children with asthma. Pediatrics will perform an initial medical evaluation and medical tests that may be necessary to guide environmental inspections of each child’s home (e.g., RAST testing for relevant allergens, cotinine levels). Pediatrics will then communicate these results to the EHC team. Once a home assessment has been completed, FCM/EHC will communicate concerns to the Pediatric team. Intervention and prevention components conducted by Pediatrics will include:

The Baseline Intake Information: The caregiver will complete a survey battery that includes: (1) demographics, (2) Brief Symptom Inventory (BSI: Derogatis), (3) Crisis in Family Systems (4) a biomarker survey (5) Time of any lead exposure (prenatal, postnatal); (6) Prenatal history (maternal alcohol use, maternal smoking, maternal drug use, infant birth weight); (7) Family history (respiratory problems, diabetes); (8) Environmental exposures (pesticide use, environmental tobacco smoke, dust, rodents, mold, etc.); and (9) Other (hygiene, nutrition, educational stimulation, presence of developmental delays, & cultural influences).

Pediatric Pulmonology: Will perform a blood draw on the child to obtain: 1) the serum levels total IgE, 2) total eosinophils, 3) Radio Allergo Sorbent Test (RAST) for household allergens, 4) cortisol level, and 5) lead level. Respiratory health-related information will be provided to the caregiver and this information will be extended to the PCP. The caregiver will provide the venous lead test results and TRACK standardized asthma symptom survey results to their Primary Care Physician PCP for further follow-up. Parent Education: 1) Basic facts about
asthma, 2) Role of medications, 3) Techniques in using an inhaler/spacer/holder chamber and how to self-monitor for asthma symptoms and 4) Environmental control measures, and 5) When and how to take rescue actions. The education sessions will use knowledge of home conditions reported by the EHC team to customize the educational intervention to better meet the family’s needs. **Educational Curriculum:** In home Seven (7) session curriculum, this includes the receipt of non-toxic cleaning supplies (e.g., vinegar, baking soda). Service and Linkages: Pediatrics will provide information and referrals to community services and organizations that can assist with food, medical care, and other necessities. For instance, staff will refer participants to Medicaid or the Children’s Health Insurance Plan (CHIP) as needed. **Child Psychosocial and Neuropsychological Assessment:** One of the following three developmental/cognitive assessments will be administered to each child based on age and language: Mullen Scale of Early Learning (Mullen, 1995) (<5 years); the Wechsler Preschool and Primary Scales of Intelligence-III (WPPSI-III; Psych. Corporation, 1993) (≥5 years; English speakers); the Wechsler Nonverbal Scales of Ability (WNV; Wechsler & Naglieri, 2006) (≥5 years; Spanish speakers). Caregivers will complete the Digit Span, Digit Coding, and Picture Completion subtests (Spanish translations of instructions developed in 2009 nationally standardized) of the Wechsler Adult Intelligence Scale-IV (WAIS-IV: Wechsler, 2008), and the Achenbach Child Behavior Checklist (CBCL) (Achenbach & Rescorla, 2001). Parental assessment for health literacy will be assessed by the Test of Functional Health Literacy in Adults (TOFHLA) developed and validated in the literacy of health Care Project (Cronbach’s alpha 0.96-0.98). Within a month of testing, participants will receive a letter with the test results including recommendations and anticipatory guidance on developmental milestones. Effectiveness Evaluation: At the beginning of each session, the educator will document any lead- or respiratory health-related services reported by the participant. The curriculum includes a pre- and post-lead Exposure and Asthma Triggers Knowledge Test, which will assess any changes in lead and asthma. Follow-up Assessments: Baseline assessments will be repeated after three, six and twelve months.

This project meets the Region 6 waiver goals for the following:
- **Triple Aim:** assuring patients receive high-quality and patient-centered care, in the most cost effective ways
- Improve the healthcare infrastructure to better serve the Medicaid and uninsured residents of our counties
- Further develop and maintain a coordinated care delivery system
- Improved outcomes while containing cost growth

We shall continually assess the quality improvement and project impacts, and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

**Starting Point/Baseline:**

1. **Number of Patients Served in Previous Department of Pediatrics Lead and Asthma Projects:** In the 2004 project 325 mothers and infants (total served 1300) were served and in the 2009-2011 project 212 (total served 848) children and parent members were served.

2. **Percent of Providers Trained in Intervention:** 100% of the Community Pediatrics Medical,
Psychological and Health Navigator/Health Educators are fully trained. In like manner, 100% of the Family Medicine staff Medical, Environmental health inspectors and Environmental technicians are fully trained and proficient in each of their fields of expertise.

2. **Number of Patients Served in Previous Department of Family Medicine Projects.**

(a) National Institute of Environmental Health Sciences Environmental House-call Pilot Study: (2000-2001). Comprehensive environmental testing was performed for 15 family units (total served 60 units); (b) U.S. Housing Urban Development (2006-2009). Healthy Homes Project Comprehensive environmental testing for 60 homes and family units (total served 240). Families reported a decrease in emergency room visits, decrease asthma severity of over the course of the year and reduction in school absenteeism related to asthma and (c) Centers for Disease Control CDC/ATSDR Border Environmental Health and Toxicology Education Research Program with Texas A&M Univ. School of Rural Public Health (2009-2012). In-home asthma educational sessions for 145 low-income Hispanic families conducted.

**Rationale:**

The Integrated Primary and Behavioral Medical Lead Poisoning and Asthma Intervention & Prevention option was selected because asthma and lead represent tremendous health and growth and development problems, not only in Bexar County, but in the state of Texas. Project components including all required core components already secured for the successful implementation of the project include provider agreements, project protocols, recruitment and enrollment procedures, an identified target population awaiting enrollment, project staff recruitment, community and HUD collaborators’ endorsements, and necessary hospital affiliations. This project is a new initiative, integrating innovative and preventive healthcare delivery through existing and successful collaborations and partnerships throughout the community and across federal agencies. This project includes qualitative and quantitative data collection for biological, psychological, quality of life, patient health literacy data and environmental health quantitative outcome data. This project addresses care for children with asthma and childhood lead poisoning--which represent major health disparities in our community.

The unique community need identification numbers the project addresses:

- **CN.4** There is a shortage of high quality mental and behavioral health services that are integrated with physical health care services and/or provide crisis stabilization.
- **CN.1** The need to deliver improved lead and asthma health care compliance, quality of life and literacy.

**Related Category 3 Outcome Measure(s):**

The rationale for selecting Primary Care Behavioral Health for lead exposed and asthmatic children.

1. Asthma is a chronic health problem for children and is the leading cause of hospital visits for children. In like manner, lead poison is a high priority concern for children in South Texas.
2. Reports from the Texas Department of State Health Services and San Antonio 2011 Needs Assessment, document these health problems and health disparities among impoverished
children.

3. The 2011 Centers for Disease Control and Prevention health advisory committee recommends primary care and home based care in conjunction with preventive education.

<tr>
<th>Project Valuation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Project Evaluation will include a cost analysis. A database will be designed to tract the number of clients served, types of services received and quantitative as-well-as qualitative measure will be collected. A power analysis will be conducted to find the number of clients needed to find significant changes in E.R. visits. Chi-square tests, <em>t</em>-tests, and analyses of variance (ANOVA) will be conducted to compare differences between the dependent variable with respect to number and types of encounters/interventions. Univariate ANOVAs will be used to assess whether the independent variables used had significant main effects on test scores and also to determine whether an interaction effect occurred between the Independent Variable and Dependent Measures. A regression analysis for each dependent measure will identify demographic and psychosocial variables as covariates in subsequent hypothesis testing of E.R visits. Associations between the demographic covariates (age, gender, and ethnicity), treatment use covariates (e.g. age of first use of any medication and age of first asthma), and the independent and dependent variables will be examined using Pearson correlation coefficients, <em>t</em>-tests, and ANOVAs. The Wilks’ lambda statistic will assess the proportion of error and of the effect variance/covariance in the dependent variables unaccounted for by the independent variables. Multivariate Analysis of Variance (MANOVA) and Multivariate Analysis of...</td>
</tr>
</tbody>
</table>
Covariance (MANCOVA) will be used to test the relationship between Independent variables and the dependent measures while controlling for age, treatment history and other variables such as; ethnicity, and gender.

**Cost Benefit Analysis:** In a study referencing the economic value of home-based, multi-trigger, multi-component interventions with an environmental focus for reducing asthma, Nurmagambetov et al. (2011) found that for every dollar spent on the intervention, the monetary value of the resulting benefits, such as averted medical costs or averted productivity losses was $5.30–$14.00 (the benefit-cost ratio). Each additional symptom-free-day had a cost-effectiveness ratio between $12–$57. Cloutier et al. (2009) found that with an asthma management program that reduces asthma-related health services utilization there is a potential $3.58 return on investment per each US dollar spent for Medicaid managed care plans.

**Project Summary:**

- **Provider Description:** The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.

- **Intervention(s):** The project will place master’s level behavioral care managers (BCM) in primary pediatric clinics to work with children with ADHD and comorbid psychiatric conditions (depression, aggression), providing behavioral and family therapy. The BCM will consult with child psychiatrists who in turn will assist pediatricians with psychopharmacology when needed. The BCM’s and child psychiatrists will provide crisis counseling as well.

- **Need for the project:** Currently child in pediatric primary care with ADHD may wait months for an appointment with mental health professional or child psychiatrists, untreated illness often leads to severe crises which result in hospitalization and increased medical costs.

- **Target population:** In December 2011, there were approximately 1400 served in the primary care pediatric clinics and 3000 served in pediatric specialty clinics of the University of Texas Health Center Health Science Center (UTHSCA). Roughly 50% of these children (n =2200) would be in the age of risk for ADHD (> 3 years) on epidemiological data, 10% of these children would meet criteria for ADHD (n = 200). Approximately 10 of these would have severe conditions requiring psychiatric hospitalization or involvement of the police each month. Thus 80-120 per year might require such a level of intervention. This population is entirely indigent/Medicaid eligible.

- **Category 1 or 2 expected patient benefits:** Perform 200 visits/month with children with ADHD and severe comorbid disorders in the PROXIMA program. This will involve up to 1200 unique patients per year. Number of patients per DY: DY2:300, DY3:800, DY4:1200, DY5:1200

- **Category 3 outcomes:** 50% reduction is baseline rate of psychiatric hospitalization (80-120 admissions per year) of children with ADHD and severe comorbidity.

**Project Description:**

PROXIMA (Primary Care Optimization for Excellence in Interventions Managing ADHD) is an integrated mental and physical health program for children with ADHD and related disorders. Master level mental health providers will be placed in primary and specialty care clinics of the Pediatrics Dept. of UTHSCSA. These Behavioral Care Managers (BCM) will conduct assessments with children with suspected ADHD, integrate diagnostic information from home and school, provide psychoeducation about ADHD as well as behavior management...
regarding not ADHD but aggression, mood regulation and sleep. A child and adolescent psychiatrist (CAP) will consult with both the BHC and the PCP. The CAP will guide the PCP in the use of expanded psychopharmacology for complex cases of ADHD, reducing need for specialty referral and psychiatric hospitalization. Since CAP residents and pediatric residents currently train in isolation from each other, PROXIMA will fund time for residents of both specialties to do joint rotations to enhance consulting and communication skills.

This project meets the Region 6 waiver goals for the following:

- **Triple Aim**: assuring patients receive high-quality and patient-centered care, in the most cost effective ways
- Improve the healthcare infrastructure to better serve the Medicaid and uninsured residents of our counties
- Further develop and maintain a coordinated care delivery system
- Improved outcomes while containing cost growth

In order to pursue quality improvement we shall continually assess the project’s impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

**Starting Point/Baseline:**

In December 2011, there were approximately 1400 served in the primary care pediatric clinics and 3000 served in pediatric specialty clinics of the University of Texas Health Center Health Science Center (UTHSCSA). Roughly 50% of these children (n =2200) would be in the age of risk for ADHD (> 3 years) on epidemiological data, 10% of these children would meet criteria for ADHD (n = 200). Approximately 10 of these would have severe conditions requiring psychiatric hospitalization or involvement of the police. Thus 80-120 per year might require such a level of intervention.

**Rationale:**

Attention-deficit/hyperactivity disorder (ADHD) affects 6-9% of school-age youth in the U.S., and is the most prevalent psychiatric disorder among preadolescents. ADHD’s adverse impact on learning, self-control, and personal safety are well-established. The large subgroup with comorbid disruptive behavior disorders (DBDs) also incurs the disadvantages of persistent antagonistic behavior, such as embittered family relations and social exclusion. Beyond childhood, ADHD raises the incidence or severity of many mental health problems, especially those distinguished by poor impulse control (e.g., antisocial behavior, affective dysregulation, and substance abuse).

- The challenges of working with this population is a high no show rate for mental health care (25-30% in UTHSCSA child psychiatry clinics and a tendency toward coming to appointments only in a crisis). There is a stigma around seeking mental health care. PROXIMA will implement and evaluate a collaborative-care model (for ADHD within primary pediatric services). This addresses the challenge by providing care in a setting comfortable to families and that is readily accessible. The five year outcome will be reduced need for hospitalization and improved psychosocial functioning as assessed by standardized measures. Improved outcome for children with ADHD with integrated care has been shown by numerous studies (http://www.skipproject.org/).
**Unique Community Need-Mental Health Among Youth.** At present, about 40% of Bexar County’s population is under the age of 21 or 640,000 individuals. (pg 9 of Community Health Assessment, CHA). Given that up to 10% of these individuals have ADHD and 14% “seriously considered suicide (these are likely overlapping populations), this means more than 60,000 youth are at risk. Only 1501 received state mental health services (Figure 277, CHA) and while many others received care in the private sector, many low income youth with ADHD and other comorbid conditions have gone untreated.

**Overview of PROXIMA.** While PROXIMA is a new program for the Performing Provider, the Divisions of Child Psychiatry and Pediatrics have recently completed a four year state wide project, Services Uniting Pediatrics and Psychiatry Outreaching to Texas (SUPPORT) which placed Master level mental health practitioners in primary care settings. SUPPORT showed that after six months, participants showed significant improvement in ratings of quality of life and behavioral/emotional functioning. PROXIMA will provide a Behavioral Care Manager (BCM), supervised by a child psychiatrist, who supports primary care physicians in assessment and optimized management of ADHD. The BCM will be a licensed master's level mental health professional. BCMS’ roles include family psychoeducation, treatment planning, and frequent outcome measurements, decision-support for a data-driven medication algorithm, psychosocial therapies, assiduous patient follow-up, and supporting families’ engagement with treatment. By early intervention with children with ADHD in the primary care setting, we hope to limit negative outcomes such as psychiatric hospitalization and antisocial behavior which often leads to involvement in the juvenile justice system.

Eligible children are 5-15 years-old who are (a) referred from primary care clinicians (PCPs) for suspected ADHD, both with and without concurrent aggression, conduct or mood disorders.

PROXIMA will occur in the primary and specialty (chronic care) clinics of the Department of Pediatrics of the UTHSCSA. Up to five BCM’s will be employed, in each of the high volume pediatric clinics in San Antonio. These clinics routinely refer out 5-10 individuals a week with ADHD and related conditions, most of these end up on waiting lists in local mental health agencies. PROXIMA will allow immediate intervention in the primary care setting.

The BCM meets with the project team’s child psychiatrist for weekly supervision. In the primary care setting, the BCM is part of the practice’s team. Each practice also has a liaison pediatrician who participates in monthly project reviews with the study team and ensures smooth implementation at the pediatric site.

Prior to meeting with a family allocated to PROXIMA, the BCM reviews the assessment information with the site’s psychiatrist and the RC. Preliminary suggestions for initial management are proposed for subsequent review by the family and PCP, with attention to factors that may disfavor the first-line medication and behavioral intervention approaches (e.g., stimulant intolerance, tics, factors that may warrant modifying behavioral therapy). When needed for diagnosis or treatment planning, other information will be identified and obtained. The BCM discusses the family’s chief concerns, and offers a summary of the history from review of the evaluation, inviting parents to clarify and elaborate. The role of ADHD as a contributor to the child’s difficulties will be introduced, along with factors/comorbidities as indicated. Parents’ ratings of ADHD and other behavioral symptoms will usually be a good starting point. The BCM will use and give families printed and video materials (available in English and Spanish) from the AAP ADHD Toolkit, AACAP, and other sources from the
common library we establish. Families’ treatment preferences, attitudes toward medications, and pressures they experience from extended family members around their child’s needs are discussed. The BCM helps parents to record specific questions about risks and benefits of medications to ask the PCP. The BCM acquaints parents with the main outcome monitoring tools, described next, and the importance of the information they yield to gauge progress.

Child psychiatrists will consult on the selecting the particular stimulant and dosing strategy for a particular child. The BHC will assist the physicians by obtaining rating scales from the parent and school. After stimulant optimization steps, not all children will experience sufficient amelioration of symptoms. We distinguish between significant residual difficulties that are chiefly core symptoms of ADHD, for which additional medications will be familiar to PCPs, and those that reflect comorbid problems such as aggression, anxiety, and mood disturbances, for which more direct care by a child psychiatric specialist is indicated. In consultation with the psychiatrist, we anticipate that PCPs will typically initiate alternate or adjunctive medication when the chief concern is persistence of ADHD symptoms.

Symptoms of ADHD and comorbid problems that persist beyond these initial steps often warrant treatments beyond the comfort zone of most PCPs. While always an option, we anticipate common scenarios for assessment by the team’s psychiatrist. (a) Related disruptive behavior symptoms, such as aggression, temper dyscontrol, or conduct problems that often improve with ADHD treatment, but nonetheless remain to a detrimental extent, may require pharmacotherapy or more intensive behavioral interventions. (b) Anxiety and mood problems may require more specific treatment. (c) Poor tolerance for pharmacotherapy or atypical responses to it may compel diagnostic reconsideration.

Most evidence-based psychosocial treatments for youngsters with ADHD focus on associated conduct problems, such as difficulties with rule-adherence, complying with directions, managing frustration and anger, etc. The core of the behavioral treatments are: 1) introduction and goal setting; 2) increasing positive interactions with the child, noticing and rewarding cooperative behavior and self-containment when frustrated, and structuring the environment and routines to avert problem behavior; 3) tools to maintain parental composure in the face of difficult behavior, including judicious ignoring of low-level misbehaviors to avoid unnecessary conflicts and inadvertent reinforcement via attention; 4) tools to help parents communicate to the child directions and other limits on behavior that hitherto resulted in combative reactions; 5) implementation of a system to provide behavioral monitoring, clarity of expectations and consequence to reward cooperation and improved frustration tolerance; 6) implementation of a similar school behavioral program in consultation with teachers; 7) interventions for handling uncooperative and dyscontrolled behavior.

PROJECT COMPONENTS:
- (A) We have identified sites (University Health System [UHS Pediatric Clinics, affiliated with UTHSCSA) to be involved in the program.
- (B) As UHS is a primary teaching hospital for UTHSCSA, agreements can be efficiently negotiated.
- (C) Establish protocols and processes for communication, data sharing, and referral between behavioral and physical health providers.
- (D) Pediatricians in the Community Medicine Associates of UHS and UTHSCSA Dept of Pediatrics (faculty and residents) will be recruited to participate.
- (E) Train physical and behavioral health providers in protocols, effective communication and
team approach. Build a shared culture of treatment to include specific protocols and methods of information sharing that include:

- Regular consultative meetings between physical health and behavioral health practitioners;
- Case conferences on an individualized as needed basis to discuss individuals served by both types of practitioners; and/or
- Shared treatment plans co-developed by both physical health and behavioral health practitioners.

(F) We will develop agreements to access Electronic Health Record (EHR) data from UHS (Sunrise) as well as develop a method to track hospitalization via Medicaid claims.

(G) Since UHS and UTHSCSA are already health care partners, legal issues are not anticipated to be significant in terms of limiting collaboration.

(H) All utilities/building services are in place.

(I) We will develop a web based tool to track progress using standardized mental health symptom rating scales.

(J) We will regularly conduct Quality Improvement to identify challenges and barriers to working with this population or that prevent true collaboration.

CN.4 This project addresses the need for high quality mental and behavioral health services that are integrated with physical health care services and/or provide crisis stabilization.

CN.1. This project addresses the need for improved health care quality in our community.

**Related Category 3 Outcome Measure(s):**

- Psychiatric hospitalizations of children with ADHD and complex comorbidities (aggression, mood disorder) have risen dramatically in Texas and nationwide. These admissions occur in crisis and rarely result in long term outpatient care to consolidate any gains. Thus, there is often little long term benefit despite high costs.
- PROXIMA will seek to reduce potentially preventable admissions (PPA, OD-2) through provision of integrated mental/physical health services.
- Process Milestones for Outcome: **Milestone 1** will be to engage stakeholders (pediatricians, community) to ensure PROXIMA program meets the challenges these families present. **Milestone 2** will establish the baseline rate of psychiatric hospitalization. **This is a customized milestone critical to accurate assessment of our Improvement Target.** **Milestone 3** will be to test data collection procedures, while **Milestone 4** will be to conduct Plan Do Study Act (PDSA). We choose reduced hospitalization as our **Improvement Target** due to the high cost of hospitalization and the lack of evidence that acute hospitalization improves long term functioning.

**Relationship to other Projects:**
It will be key for the PROXIMA project to be integrated with other child health providers in the region, as well as schools. Children in this population are likely to have variety of neurodevelopmental (autism spectrum and learning disorder) and social issues that will need intervention outside the primary care clinic. When children do need hospitalization, coordination of treatment planning and follow up services will be integrated to prevent gaps in care. A project related to PROXIMA is TEACH (Targeting Environmental Aspects of Children’s Health – 2.15.2), which also integrates primary care and behavioral health for children with a team approach to care.
**Relationship to Other Performing Providers’ Projects in the RHP:**

None of the other projects are proposing an integrated primary and behavioral health system for children, though one other project (UTHSCSA, 2.15.1) will do so in adults. This project, along with the two projects mentioned above (Clarity, CHCS) will be included in a learning collaborative.

**Plan for Learning Collaborative:**

A weekly phone conference will focus on identifying patients shared by the providers and addressing the challenge of obtaining permission form parent to share children’s data amongst the providers. The Dept of Psychiatry developed a web-based simple database as part of an earlier practice to track data across practices. Information from the BHC’s on patients’ will be used to identify common barriers to continuity of care and follow through. This information will be rapidly disseminated to all sites and a webinar based brain storming session will carried out to propose ways of dealing with these barriers. Pilot projects will be launched and the results (i.e., reduction in drop-out from treatment) disseminated to sites. Quarterly in person meeting will be held amongst the partners. Families will be asked if they wish to speak of their experience in PROXIMA, with quotes of successful outcomes disseminated each week to encourage staff of PROXIMA to preserve in their efforts. Successful interventions will be mandated in all the practices using PROXIMA.

**Project Valuation:**

In 1982 Satterfield and colleagues reported an 8 year follow up of 110 boys with ADHD (mean age 17). 58% of low income boys with ADHD had a conviction for a serious offense compared to 11% of low income boys without ADHD. While children are never admitted to a psychiatric facility for symptoms of ADHD alone, 1 in 5 children with ADHD have severe comorbidity such as mood disorder or severe aggression which leads to dangerous behavior to self or others. Incarceration in a juvenile justice facility may cost $100 per day, such that long term costs may be in excess of $40,000 per year. A typical psychiatric hospitalization may cost $1,000 per day for 5-10 days (~$7,500). In the baseline data we noted that 10 youth per month need inpatient care. Assuming 80 youth per year from our sample needing institutional care of some sort, the cost of caring for this cohort would be:

- 20 youth in long term juvenile care: $800,000 per year
- 20 youth with short term juvenile detention stays: $90,000 per year
- 40 youth with 1.5 psych admissions per year $450,000 per year

Total: $1,340,000 per year

Other costs of under treated ADHD are increased special education services, demands on the juvenile courts for truancy can be estimated to be about $260,000 per year for the entire cohort. Thus our population would account for $1.6 million in costs per year, or $6.4 million over 4 years. The total cost of PROXIMA would be $4 million for all four years, a significant savings.

**Project Summary:**

**Provider Description:**

The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.

**Intervention(s):** The project provides evidence-based transitional care for individuals discharged from psychiatric units or diverted from emergency rooms. Interventions to be delivered include cognitive behavior therapy (a treatment focused on correcting errors in attribution and thinking in an effort to improve outcomes in depression, anxiety and psychosis); cognitive adaptation training (a home based treatment using environmental supports such as signs, alarms, checklists, pill containers to promote medication adherence and improve community functioning); family psychoeducation and care coordination (designed to link patients to appropriate options for care in the community for longer term follow up). A unique feature of this program is that it provides interprofessional training in these evidence-based approaches for social workers, nurses, and case workers to improve workforce development as well as community behavioral health training for prescribing professionals—physicians, advance practice nurses and physician assistants.

**Need for the project:** There is a severe shortage of mental health providers in Bexar county coupled with reduced availability of services for the most seriously mentally ill—overwhelming existing health care systems, dramatically increasing the use of emergency services and leaving the most vulnerable in our society with inadequate or no mental health care options. This project increases service availability and delivery and develops the workforce for multiple disciplines for work with the seriously mentally ill.

**Target population:** Seriously mentally ill being discharged from inpatient psychiatry units or diverted from emergency services.

**Category 1 or 2 expected patient benefits:** Enroll and provide evidence-based services for over 4600 individuals in the immediate post-discharge/diversion period with average number of wrap around visits=4 per individual prior and ensuring connection with longer-term services in the community. Training a minimum of 40 new providers (10 per year) in application EBPs for the seriously mentally ill using an inter-professional treatment model that is easily replicable throughout Texas.

**Category 3 outcomes:** Our goal is to reduce the potentially preventable all-cause readmission.
rate within in 1 year by 20% in DY4 and 30% in DY5.

Project Description:
The costs of serious mental illness (SMI) are $317 billion annually, or more than $1,000/year for every man, woman, and child in the U.S. The 2010 Community Health Assessment of Bexar County found that 32% of residents have no usual source of health care. For those who do, transportation issues and cost issues, including underinsurance, often lead to a delay in seeking care. Other barriers include a lack of knowledge of community services, lack of access to those services and a lack of localized services. According to a 2011 report by Capitol Healthcare Planning, a severe shortage of mental health providers in the area coupled with reduced availability of services for the most seriously ill have combined to overwhelm existing health care systems and leave the most vulnerable in our society with inadequate or no mental health care options. This situation has led to a dramatic increase in the use of emergency services by patients who have not been able to obtain timely appointments in community agencies or have no other place to go for help. Even when resources exist, mental health providers are frequently not available. To address these needs the Department of Psychiatry has developed a Transitional Care Clinic (TCC) designed to give patients rapid access to a prescriber upon hospital discharge or diversion from emergency departments (ED) and provide gap services and linkage to community services for a period of up to 90 days. The TCC also functions as a specialty training program in community psychiatry training residents and nurse practitioners with the goal of increasing the number of providers in the underserved South Texas area. However, in addition to medication, the patients coming out of emergency departments and psychiatric units need access to rapid wrap around care including prescription medications, specialized behavior therapies, psychosocial rehabilitation, skills training, transportation and case management. Those patients who are deemed "priority population" including those with psychosis and bipolar I disorders can eventually qualify for wrap-around services through the local mental health authority, but cannot qualify to receive these services until they have completed the required Texas assessment (TRAG). These patients are essentially "unfunded" until they can be assessed and assigned to a clinic which may take a number of months. They are left vulnerable to relapse and readmission in the critical days immediately following discharge/diversion. Many other patients with recent suicide attempts, severe anxiety or depression, are not priority population and will remain unfunded for services until a solution is found. The critical period post discharge or diversion is a period in which aggressive wrap around services can prevent deterioration and readmission.

The Transitional Care Clinic (TCC) began providing gap services including medication management, case management, skills training, and psychotherapy in an innovative inter professional setting on 4/2/12. Currently, there are over 200 active patients in the 90 day program funded by a private foundation grant. No federal money funds the TCC. The majority of patients have no health care benefits upon admission. The TCC provides comprehensive wrap around transitional services including; cognitive behavior therapy (a treatment focused on correcting errors in attribution and thinking in an effort to improve outcomes in depression, anxiety and psychosis); cognitive adaptation training (a home based treatment using environmental supports such as signs, alarms, checklists, pill containers to promote medication adherence and improve community functioning); family psychoeducation and care coordination (designed to link patients to appropriate options for care in the community for longer term follow up). Patients are connected for follow up at the Center for Health Care Services, FQHCs, the University Health System outpatient clinic, UTHSCSA psychiatry clinic, other MHMR clinic’s outside the county or private providers. A unique feature of this program is that it provides
interprofessional training in these evidence-based approaches for social workers, nurses, and
case workers to improve workforce development as well as community behavioral health
training for prescribing professionals—physicians, advance practice nurses and physician
assistants. Our Division of Schizophrenia and Related Disorders is a world-leader in developing
and testing EBPs for the SMI population. The TCC will provide critically needed services and
increase the number of providers trained in this model. The program will develop a referral
mechanism accessible on a secure internet site to be used by all local hospital emergency rooms
and inpatient psychiatric units in the Bexar county area, allowing for rapid assessment of need
and triage to most appropriate type of service. An Outreach Coordinator serves as a liaison
between referral sites and the TCC as well as from TCC to community resources. Evidence from
a pilot study with Superior Medicare found that our wrap around services cut hospitalizations for
frequent service utilizers in half and saved more than $20,000 per patient in 9 months. Wrap
around services immediately following hospital admission or emergency room contact, can
prevent a return to these costly services. In a community where 32% of the population has no
usual source of care and little knowledge of community resources, a program that provides
multiple EBPs and links individuals at their most vulnerable point to community resources will
assist in decreasing the "stacking" of behavioral health problems in emergency rooms and ease
access to emergency care for truly emergent patients.

Quality:

To achieve continuous quality improvement we shall assess the projects impact and make
adjustments as necessary using a PDSA approach. We will share best practice and lessons
learned, seize scaling opportunities to expand successful outcomes to broader populations, and
rapidly disseminate successful outcomes to other providers across Texas.

Region 6 goals:

This project achieves CMS’s Triple aim objectives of assuring patients receive high quality and
patient centered care, in the most cost effective way, improves the health care infrastructure to
better serve the Medicaid and uninsured residents of the counties we serve, further develops and
maintains a coordinated care delivery system and improves outcomes while containing costs.

Starting Point/Baseline:

Prior to 2012 no services of this type were available. Zero encounters were being made and zero
physicians, physician assistants, advance practice nurses, or social worker, psychology or case
coordination trainees were receiving training in EBPs for SMI at this location. At the University
Hospital, readmissions within 30 days for the same quarter in the year before the opening of the
TCC were 54 out of every 1000. Readmissions within 72 hours were 37 per 1000.

Rationale:

A program that is adaptable, aligned with patient needs and provides wrap around service and
EBPs within their community offers a unique opportunity to continually adapt practices to
improve health in a vulnerable and difficult to treat population. The project will allow expansion
of the TCC to serve greater numbers of patients in need. An issue identified in the 2010 Bexar
County Community Health Assessment, as well as every other assessment over the past 2
decades is the lack of mental health care workers and services for individuals in crisis. Creating
an inter-professional training clinic has the added advantage of addressing the severe shortage of mental health providers in the area. Trainees exposed to our rapid PDSA cycle learn to be more agile in responding to patient and community needs and are more likely to translate what they have learned to other work settings with similar populations, thereby addressing potential behavioral issues early on before they reach crisis proportions. Patients served, individuals trained and PPAs are clear, objective methods to measure the outcome. This project is already funded in a limited fashion through a Methodist Healthcare Ministries grant. Early experiences have allowed us to define new challenges and to better target this request to meet those challenges. In particular, issues of transportation, providing medication for indigent patients, creating a living data base of community resources, providing short term EBPs and ensuring linkage to community resources will be addressed.

Our community has defined crowding of emergency rooms by people seeking behavioral health treatment to be a major issue. Use of a scarce resource not only increases wait time for all patients, but also adversely effects patients with urgent medical needs that need emergency treatment. Deflecting access to care issues from emergency centers to a transitional program and decreasing readmissions to EDs due to inability to provide follow up care will directly impact this issue of “stacking” and address a major community concern.

At this time, the Local Mental Health Authority offers a wrap-around service to patients who present to their Crisis Care Clinic. That program has diverted these individuals from the emergency room. However, the CCC does not impact those who already use the emergency room as their access point to health care. In addition, patients utilizing CCC continue to utilize (and be referred by the CCC to) the emergency department whenever substance use or co-morbid medical conditions are involved. Currently there is no care coordination between the Emergency Department and referrals.

CN.1 Enhance quality by delivering care in the right setting
CN.4 Provide mental health services to at risk populations

**Related Category 3 Outcome Measure(s):**

Rehospitalization- Hospitalization is the single most costly intervention for individuals with behavioral health diagnoses and preventing readmission and ED diversions is a primary goal of the community. The TCC will achieve this goal by providing rapid access to care and multiple EBPs including medication management, Cognitive Adaptation Training, Cognitive Behavior Therapy, and Case coordination. Focusing on PPAs will allow rapid and evidence-based treatment in the community where individuals have maximal independence and costs of care are lower.

**Relationship to other Projects:**

This project will directly reinforce others that aim to support holistic patient care within the community. Other projects being submitted from our department will create a substance use disorder clinic and training program that will specifically address co-morbid substance use and mental health. Together, addressing these issues in the period of increased vulnerability a person experiences post hospitalization or post crisis, these projects will have a direct impact on recurrent hospitalization and emergency room visits leading to a decrease in the crowding and "stacking" of behavioral health patients in emergency departments.
Relationship to Other Performing Providers’ Projects in the RHP:

This project will directly reinforce others that aim to support holistic patient care and wellness within the community. Several other projects in the region plan to establish post-discharge support for behavioral health/substance abuse as well as developing innovation for provider training and capacity. These providers include the Center for Health Care Services and University Health System. The current project builds on a pre-existing grant that has already begun to realize both of those goals. As these providers already have a relationship, this would be an ideal nidus for a Learning Community to share what we have already learned and translate it to other areas of the RHP that have not submitted similar projects. Other projects being submitted from our department will create a substance use disorder clinic and training program that will specifically address the complicated issues of mental illness with co-morbid substance use. Together, addressing these issues in the period of increased vulnerability a person experiences post hospitalization or post crisis, these projects will have a direct impact on recurrent hospitalization and emergency room visits leading to a decrease in the crowding and "stacking" of behavioral health patients in emergency departments.

Plan for Learning Collaborative:

Following completion of the RHP Plan, University Health System will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which will identify participants, establish Learning Collaborative goals, develop a calendar of meetings, visits and or calls, develop a plan to communicate ideas, data and successes across the region and state, adopt metrics to measure success and may organize a learning event to share knowledge and best practices. We anticipate playing a large role in such a community as we have already faced some of the challenges related to connecting with and supporting individuals after a behavioral health crisis and ED or hospital visit.

Project Valuation:

Within the 5 years of this project, we will 1) deliver wrap-around services to at least 3600 individuals in the immediate post-discharge/diversion period with average number of wrap around visits=4 per individual prior to ensure connection with longer-term services in the community 2) develop, deploy and maintain a web-based system to be used by all referring hospitals and emergency departments. We expect 80% of all referrals to be web based, with an estimated 35 patients referred daily by the end of the waiver period. 3) Train over 40 providers in application EBPs for the seriously mentally ill using an inter-professional treatment model that is easily replicable throughout Texas. This project will not only impact access to care within Bexar County, but will train 10 providers yearly in an evidence based inter professional treatment model that is easily replicable throughout Texas. As described above, lack of knowledge of community programs and economic factors combine to foster use of high level services in emergency departments, particularly among those without access to general health care. Patients with severe mental illness who are seen and dismissed from emergency departments often lack ability to connect to social supports revisit the emergency department whenever a perceived need arises. Furthermore, care coordination after hospitalization is generally insufficient to ensure connection to community supports. Over the period of the waiver, at least 40 new providers will be trained to ensure that these needs are met in the community in a timely fashion to prevent emergency department visits. They, in turn can replicate this program in communities all over the region and the state.

An estimated 35 patients daily will ultimately be referred via the web based referral system
by the end of the waiver period. This immediate referral and initiation of care coordination to over 3600 patients will decrease re-hospitalization within 1 year for behavioral health issues by two-thirds over 4 years which not only represents a major cost savings, but also an increase in access to scarce hospital beds. Similarly, immediate referral will have a major impact on 72 hour behavioral health readmission to the emergency department.

Combined increase in capacity and rapidity of access to care after a crisis or hospitalization decompresses hospital and emergency services and spawns a shift from high acuity, expensive care to community based prevention and care. Re-hospitalization and emergency room revisit rates from Major Hinchman 2010 study yield the cost lack of care coordination between inpatient/ED and outpatient settings as well as of the delay in accessing care. This was coupled with the anticipated cost of developing and maintaining a web-based tool.

**Milestone 1,4,7,11:** Each new prescribing psychiatric APN and PA entering the community to provide services yearly will increase capacity by approximately 350 patients/caseload. This creates a decrease on the crisis and emergency services as well as decompressing the caseloads in primary care. Social workers and LPCs trained in EBP case-management practices for the seriously mentally ill will increase the availability of localized community based behavioral health services. This is the most difficult milestone to value as a many of these services are prevention based in agencies that are not strictly mental health, but work with families and youth. **Milestone 2,5,8, 12:** Re-hospitalization and emergency room revisit rates from Major Hinchman 2010 study yield the cost lack of care coordination between inpatient/ED and outpatient settings as well as of the delay in accessing care. This was coupled with the anticipated cost of developing and maintaining a web-based tool. **Milestone 3,6,9,13:** Valuation is estimated using the 2011 Community Assessment percentage of individuals in Bexar County who do not have a usual source of care and are presumed to visit crisis clinics or emergency rooms for behavioral healthcare needs including detox and other substance related issues and domestic crises. Improvement Milestone 10,14: Valuation is estimated based upon costs of a typical psychiatric admission ($8100) per stay.

Identifying Project and Provider Information:
Title: 2.2.1 Redesign the outpatient delivery system to coordinate care for patients with chronic disease: Expanding chronic care management in a safety net clinic
Unique RHP ID#: 085144601.2.4 – PASS 1
Performing Provider: University of Texas Health Science Center at San Antonio
Performing Provider TPI: 085144601

Project Summary:

Provider Description: The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. UTHSCSA clinics serve a large number of Medicaid and uninsured patients. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.

Intervention(s): The project will implement specific Chronic Care Model activities within the practice, including a comprehensive care management plan, adopting evidence-based protocols, implementing patient self-management plans for chronic conditions, nurse-care management and medical group visits.

Need for the project: The practice’s patient population has high levels of poorly controlled chronic diseases, including diabetes mellitus, hypertension, and others. Barriers to better performance include a patient population with severe socioeconomic disadvantage needing more support, combined with a delivery system that has not yet implemented a comprehensive care management plan for these patients. The Chronic Care Model is an evidence based mechanism for organizing effective care and improving outcomes.

Target population: The practice serves a largely Latino disadvantaged urban population, 50% of whom are uninsured patients receiving care through a county assistance plan, 15% on Medicaid, and 4% self pay. Chronic disease prevalence is high and control poor; for example diabetes prevalence in the patient panel is 35%, with 1 in 4 of those having glycosylated hemoglobin values greater than 9%.

Category 1 or 2 expected patient benefits: The project seeks to enroll 50 patients in medical group visits in Year 3, 75 in year 4 and 100 in Year 5. For the self-management plan, we expect to enroll 75 in Year 3, 150 in Year 4 and 250 in Year 5. For the care model and protocols, we plan to have 200 patients receive care under the model in Year 3, 400 in Year 4 and 600 in Year 5.

Category 3 outcomes: IT 1.10 The project seeks to reduce the proportion of adult patients with diabetes who have glycosylated hemoglobin >9%. Starting at a baseline of 25%, the goal is to reach 22.5% in Year 4 and 17.5% in Year 5.

Project Description:
The project goal is to implement patient management consistent with the Chronic Care Model (CCM) in a large safety net primary care practice. The practice serves a vulnerable patient population with high burdens of chronic disease and socioeconomic disadvantage. Although the practice has made recent progress in reconfiguring its systems (see below under “baseline”)

875 ★ RHP 6 Plan ★ March 8, 2013 UTHSCSA
limited resources have prevented the hiring of sufficient personnel with the right training to more fully implement elements of the CCM. Specifically, there has been a need for nurse care managers, medical assistants in numbers sufficient to allow for registry activities or delegation of standing orders, and community health workers (CHW) to help patients navigate the system and activate community health workers. As a result, patients do not have access to nurse care management, medical assistants remain fixed in traditional roles taking vital signs and rooming patients, and a small CHW pilot was just completed (the CHW component is described in a related project 2.9.2). But the practice still lacks evidence-based protocols for most chronic disease management (opioid management is an exception), does not assess its performance on population-based process or outcome metrics for outpatient care, and has little internal capacity for patient self-management support.

This project will address those challenges through a systematic process from comprehensive care planning, through hiring and training of necessary personnel, to implementation of specific CCM activities. The specific plans are as follows:

A practice improvement team with representation from practice leadership, physicians, mid-level practitioners, nurses, medical assistants, and front office will meet weekly to plan a comprehensive care management program. “Comprehensive” means considering all domains of the CCM including health system, delivery system design, information systems, decision support, patient self-management support, and mobilizing community resources. CCM training for new and existing staff will be developed from resources made available by the Robert Wood Johnson Foundation, the American Academy of Family Physicians, TEAMcare, Agency for Healthcare Research and Quality, and other sources.

A critical component of the project is the use of health system utilization and EHR data to identify patients for coordinated care management. This proactive risk assessment will focus resources on identifying patients with clinical parameters for hypertension and diabetes that are above recommended therapeutic goals, as well as patients with poor follow-up histories. Effort will be devoted in the first 2 project years to developing and testing these queries and reports.

To focus the team’s activities, members of the improvement team will develop evidence-based clinical protocols for the 2 most common DSRIP Category 3 diagnoses of chronic disease in our practice: type 2 diabetes mellitus and hypertension. The protocols will consider best practices for clinician management, disseminating guidelines, patient engagement, tracking outcomes, protocols for self-management support by a nurse care manager, care coordination, and connecting with community resources.

A self-management program based on the work of Lorig (Ann Beh Med 2003;26:1) and others will be created from available resources, with special attention to approaches appropriate for our patients’ culture and health literacy (Lorig et al, Nurs Res 2003;52:361). In addition, we will conduct group medical visits. Our implementation of this concept will assemble high-risk patients (identified by no or inconsistent visits for chronic care, poor control of diabetes or hypertension, sentinel health events such as hospitalization or ER visits for the two conditions, or nomination by clinicians) for structured interactions with a team including physicians, nurses, care-manager, pharmacist, social worker, and community health worker. Multidisciplinary assessment in this setting allows the team to efficiently evaluate patients’ needs while
coordinating efforts across disciplines.

Additional personnel to be hired for this project include:
Year 1 – Nurse Care Manager
Year 2 – 1 additional Nurse Care Manager; 3 additional Medical Assistants
Year 3 – 1 additional Medical Assistant

We will address all 5 required core project components under Project 2.2.1:
a) We will design and implement care teams that are tailored to the patient’s health care needs, including non-physician health professionals, such as pharmacists doing medication care managers providing care outside of the clinic setting via phone, email, and home visits; and navigators (in the linked project) helping patients successfully engage with the health care system.
b) Ensure that patients can access their care teams in person or by phone or email. We are now tracking appointment access time and have developed protocols for telephone access and monitoring of call line performance.
c) Increase patient engagement. The project addresses patient education, group visits, self-management support, improved patient-provider communication techniques, and coordination with community resources.
d) Through self-management education by the nurse care manager (and community health workers in the linked project) we will create mechanisms to empower patients to make lifestyle changes to stay healthy and self-manage their chronic conditions.
e) Quality improvement for project is built in with specific performance goals specifying methods such as rapid cycle improvement.

The expected major 5-year outcome for this project is improved care processes for diabetes, better disease control, and improved health outcomes, measured by reductions in patients with uncontrolled hyperglycemia (HbA1c >9%).

Region 6 RHP Goal:
To achieve continuous quality improvement we shall assess the project’s impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

Quality:
This project achieves CMS’s Triple aim objectives of assuring patients receive high quality and patient centered care, in the most cost effective way, improves the health care infrastructure to better serve the Medicaid and uninsured residents of the counties we serve, further develops and maintains a coordinated care delivery system and improves outcomes while containing costs.
Starting Point/Baseline:

Our Family Health Center clinic cares for approximately 17,000 unduplicated patients (2010-11 data) over a two-year period, the majority (75%) of which are enrolled in Bexar County's CareLink program for uninsured residents or Medicaid/dual eligible. In the past 5 years, the FHC has successfully implemented a number of practice improvements, including open access for children and improved access for adults; improvements in telephone and refill systems, and small CCM pilots under HRSA training grants. An important initial condition for project success is that senior management is heavily committed to and engaged in practice improvement. The department Chair, the Vice Chair for Clinical Services, and the practice Medical Director actively participate on the improvement team.

However, limited resources have prevented the hiring of sufficient personnel with the right training to more fully implement elements of the CCM. Specifically, there has been a need for nurse care managers, medical assistants in numbers sufficient to allow for registry activities or delegation of standing orders, and community health workers (CHW) to help patients navigate the system and activate community health workers. As a result, patients do not have access to nurse care management, medical assistants remain fixed in traditional roles taking vital signs and rooming patients, and a small CHW pilot was just completed (the CHW component is described in a related project). But the practice still lacks evidence-based protocols for most chronic disease management (opioid management is an exception), does not assess its performance on population-based process or outcome metrics for outpatient care, and has little internal capacity for patient self-management support.

Our baseline for glycosylated hemoglobin (HbA1c) values >9% for patients with at least one measurement in the calendar year is 25%.

Rationale:

As noted in the 2010 Community Health Assessment, Bexar County, and especially its poor and underserved minority residents, face high rates of common chronic diseases such as diabetes, hypertension, cardiovascular disease, obesity, and cancer. Specifically, Bexar County, TX had a diabetes prevalence among adults >18 y/o of 13.5% in 2006-07; the median among other communities sampled by the Behavioral Risk Factor Surveillance System was 7.6% (MMWR Surveillance Summaries September 24, 2010 / 59(SS08):1-37). In that same dataset the proportion of Bexar County respondents with diabetes mellitus who reported at least 2 glycosylated hemoglobin measurements in the past year was 65.5% vs. 66.3% as the nationwide median. For hypertension, the Bexar County adult prevalence in 2007 was 28.1% with a U.S. county median of 27.4% (MMWR Surveillance Summaries February 5, 2010 / Vol. 59 / No. SS-1). Providing effective chronic care management to this population will improve the quality and effectiveness of care, leading to reductions in preventable morbidity and mortality.

This project specifically addresses the “poor health care quality” and “high rates of chronic disease” indicators listed in the community needs document.

The rationale for our overall approach using the CCM as a guide is supported by ample evidence that the CCM is an effective framework for primary care interventions (Bodenheimer et al, JAMA 2002 Pt.2). Yet outcome improvements do not necessarily follow process improvements based on the CCM (Chin et al, Diabetes Care 2004; Landon et al, NEJM 2007). Several analyses
of the reason for this dissociation have concluded that successful interventions are more likely to have addressed multiple CCM domains, in particular both professional performance and its organizational context (Renders et al, Diabetes Care 2001; Coleman et al Health Affairs 2009). Therefore in this project we seek to significantly alter the organizational context, aiming for a system centered on multidisciplinary collaboration and proactive population management.

The rationale for selecting the milestones began with the premise that comprehensive care management planning was necessary to address all aspects of the chronic care model in a setting where such comprehensive assessment has never occurred. We will accomplish this through carefully planning a CCM approach at the project’s start, using a collaborative, inclusive process that involves all job titles in our center. The working plan will specify new roles, collaborations, and team-based accountability for process and improvement milestones. This initial work is essential to achieving the critical CCM component of health care organization that is built on a foundation of leadership and staff engagement (Bodenheimer et al, JAMA 2002 Pt.1). Delivery system design is addressed through reducing reliance on physicians for certain tasks such as standing orders in prevention/chronic disease management – these will be assumed by MA’s – while adding new roles such as nurse care managers and community health workers who can assist with supporting patient self-management and linkage to community resources and partners. Decision support will be built in by creating evidence-based protocols for stepped management of diabetes and hypertension, while information systems will provide essential feedback on performance.

The process milestones below were selected to create a logical flow from planning, to developing an overall CCM approach, to developing specific elements supporting the CCM Hroscikoski et al, Ann Fam Med 2006;4:317). The Category 2 milestones focus on program development, staff training, and ongoing improvement, while specifying the number of patients who will receive care under the different CCM components.

We are not aware of any projects at UTHSCSA funded by the U.S. Dept. of Health and Human Services that serve a similar purpose to this proposed project.

CN. 2 Project meets need for improved management of patients with chronic conditions

Related Category 3 Outcome Measure(s):

The selected Category 3 outcome milestones address process and improvement milestones. The process milestones set specific goals for planning, testing data systems, and establishing baseline rates that will support the improvement milestones.

We specify two improvement milestones:

IT 1.10 HbA1c poor control (>9%). We chose this milestone because our system-wide assessments reveal that the prevalence of poor diabetes control is high in our population. For example, in the year from mid-2010 to mid-2011, 4,867 of 17,705 patients (27.5%) with a measured HbA1c had values over 9%. The proportion for patients having more than one reading
was 24.5%. Also, there are persistent disparities in control of diabetes by socioeconomic status and race/ethnicity (McWilliams et al, Ann Int Med 2009;150:505) that require special attention to the needs of vulnerable populations.

Relationship to other Projects:
This project relates to “Community health worker program to address health and social needs in a vulnerable population.” (Unique RHP ID#:08514460-2.9.2). The projects are mutually supportive. The proactive assessment of the patient panel employed in this project will identify high-morbidity patients likely to benefit from health system navigation and enhanced connections to community resources.

Relationship to Other Performing Providers’ Projects in the RHP:
Other providers and projects with the same project area:
CHOSA – 2.2 - Asthma Program.
University Health System – 2.2 – Expand chronic care models.

Plan for Learning Collaborative:
Following completion of the RHP Plan, University Health System will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include the following:
- Identify participants
- Establish Learning Collaborative goals
- Develop a calendar of regular meetings, site visits, and/or conference calls
- Develop a plan to communicate ideas, data, and successes across the region and state
- Organize a learning event and invite experts and other Performing Providers from outside the region to share knowledge and best practices
- Adopt metrics to measure success

University Health System will seek to provide facilitation and administrative assistance as needed to ensure the success of these endeavors. The RHP 6 website will be available to the Learning Collaboratives to network and share ideas, challenges, and success stories with colleagues. RHP 6 hopes to make significant transformational progress on its project milestones to achieve waiver goals and share what we learn with the rest of the State.

Project Valuation:
Achieves waiver goals: The project directly addresses waiver goals, with its Triple Aim objectives, improvement of health care infrastructure at a safety net clinic where more than 75% of patients are uninsured or on Medicaid. The CCM approach will created a coordinated care system that is consistent with other models for which there is strong evidence of improved outcomes while reducing costs 10-30% (Nielsen, PCPCC 2012; Grumbach, PCPCC 2010).

Addresses community needs: The project directly addresses the high prevalence of poorly controlled diabetes and other chronic diseases in the community. Impact on better disease control should be significant, [Nielsen:2012wt] though public health approaches are necessary to reduce
incidence of common chronic diseases.

Project Scope – the project is implemented in a safety net clinic with 17,000 unduplicated patients seen over a two-year period. The panel has a high prevalence of diabetes with many patients not meeting standards for control.

Project Investment - The expected investment in human resources and time to implement is relatively small. Capital investments are minimal. Gaining experience with implementations of the chronic care model and population management in primary care is important for University Health System in the era of Accountable Care Organizations.

### Identifying Project and Provider Information:

| Title: | 2.9.2 Implement other evidence based project to establish a patient care navigation program in an innovative manner: Community health worker program to address health and social needs in a vulnerable population |
| Unique RHP ID#: | 085144601.2.5 – PASS 1 |
| Performing Provider: | University of Texas Health Science Center at San Antonio |
| Performing Provider TPI: | 085144601 |

### Project Summary:

**Provider Description:** The University of Texas Health Science Center at San Antonio (UTHSCSA) serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. UTHSCSA clinics serve a large number of Medicaid and uninsured patients. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.

**Intervention(s):** The project will implement a patient navigator program linked to a primary care safety net clinic to improve diabetes outcomes. Community health workers will engage high-risk patients, identified by glycosylated hemoglobin values greater than 9%, through home and community-based interventions to address barriers to successful interaction with the health system and self-management.

**Need for the project:** The region has a prevalence of diabetes well above the national average. The practice’s patient population has high levels of poorly controlled diabetes mellitus. Barriers to better control include patients’ difficulty navigating a complex health system, difficulty adhering to treatment because of low healthy literacy, and social stresses in the home and community that impede clinical success. Patient navigation is an evidence-based mechanism to help disadvantaged minority communities successfully engage in the health system as well as to promote health in patients’ community settings.

**Target population:** The practice serves a largely Latino disadvantaged urban population, 50% of whom are uninsured patients receiving care through a county assistance plan, 15% on Medicaid, and 4% self pay. Diabetes prevalence in the patient panel is 30%, with 1 in 4 of those having glycosylated hemoglobin values greater than 9%.

**Category 1 or 2 expected patient benefits:** The project seeks to document 120 unique patients with community health worker visits in Year 3, 360 in Year 4, and 360 in Year 5 for a cumulative total of 840 high-risk patients reached over the three years. A secondary goal is to reduce emergency room visits and hospital admissions for patients seen by the CHWs.

**Category 3 outcomes:** IT 1.10 The project seeks to reduce the proportion of adult patients with diabetes who have glycosylated hemoglobin >9%. Starting at a baseline of 25%, the goal is to reach 22.5% in Year 4 and 17.5% in Year 5.
Project Description:
The goal of this project is to implement a patient navigator program linked to a primary care safety net clinic to improve diabetes outcomes. The practice serves a vulnerable patient population with high burdens of chronic disease and socioeconomic disadvantage. In this setting, where social determinants of health create high barriers to successful patient self-management, CHWs are trusted natural helpers who enhance their community’s wellbeing by responding to problematic situations. They also understand how people make decisions in real life, and they act as brokers between health professionals and their patients. CHWs role in this project will encompass a set of the following core functions in community-based development of basic skills necessary to produce health. We have developed training and practice models for these core functions in two pilot projects, now completed, funded by our county health system (Ferrer et al, J Am Board Fam Med, 2013 in press).

a. Promoting healing relationships with the health care team, meaning that CHW will assist patients in navigating health care visits and procedures, assess patients sense-making of messages from health care providers and counsel patients on effective communication and agenda-setting for clinical visits.

b. Reinforcing clinical messages as directed by the clinical team, promoting adherence with prescribed therapies.

c. Problem solving for family, social, and economic issues that may impede clinical success.

d. RN-Care Manager and CHW will coordinate their plans in twice-monthly discussions of patients in active management. The RN-CM and CHW interaction is intended to optimize problem solving for 5 cross-cutting issues in chronic disease management: healthy lifestyles, treatment adherence, behavioral illness, literacy/health literacy, and socio-environmental factors.

e. CHWs will teach community-based health education sessions, in areas where there are concentrations of high-risk patients. We have recently begun geocoding our patient addresses to identify such concentrations.

f. CHWs will promote connections with community resources relevant to patients’ needs. In our pilot project, CHWs have been creating asset maps in their communities.

The project option selected is 2.9.2, “implement other evidence-based project to establish/expand a patient care navigation program in an innovative manner.” Our use of CHWs focuses on employing them to enhance not just access to care but also to extend the primary care team into patients’ homes and communities to improve chronic disease management for vulnerable patients.

The CHWs we will employ will have been certified as community health workers through a recognized training program. The skill level we are targeting is trained peer educators from the neighborhoods where our patient population resides.

The project plan includes hiring and training 6 FTE CHWs in year one and an additional 6 FTE in year two. We have developed training curricula and materials in our pilot project. Subsequently, the CHW services will be deployed using EHR data that identifies patients with poor diabetes control (A1c>9%). Additional triggering events will include hospitalizations and emergency room visits for diabetes, poor attendance at primary care visits for diabetes follow-up. Clinicians will also be able to make referrals to CHWs when they suspect social issues are creating important barriers to successful medical management.
CHWs will meet weekly with our project improvement team to develop systems linking them closely with other team members in our chronic care model. Based on their interactions with patients, CHWs will be able to activate nurse care managers, pharmacists, or physicians if they observe specific needs during patient home assessments. In return, those healthcare professionals will be able to request that the CHWs make specific observations of adherence to care, medication use, and self-management strategies in the home environment. These meetings will also promote QI for the CHW program, as participants create, plan, and review short-cycle tests of proposed improvements.

CHW services will be tracked through structured reports of CHW activities. To help guide their work with a patient-centered focus, CHWs will assess patients’ goals related to functional status and track their progress. They will also record specific process measures such as healthcare visits facilitated, appointments made, community resource referrals, and assistance with maintaining health care coverage.

In addition to examining CHWs’ program records, we will be tracking outcomes by examining monthly reports of glycemic control, emergency department and hospital admissions for our practice cohort.

The expected 5-year outcome is a community-based CHW project that effectively links vulnerable patients to health care while also addressing patients’ social needs in the context of family and community. These processes will lead to improved control of diabetes as measured by HbA1c levels. Improved diabetes control is expected to reduce diabetes complications, improve quality of life, and decrease health care costs.

Region 6 RHP Goal:

To achieve continuous quality improvement we shall assess the projects impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

Quality:

This project achieves CMS’s Triple aim objectives of assuring patients receive high quality and patient centered care, in the most cost effective way, improves the health care infrastructure to better serve the Medicaid and uninsured residents of the counties we serve, further develops and maintains a coordinated care delivery system and improves outcomes while containing costs.

Starting Point/Baseline:

Our Family Health Center clinic cares for approximately 17,000 unduplicated patients (2010-11 data) over a two-year period, the majority (75%) of which are enrolled in Bexar County's CareLink program for uninsured residents or Medicaid/dual eligible.

A small pilot from 2/1/12 to 1/31/13 of community health workers visiting high-utilizing socially vulnerable patients has just ended, funded by the Bexar County Hospital district. At the time of writing, approximately 60 patients were being followed by CHWs. The pilot was targeted at high-utilizers, regardless of diagnosis, and thus differs in targeting and scope from the proposed
Our baseline for glycosylated hemoglobin (HbA1c) values >9% for patients with at least one measurement in the calendar year is 25%. At present, a report like this can be generated only as a “one-off” so we will need to develop a monthly reporting system during our first project year.

Our baseline for emergency room visits and hospitalizations among our patient cohort with diabetes and HbA1c>9% will be determined in year 1 of the project.

**Rationale:**

As noted in the 2010 Community Health Assessment, Bexar County, and especially its poor and underserved minority residents, face high rates of common chronic diseases such as diabetes, hypertension, cardiovascular disease, obesity, and cancer. Specifically, Bexar County, TX had a diabetes prevalence among adults >18 y/o of 13.5% in 2006-07; the median among other communities sampled by the Behavioral Risk Factor Surveillance System was 7.6% (MMWR Surveillance Summaries September 24, 2010 / 59(SS08);1-37). In that same dataset the proportion of respondents with diabetes mellitus who reported at least 2 glycosylated hemoglobin measurements in the past year was 65.5% vs. 66.3% as the nationwide median.

Our Category 3 improvement target and valuation is based on the following considerations: there is strong evidence that moving patients from poor to fair or good glycemic control (a) reduces diabetes complications such as coronary disease, stroke, and renal failure; (b) decreases hospitalizations, and health care costs, and (c) improves patients’ quality of life. This evidence is briefly summarized and quantified below.

In recent years, data from UKPDS and other studies have led to a reconsideration of the utility and safety of aggressive glucose targets in type 2 diabetes. Our goal in this project is therefore to reduce the prevalence of markedly abnormal glycemic control, which we define as HBA1c >9%. Ample evidence documents the micro- and macro-vascular morbidity associated with uncontrolled diabetes. For example, persons with diabetes in a community-based cohort study (Atherosclerotic Risk in Communities) in the highest HbA1c quintile (A1c>8.2%) had a 2.8 fold increased risk of coronary heart disease events (on a baseline of 14.4%) compared with those in the lowest quintile (Selvin et al, Arch Int Med 2005). In a secondary analysis of data from the HOPE study, a randomized drug trial, a 1% rise in the HbA1c level was associated with a 7% increase in the risk of cardiovascular events, a 20% increase in the risk of hospitalization for heart failure, a 12% increase in total mortality risk, and a 26% increase in risk of overt nephropathy. Risks increased nonlinearly, with steeper increases in patients in the top 2 deciles of A1c (A1c >8.9%)(Gerstein, Diabetologia 2005). An observational study from the Fallon Clinic showed poor glycemic control (A1c >10%) was associated with a high risk of hospitalization -- 31 per 100 per year, twice that of patients with fair control (A1c 8-10%). Mean adjusted hospital charges were also twice as high ($3040 vs. $1380/year; in 1998 dollars) (Menzin et al, Diabetes Care 2001). A larger follow-up study from 2010 in the same system confirmed the findings: annual costs for diabetes-related hospitalizations were $3278 with HbA1c of 7-8%, $4029 at 8-9%, $4963 at 9-10%, and $6759 when the A1c exceeded 10% (Menzin et al, J Managed Care Pharm 2010). And the Group Health Cooperative of Puget Sound, found that reductions in HbA1c from a mean of 10% were associated with annual savings of $680-950 (in 1997 dollars). (Wagner et al, JAMA 2001).
Improved glycemic control also improves quality of life. A randomized trial of intensified glycemic control (from mean HbA1c of 9.3% to 7.5%) examining patients’ functional outcomes, such as quality of life, work participation, bed-days, and restricted activity days, demonstrated substantial improvements in a wide range of QOL and activity measures (Testa, JAMA 2008).

The evidence base supporting this CHW intervention derives from a variety of CCM interventions that are being adapted for low-income populations (e.g. Epping-Jordan et al, Qual Saf Health Care 2004;13:299–305; Lorig et al, Nurs Res 2003;52:361). In many of these models, CHWs collaborate closely with nurse care managers to deliver assessment and education in the home setting when patients have barriers limiting travel to the health center.

In this project the CHW role encompasses 3 models of care defined in the Community Health Worker National Workforce Study (HRSA 2007): member of care delivery team, navigator, and organizer. These models, which the report noted were not mutually exclusive, consist of working under the direction of clinicians (physicians or nurses), helping patients navigate complex health systems, and working in communities to promote self-directed change and community development (HRSA 2007).

Providing community health worker navigation to this population will enhance patients’ connections to effective care, help identify and address obstacles to self-management in the home and community environment, and provide important feedback loops with clinicians about patients’ understanding and adherence to disease management. It will enhance the quality and effectiveness of care, leading to improvements in clinical outcomes. (Brownstein et al, J Ambul Care Mgmt 2011;34:210; Balcazar et al, Prev Chron Dis;2010;7:1; Brownstein et al, Am J Prev Med 2007;32:435; Gabbay et al, Jt Comm J on Qual Pt Safety 2011).

This project specifically addresses the “high rates of chronic disease” indicators listed in the community needs document. It also addresses disparities due to socioeconomic status.

The process milestones for CHW’s unique patients served were estimated at follows. Our CHW model calls for assessments and teaching in the patients’ homes so as to provide data on contextual influences such as neighborhood setting for diet and physical activity, or family situations that interfere with self-management. We therefore estimate each CHW will make 1 visit per ½ day or 8 visits per week (with 1 day/week for meeting with clinical team and QI activities) x 45 wks (3 weeks of training/year and 2 weeks vacation) or 360 visits per year per FTE. Conservatively estimating 6 visits per year per unique patient to allow for both assessment and self-management training, each CHW FTE will manage 60 unique patients per year. We allow for 50% capacity in the first year after hire. With 6 CHW hired in year 1 and 6 additional CHW hired in year 2, the target numbers for unique patients served in years 3/4/5 are thus 180/540/720.

The process milestones for community-based classes were based on data we developed this year showing that 6 ZIP codes around our health center contain many of our high-risk, high utilizing patients. Holding 12 classes in a year will therefore allow us to reach each of those ZIP codes twice. Expanding to 18 classes will permit outreach in an additional 3 ZIP codes.

We are not aware of any projects at UTHSCSA funded by the U.S. Dept. of Health and Human
Services that serve a similar purpose to this proposed project.

CN.2 This project meets the community need for improved management of Diabetes.

### Related Category 3 Outcome Measure(s):

We will hire and train 6 FTE promotoras in disease self-management (using the Lorig self-management curriculum in each of the first 2 project years; we have certified trainers on staff) and other elements of the chronic care model, map community assets relevant to chronic disease management.

The selected Category 3 outcome measure is IT 1.10 HbA1c poor control (>9%). We chose this measure because our system-wide assessments reveal that the prevalence of poor diabetes control is high in our population. For example, in the year from mid-2010 to mid-2011, 4,867 of 17,705 patients (27.5%) with a measured HbA1c had values over 9%. The proportion for patients having more than one reading was 24.5%. Also, there are persistent disparities in control of diabetes by socioeconomic status and race/ethnicity (McWilliams et al, Ann Int Med 2009;150:505) that require special attention to the needs of vulnerable populations. In our low-income population with poor health care access, we anticipate that improved connections through community health workers to effective care and self-management support will decrease the proportion of patients with poorly controlled diabetes (Balcazar et al, Prev Chron Dis 2009;6:1). The other rationale for this measure is that poorly controlled diabetes mellitus creates high risk for the complications (myocardial infarction, stroke, nephropathy, blindness) that account for the human suffering and high costs of this disease (Elly et al, Diab Med 2008). Please see the data reviewed in “Rationale” above for details.

The targets for IT-1.10 are as follows: The achievable change in % of patients with HbA1c >9% is determined by three factors: (a) how many practice patients have HbA1c >9%, (b) of those, how many we can reach with our program’s capacity, and (c) how many of those reached achieve HbA1c <9%. Beginning with a baseline rate of 25% of patients with diabetes having A1c > 9%, our goal is to reach 22.5% by DY4 and 17.5% by DY5. Our justification for these targets is as follows. We estimate 3600 patients with diabetes in our practice, of whom ¼ or 900 will have A1c >9%. With 540 of those patients reached in DY4 (Category 2 milestone) and a 25% success rate in reducing A1c below 9, we will reach our goal of 22.5%. With an additional 720 patients reached by CHWs (Category 2 Milestone) in DY5, and continued work with the DY4 patient cohort, we expect to reach our DY5 goal of 17.5% with A1c>9.

### Relationship to other Projects:

This project relates to “Expanding chronic care management in a safety net clinic” (Unique RHP ID#: 085144601.2.4). The projects are mutually supportive. The community health worker activities in this project will extend the clinic’s capacity to reach patients in their home and community settings, enhancing the clinical team’s understanding of contextual obstacles to clinical success. Community health workers will work closely with nurse care managers to reinforce self-management support and troubleshoot stumbling blocks.
**Relationship to Other Performing Providers’ Projects in the RHP:**

Bluebonnet Trails – 2.9 – Patient navigator for persons with chronic illness.
University Health System – 2.9 – Patient care navigation program.

**Plan for Learning Collaborative:**

Following completion of the RHP Plan, University Health System will facilitate the formation of working groups of performing providers who are pursuing similar projects. These working groups will develop their learning collaborative structure which may include the following:

- Identify participants
- Establish Learning Collaborative goals
- Develop a calendar of regular meetings, site visits, and/or conference calls
- Develop a plan to communicate ideas, data, and successes across the region and state
- Organize a learning event and invite experts and other Performing Providers from outside the region to share knowledge and best practices
- Adopt metrics to measure success

University Health System will seek to provide facilitation and administrative assistance as needed to ensure the success of these endeavors. The RHP 6 website will be available to the Learning Collaboratives to network and share ideas, challenges, and success stories with colleagues. RHP 6 hopes to make significant transformational progress on its project milestones to achieve waiver goals and share what we learn with the rest of the State.

**Project Valuation:**

Achieves waiver goals - The project directly addresses waiver goals, with its objectives to improve care access and address barriers to self-management at a safety net clinic where 75% of patients are uninsured or on Medicaid. It addresses the triple aim of improved outcomes, lower costs and improved patient experience; it provides a mechanism to reduce health disparities for a socioeconomically disadvantaged population through culturally appropriate, patient-centered approaches augmented by community-based interventions.

Addresses community needs – Better management of diabetes mellitus is an identified community health priority. The project directly addresses social and contextual influences on poorly controlled chronic diseases at the patient level, but the project also addresses community based education by using CHWs, who are accustomed to assuming this role. Embedding some project activities in community settings will not only reach out to those who have difficulty accessing clinical resources, but will also promote self-management education to a larger at-risk population.

Project Scope – The project is implemented in a safety net clinic with 17,000 unduplicated patients seen over a two-year period. The prevalence of diabetes mellitus among adults in our practice is 30%

Project Investment – Implementing this project will require additional investment in community health workers for the work described. Although they are relatively low-cost health workers, their high load of community-based work means that they can manage fewer visits than a doctor or nurse in a fixed location. In addition, because this work differs in some respects from the work that CHWs are accustomed to, additional training is required for new hires, as well as a ramp-up period as they learn to work with clinical teams.

### Milestone 10

**P-4** Increase patient engagement through patient education and coordination with community resources.
- **Metric P-4.1:** Number of classes offered.
- **Baseline:** 0 classes.
- **Measure:** Hold 6 community-based classes in self-management targeted in communities with concentrations of high-risk patients.
- **Data source:** Program records.

**Milestone 10** Estimated Incentive Payment: $159,294.33

### Milestone 11

**P-4** Increase patient engagement through patient education and coordination with community resources.
- **Metric P-4.1:** Number of classes offered.
- **Baseline:** 0 classes.
- **Measure:** Hold 6 community-based classes in self-management targeted in communities with concentrations of high-risk patients.
- **Data source:** Program records.

**Milestone 11** Estimated Incentive Payment: $159,294.33

### Milestone 12

**P-4** Increase patient engagement through patient education and coordination with community resources.
- **Metric P-4.1:** Number of classes offered.
- **Baseline:** 0 classes.
- **Measure:** Hold 6 community-based classes in self-management targeted in communities with concentrations of high-risk patients.
- **Data source:** Program records.

**Milestone 12** Estimated Incentive Payment: $159,294.33

### Milestone 13

**I-7.** Reduce number of ED visits and avoidable hospitalizations for patients enrolled in the navigator program
- **Metric I-7.1:** ED visits and avoidable hospitalizations
- **Numerator:** Number of patients enrolled in the navigator program who have had an ED visit or an inpatient admission in the year after enrollment.
- **Denominator:** Total number of patients enrolled in the program.

**Milestone 13** Estimated Incentive Payment: $153,907.67
Metric 1: P-11.1: Written guidelines for CHW collaborations with primary care team. Data source: Program documents. Rationale: Integrating CHWs closely with the clinical team will be necessary for effective collaboration and achieving patient benefit.

Milestone 4 Estimated Incentive Payment: $101,700

Milestone 7 Estimated Incentive Payment: $148,905.67

Denominator: Total number of patients enrolled in the navigator program. Baseline: To be determined from data in year prior to project initiation. Goal: 5% relative reduction in ED and avoidable hospitalization rate for enrolled patients. Data Source: EHR, navigation program database.

Milestone 10 estimated incentive payment: $159,294.33

Milestone 13 estimated incentive payment: $153,907.67

Year 2 Estimated Milestone Bundle Amount: $406,800

Year 3 Estimated Milestone Bundle Amount: $446,717

Year 4 Estimated Milestone Bundle Amount: $477,883

Year 5 Estimated Milestone Bundle Amount: $461,723

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $1,793,123**
Identifying Project and Provider Information:

**Title:** 2.13.2 Implement other evidence based project to provide intervention for a targeted behavioral health population to prevent unnecessary use of services. (Transdermal Alcohol Monitoring Intervention to Reduce Drunk Driving, Lower Incarceration Costs, and Prevent Recidivism)
**Unique RHP ID#:** 085144601.2.6 – PASS 2
**Performing Provider:** University of Texas Health Science Center San Antonio
**Performing Provider TPI:** 085144601

Project Summary:

**Provider Description:** The University of Texas Health Science Center at San Antonio serves San Antonio and the 50,000 square-mile area of South Texas. It extends to campuses in the metropolitan border communities of Laredo and the Rio Grande Valley. More than 3,000 students a year train in an environment that involves more than 100 affiliated hospitals, clinics and health care facilities in South Texas.

**Intervention(s):** Novel treatment program designed to reduce recidivism for alcohol-related driving offenses.

**Need for the project:** Alcohol is a pervasive problem in Texas, and our state has the 2nd highest number of alcohol-related driving offenses in the nation. Locally, in Bexar County, the number of DWI arrests have risen by 33% in recent years, and it ranks 3rd in Texas (behind Dallas and Harris counties) in terms of driving fatalities. Even more concerning is the fact that it is estimated that 50-75% of convicted drunk drivers continue to drive on a suspended license, indicating that existing legal remedies themselves lack sufficient impact on this costly problem.

**Target population:** Legally indigent adults convicted of alcohol-related driving offenses.

**Category 1 or 2 expected patient benefits:** We propose treating 650 offenders in this pilot program.

**Category 3 outcome:** Decrease recidivism rates for alcohol-related driving offenses by 25% to 50% compared to probation.

Project Description:

The overall goal is to develop and implement a novel program for managing individuals charged with alcohol-related driving offenses, which will provide the judicial system with a cost-effective alternative to jail and reduce rates of recidivism among offenders. This project is designed to address the Improvement Target IT-9.1 *Decrease in mental health admissions and readmissions to criminal justice settings such as jails or prisons.* Legally indigent adults arrested for alcohol involved driving offenses will be offered treatment. This treatment involves a novel technology that will allow us to continuously monitor alcohol use. Information from this monitoring technology is used by clinicians to guide each individuals treatment, using contingency management and motivational interviewing to help them reduce alcohol use. A target of 650 patients was chosen because it is what our clinic can accommodate in 4 years and this is sufficient to demonstrate the efficacy and feasibility of the program. At the conclusion of this program, our intention is that this model program will be adopted across the state as a cost of...
effective means to reduce alcohol driving offenses.

Quality:
To achieve continuous quality improvement we shall assess the projects impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

Region 6 goals:
This project addresses the RHP 6 goal of "improving outcomes while containing costs." Reduced recidivism in alcohol driving offenses is the improved outcome. The costs savings comes from: reduction in court costs generated by recidivism; providing an alternative to incarceration and its associated costs; and the cost associated with loss of life, injury, and property damage as a result of alcohol-related motor vehicle accidents.

Starting Point/Baseline:
We propose enrolling 650 offenders in this pilot program. This is a new intervention, no clients or providers have previously experienced this kind of intervention. At the conclusion of the 5-years this model could be adopted by drug courts state-wide.

Rationale:
The project was chosen because Texas consistently ranks at the top of US DWI fatalities and recidivism. Currently legally indigent individuals with alcohol problems do not have access to treatment and instead the state bears the cost of alcohol misuse through the legal system. This project use a novel technology to continuously monitor for alcohol consumption and information from this monitoring is used in treatment to facilitate reduction in alcohol misuse. Besides being responsive to the IT-9.1, there are several clinically significant reasons to target the legal system for treatment to reduce alcohol misuse: (1) DUI arrests are objective method for identifying individuals who are experiencing impairment from alcohol misuse and an objective method to quantify treatment success (i.e. lack of recidivism); and (2) contact with the legal system is a time when those who misuse alcohol are more likely to consider reducing their drinking.

CN.4 Meets need for high quality behavioral health services that is integrated with physical health services.

Related Category 3 Outcome Measure(s):
Data supporting RHP priority. This proposal addresses needs identified in the 2010 Community Health Assessment for Bexar County; it addresses Lifestyle Behaviors (Alcohol Consumption). Alcohol is a pervasive problem in Texas, and our state has the 2nd highest number of alcohol-related driving offenses in the nation. Current judicial approaches to curb these offenses are costly; an estimated cost to the state is $5.9 billion dollars. A full 10% of the Texas state budget is for incarceration. More locally, in Bexar County, the number of DWI arrests have risen by 33% in recent years, and it ranks 3rd in Texas (behind Dallas and Harris counties) in terms of driving fatalities. More problematic is the fact that it is estimated that 50-75% of convicted drunk drivers continue to drive on a suspended license; this fact underscores the need for treatment programs that work in conjunction with existing procedures. It has been estimated that treatment of individuals that have been convicted of alcohol and/or drug offenses...
costs only 1/4th as much as the alternative, incarceration. For every dollar spent on treatment, there is an estimated return of $8.87 to the state. These statistics, when taken together, indicate the existing legal remedies themselves lack sufficient impact on this costly problem.

**Improved Health.** Current methods for managing alcohol offenses result in a very high rate of recidivism and indigent do not have access to monitored care offered by this proposal.

**Relationship to other Projects:**
This is the only intervention study to reduce alcohol related driving offenses and recidivism.

**Relationship to Other Performing Providers’ Projects in the RHP:**
No other performing providers are proposing similar projects.

**Plan for Learning Collaborative:**
Goals of the project include dissemination of findings of a manualized system for courts to use transdermal alcohol monitoring to enhance probation management and reduce recidivism of alcohol related offenses (Goal 3 of the plan).

**Project Valuation:**
While there could be a wide range of parameters used to estimate the value of this program, if you consider only three factors, the anticipated value would be at least $6,027,270. There are several ways to calculate this value:
1- Value to the individual alcohol offender. Given the typical cost of a DWI in Texas ($19,200) and recidivism rate (27%), if our programmed reduced recidivism by 25 among a 650 participants in the program there would be a cost saving of $842,400;
2- Saving due to reduce incarceration. Given the typical daily cost of housing a prisoner ($66/day) and duration of prison sentence for a DWI (180 days for first offense) if this program reduces recidivism by 25%, the prison savings is $521,235;
3- Cost associated with preventing a single fatality related to DWI is estimated to be $3,300,000. Note, the intention of conducting this program is that it would serve as a model that could be adopted throughout the state, and as a result, the value of this program would be exponentially higher (Milestone 3).

<td>Performing Provider TPI: 126844305</td>
</tr>
</tbody>
</table>

### Project Summary:

**Provider Description:** Bluebonnet Trails Community Services (BTCS) is the state designated Local Mental Health Authority (LMHA) for Guadalupe County in Region 6 as well as for seven other Counties located east of and parallel to IH 35 extending north of Austin, Texas in Travis County. In that capacity we are responsible for an array of public services as well as for behavioral health planning and coordination throughout our local service area. We operate services in Guadalupe County and we have responsibility to identify gaps in service or barriers to access for persons diagnosed with behavioral health disorders residing in the area.

**Intervention(s):** BTCS proposes to work in collaboration with the Guadalupe Regional Medical Center to implement a patient navigation project for persons who are frequent users of the Emergency Department due to behavioral health disorders. We will employ a Peer Support Specialist and a registered Nurse to work on site at Guadalupe Regional Medical Center to provide rapid triage, assessment and alternative services to frequent users of the ED. The RN will provide patient education, assessment and guidance on follow up care. The Peer Support Specialist will identify community resources and directly link and advocate for the patients. Peer Support Specialists are former or current consumers of behavioral health services. Linkage and referral will include transportation to services by BTCS workers in currently owned transport vehicles.

**Need for the project:** This project addresses the RHP 6 Community Needs Assessment Needs:

- **CN.2** “A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions”;
- **CN.3** “Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages”; and especially **CN.4** “There is a shortage of high quality mental and behavioral health services that are integrated with physical health care services.”

**Target population:** Are target population those users of ED services who are admitted more than 5 times in one year. BTCS served 3,377 persons in Guadalupe County in FY 2012; 2,401 persons with mental illnesses. An average of 43% of the adults and 76% of the children with mental illnesses were eligible for Medicaid or CHIP and approximately 25 % of non-Medicaid adults were indigent. We expect about 75 % of the persons benefitting from these navigation services to be Medicaid or CHIP eligible or uninsured. We expect to serve 30 people in DY 4 and 50 people in DY 5.

**Category 1 or 2 expected patient benefits:** The starting point/baseline for this service in DY 2 is 0 since no such service currently exists in this County. The project seeks to serve 30 people in DY
4 and 50 people in DY 5. Those served will be high utilizers of the ED with multiple visits per year. We plan to intervene at the point of the visit and to assist the individuals in connecting for ongoing care through a medical home, thereby reducing future ED utilization.

Category 3 outcomes: IT-3.1 Our goal is to reduce all cause 30 day readmission rate for this group of high utilizers by a percentage TBD after baseline is established in DY 3.

**Project Description:**

Bluebonnet Trails Community Services (BTCS) is the state designated Local Mental Health Authority (LMHA) for Guadalupe County in Region 6 as well as for seven other Counties located east of and parallel to IH 35 extending north of Austin, Texas in Travis County. In that capacity we are responsible for an array of public services as well as for behavioral health planning and coordination throughout our local service area. We operate services in Guadalupe County and we have responsibility to identify gaps in service or barriers to access for persons diagnosed with behavioral health disorders residing in the area.

BTCS proposes to work in collaboration with the Guadalupe Regional Medical Center to implement a patient navigation project for persons who are frequent users of the Emergency Department due to behavioral health disorders. We have a good relationship with this local hospital and with other health care providers in Guadalupe County. BTCS staff frequently assists the hospital with assessment, discharge and continuity of care issues for BTCS patients and therefore are familiar with key staff, facilities and resources. We continue to hold planning discussions with the leadership of Guadalupe Regional Medical Center and are hopeful that we can identify a location for the navigation program staff within the hospital itself or alternatively in the facility that BTCS is constructing in partnership with the FQHC, Community Centers of South Texas. Plans for the project are to hire an RN and a Peer Support Specialist to deliver the navigation services. The RN will provide patient education, assessment and guidance on follow up care. The Peer Support Specialist will identify community resources and directly link and advocate for the patients. Peer Support Specialists are former or current consumers of behavioral health services. They bring an ability to connect with frequent ED visitors and engage them in recovery and solutions. Using Peers is an Evidenced Based Practice promoted by the Texas Department of State Health Services (‘DSHS’) and the SAMHSA division of US Department of HHS. DSHS certifies Peer Specialists and this individual carrying out the navigation role will be certified or seek certification.

The **project goals** for the program and for the patient navigators will be to provide enhanced social support and culturally competent care to this high risk population. They will help support the patients as they seek access throughout the continuum of health care. In addition they will ensure timely, coordinated and site appropriate health care and if needed behavioral health care. The patient navigators will work closely with hospital and emergency department staff to divert non urgent patients to other more appropriate levels of care. This **project also meets regional goals to include:** integrating primary and behavioral health care; improving access for the poor and uninsured; and advancing the goals articulated in the Community Health Improvement Plan for Bexar County of 2012 to improve comprehensive behavioral health services and access for all. It also advances the triple aim of CMS because reduction in ED use by these high utilizers will have a positive impact on regional health care costs.

The **challenges** to this project are to engage those who are frequent visitors to the EDs and help
them access alternatives. This project will address this problem by providing the opportunity for a person centered intervention offered by a Peer, to connect the individuals to services at the point that they need them the most, i.e., at the point they are seeking emergency care. We expect to use community resources to fill unmet social needs such as housing, transportation, income, food and medication. For those who are in need of behavioral health services either as a short term stabilization strategy or for long-term, we will connect patients to BTCS or to primary care practitioners who can support behavioral health treatment. We plan to provide transportation to make access to healthcare as smooth as possible. BTCS currently uses staff and Peers to provide transportation in current Center owned vehicles and we plan to continue to use these personnel and resources to transport to services. This approach is aimed at resolving the multiple issues that lead to repeated visits to the ED. Our goal is to do all we can to ensure connection to aftercare and follow up rather than quick treatment and release from the ED with instructions for aftercare but no community support.

Over the next five years we expect the outcomes of this project to be the continued development robust alternatives to ED care and improve the performing provider and the healthcare system in the region. We expect the patients who receive navigation services to reduce utilization of EDs and reduce preventable readmissions as a result. These outcomes are directly achievable due to the goals and interventions described above.

**Starting Point/Baseline:**
Since this program has not been established and does not exist in Guadalupe County, the baseline for DY 2 is 0. We will use the remainder of DY 2 to identify the target population as a discrete cohort by review of emergency department admissions at Guadalupe Regional Medical Center.

**Rationale:**
The primary intent of our project, which is to establish a patient navigation program for persons with cognitive impairments who are frequent visitors to the ED. We plan to use Peer Support Specialists as navigators. These are innovative health care workers who have been consumers in the system and will bring an enhanced level of cultural competency and understanding to the process and the people who they are helping. The navigators will be assisted by RNs to act as nurse educators. The team is enriched by inclusion of a trained health care professional and Peer support, founded on recovery oriented focus ensures access to care management and education that promotes self-management. BTCS and its partner, Community Health Centers of South Texas, FQHC for Guadalupe County, are in process of building a clinic to co-locate behavioral health services with primary care services in partnership in Seguin, further enhancing access to care.

BTCS has participated as a member of the Guadalupe County Mental Health Task Force to identify behavioral health gaps and needs. Health disparity is often driven by income disparity. 11% to 20% of the population of Guadalupe County is below the poverty level. Additionally, 24% of the people in the RHP 6 region are without insurance or any third party coverage. The entire county has been designated a health care provider shortage area for behavioral health and for primary care according to US Department of HHS, HRSA. An area of concern that the hospital leadership, task force members and BTCS have identified is the repeated ED visits by a group of patients some of whom are BTCS patients and some of whom are not. Anecdotal
Evidence indicates reasons for the multiple ED visits by this group of patients, ranging from chronic behavioral health issues, mental illnesses and substance use disorders to chronic physical health issues such as asthma, chronic pain, cardiopulmonary disease, etc., but frequently triggered by behavioral health conditions. According to the Bexar County Consortium Report, the root cause of a large number of visits to the ED’s in RHP 6 is related to anxiety, symptoms of mental illness and/or substance abuse. Poverty and provider shortages coupled with cognitive deficits that are symptoms of mental illnesses, makes finding and accessing care difficult for many in Guadalupe County. We believe a special intervention provided by people who are trained in behavioral health assessment and management is required. The target population is composed of patients identified as having multiple emergency department/hospitalizations over the last year. Most of the patients have chronic health problems often exacerbated by substance abuse and mental illness. They tend to have poor compliance with treatment recommendations, often lack a medical home and have few natural community supports such as friends and family.

Since this is a wholly new program for Guadalupe County we expect to follow and carry out each of the required core project components:

a) Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency.
b) Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators.
c) Connect patients to primary and preventive care.
d) Increase access to care management and/or chronic care management, including education in chronic disease self-management.
e) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

This project addresses RHP 6 Community Needs Assessment needs: CN.2 “A high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions”; CN.3 “Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages”; and especially CN.4 “There is a shortage of high quality mental and behavioral health services that are integrated with physical health care services and/or provide crisis stabilization.”

BTCS has operated a free-standing mental health outpatient clinic site in Seguin in Guadalupe County for a number of years. We have been engaged in planning for a number of years with the local FQHC to build and establish a clinic site that integrates behavioral health care and primary care. This navigation project is enhanced by that delivery system reform. Our planning recently resulted in the award of a grant through the Health Resources and Services Administration Division of the US Department of HHS to develop a primary care/behavioral health care clinic site in Seguin in partnership with the Federally Qualified Health Center for Guadalupe County. These Federal funds will not be used to provide the patient navigation program, but having the integrated clinic will more effectively meet the needs of those we provide navigation services to and provide options for care and a medical home that has heretofore been unavailable.
## Related Category 3 Outcome Measure(s):

The Category 3 Outcome Measure that we selected is “OD-3 Potentially Preventable Re-Admissions- 30 day Readmission Rates (PPRs) IT-3.1 All cause 30 day readmission rate- NQF 1789.” This is a stand-alone measure. We selected this measure because the goal of this project is to help people who have multiple visits to EDs and we believe in many cases that has resulted in admission and readmission to hospital. We believe that measuring the reduction in re-hospitalization will be a good indicator of success for the program. Over the four years of the project we expect to dramatically reduce the number of ED visits for the target population and the associated inpatient admissions. These reductions will occur by improved chronic disease management, linkage to a primary care provider and medical home. The RN will be hired and trained to deliver culturally and linguistically appropriate services to the target population. Patients will be diverted from EDs/hospitals and linked with primary care providers who can offer a medical home. Navigators will also link patients to social support programs and behavioral health programs where a need is identified. It is expected that utilization of programs such as self-management support, patient education, improved patient provider communication and coordination with community resources will lead to increased patient engagement in maintaining their health. This outcome supports RHP 6 goals to improve health for low-income populations and link to a medical home.

## Relationship to Other Projects:

BTCS has also proposed in Category 1, Project 1268443-05.1.2. That project is the establishment of new treatment site for outpatient substance abuse care. The navigation project will be able to refer to services offered through the substance abuse clinic and thereby initiate much needed treatment and reduce returns to the ED. This is project fills a gap in services that the patient navigators will need for referral and care.

## Relationship to Other Performing Providers’ Projects in the RHP:

BTCS plans to participate in learning collaborative with Center for Health Care Services which is planning integrated care and specialized care management projects. We would also request to participate with University of Texas Health Science Center, San Antonio and University Health System both of which are planning patient navigation programs.

## Plan for Learning Collaborative:

BTCS will participate in all learning collaboratives organized or sponsored by University Health System that are relevant to our projects. As above, we will actively seek participation in other learning collaboratives in the Region. We believe it is important to improving and adjusting the care provided.
Project Valuation:
The project seeks to serve 30 people in DY 4 and 50 people in DY 5. Those served will be high utilizers of the ED with multiple visits per year. We plan to intervene at the point of the visit and to assist the individuals in connecting for ongoing care through a medical home, thereby reducing future ED utilization. The valuation calculated for this project used cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units that were applied to the factors existing in this underserved area, including: limited access to primary care and to behavioral health care, poverty and the link between chronic health conditions and chronic behavioral health conditions. The valuation study was prepared by professors H. Shelton Brown, Ph.D. and A. Hasanat Alamgir, Ph.D. both of the UT Houston School of Public Health and Thomas Bohman, Ph.D. of the UT Austin Center for Social Work Research based on a model that included quality-adjusted life-years (QALYs) and an extensive literature of similar interventions and cost savings and health outcomes related to those interventions. The QALY index incorporates costs averted when known (e.g., emergency room visits that are avoided). We assigned a value of $1,134,866 through DY 5. Complete write-up of project will be available at performing provider site.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $1,134,866**
Identifying Project and Provider Information:

Title: 2.13.2 Implement other evidence-based project to provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in an innovative manner: Transitional housing with behavioral supports
Unique RHP ID#: 1268443-05.2.2 – PASS 2
Performing Provider: Bluebonnet Trails Community Mental Health and Mental Retardation Center dba/Bluebonnet Trails Community Services
Performing Provider TPI: 126844305

Project Summary:

Provider Description: Bluebonnet Trails Community Services (BTCS) is the state designated Local Mental Health Authority (LMHA) for Guadalupe County in Region 6 as well as for seven other Counties located east of and parallel to IH 35 extending north of Austin, Texas in Travis County. That responsibility includes identifying gaps in service or barriers to access for persons with behavioral health issues residing in the area. We also provide behavioral health services through various contracts including a contract with the state to serve adults who are primarily diagnosed with Serious Mental Illnesses. BTCS is responsible for aftercare upon release from hospital and for stability in the community following ED visits, jail stays and the number disruptive of events that happen for those with SMI. Community stability cannot occur for anyone without access to housing.

Intervention(s): BTCS proposes to implement a transitional housing facility that is provided consistent with SAMHSA recognized recovery principles. We will secure, renovate, open and staff a facility suitable for about 6 individuals who will be provided behavioral health services in this transitional housing setting to improve community living skills. The program will be for individuals who have a need for housing but who are also willing to participate in a Recovery-Based Program. While in the program they will participate in psychosocial skills training to learn and practice skills to improve the likelihood of a successful transition into independent living. All admissions to the program will participate in a Wellness, Recovery, Action Plan.

Need for the project: This project addresses RHP 6 Community Needs Assessment needs CN.4 “There is a shortage of high quality mental and behavioral health services that are integrated with physical health care services.” It also addresses the lack of affordable housing in Guadalupe county for the poor and mentally ill.

Target population: The target population is our patients or potential patients referred from the Crisis Respite Unit, State Psychiatric Inpatient Facilities, and the local Community Centers. The referrals will be screened and considered based on need. We will prioritize admissions to those with long or repeated stays in inpatient settings or with frequent contacts with the criminal justice system. BTCS served 3,377 persons in Guadalupe County in FY 2012; 2,401 persons with behavioral health disorders. In FY 2012, an average of 43% of the adults were eligible for Medicaid; 73% of BTCS clients are below the federal poverty level; 55% are uninsured. We estimate that approximately 70% of those benefitting from this project will be poor, uninsured or underinsured.

Category 1 or 2 expected patient benefits: This project seeks to provide transitional housing services and placement in permanent housing for 12 people in DY 4 and 18 people in DY 5.

Category 3 outcomes: IT-3.8 Our goal is to reduce behavioral health /substance abuse 30 day
readmission rate by a percentage TBD after baseline is established in DY 3.

**Project Description:**

Bluebonnet Trails Community Services (BTCS) is the state designated Local Mental Health Authority (LMHA) for Guadalupe County in Region 6 as well as for seven other Counties located east of and parallel to IH 35 extending north of Austin, Texas in Travis County. That responsibility includes identifying gaps in service or barriers to access for persons with behavioral health issues residing in the area. We also provide behavioral health services through various contracts including a contract with the state to serve adults who are primarily diagnosed with Serious Mental Illnesses (SMI the Federal definition can be found at “Federal Definition for SMI,” [http://www.healthcare.uiowa.edu/icmh/documents/FederalDefinitionsofSMIandSED.doc](http://www.healthcare.uiowa.edu/icmh/documents/FederalDefinitionsofSMIandSED.doc).) This group of patients generally suffers from the most profound deficits in functioning and are often unemployed, homeless or living in sub-standard housing and without natural family or community supports. Recovery is possible for these individuals but it is a difficult journey requiring help and supports. BTCS and community partners are responsible for aftercare upon release from hospital and for stability in the community following ED visits, jail stays and the number disruptive of events that happen for those with SMI. Community stability cannot occur for anyone without access to housing.

BTCS proposes to implement a transitional housing facility that is provided consistent with SAMHSA recognized recovery principles, ([National Consensus Statement on MH Recovery,](http://www.samhsa.gov/SAMHSA_News/VolumeXIV_2/article4.htm) Based on our experience providing treatment in the region and with the consensus of community leaders, we realize no housing now exists in Guadalupe County that can be used to help people make the transition to recovery. We will identify a suitable facility in Seguin, Texas to rent, remodel and use for the transitional housing project. Program participants may be referred from the Crisis Respite Unit, State Psychiatric Inpatient Facilities, and the local Community Centers. The referrals will be screened and considered based on need. The program will be for individuals who have a need for housing but who are also willing to participate in a Recovery-Based Program. While in the program they will participate in psychosocial skills training to learn and practice skills to improve the likelihood of a successful transition into independent living. All admissions to the program will participate in a Wellness, Recovery, Action Plan (WRAP) to help target the individual needs. We have identified a variety of evidenced based program models that focus on promoting recovery and self–responsibility. We will assess the models and through a process of review and evaluation, incorporate practices that enhance our current plans. (“Developing a Recovery and Wellness Based Lifestyle Guide,” [http://store.samhsa.gov/product/Developing-a-Recovery-and-Wellness-Lifestyle-A-Self-Help-Guide/SMA-3718](http://store.samhsa.gov/product/Developing-a-Recovery-and-Wellness-Lifestyle-A-Self-Help-Guide/SMA-3718); and “Consumer Operated Services – EBP,” [http://store.samhsa.gov/product/Consumer-Operated-Services-Evidence-Based-Practices-EBP-KIT/SMA11-4633CD-DVD](http://store.samhsa.gov/product/Consumer-Operated-Services-Evidence-Based-Practices-EBP-KIT/SMA11-4633CD-DVD).) The common elements in the models are that they all contain components supporting skills development, self- awareness and individual responsibility in the recovery process. For example, WRAP is listed on the SAMHSA registry of evidenced based practices. WRAP is an effective, manual-based group intervention for adults with mental illness. WRAP guides participants through the process of identifying and understanding their personal wellness resources ("wellness tools") and then helps them develop an individualized plan to use these resources on a daily basis to manage their mental illness. Tools and practices such as these will form the foundation of the Transitional Housing project. The program will be evaluated
quarterly and outcomes will be closely monitored. All services will be documented in our electronic information system. Data will determine the amount and frequency of the services being provided and will be utilized to help guide the program quarterly. Satisfaction surveys will be provided for individuals leaving the program to ensure we gather personal attitudes regarding the effectiveness of the program. The final phases of this program will include transition assistance – assistance to establish a basic household, including security deposits, essential furnishings, moving expenses, bed and bath linens so that individuals can smoothly move into community living.

**Goals and Relationship to Regional Goals:** Over the next five years we expect to fully implement the transitional housing program based on recovery principles. We expect the program to maintain an average census of around 6 persons who will stay from one month to six months depending on assessed need. We expect to serve 12 to 18 people each year after the program is underway. The goal of the program is to facilitate the change and recovery process for individuals with SMI through skills building, self-awareness, self-advocacy, and providing the supports necessary for stable lives in a community setting.

**Project Goals are to:**
1. Establish a Transitional Housing program based on Recovery Principles;
2. Recruit and train staff to provide transitional services;
3. Provide services to the target population of people who have been hospitalized or experienced a recent crisis event; and
4. Assist people to regain functioning and self-manage their wellness.

**This project meets the following regional goals:**
1. Further develop and maintain a coordinated care delivery system; and
2. Improve outcomes while containing cost growth.

As this program is established and grows, we expect individuals will have fewer emergency departments visits, fewer state hospitalizations, a lower rate of arrests and fewer days incarcerated. An additional benefit of this program is that it can serve as a recovery resource center to the broader community of persons in Guadalupe County with SMI who are in the process of recovery.

**Challenges:** Challenges include finding adequate housing for persons when they are ready to exit the transitional housing program to live independently or in a supportive living situation in the community. We are fortunate to have a long standing presence in the community and the support of community leaders who can assist in identifying suitable locations for independent housing. Over the next few months staff will assess houses and apartment complexes that BTCS could access. We will also work with them to find other locations in the future. Another key challenge is recruiting and training staff in recovery principles and ensuring they have the knowledge necessary to make linkages with other programs such as crisis respite and federally qualified health clinics. During DY 2 we will begin actively recruiting and review and inventory of community resources.

**5-Year Expected Outcome for Provider and Patients:** Over the next 5 years, we expect the outcomes to include reduction of readmissions to psychiatric hospitals within 30 days. The goals of this project are to establish a service that helps people improve functioning so that they can live successfully. Improvement in functioning and managing one’s wellness gives the opportunity to make a transition from inpatient stay or crisis event to community living. Providing this stable living environment along with skills training and supports will reduce
Starting Point/Baseline:
Currently no Transitional Housing program exists in Guadalupe County; therefore, the baseline is 0 in DY 2. Baseline data will be based on patients entering the transitional housing program in DY3.

Rationale:
The Transitional Housing program based on Recovery principles provides an opportunity for those persons discharged from a psychiatric hospital or recently experiencing a behavioral health crisis to have a stable place to live and participate in learning the skills needed to move on to independent or supported living in the community. We selected the “Implement other evidence-based project to provide an intervention for a targeted behavioral health population to prevent unnecessary use of services” because assessment of the needs in the County indicate that resources and interventions are lacking to reduce inpatient stays and provide community options after a crisis event. The community-based interventions employed in the project mirror many of those listed as components under this Option; including:

- Residential Assistance (Foster/Companion Care, Supervised Living, Residential Support Services);
- Psychosocial Rehabilitation;
- Transition assistance – assistance to establish a basic household, including security deposits, essential furnishings, moving expenses, bed and bath linens;
- Transportation to appointments and community-based activities;
- Prescription medications;

Project Components: Even though there are no Core Components associated with this option, we plan to follow the components listed for 2.13.1. We will convene community stakeholders during the remainder of FY 2013 to identify information needed to assess the gaps that must be filled to secure housing and to gain the skills for a smooth transition. With these stakeholders, we will identify tools to provide data to get an inventory of community resources currently utilized and those needed by the people we expect to serve. We will use the current staff to assess current needs of those who are now hospitalized and soon to be discharged and those experiencing crisis events needing transition to community housing. Using the information from stakeholders, from capacity and utilization tools, from further literature reviews and from assessment of those potential referrals, we will assess the intervention we are planning to provide. As we implement the project we will plan a rapid cycle quality improvement component through our Quality Management Department at BTCS. We plan to continuously improve the program over the next 5 years as we adjust the interventions, peer supports and make changes based on lessons learned. Those changes may include adjustments to the model with respect to interventions, intensity and population. Continuous Quality Improvement: BTCS is committed to continuous quality improvement and learning related to this project. We will establish quality improvement activities such as rapid cycle improvement and will perform other activities such as “lessons learned” and identifying project impacts. In addition, we are participating in a regional learning collaborative which shares information such as challenges, lessons learned and considerations for safety net populations.
We expect the milestones and metrics in the first 2 years to reflect the innovative and developmental nature of this project. We will measure progress toward community assessment and development of infrastructure such as policies, training materials, contracts and support. These Milestones and Metrics are specifically related to the targeted population of individuals who have recent crisis events that sometimes result in hospitalizations with the aim of providing them the best opportunity to make a recovery oriented transition to the community and thereby prevent further crises and hospitalizations.

BTCS has participated as a member of the Guadalupe County Mental Health Task Force to identify behavioral health gaps and needs. Health disparity is often driven by income disparity. 11% to 20% of the population of Guadalupe County is below the poverty level. Additionally, 24% of the people in the RHP 6 region are without insurance or any third party coverage. The entire county has been designated a health care provider shortage area for behavioral health and for primary care according to US Department of HHS, HRSA. BTCS reviewed data related to admissions to the State Hospital and to the voluntary Crisis Respite facility. We found a large percentage of the 218 year to date admissions to the State Hospital--17% accounting for 37 of the 218 admissions--were made without prior screening and authorization by BTCS, the LMHA. Analysis reveals that those admissions are being taken directly to the hospital by law enforcement officers because they have few local alternatives. Analysis of those State Hospital admissions reveals a substantial number with very short lengths of stay, indicating that they were inappropriately admitted and might be prevented with a community alternative for transitional housing. The number of individuals with lengths of stay less than 3 days reflects that 61 persons may have been inappropriately admitted year-to-date. When we reviewed the admission data for the voluntary Crisis Respite facility, it revealed that there were 252 admissions in FY 2012 and of those admissions, 13% were from EDs and local Hospitals; 8% were from the State Hospital; and 13% were from jail. All of these individuals would meet initial eligibility criteria for transitional housing.

This project addresses RHP 6 Community Needs Assessment need CN.4 “There is a shortage of high quality mental and behavioral health services that are integrated with physical health care services.”

BTCS has operated a free-standing mental health outpatient clinic site in Seguin in Guadalupe County for a number of years. We have been engaged in planning with the local FQHC, Community Health Centers of South Central Texas, to build and establish a clinic site that integrates behavioral health care and primary care. This navigation project is enhanced by that delivery system reform. Our planning recently resulted in the award of a grant through the Health Resources and Services Administration Division of the US Department of HHS to develop a primary care/behavioral health care clinic site in Seguin in partnership with the Federally Qualified Health Center for Guadalupe County. These Federal funds will not be used to provide the patient navigation program, but having the integrated clinic will more effectively meet the needs of those we provide navigation services to and provide options for care and a medical home that has heretofore been unavailable. Successful community living requires whole health. Our collaboration increase the opportunities for linkage to primary care and a medical
Related Category 3 Outcome Measure(s):

- OD-3 Potentially Preventable Re-Admissions- 30 day Readmission Rates
- IT-3.8 Behavioral Health /Substance Abuse 30 day readmission rate.

Reasons/ rationale for selecting the outcome measure: This is a stand-alone measure. We selected this measure because the goal of this project is to help people who have been hospitalized or experienced a crisis event that could have resulted in a hospitalization to transition to stable living in the community. That transition will be made because of the program interventions that improve functioning and the skills needed for successful community living. When the goal is achieved then program participants will self-manage their recovery and wellness and there should be a reduction in symptoms and a reduction in crisis events. The outcome of this is fewer readmissions to the hospital both for 30 days and in the long term.

Relationship to other Projects:
BTCS has also proposed in Category 1, Project 1268443-05.1.2. That project is the establishment of new treatment site for outpatient substance abuse care. The navigation project will be able to refer to services offered through the substance abuse clinic and thereby initiate much needed treatment and reduce returns to the ED. This project fills a gap in services that the patient navigators will need for referral and care.

Relationship to Other Performing Providers’ Projects in the RHP:
BTCS plans to participate in learning collaborative with Center for Health Care Services which is planning integrated care and specialized care management projects. We have contracts with the Center to provide Crisis Respite and Detoxification services. Adjusting these interventions along with the Transitional Housing program will improve potential for success. We expect to meet quarterly with the Center for Health Care Services and other community providers. We would also request to participate with University of Texas Health Science Center, San Antonio and University Health System both of which are planning patient navigation programs.

Plan for Learning Collaborative:
BTCS will participate in all learning collaboratives organized or sponsored by University Health System that are relevant to our projects. As stated by University Health System in guidance to Performing Providers on October 2, 2012, “RHP 6 is committed to transforming health care in our region and throughout the state. Given the large number and value of projects proposed for our region, University Health System, as the RHP 6 anchor, will promote and facilitate learning collaboratives.” As above, we will actively seek participation in other learning collaboratives in the Region. We believe it is important to improving and adjusting the care provided.

Project Valuation:
This project seeks to provide transitional housing services and placement in permanent housing for 12 people in DY 4 and 18 people in DY 5. The valuation calculated for this project used cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units that were applied to the factors existing in this underserved area, including: limited access to primary care and to behavioral health care, poverty and the link between chronic health conditions and chronic behavioral health conditions. The valuation study was prepared by professors H. Shelton Brown, Ph.D. and A. Hasanat Alamgir, Ph.D. both of the UT
Houston School of Public Health and Thomas Bohman, Ph.D. of the UT Austin Center for Social Work Research based on a model that included quality-adjusted life-years (QALYs) and an extensive literature of similar interventions and cost savings and health outcomes related to those interventions. The QALY index incorporates costs averted when known (e.g., emergency room visits that are avoided). We assigned a value of $1,313,236 through DY 5. A description of the method used, titled ‘Valuing Transformation Projects,’ has been posted on the performing provider website which will be linked to www.bbtrails.org under the Medicaid 1115 Transformation Waiver tab. Complete write-up of the project will be available at performing provider site.

Identifying Project and Provider Information:
Title: 2.13.1 Design, implement and evaluate research supported and evidence-based interventions tailored towards individuals in the target population,
Unique RHP ID#: 137251808.2.1 - PASS 1
Performing Provider: The Bexar County Board Of Trustees for Mental Health Mental Retardation Services, d/b/a/ The Center For Health Care Services
Performing Provider TPI: 137251808

Project Summary:
Provider Description: Center for Health Care Services (CHCS) is the Local Mental Health Authority for Bexar County (population 1.75M). CHCS provides behavioral health services and treatment to children, adolescents and adults.
Intervention(s): CHCS seeks to expand a therapeutic justice model for persons with serious mental illness as a means of diverting them from being placed in the criminal justice system whether through institutionalization or adjudication. Points of entry into services will include mental health assessors stationed at the Magistrate Court providing screening and assessment of self-referrals or system referrals. Those identified with behavioral health needs are referred under judicial order to the specialized outpatient program, which features targeted interventions for this hard to serve population, in lieu of incarceration. The services to be provided are community based mental health services provided in the community and not provided in the criminal justice jail site. As an alternative to hospitalization or incarceration, this is a cost efficient approach and connects patients to appropriate treatment in a more durable fashion. This population is differentiated from a general adult mental health outpatient population by their demonstrated reticence to access care and their historical failures to comply with care recommendations; the basis of a therapeutic justice model. Evidence-based practice research indicates that the presence of court ordered monitoring improves compliance and treatment outcomes. There is an estimated 25% difference between available funding for current capacity and demonstrated need. A consistent, coordinated, service-rich continuum of care for adults with mental illness, key components of a therapeutic justice model will ensure positive, long-term improvements in mental health, quality of life, functioning and stability, and will provide appropriate alternatives to incarceration.
Need for the project: Diverting adults with behavioral health disorders into treatment rather than incarceration is an evidence-based, cost-effective practice. CHCS has implemented a variety of therapeutic justice programs targeting adults with serious mental illness, which have shown positive outcomes; however, CHCS is currently providing these services at 25% above capacity and significant numbers of otherwise eligible adults are going un-served or experiencing a lengthy wait for treatment.
Target population: Adults with a behavioral health disorders. Based upon current service data, it is anticipated that 54% of those to be served will be indigent and 44% will be covered by Medicaid.
Category 1 or 2 expected patient benefits: The project seeks to divert adults with serious mental illness from institutionalization or incarceration and into treatment and readmissions. In DY4 the percentage of individuals who demonstrate improved functional status on standardized instruments (e.g., ANSA, CANS, etc) will improve from a base line of 295 served in DY3, by 50%, totaling 148 individuals and in DY5, 75%, totaling 221 individuals will demonstrate improved functional status on standardized instruments.
Category 3 outcomes: IT-9.1. Our goal, which will be quantified by DY4, is to decrease mental
Project Description:

The Center For Health Care Services (CHCS) seeks to increase the availability of mental health support services for mentally ill persons as a means of diverting them from institutionalization or incarceration and into treatment. Only a fraction of the medically indigent population can be served and there is a wait time of up to three months for persons needing this type of treatment. Compounding the issue is the need to establish a sufficient continuum of care for persons who are exiting crisis services. Linkages to specialized, community-based services will reduce the number of subsequent crises.

Bexar County and The Center for Health Care Services recognizes the need for expeditious and effective mental health treatment and stabilizing supports for this target population, including the subset that becomes involved with the criminal justice system. Expansion of existing services and further implementation of the therapeutic justice approaches for this target population must include additional mental health, substance-abuse and support services components if we are to stabilize mental health, restore community functioning and improve quality of life while simultaneously reducing cyclic acute episodes.

Goals. Reduce the number of adults with serious mental illness who repetitively cycle through the criminal justice and courts system by expanding the availability of specialized services designed to promote treatment engagement and prevent unnecessary incarceration and utilization of emergency departments and urgent care facilities. Provide an intervention for adults with serious mental illness to promote treatment engagement and prevent unnecessary incarceration and the utilization of emergency departments and urgent care facilities. Reduce the number of adults with serious mental illness who repetitively cycle through the criminal justice, acute inpatient and other costly systems. Maintain adults in treatment for a minimum of one year.

Challenges addressed by the project. Diverting adults with a behavioral health disorder into treatment rather than institutionalization or incarceration is an evidence-based, cost-effective practice. In a limited study, CHCS examined the expense associated with members of the target population who received psychiatric in-jail services during a one year period ($3,058,000) versus the same target population receiving community-based therapeutic justice services in lieu of incarceration ($497,000). A $2,561,000 cost savings was verified. While CHCS interventions have shown positive outcomes, we are currently operating at 25% above capacity and significant numbers of otherwise eligible adults are going un-served or experiencing a lengthy wait for treatment. In the absence of rapidly responsive treatment services, the members of the target population also often experience extended or repeated stays at inpatient psychiatric facilities.

5-year expected outcomes for CHCS. CHCS seeks to provide specialized diversion services in an outpatient clinic that will be easily accessed for this population and allow for expanded access to psychiatric and related clinical services.

5-year expected outcomes for persons served by the project.

Improved access to services, including: 1) significantly reduced waiting time for physician appointments, which will improve patient satisfaction and compliance, and reduce adverse outcomes attributable to the lack of timely access to care. 2) improved compliance with scheduled appointments resulting from timely access. 3) urgent care for medication management and related health admissions and readmissions to criminal justice settings.
Relation to Regional Goals. Expanding resource availability to address the dearth of intensive outpatient mental health services is a key means of achieving the regional goal of “Improving the infrastructure for delivery of behavioral health services”. The program fills an existing gap in care and improves the existing behavioral health infrastructure to better serve Medicaid and uninsured adults in Bexar County while containing cost growth.

Starting Point/Baseline:
244 unduplicated adults per year

Rationale:
The project option 2.13.1 Design, implement, and evaluate research-supported and evidence-based interventions tailored towards individuals in the target population, process milestone (P-3: Enroll and serve individuals with targeted complex needs (i.e., a diagnosis of severe mental illness with concomitant circumstances such as chronic physical health conditions, chronic or intermittent homelessness, cognitive issues resulting from severe mental illness, forensic involvement, resulting in extended or repeated stays at inpatient psychiatric facilities) was selected in correspondence to an existing, unmet need for additional services for integrated care among adults with serious mental illness, frequent co-occurring behavioral and physical health problems and involvement with the criminal justice and courts systems. The target population often has a complex combination of physical and behavioral health care needs. Community mental health facilities are the right place for the mentally ill with complex behavioral health issues to access specialized care and treatment. When such services are sufficiently available and easily accessed, persons with mental illness will experience an improved quality of life. Consequently, sufficient access to services in the community for persons with mental illness will: a) positively impact their quality of life by ensuring that they will receive consistent, appropriate treatment in the right setting; b) reduce the likelihood that adults with mental illness will be less likely to inappropriately enter the criminal justice or court system; and, c) promote wellness and adherence to medication and other treatment modalities, which will promote recovery and stability in the community.

Project Components: a). Assess size, characteristics and needs of target population(s) (e.g., people with severe mental illness and other factors leading to extended or repeated psychiatric inpatient stays. b). Review literature / experience with populations similar to target population to determine community-based interventions that are effective in averting negative outcomes such as repeated or extended inpatient psychiatric hospitalization, decreased mental and physical functional status, nursing facility admission, forensic encounters and in promoting correspondingly positive health and social outcomes / quality of life. c) Develop project evaluation plan using qualitative and quantitative metrics to determine outcomes. d) Design models which include an appropriate range of community-based services and residential supports. e) Assess the impact of interventions based on standardized quantitative measures and qualitative analysis relevant to the target population.

Unique community need identification numbers the project addresses:
CN.4 - Inadequate mental health services results in avoidable costs to hospital and criminal and juvenile justice systems. The RHP 6 Community Needs Assessment also cited information from the Bexar County Health Collaborative Community Health Improvement plan that includes the following facts.

- About 6 people per 1000 are hospitalized for mental disorders every year in Bexar
County.

- About 1 person in 10,000 dies every year in Bexar County due to suicide.
- Adjusted for age, in 2008, this rate added up to 245 years of potential life lost per 100,000 under age 65 due to suicide for the residents Bexar County.
- The goal of the improvement plan is to improve comprehensive behavioral health services and access for all.

According to RHP6 Community Needs Assessment, inadequate services for individuals who have been arrested or incarcerated either as a result of or precipitated by unmet behavioral health needs remain a concern in Bexar County.

The proposed project will positively impact issues identified by UHS as Mental and Behavioral Health Unique Needs, identification number:

**How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative:** Significant enhancement

**Related initiatives funded by U.S. Department of HHS:** None

### Related Category 3 Outcome Measure(s):

- OD-9 Right Care Right Setting.
- IT-9.1 Decrease in Mental Health Admissions and readmissions to criminal justice settings such as jails or prisons.

**Reasons/rationale for selecting the outcome measures:** Twenty percent of the Bexar County Adult Detention Center (BCADC) population includes persons with mental illness. The right place for consistent clinical therapeutic mental health treatment is not BCADC or local emergency rooms; the right place is a community-based mental health facility. The lack of access to a therapeutic justice system makes adults with serious mental illness more vulnerable to repetitively entering the criminal justice and courts systems, adversely impacting quality of life, and increasing vulnerability. Since the mentally ill are over-represented in low-income populations, improvement in community based treatment and services will benefit a significant share of persons in poverty.

### Relationship to other Projects:

The proposed project will address significant behavioral health care resource insufficiency in Bexar County. As such, it is an integral component of this County’s health care infrastructure. Another proposed project seeks to establish research-based care for a segment of the population of adults with mental illness. These resources will be coordinated with CHCS’s proposed service expansion, if appropriate, to build a more durable continuum of care.

### Relationship to Other Performing Providers’ Projects in the RHP:

UTHSCA is proposing a potentially similar project. CHCS will join any collaborative learning communities with UTHSCA or other providers dedicated to serving adults with mental illness.

### Plan for Learning Collaborative:

CHCS will participate in any and all relevant learning collaboratives organized by University Health System.

### Project Valuation:

886 ★ RHP 6 Plan ★ March 8, 2013  
Center for Health Care Services
The value for this project is $3,618,510 for DY 2 and $15,152,433 for all years. A total of 295 adults will be served by the program by the end of DY3. The proposed service expansion increases accessibility of behavioral health care for adults. Additionally, the availability of the proposed resource will ensure adults with mental illness are treated expediently, connected to systems of care that support community living and not institutionalized or incarcerated inappropriately. Services and treatment provided will demonstrate that 75% of the individuals served, 221 consumers will demonstrate improved functional status. CHCS has a significant amount of existing infrastructure from which this project can be launched and only site preparation is required; thereby driving down the required investment and increasing the cost effectiveness of the approach.

The annual value of benefits provided to those served at full implementation considered several factors in valuing this project such as reducing costs at hospitals, costs for emergency detention and use of psychiatric institutions. This information was based on extensive literature as well as a valuation study completed and prepared by professors of the Houston School of Public health and of the UT Austin Center for Social Work Research that was based on the cost utility model, usage of extensive literature of similar interventions, costs savings and health outcomes related to those interventions.

The annual value of benefits provided to those served at full implementation was calculated by multiplying the annual value of a single successful intervention by five. The rationale for selection of a multiplier of five was that to overcome resistance to change in a hard-to-serve population, both in the delivery and payment systems, five years of benefits would be needed. This assumption was verified as valid after an extensive literature review.

Cost-utility analysis (CUA) also was used to measure the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state. Cost-utility analysis is a useful tool for assessing the value of new health service interventions because it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across different types of interventions, the common health goal, or outcome, is the number of life-years added.

The CUA calculations indicate that the availability of therapeutic justice services, in lieu of institutionalization or incarceration, has the potential to increase QALY among those it serves.

### Year 2 (10/1/2012 – 9/30/2013)

**Milestone 1**
P-3: Enroll and serve individuals with targeted complex needs (i.e., a diagnosis of severe mental illness with concomitant chronic physical health conditions, chronic or intermittent homelessness, cognitive issues resulting from severe mental illness, forensic involvement, resulting in extended or repeated stays at inpatient psychiatric facilities)

- **Metric 1**
  - P-3.1: Number of targeted individuals enrolled or served.
  - Baseline: 244
  - Goal: 268
  - Data Source: client records

**Milestone 2**
P-3: Enroll and serve individuals with targeted complex needs (i.e., a diagnosis of severe mental illness with concomitant physical health conditions, chronic or intermittent homelessness, cognitive issues resulting from severe mental illness, forensic involvement, resulting in extended or repeated stays at inpatient psychiatric facilities)

- **Metric 1**
  - P-3.1: Number of targeted individuals.
  - Baseline/Goal: 295
  - Data Source: client records

**Milestone 1 Estimated Incentive Payment:** $3,774,893

### Year 3 (10/1/2013 – 9/30/2014)

**Milestone 3**
I-5: Functional status.

- **Metric 1**
  - Percentage of individuals who demonstrate improved functional status on standardized instruments (e.g., ANSA, CANS, etc.)
  - Goal: 148 (50%)
  - Data Source: Client records

**Milestone 3 Estimated Incentive Payment:** $4,038,257

### Year 4 (10/1/2014 – 9/30/2015)

**Milestone 4**
I-5: Functional status.

- **Metric 1**
  - Percentage of individuals who demonstrate improved functional status on standardized instruments (e.g., ANSA, CANS, etc.)
  - Goal: 221 (75%)
  - Data Source: Client records

**Milestone 4 Estimated Incentive Payment:** $3,901,698

### Year 5 (10/1/2015 – 9/30/2016)

- **Milestone 3 Estimated Incentive Payment:** $4,038,257

**Identifying Project and Provider Information:**

| Title: 2.15.1 Design, implement, and evaluate projects that provide integrated primary and behavioral health care services: PCY Integrated Clinic  
| Unique RHP ID#:137251808.2.2 – PASS 1  
| Performing Provider: The Bexar County Board Of Trustees for Mental Health Mental Retardation Services, d/b/a/ The Center For Health Care Services  
| Performing Provider TPI: 137251808 |

**Project Summary:**

Provider Description: Center for Health Care Services (CHCS) is the Local Mental Health Authority for Bexar County (population 1.75M). CHCS provides behavioral health services and treatment to children, adolescents and adults.

Intervention(s): CHCS seeks to establish a comprehensive, integrated care management center offering primary and behavioral health care to homeless adults living at Prospects Courtyard (PCY) within the Haven for Hope campus. The great majority will have co-occurring mental health and/or substance use and chronic physical disorders. CHCS, with funding from local public and private stakeholders, has established an on-site psychiatric clinic that has exceeded service expectations and continues to grow in utilization and positive impact; however, there remains a critical need for on-site primary care. The new integrated care clinic will provide walk-in triage, preliminary diagnostics, initial treatment, referral and follow up for medical care, psychiatric care, urgent care, medication management, immunizations, and chronic disease prevention strategies. A health navigator will support treatment compliance through evidenced-based practices, such as motivational interviewing. Also, commonly used medication will be available, a significant unmet need for the target population and a major contributing factor to their physical and behavioral health problems. The easily accessed, integrated care clinic will foster greater stability and compliance with recommended treatment by a frequently treatment-averse target population, which in turn will reduce crises and the inappropriate utilization of emergency department (ED) services. Most patients will be uninsured despite their eligibility for Medicaid because they lack a permanent address.

Need for the project: PCY sleeps more than 600 adults per night and cares for more than 700 during the day. The initial goal was to provide a safe sleeping environment, three meals a day and access to showers and bathrooms but it quickly became apparent that untreated physical and behavioral health problems were inextricably tied for the target population. Also, it is well documented that homeless populations routinely access primary health care through hospital emergency departments (ED), a costly approach and a major contributor to congestion and over-crowding in urban EDs.

Target population: Homeless adults with untreated physical and behavioral health disorders. These adults can be expected to have significant, chronic physical and behavioral health problems and all will be extremely low income. Most will repetitively cycle through the San Antonio State Hospital and/or University Hospital. Based upon current service information, 16% of the target population will be funded by Medicaid and 57% will be indigent and uninsured.

Category 1 or 2 expected patient benefits: The project seeks to ensure that in DY4, a baseline of 500 residents will receive services and a goal of 125 individuals or 25% will receive integrated services and in DY5, 175 or 35% of baseline will receive integrated care.
Category 3 outcomes: IT-9.2. Our goal, which will be quantified in DY4, is to increase the appropriate utilization of area EDs.

**Project Description:**

The Center For Health Care Services (CHCS) seeks to establish a comprehensive, integrated care management center offering primary and behavioral health care at Prospects Courtyard (PCY) within the Haven for Hope campus. The target population will consist of homeless adults living at PCY with co-occurring mental health and/or substance use and chronic physical disorders. CHCS, with funding from local public and private stakeholders, has established an on-site psychiatric clinic that has exceeded service expectations and continues to grow in utilization and positive impact; however, there remains a critical need for on-site primary care.

The new integrated care clinic will provide walk-in triage, preliminary diagnostics, initial treatment, referral and follow up for medical care, psychiatric care, urgent care, medication management, immunizations, and chronic disease prevention strategies. A health navigator will be provided to support treatment compliance through evidenced-based practices, such as motivational interviewing. Also, commonly used medication will be available, a significant unmet need for the target population and a major contributing factor to their physical and behavioral health problems.

The easily accessed, integrated care clinic will foster greater stability and compliance with recommended treatment by a frequently treatment-averse target population, which in turn will reduce crises and the inappropriate utilization of emergency department (ED) services. The great majority of those who will be served are uninsured despite their eligibility for Medicaid because they lack a permanent address.

**Goals.** Improve health outcomes by delivering the right care at the right time and the right place. Increase use of preventive, primary and specialty care. Decrease use of costly ED and inpatient care.

**Challenges addressed by the project.** PCY, initially designed to accommodate 400 homeless adults (June 2010), has grown to sleeping more than 600 at night and caring for more than 700 during the day. The initial goal was to provide a safe sleeping environment, three meals a day and access to showers and bathrooms. However, it quickly became apparent that untreated physical and behavioral health problems were inextricably tied for the target population, with one undermining stability and improvement of the other. For example, Texans with severe and persistent mental illness die 28 years sooner than the general population. And the most frequent causes of death, e.g., diseases of the circulatory system, can be effectively addressed through early intervention and primary care that is integrated with behavioral health care.

Also, it is well documented that homeless populations routinely access primary health care through hospital emergency departments (ED), a costly approach and a major contributor to congestion and over-crowding in urban EDs. The primary means of getting to an ED is EMS and in 2011, the City of San Antonio’s EMS responded to 950 emergency calls at Haven for Hope, resulting in approximately 600 transports to area hospital EDs. Two-thirds of these calls were in the evening, signaling the need for extended clinic hours.

It is reported that 9 PCY residents have died in the last year. Reducing costs for area EDs and EMS are worthy goals but both are superseded by the need to avert the tragic loss of life and functioning associated with untreated behavioral and physical illnesses among homeless adults.
5-year expected outcomes for CHCS. Development of an integrated care management center to be oriented around the patient so that primary care access and the patient experience can be improved. Decreased emergency room visits. Decreased use of emergency detoxification services. Decrease 911, psychiatric crisis and triage calls. Decreased utilization of emergency transportation services. Decreased utilization of State and crisis transitional psychiatric beds
5-year expected outcomes for persons served by the project. Increased preventive behavioral health behaviors (e.g. vaccinations, nutrition, and hygiene). Improved overall primary, mental, and behavioral health outcomes
Relation to Regional Goals. Psychiatric triage and primary care are available within two blocks of PCY but residents will not consistently utilize these resources. Therefore, the proposed project supports achievement of the regional goal of “Integrating behavioral health with physical health and other evidence-based services and supports”. It also meets the CMS three part aim, as follows. The program enables and ensures individualized, patient-centered care. The program fills an existing gap in care and improves the existing behavioral health infrastructure to better serve Medicaid and uninsured adults in Bexar County.

Starting Point/Baseline:
Integrated behavioral and physical health care is not currently available to the target population. However, as previously mentioned, it is known that the City of San Antonio’s EMS made over 600 transports to EDs for all Haven for Hope residents. It is unknown how many of these were PCY residents.

Rationale:
The project option (2.15.1 Design, implement and evaluate projects that provide integrated primary and behavioral health care services), process milestone (P-6 Develop integrated behavioral health and primary care services within co-located site) and improvement milestone (I-8.1 % of individuals receiving both physical and behavioral health care at the established location) were selected in correspondence to an existing, unmet need for integrated care among homeless adults. The target population often has a complex combination of physical and behavioral health care needs combined with concomitant issues of substance abuse, traumatic injury, cognitive challenges and a lack of daily living skills and natural supports, causing them to be frequent users of public health services. This project will expand the capacity of currently available treatment options and will install a new, integrated treatment methodology in an effort to avert outcomes such as the inappropriate use of emergency departments and potentially avoidable inpatient admission and readmission, and to promote recovery in the community.

Project Components: Through the PCY Integrated Clinic Care service, we propose to meet all required project components. a) Identify sites for integrated care projects, which would have the potential to benefit a significant number of patients in the community. Examples of selection criteria could include proximity/accessibility to target population, physical plant conducive to provider interaction; ability / willingness to integrate and share data electronically; receptivity to integrated team approach. b) Develop provider agreements whereby co-scheduling and information sharing between physical health and behavioral health providers could be facilitated. c) Establish protocols and processes for communication, data-sharing, and referral between behavioral and physical health providers. d) Recruit a number of specialty providers (physical health, mental health,
substance abuse, etc. to provide services in the specified locations. e) Train physical and behavioral health providers in protocols, effective communication and team approach. Build a shared culture of treatment to include specific protocols and methods of information sharing that include: Regular consultative meetings between physical health and behavioral health practitioners; Case conferences on an individualized as-needed basis to discuss individuals served by both types of practitioners; and/or, Shared treatment plans co-developed by both physical health and behavioral health practitioners. f) Acquire data reporting, communication and collection tools (equipment) to be used in the integrated setting, which may include an integrated Electronic health record system or participation in a health information exchange – depending on the size and scope of the local project. g) Explore the need for and develop any necessary legal agreements that may be needed in a collaborative practice. h) Arrange for utilities and building services for these settings. i) Develop and implement data collection and reporting mechanisms and standards to track the utilization of integrated services as well as the health care outcomes of individual treated in these integrated service settings. j) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

**Unique community need identification numbers the project addresses:**

- CN.1 - Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.
- CN.4 - There is a shortage of high quality mental and behavioral health services that are integrated with physical health and/or provide crisis stabilization.

More specifically, the proposed project will positively impact the following:

- Need for integrated behavioral health and primary care services
- Inadequate access to care management and resource navigation
- Inadequate resources for special needs populations (e.g., homeless adults, sex offenders) including efficiencies such as integrated behavioral and primary care, pharmacy services, telemedicine, and physician extenders
- Inadequate outpatient care for adults with moderate acuity behavioral health needs to support reductions in hospital readmissions and the inappropriate use of emergency departments

**How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative:** Significant enhancement. Currently, the targeted population of homeless adults does not receive or access consistent primary care and, as a result, are over-represented among individuals with preventable, often life-threatening illnesses. The initiative will remove access barriers for and reduce incidence rates of chronic diseases.

**Related initiatives funded by U.S. Department of HHS:** CHCS recently received a Health Care Innovation grant from CMS to test and verify the efficacy of a specific integrated care model for the same target population. Details follow.

**Total budget:** $4,557,969 for a 36-month project period
**Number of projected participants:** 260 for 36-month project period
**Cost of care savings:** 34.57% savings PBPY

**Fund use:** Staffing the integrated care clinic, evaluation, workforce development training,
health care supplies. The significant enhancement of this project will allow for services to be provided outside of the 260 participants identified above.

**Project Goals:** Improve health care for target intervention population with complex behavioral and physical health disorders. Improve behavioral and physical health outcomes for target population. Lower the health care costs of the target population.

<th><strong>Related Category 3 Outcome Measure(s):</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>OD-9 Right Care</td>
</tr>
<tr>
<td>Right Setting, IT-9.2 ED appropriate utilization.</td>
</tr>
</tbody>
</table>

**Reasons/rationale for selecting the outcome measures:** This measure is indicative of consumers receiving easily accessed care when it is needed most, a critical means of addressing emergent issues and reducing inappropriate use of emergency departments.

**Relationship to other Projects:**
There are multiple projects proposed for RHP 6 that could support or be supported by the PCY Integrated Care Clinic, including increased training of the primary care workforce (1.2), implementation of a chronic disease registry (1.3), introduce, expand or enhance telemedicine/telehealth (1.7), and expand chronic care management models (2.2).

**Relationship to Other Performing Providers’ Projects in the RHP:**
There are no similar projects proposed for implementation in RHP 6. However, CHCS will participate in any relevant learning communities organized by University Health System.

**Plan for Learning Collaborative:**
CHCS will participate in any and all relevant learning collaborative organized by University Health System.

**Project Valuation:**
The value for this project for DY 2 is $1,538,919 and $6,783,356 for all years. By DY5, 175 homeless individuals with significant, chronic physical and behavioral health problems will receive integrated care every year through the proposed PCY Clinic. The establishment of integrated care at PCY fills an existing gap in the local continuum of behavioral health care for high need adults and frequent utilizers of public health care resources. Chronically mentally and physically ill adults will have access to the care required to improve status and stabilize in both domains, which will prevent or reduce costly, avoidable hospitalization and the inappropriate use of emergency departments. CHCS has significant existing infrastructure from which this project can be launched and only site preparation is required, driving down the required investment and increasing cost effectiveness.

The annual value of benefits provided to those served at full implementation considered several factors in valuing this project such as reducing costs at hospitals, costs for emergency detention and use of psychiatric institutions. This information was based on extensive literature as well as a valuation study completed and prepared by professors of the Houston School of Public health and of the UT Austin Center for Social Work Research that was based on the cost utility model, usage of extensive literature of similar interventions, costs savings and health outcomes related to those interventions.
The annual value of benefits provided to those served by the PCY Clinic at full implementation was calculated by multiplying the annual value of a single successful intervention by five. The rationale for selection of a multiplier of five was that to overcome resistance to change in a hard-to-serve population, both in the delivery and payment systems, five years of benefits would be needed. This assumption was verified as valid after an extensive literature review.

Cost-utility analysis (CUA) also was used to measure the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state. Cost-utility analysis is a useful tool for assessing the value of new health service interventions because it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across different types of interventions, the common health goal, or outcome, is the number of life-years added.

The CUA calculations indicate that the availability of the PCY Clinic has the potential to increase QALY among those it serves.

### Year 2 (10/1/2012 – 9/30/2013)

**Milestone 1**
- P-6: Develop integrated behavioral health and primary care services within collocated sites
  - Metric 1 P-6.1 Number of providers achieving Level 4 of interaction
    - Baseline: 2 prescribers staff the psychiatric and primary care clinics
    - Goal: 2 or 100% of baseline achievement close collaboration (Level 4)
      - Data Source: Project Data
  - Milestone 1 Estimated Incentive Payment: $1,538,919

### Year 3 (10/1/2013 – 9/30/2014)

**Milestone 2**
- P-6: Develop integrated behavioral health and primary care services within collocated sites
  - Metric 1 P-6.2 Number of providers achieving Level 5 of interaction
    - Goal: 2 prescribers achieve full integration (Level 5)
      - Data Source: Project Data
  - Milestone 2 Estimated Incentive Payment: $1,689,923

### Year 4 (10/1/2014 – 9/30/2015)

**Milestone 3**
- I-8: Integrated services
  - Metric 1: I-8.1. % of individuals receiving both physical and behavioral health care at the established location.
    - Baseline: 500 residents will receive services
    - Goal: 125 or 25% of baseline will receive integrated services
      - Data Source: Project Data.
  - Milestone 3 Estimated Incentive Payment: $1,807,824

### Year 5 (10/1/2015 – 9/30/2016)

**Milestone 4**
- I-8: Integrated services
  - Metric 1: I-8.1. % of all patients receiving integrated care.
    - Goal: 175 or 35% of baseline will receive integrated services
      - Data Source: Project Data.
  - Milestone 4 Estimated Incentive Payment: $1,746,690

### Year 2 Estimated Milestone Bundle Amount: $1,538,919

### Year 3 Estimated Milestone Bundle Amount: $1,689,923

### Year 4 Estimated Milestone Bundle Amount: $1,807,824

### Year 5 Estimated Milestone Bundle Amount: $1,746,690

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $6,783,356
Identifying Project and Provider Information:

Title: 2.15.1 Design, implement, and evaluate projects that provide integrated primary and behavioral health care services: Integrated Primary Care for SA and HIV Population
Unique RHP ID#:137251808.2.3 – PASS 1
Performing Provider: The Bexar County Board Of Trustees for Mental Health Mental Retardation Services, d/b/a/ The Center For Health Care Services
Performing Provider TPI: 137251808

Project Summary:

Provider Description: Center for Health Care Services (CHCS) is the Local Mental Health Authority for Bexar County (population 1.75M). CHCS provides behavioral health services and treatment to children, adolescents and adults.

Intervention(s): The Center For Health Care Services (CHCS) seeks to embed and integrate primary care services at the Restoration Center, a comprehensive substance abuse treatment facility. Adults served at the Restoration Center will experience enhanced access to primary care, including health promotion, disease prevention, health maintenance, counseling, patient education, and diagnosis and treatment of acute and chronic illnesses. Frequent co-morbidity of medical conditions and drug dependency among existing Restoration Center consumers verifies the appropriateness of the approach. CHCS’ Restoration Center serves up to 10,000 individuals annually with approximately half needing some physical health care during their period of treatment. Additionally, they commonly require support for enrollment in benefit programs (e.g., Medicaid), referrals for specialty care, and access to medications at low or no cost until health insurance coverage can be obtained.

This is a cost effective service as it diverts adults away from over-crowded emergency departments. The proposed project will expand and scale up an existing Clinic by providing a person-centered health care home for adult consumers of substance abuse and mental health services and their families when they are involved in their care. Results of integrated care will include better functioning in both domains, improved behavioral and physical health outcomes any lower costs to the community.

Need for the project: Individuals who utilize substance use treatment and other behavioral health treatments, including those with HIV and pregnant women, often have untreated physical health conditions. In the absence of integrated physical and behavioral health care, these conditions have the potential to worsen and ultimately require more expensive tertiary care and hospitalization.

Target population: Adults with substance abuse with or without other behavioral health disorders and who also have or are at risk for HIV, are pregnant or have other physical health problems. Based upon current service statistics, it is anticipated that 25% will be covered by Medicaid and 48% will be indigent and uninsured.

Category 1 or 2 expected patient benefits: The project seeks to ensure that in DY4, a goal of 1,250 patients with dual health care needs will receive integrated care of 5,000 total patients with dual health care needs and in DY5, 1,750 patients with dual health care needs will receive integrated care of the 5,000 total patients.

Category 3 outcomes: IT-9.2. Our goal for increasing the appropriate utilization of ED resources will be established in DY4.
Project Description:
The Center For Health Care Services (CHCS) seeks to embed and integrate primary care services at the Restoration Center, a comprehensive substance abuse treatment facility. Adults served at the Restoration Center will experience enhanced access to primary care, including health promotion, disease prevention, health maintenance, counseling, patient education, and diagnosis and treatment of acute and chronic illnesses. Frequent co-morbidity of medical conditions and drug dependency among existing Restoration Center consumers verifies the appropriateness of the approach. CHCS’ Restoration Center serves up to 10,000 individuals annually with approximately half needing some physical health care during their period of treatment. Additionally, they commonly require support for enrollment in benefit programs (e.g., Medicaid), referrals for specialty care, and access to medications at low or no cost until health insurance coverage can be obtained. This is a cost effective service as it diverts adults away from over-crowded emergency departments. The proposed project will expand and scale up existing Clinic and increase hours of operation to 24 hours. Results will include better behavioral and physical health outcomes at a lower cost to the community.

Goals. Improve health care by improving consumers’ capacity to participate and self-manage. Improve health outcomes by delivering the right care (behavioral then physical) at the right time (once stability and sobriety are achieved) and the right place (behavioral health clinic). Lower the cost of care. Increase ease of access and coordination of care for individuals served.

Challenges addressed by the project. Individuals in need of substance abuse and other behavioral health treatment, including those with HIV or pregnant women, often have untreated physical health conditions. In the absence of integrated physical and behavioral health care, these conditions have the potential to worsen and ultimately require more expensive tertiary care and hospitalization.

CHCS’ Restoration Center features Residential and Ambulatory Detoxification, Outpatient Substance Abuse Services, Opioid Addiction Treatment Outpatient Services, Sobering Unit, Sober Living Dorms and a Crisis Care Center. The majority of consumers served are episodically homeless and many are chronically homeless. At least 50% also suffer from a co-occurring mental illness and one or more chronic physical illnesses, e.g., cardiovascular disease, diabetes, stroke, cancer, HIV/AIDS, hepatitis and lung disease. Each of these illnesses has a higher prevalence among substance abuse patients, whose diminished capacity limits self-care and follow through. These consumers also are likely to perpetually cycle through emergency departments, substance abuse treatment settings, crisis care services and shelters. In San Antonio, roughly 45% of these high acuity patients are eligible for Medicaid but they are unable to navigate through either the behavioral or physical health systems, causing them to be largely untreated until symptom acuity necessitates a call for an ambulance and a trip to an emergency department.

5-year expected outcomes for CHCS. Development of an integrated care management center to be oriented around the patient so that primary care access and the patient experience can be improved. Decreased emergency room visits. Decreased use of emergency detoxification services. Decreased 911 calls. Decreased utilization of emergency transportation services.

5-year expected outcomes for persons served by the project. Increased preventive health
behaviors (e.g. vaccinations, nutrition, hygiene). Improved overall primary and behavioral health outcomes. Improved physical health status of HIV patients receiving primary care.

Relation to Regional Goals. Single-site, integrated primary and behavioral health care is believed to be an innovative approach as it first stabilizes the individual’s behavioral health and then enables him or her to participate in and remain compliant with primary care, including chronic disease prevention or treatment. Therefore, the proposed project supports achievement of the regional goal of “Integrating behavioral health with physical health care services in order to improve care and access to needed services” by addressing a population with problems substance use that is largely ignored in other settings. It also meets the CMS three part aim, as follows. The program enables and ensures individualized, patient-centered care. The program fills an existing gap in care and improves the existing behavioral health infrastructure to better serve Medicaid and uninsured adults in Bexar County and creates cost savings through reduced use of emergent and urgent care.

Starting Point/Baseline:
Integrated behavioral and physical health care is not currently available to the target population.

Rationale:
The project option (2.15.1 Design, implement and evaluate projects that provide integrated primary and behavioral health care services), process milestone (P-6 Develop integrated behavioral health and primary care services within co-located site) and improvement milestone (I-8.1 % of individuals receiving both physical and behavioral health care at the established location) were selected in correspondence to an existing, unmet need for integrated care among adults with co-occurring substance use, behavioral and physical health problems. The target population often has a complex combination of physical and behavioral health care needs combined with concomitant issues of substance abuse, traumatic injury, cognitive challenges and a lack of daily living skills and natural supports, causing them to be frequent users of public health services. This project will expand the capacity of currently available treatment options and will install a new, innovative sequential treatment methodology in an effort to avert outcomes such as potentially avoidable inpatient admission and readmission, and to promote recovery in the community.

Project Components:
Through the Integrated Primary Care for Substance Abuse and HIV population service, we propose to meet all required project components. a) Identify sites for integrated care projects, which would have the potential to benefit a significant number of patients in the community. Examples of selection criteria could include proximity/accessibility to target population, physical plant conducive to provider interaction; ability / willingness to integrate and share data electronically; receptivity to integrated team approach. b) Develop provider agreements whereby co-scheduling and information sharing between physical health and behavioral health providers could be facilitated. c) Establish protocols and processes for communication, data-sharing, and referral between behavioral and physical health providers. d) Recruit a number of specialty providers (physical health, mental health, substance abuse, etc. to provide services in the specified locations. e) Train physical and behavioral health providers in protocols, effective communication and team
approach. Build a shared culture of treatment to include specific protocols and methods of information sharing that include: Regular consultative meetings between physical health and behavioral health practitioners; Case conferences on an individualized as-needed basis to discuss individuals served by both types of practitioners; and/or Shared treatment plans co-developed by both physical health and behavioral health practitioners. f) Acquire data reporting, communication and collection tools (equipment) to be used in the integrated setting, which may include an integrated Electronic health record system or participation in a health information exchange – depending on the size and scope of the local project. g) Explore the need for and develop any necessary legal agreements that may be needed in a collaborative practice. h) Arrange for utilities and building services for these settings. i) Develop and implement data collection and reporting mechanisms and standards to track the utilization of integrated services as well as the health care outcomes of individual treated in these integrated service settings. j) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

**Unique community need identification numbers the project addresses:**

- **CN.1** - Texas ranks last in the nation on health care quality. RHP 6 is challenged to deliver improved quality and patient satisfaction.
- **CN.4** - There is a shortage of high quality mental and behavioral health services that are integrated with physical health and/or provide crisis stabilization.

More specifically, the proposed project will positively impact the following issues:

- Need for integrated behavioral health and primary care services
- Inadequate access to care management and resource navigation

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative: Significant enhancement. Currently, Integration for Primary Care for Substance Abuse and HIV population is not available through the community mental health system. The initiative will improve access for targeted patients while helping the system by reduction of primary care illness that otherwise would not be treated. (needs more work).

Related initiatives funded by U.S. Department of HHS.

Funding which was received from SAMHSA for a similar project, Project Carino, terminated in early 2013 and there is no current federal funding by U.S. Department of HHS.

**Related Category 3 Outcome Measure(s):**

- OD-9 Right Care, Right Setting
- IT-9.2 ED appropriate utilization.

**Reasons/rationale for selecting the outcome measures:** This measure is indicative of consumers receiving easily accessed care when it is needed most, a critical means of addressing emergent issues and reducing inappropriate use of emergency departments.

**Relationship to other Projects:**

CHCS is the only provider proposing an integrated behavioral and primary health care project for adults with substance use disorders in RHP 6. However, this project will
benefit from other proposed interventions and infrastructure capacity enhancements, including increased training of the primary care workforce (1.2) available to staff the proposed project and the development of workforce enhancement initiatives to support access to behavioral health providers (1.14).

**Relationship to Other Performing Providers’ Projects in the RHP:**

There are no similar projects proposed in RHP 6.

**Plan for Learning Collaborative:**

CHCS will participate in any and all relevant learning collaborative organized by University Health System.

**Project Valuation:**

The value for this project for DY 2 is $1,678,820 and $7,400,024 for all years. By DY5, 1,750 individuals will receive integrated behavioral and physical health care. The establishment of integrated care for adults receiving substance abuse treatment, who may be HIV+ and receiving care fills an existing gap in the local continuum of behavioral health care for high need adults and frequent utilizers of public health care resources. The availability of this new resource will ensure adults receive the treatment they need in an easily accessed location with the capacity to meet needs in both health domains, which will prevent or reduce costly, avoidable hospitalization and the inappropriate use of emergency departments. CHCS has a significant amount of existing infrastructure from which this project can be launched and only site preparation is required; thereby driving down the required investment and increasing the cost effectiveness of the approach.

The annual value of benefits provided to those served at full implementation considered several factors in valuing this project such as reducing costs at hospitals, costs for emergency detention and use of psychiatric institutions. This information was based on extensive literature as well as a valuation study completed and prepared by professors of the Houston School of Public health and of the UT Austin Center for Social Work Research that was based on the cost utility model, usage of extensive literature of similar interventions, costs savings and health outcomes related to those interventions.

The annual value of benefits provided to those served at full implementation was calculated by multiplying the annual value of a single successful intervention by five. The rationale for selection of a multiplier of five was that to overcome resistance to change in a hard-to-serve population, both in the delivery and payment systems, five years of benefits would be needed. This assumption was verified as valid after an extensive literature review.

Cost-utility analysis (CUA) also was used to measure the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state. Cost-utility analysis is a useful tool for assessing the value of new health service interventions because it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across different types of interventions, the common health goal, or
outcome, is the number of life-years added.

The CUA calculations indicate that the availability of integrated care has the potential to increase QALY among those it serves.

<th>Project Summary:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Provider Description:</strong> Center for Health Care Services (CHCS) is the Local Mental Health Authority for Bexar County (population 1.75M). CHCS provides behavioral health services and treatment to children, adolescents and adults.</td>
</tr>
<tr>
<td><strong>Intervention(s):</strong> This project results from a collaborative planning effort among area hospitals and CHCS to identify and engage in treatment adults with significant unmet behavioral and physical health care needs who perpetually cycle through the community’s emergency departments (ED) and inpatient psychiatric facilities. This population will be most efficiently served, will more likely recover and, as a result their quality of life will improve, if their providers collaboratively plan for their needs. To this end, CHCS is developing protocols and a shared cloud-based data platform that will enable ED staff to quickly verify that a patient is a super-utilizer and gain access to the community treatment plan. If the individual has been lost from care, e.g., has not filled prescriptions or made recent therapy appointments, they will be reconnected to their treatment team before leaving the ED. Also, because all members of the target population have complex health concerns with a history of substantial reliance on acute and sub-acute care, CHCS will expand treatment to encompass a holistic perspective, including integrated primary and behavioral health care and clinical and organizational alignment with other community providers involved in care. Project staff will be trained in the chronic care wellness and integrated care models to provide effective, evidence-based treatment to the patient population. An important attribute of the proposed project is that it is patient-centered and <em>in vivo</em>, meeting the patient where he or she is in terms of clinical presentation, readiness for engagement and change, need, and physical location. Service selections will be based on the results of comprehensive assessment and integrated treatment planning will ensure linkage to primary medical, mental health and substance abuse treatment services. A trauma-informed service delivery system will be used. Additional supports will include transition services to foster stability, peer support, specialized therapies, medical services, and residential options. The program will operate in the context of the recovery model in which the individual is encouraged and empowered to take an active role in his or her health and treatment, and is provided with tools and supports to achieve individual goals.</td>
</tr>
</tbody>
</table>
| **Need for the project:** Targeted individuals are not reliably engaged in appropriate, effective or efficient behavioral or primary health care that will ensure their needs are met or that stability and community functioning is restored. In addition to experiencing sub-standard outcomes for their own health, their inappropriate over-utilization of acute and sub-acute care results in the diversion of health care dollars that could be more effectively deployed, exacerbating the health care resource deficit in Bexar County. Historically,
Target population: The target population consists of adults with severe mental illness and other factors -- e.g., chronic physical health conditions, chronic or intermittent homelessness, cognitive issues resulting from severe mental illness and/or forensic involvement -- that produce an over-reliance on and over-utilization of emergency departments and psychiatric facilities and inpatient hospitals. Based upon current service utilization data, it is anticipated that 38% of the target population will be indigent and uninsured and 60% will be covered by Medicaid.

Category 1 or 2 expected patient benefits: The project seeks to enroll and serve individuals with targeted complex needs with a baseline of 100 individuals in DY3 with a goal to increase to 125 served. In DY4 the goal will increase to serving 160 individuals. In DY5, 48 individuals (30%) receiving specialized interventions will demonstrate improved functional status.

Category 3 outcomes: IT 10.1. Our goal, Quality of Life. Our goal for improvement in quality of life will be determined in Year 4. This outcome goal will positively impact the need for appropriate diversion from expensive tertiary care, which has been shown to be temporary and not impacting on the cycle of super utilization.

Project Description:
The proposed project results from a collaborative planning effort among area hospitals and CHCS to identify and engage in treatment adults with significant unmet behavioral and physical health care needs who perpetually cycle through the community’s emergency departments (ED) and inpatient psychiatric facilities. This population will be most efficiently served, and will more likely recover, if their providers collaboratively plan for their needs. To this end, CHCS is developing protocols and a shared cloud-based data platform that will enable ED staff to quickly verify that a patient is a super-utilizer and gain access to the community treatment plan. If the individual has been lost from care, e.g., has not filled prescriptions or made recent therapy appointments, they will be reconnected to their treatment team before leaving the ED. Also, because all members of the target population have complex health concerns with a history of substantial reliance on acute and sub-acute care, CHCS will expand treatment to include a holistic perspective, including integrated primary and behavioral health care and clinical and organizational alignment with other community providers involved in care. The project will expand a current CHCS pilot that is developing a community collaborative response to identifying and providing effective interventions to high utilizers. Historically, there has not been a mechanism for cross-identification of these individuals between systems i.e., where else are they seeking care, and how providers have not worked together to deliver the care that is essential to helping these individuals attain stability and a higher level of functioning. The pilot project is limited in scope by funding; the proposed project will expand the numbers served, establish a framework for an effective, integrated community response and foster long-term sustainability of the intervention.

Project staff will be trained in the chronic care wellness and integrated care models to provide effective, evidence-based treatment to the patient population. Five licensed Behavioral Health Care Managers will be hired and trained for every 100 new consumers...
served. A psychiatric care provider (MD or APN) will be hired for every 200 new consumers served. An important attribute of the proposed project is that the comprehensive, community-based interventions it includes are patient-centered and in vivo, meeting the patient where he or she is in terms of clinical presentation, readiness for engagement and change, need, and physical location. Service selections will be based on the results of comprehensive psychosocial and multi-axial assessment and integrated treatment planning will include linkage to primary medical, mental health and substance abuse treatment services. A trauma informed service delivery system will be used and will feature evidence-based practices and tools. Additional supports will include transition services to help establish a stable living environment, peer support, specialized therapies, medical services, and residential options. The program will operate in the context of the recovery model in which the individual is encouraged and empowered to take an active role in his or her health and treatment, and is provided with tools and supports to achieve individual recovery goals, which will yield measurable improvement in quality of life. This approach has been found to be efficacious with the target population and is in direct response to a community-identified need for appropriate diversion from expensive tertiary care, which has been shown to be temporary and not impacting on the cycle of super utilization.

**Goals:** The goals are to: 1) avert negative outcomes, e.g., potentially avoidable psychiatric inpatient admission and readmissions, criminal justice involvement and homelessness; 2) break the cycle of overutilization of ED; 3) promote wellness and adherence to medication and other treatments; and 4) promote recovery in the community and enhanced quality of life.

**Challenges addressed by the project:** The target population consists of adults with severe mental illness and other factors -- e.g., chronic physical health conditions, chronic or intermittent homelessness, cognitive issues resulting from severe mental illness and/or forensic involvement -- that produce an over-reliance on and over-utilization of emergency departments and psychiatric facilities. Targeted individuals are not reliably engaged in appropriate, effective or efficient behavioral or primary health care that will ensure their needs are met or that stability and community functioning is restored. In addition to experiencing sub-standard outcomes for their own health, their inappropriate over-utilization of acute and sub-acute care results in the diversion of health care dollars that could be more effectively deployed, exacerbating the health care resource deficit in Bexar County.

**5-year expected outcomes for CHCS.** 1) A comprehensive, collaborative continuum of care is established for the high utilizer population. 2) Scarce behavioral health care resources are more effectively utilized and cost of care is reduced. 3) Expanded access to psychiatric and related clinical services. 2) Increased engagement in care. 3) Reduced reliance upon crisis and emergency care. 4) Restoration of community functioning and quality of life.

**Recovery. Relation to Regional Goals.** Integrating all community care resources on behalf of the highest utilizing population is a key means of achieving the regional goal of “Improving the infrastructure for delivery of behavioral health services”. It also meets the CMS three part aim, as follows. The program fills an existing gap in care and **improves the existing behavioral health infrastructure** to better serve high utilizing adults in Bexar County. The program will support lasting community living and reduce hospital
re-admissions, which will **improve outcomes while containing cost growth.**

### Starting Point/Baseline:

The initial pilot project is funded for two years to serve a cohort of 50 individuals per year and to provide 60 intervention encounters per year per consumer. The proposed project will enable CHCS to serve an additional 50 super-utilizing consumers per year.

### Rationale:

The project option, 2.13.1, Design, implement, and evaluate research-supported and evidence-based interventions tailored towards individuals in the target population to include core components:

- **a)** Assess size, characteristics and needs of target population(s) (e.g., people with severe mental illness and other factors leading to extended or repeated psychiatric inpatient stays. Factors could include chronic physical health conditions; chronic or intermittent homelessness, cognitive issues resulting from severe mental illness and/or forensic involvement.
- **b)** Review literature / experience with populations similar to target population to determine community-based interventions that are effective in averting negative outcomes such as repeated or extended inpatient psychiatric hospitalization, decreased mental and physical functional status, nursing facility admission, forensic encounters and in promoting correspondingly positive health and social outcomes / quality of life.
- **c)** Develop project evaluation plan using qualitative and quantitative metrics to determine outcomes.
- **d)** Design models which include an appropriate range of community-based services and residential supports.
- **e)** Assess the impact of interventions based on standardized quantitative measures and qualitative analysis relevant to the target population.

Examples of data sources include: standardized assessments of functional, mental and health status (such as the ANSA and SF 36); medical, prescription drug and claims/encounter records; participant surveys; provider surveys. Identify “lessons learned,” opportunities to scale all or part of the intervention(s) to a broader patient populations, and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations.

Process Milestone P-2, Design community-based specialized interventions for target populations; and Improvement Milestone I-5, Functional Status, were selected in correspondence to an existing, unmet need for targeted interventions for super-utilizing adults with a complex constellation of unmet physical and behavioral health needs. The right place for these individuals to access specialized services is in community mental health settings. Attendant benefits include: a) positive impact on quality of life by ensuring consistent, appropriate treatment in the right setting; b) reduce inappropriate use of ED or in-patient psychiatric facilities; and, c) promote recovery and wellness with adherence to medication and other treatment modalities.

CHCS and the collaborating hospitals are conducting ongoing research and have identified multiple, evolving outcomes measures related to practice with this population from NAHQ, SAMHSA, Bureau of Primary Health Care, CMS. A Ph.D.-level external
evaluator has been hired to work with the partners on developing an evaluative framework that captures outcomes related to: reduction in system encounters, Quality of Life Measures, Self Efficacy, and general health measures aligned with NAHQ and the Bureau of Primary Health Care index of measures. The evaluation also will assess the impact of the intervention usage on standardized quantitative measures and qualitative analysis. Examples of data sources include: standardized assessments of functional, mental and health status (such as the ANSA and SF 36); medical, prescription drug and claims/encounter records; participant surveys; and provider surveys. The collaborators will identify “lessons learned,” opportunities to scale all or part of the intervention to a broader patient population, and key challenges.

Waiver funding will expand the initial pilot project and add new community based services, e.g., transitional and supported housing and residential support programs, substance abuse treatment, and incentives for recovery. The project also will add peer support specialists to the intervention team. Participating consumers will have access to comprehensive screening, assessment, treatment planning and care. Behavioral Health Care Managers will provide evidence-based interventions and comprehensive coordination of services and will monitor service use for each patient over time to quantify impact. Performance assessment activities will examine the effect of participation on a specific set of high impact outcomes: 1) emergency room encounters, 2) crisis encounters, 3) psychiatric hospital encounters, and 4) criminal justice involvement. Data explorations will examine outcome variations for different racial/ethnic groups, and any cost benefits/effectiveness for implementing this treatment model.

The proposed project will positively addresses CN.4 - Inadequate mental health services results in avoidable costs to hospital and criminal and juvenile justice systems. More specifically, this project will address

- Inadequate access to care management and resource navigation.
- Inadequate services for individuals who have been arrested or incarcerated either as a result or precipitated by unmet behavioral health needs.
- Inadequate resources for special needs populations (e.g., homeless adults, sex offenders) including efficiencies such as integrated behavioral and primary care, pharmacy services, telemedicine, and physician extenders.
- Inadequate outpatient care for adults with moderate acuity behavioral health needs to support reductions in hospital readmissions and the inappropriate use of emergency departments.

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative: Significant enhancement.

Related initiatives funded by U.S. Department of HHS. None

### Related Category 3 Outcome Measure(s):

- **OD-10 Quality Of Life/ Functional Status.**
- **IT-10.1 Quality of life**

This measure is indicative of consumer retention in care and enhanced stability, both of which are critical means of reducing unnecessary hospitalizations and the inappropriate use of emergency departments.
**Relationship to other Projects:**
The proposed project will address significant behavioral health care resource insufficiency in Bexar County. As such, it is an integral component of this County’s health care infrastructure. Another proposed project seeks to establish research-based care for a segment of the population of adults with mental illness. These resources will be coordinated with the proposed project to build a more durable continuum of care.

**Relationship to Other Performing Providers’ Projects in the RHP:**
UTHSCA is proposing a potentially similar project. CHCS will join any collaborative learning communities with UTHSCA or other providers dedicated to serving adults with mental illness.

**Plan for Learning Collaborative:**
CHCS will participate in any and all relevant learning collaboratives organized by University Health System.

**Project Valuation:**
The value for this project is $1,602,595 for DY 2 and $7,186,790 for all years. By DY4, 160 adults who are high utilizers of behavioral health care will receive targeted, specialized support every year. The introduction of specialized, intensive care for adults with severe mental illness will ensure they are treated expeditiously, connected to systems of care that will support community living and prevent or reduce costly, avoidable hospitalization, lengthy stays in institutions, further crises and the inappropriate use of emergency departments. CHCS has a significant amount of existing infrastructure from which this project can be launched and only site preparation is required; thereby driving down the required investment and increasing the cost effectiveness of the approach.

The annual value of benefits provided to those served at full implementation considered several factors in valuing this project such as reducing costs at hospitals, costs for emergency detention and use of psychiatric institutions. This information was based on extensive literature as well as a valuation study completed and prepared by professors of the Houston School of Public Health and of the UT Austin Center for Social Work Research that was based on the cost utility model, usage of extensive literature of similar interventions, costs savings and health outcomes related to those interventions.

The annual value of benefits provided to those served by the proposed program at full implementation was calculated by multiplying the annual value of a single successful intervention by five. The rationale for selection of a multiplier of five was that to overcome resistance to change in a hard-to-serve population, both in the delivery and payment systems, five years of benefits would be needed. This assumption was verified as valid after an extensive literature review.

Cost-utility analysis (CUA) also was used to measure the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state. Cost-utility analysis is a useful tool for assessing the value of new health service interventions because it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the
valuations fair across different types of interventions, the common health goal, or outcome, is the number of life-years added.

The CUA calculations indicate that the availability of specialized treatment for high utilizers of behavioral health care has the potential to increase QALY among those it serves.

</tbody>
</table>

**Project Summary:**

**Provider Description:** Center for Health Care Services (CHCS) is the Local Mental Health Authority for Bexar County (population 1.75M). CHCS provides behavioral health services and treatment to children, adolescents and adults.

**Intervention(s):** CHCS seeks to establish a 24-bed comprehensive, safe, structured day treatment program and a therapeutic milieu living environment for females on the Haven for Hope campus, to be known as the In-House Women’s Wellness Program (IHWWP). The majority of consumers will have co-occurring mental health and/or substance use and chronic physical disorders; the program will support return of functioning by integrating and managing all aspects of their care, including offering single-site primary and behavioral health care. The carefully monitored therapeutic living environment will promote compliance with medication and treatment and greater physical and mental health stability. The ultimate goal will be for these highly vulnerable female consumers to enter into and maintain their recovery. Goal achievement will be advanced with the provision of psychosocial trauma focused treatment (Seeking Safety), a much-needed intervention given the prevalence of sexual violence the target population has experienced and the correspondingly high rate of Post-Traumatic Stress Disorder. IHWWP also will provide medication compliance using the Wellness Self-Management model.

**Need for the project:** CHCS has established an on-site psychiatric clinic and an In-House Wellness Program (IHWP) dormitory for males at Haven for Hope and both have exceeded service expectations and continue to grow in positive impact. However, there remains a critical need for similar, specialized residential services for females, most of whom have a complex constellation of physical and behavioral health care needs, issues of substance abuse and trauma, cognitive challenges, a lack of daily living skills, and minimal if any natural supports. While delivering the right care, at the right time and the right place is the right approach for all, current data reflects females (55%) are more likely to seek treatment if it is readily available than males (41%).

**Target population:** Homeless females with untreated physical and behavioral health disorders. These women can be expected to have significant, chronic physical and behavioral health problems and all will be extremely low income. Based upon current service information, 16% of the target population will be funded by Medicaid and 57% will be indigent and uninsured.

**Category 1 or 2 expected patient benefits:** The project seeks to improve functional status by 37 women (40%) in DY4, increasing to 51 women (55%) in DY5 with a baseline of 92 homeless women served in DY3.

**Category 3 outcomes:** IT-10.1. Our goal, to be quantified in DY4, is to improve quality of life.
Project Description:

CHCS seeks to establish a 24-bed comprehensive, safe, structured therapeutic living milieu for females at the Haven for Hope campus. The majority of residents will be transitioning from Prospects Courtyard (PCY) and will have co-occurring mental health and/or substance use and chronic physical disorders; the program will support their transition by integrating and managing all aspects of their care, including offering single-site primary and behavioral health care. The carefully monitored environment will promote compliance with medication and treatment and greater physical and mental health stability. The ultimate goal will be for these highly traumatized female consumers to obtain and maintain recovery.

CHCS, with funding from public and private stakeholders, has established an on-site psychiatric clinic and an In-House Men’s Wellness Program (IHWP) dormitory serving males; both of which have exceeded service expectations and continue to grow in utilization and positive impact. However, there remains a critical need for similar, specialized residential services for females, most of whom have a complex constellation of physical and behavioral health care needs, issues of substance abuse and trauma, cognitive challenges and a lack of daily living skills, and minimal if any natural supports. The new In-House Women's Wellness and day treatment Program (IHWWP) will address each of these presenting problems with the provision of psychosocial trauma focused treatment (Seeking Safety), a much-needed intervention given the prevalence of sexual violence the target population has experienced and the correspondingly high rate of Post-Traumatic Stress Disorder (PTSD). IHWWP also will provide medication compliance (Day Treatment) through evidenced-based practices, such as Wellness Self-Management (WSM). Core components will be provided or available, including residential assistance, psychosocial rehabilitation, supported employment, prescription medications, peer support, substance abuse services, and employment supports.

Goals. Improve health outcomes by delivering the right care at the right time and the right place. Increase use of preventive, primary and specialty care. Decrease use of costly ED and inpatient care.

Challenges addressed by the project. PCY, initially designed to accommodate 400 homeless adults (June 2010), has grown to sleeping more than 600 at night and caring for more than 800 during the day. PCY data shows that 30% of this population is female. Untreated physical and behavioral health problems are pervasive among the target population. As a result, Texans with severe and persistent mental illness were found to die 28 years sooner than the general population and the predominant causes of death were chronic illness, e.g., heart disease, lung disease, cancer. The most frequent causes of death for females were heart disease and stroke, both of which can be effectively addressed through integrated physical and behavioral health care. However, in the absence of easily accessed, integrated care, studies show that homeless persons routinely use hospital emergency departments (ED), a costly substitution and a major contributor to congestion and over-crowding in urban ED. Also, the primary means of transport to an ED for homeless persons is EMS and in 2011, the City of San Antonio’s EMS responded to 950 emergency calls at Haven for Hope, resulting in approximately 600 transports to area ED. Finally, while delivering the right care, at the right time and the right place is the right approach for all, current data reflects females (55%) are more likely to seek treatment, if readily available, than males (41%).
### 5-year expected outcomes for CHCS

1) Development of an integrated care management model oriented around the **female patient** that features accessible, integrated primary and behavioral health care. 2) Decreased inappropriate ED visits. 3) Decreased 911, psychiatric crisis and triage calls. 4) Decreased inappropriate utilization of EMS. 5) Decreased utilization of State and crisis transitional psychiatric beds. 6) Implementation of CQI activities as directed by the SAMHSA evidence-based toolkit for Permanent Supported Housing.

### 5-year expected outcomes for persons served by the project

1) Increased preventive physical health behaviors (e.g. vaccinations, nutrition, hygiene). 2) Improved overall primary, mental, and behavioral health outcomes. 3) Improved patient experience of care.

### Relation to Regional Goals

Psychiatric triage and primary care are available within two blocks of PCY but residents will not consistently utilize these resources. Therefore, the proposed project supports achievement of the regional goal of “Integrating behavioral health with physical health and other evidence-based services and supports”. The program also enables and ensures individualized, female **person-centered** care, filling a **gender gap** in care and **improving** the existing behavioral health infrastructure to better serve Medicaid and uninsured female adults.

### Starting Point/Baseline:

Integrated behavioral and physical health care is not currently available to the target population. The City of San Antonio’s EMS made over 600 transports to ED for all Haven for Hope residents. Also, while men have access to comprehensive, safe, structured, integrated care management (the CHCS-operated In House Men’s Wellness Program), **women do not**. This unacceptable, gender-based **health disparity** will be addressed by the In-House Women’s Wellness Program.

### Rationale:

The project option “Other” (2.13.2 Implement other evidence based project to provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in an innovative manner), process milestone P2: Design community based specialized interventions for target population) and improvement milestone (I-5.1 % of individuals receiving specialized interventions who demonstrate improved functional status on standardized instruments) were selected in correspondence to an existing, unmet need for a comprehensive, safe, structured, integrated care management program for high-need, homeless females in Bexar County. The target population often has a complex combination of physical and behavioral health care needs combined with concomitant issues of substance abuse, traumatic injury, cognitive challenges and a lack of daily living skills and natural supports, causing them to be frequent users of public health services. This project will expand available treatment options (SS, WSM, and Matrix Psychosocial EBPs) for females and will establish a parallel, 24 bed dormitory (IHWWP) for females. Outcomes to be realized will include reductions in the inappropriate use of ED,
reductions in potentially avoidable inpatient admission and readmission, and promotion of recovery. CHCS has demonstrated the ability to improve functional status in this high need population through the existing, SAMHSA-funded Project HOMES, with outcomes that include significant functional improvement from baseline to 6 month follow-up.

The IHWWP addresses CN.4 – shortage of high quality mental and behavioral health services that are integrated with physical health care services and/or provide crisis stabilization.

More specifically it addresses:

- Need for integrated behavioral health and primary care services for homeless females
- Inadequate access to care management and resource navigation
- Inadequate resources for special needs populations (e.g., homeless adults, sex offenders) including efficiencies such as integrated behavioral and primary care, pharmacy services, telemedicine, and physician extenders
- Inadequate outpatient care for adults with moderate acuity behavioral health needs to support reductions in hospital readmissions and the inappropriate use of emergency departments

New initiative or significant enhancement of existing initiative. New initiative.

Related initiatives funded by U.S. Department of HHS. Other federal funding will not be used for this project. However as part of the continuum of housing and treatment services, clients being served in this proposed project are likely to benefit from other services offered by other separate programs that are funded by federal monies. CHCS recently received a Health Care Innovation grant from CMS to test and verify the efficacy of a specific integrated care model for the same target population. CHCS also received funding for Project HOMES, referenced above from the Substance Abuse and Mental Health Services Administration to serve the target population of high need homeless males and females.

**Related Category 3 Outcome Measure(s):**

The impact of the proposed primary and behavioral health care integration project can be measured by one stand-alone Category 3 Outcome Measure. 1) **OD-10 Quality of Life/Functional Status, IT-10.1 Quality of Life, IT-10-1a.** In a similar activity -- Project HOMES -- CHCS has already demonstrated statistically significant quality of life improvements using the SF-36 (IT-10-1b). Project HOMES will collaborate with the IHWWP to acquire permanent housing for the targeted population. **IT-10-1c.** Quality improvement will be monitored by SF-36 outcomes consisting of a pre-post single group design. The IHWWP target population also will be baselined and followed up at six (6) months.
**Relationship to other Projects:**

There are multiple projects proposed for RHP 6 that could support or be supported by the In-House Women’s Wellness Program, including increased training of the existing and additional peer workforce (1.2), implementation of a chronic disease registry (1.3), introduce, expand or enhance telemedicine/telehealth (1.7), and expand chronic care management models (2.2).

**Relationship to Other Performing Providers’ Projects in the RHP:**

There are no similar projects proposed for implementation in RHP 6. However, CHCS will participate in any relevant learning communities organized by University Health System.

**Plan for Learning Collaborative:**

CHCS will participate in any and all relevant learning collaborative organized by University Health System.

**Project Valuation:**

The value for this project for DY 2 is $1,006,831 and $4,369,746 for all years. By DY5, 92 homeless women with significant, chronic physical and behavioral health problems, many of which are exacerbated by lengthy histories of trauma, will receive day treatment and therapeutic milieu living services **every year**. The establishment of the In-House Women’s Wellness Program fills an existing gap in the local continuum of behavioral health care for high need female adults and frequent utilizers of public health care resources. The availability of this new resource will ensure homeless females receive the treatment they need in an easily accessed location with the capacity to meet needs in both health domains, and are stabilized, which will prevent or reduce costly, avoidable hospitalization and the inappropriate use of emergency departments. CHCS has a significant amount of existing infrastructure from which this project can be launched and only site preparation is required; thereby driving down the required investment and increasing the cost effectiveness of the approach.

The annual value of benefits provided to those served at full implementation considered several factors in valuing this project such as reducing costs at hospitals, costs for emergency detention and use of psychiatric institutions. This information was based on extensive literature as well as a valuation study completed and prepared by professors of the Houston School of Public health and of the UT Austin Center for Social Work Research that was based on the cost utility model, usage of extensive literature of similar interventions, costs savings and health outcomes related to those interventions.

The annual value of benefits provided to those served by the In-House Women's Wellness Program at full implementation was calculated by multiplying the annual value of a single successful intervention by five. The rationale for selection of a multiplier of five was that to overcome resistance to change in a hard-to-serve population, both in the delivery and payment systems, five years of benefits would be needed. This assumption was verified as valid after an extensive literature review.

Cost-utility analysis (CUA) also was used to measure the cost of the program in dollars.
and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state. Cost-utility analysis is a useful tool for assessing the value of new health service interventions because it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across different types of interventions, the common health goal, or outcome, is the number of life-years added.

The CUA calculations indicate that the availability of the In-House Women's Wellness Program has the potential to increase QALY among those it serves.

### Year 2 (10/1/2012 – 9/30/2013)

**Milestone 1**
- P2: Design community based specialized interventions for target population.
- **Metric 1:** P2.1. Project plans which are based on evidence/experience and which address the project goals.
- **Goal:** A written project service delivery plan ready for implementation in DY3.
- **Data Source:** Written plan.
- **Milestone 1 Estimated Incentive Payment:** $1,006,831
- **Year 2 Estimated Milestone Bundle Amount:** $1,006,831

### Year 3 (10/1/2013 – 9/30/2014)

**Milestone 2**
- P2: Design community based specialized interventions for target population.
- **Metric 1:** P2.3.1-Number of targeted individuals enrolled and served in the project
- **Baseline:** No women are being served until DY3.
- **Goal:** 92 women served
- **Data Source:** HMIS census report
- **Milestone 2 Estimated Incentive Payment:** $1,081,226
- **Year 3 Estimated Milestone Bundle Amount:** $1,081,226

### Year 4 (10/1/2014 – 9/30/2015)

**Milestone 3**
- I-5: Functional Status
- **Metric 1:** I-5.1 – The percentage of individuals receiving specialized interventions who demonstrate improved functional status on standardized instruments
- **Goal:** 37 or 40% of baseline will demonstrate improvement in functional status
- **Data Source:** Standardized functional assessment instrument.
- **Milestone 3 Estimated Incentive Payment:** $1,161,011
- **Year 4 Estimated Milestone Bundle Amount:** $1,161,011

### Year 5 (10/1/2015 – 9/30/2016)

**Milestone 4**
- 1.5 Functional Status
- **Metric 1:** I-5.1 – The percentage of individuals receiving specialized interventions who demonstrate improved functional status on standardized instruments
- **Goal:** 51 or 55% of baseline will demonstrate improvement in functional status
- **Data Source:** Standardized functional assessment instrument.
- **Milestone 4 Estimated Incentive Payment:** $1,120,678
- **Year 5 Estimated Milestone Bundle Amount:** $1,120,678

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $4,369,746

<tr>
<th><strong>Project Summary:</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Provider Description:</strong> Hill Country Community MHMR Center (dba Hill Country MHDD Centers) is a community mental health center providing mental health, substance use disorder, early childhood intervention and intellectual and developmental disability services to the following counties of RHP6 (Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde). Hill Country serves a 14,390 square mile area of RHP6 with a population of approximately 401,123 in 2012.</td>
</tr>
<tr>
<td><strong>Intervention(s):</strong> This project will implement two Mobile Crisis Outreach Teams (one for Kerr and Gillespie counties and one for Val Verde County) to provide 24 hour a day, 7 day a week behavioral health crisis intervention and crisis follow up services within the community setting in order to reduce emergency department utilization, incarceration and hospitalizations.</td>
</tr>
<tr>
<td><strong>Need for the project:</strong> Between Gillespie, Kerr and Val Verde counties, Hill Country responded to 444 behavioral health crisis episodes between September 2011 and August 2012. Providing committed Mobile Crisis Outreach Teams transitions from screening for psychiatric hospitalization to providing community crisis services and supports aimed at helping the individual stabilize in the community.</td>
</tr>
<tr>
<td><strong>Target population:</strong> The target population is individuals within Gillespie, Kerr and Val Verde counties who have a behavioral health crisis. Between September 2011 and August 2012 this consisted of 444 individuals. Approximately 32% of our behavioral health patients within RHP6 have Medicaid and approximately 82% have income below $15,000 per year.</td>
</tr>
<tr>
<td><strong>Category 1 or 2 expected patient benefits:</strong> The project aims to establish two Mobile Crisis Outreach Teams which will have provided community based behavioral health crisis and crisis follow-up services to a minimum of 190 individuals within the community (30 in DY3; 60 in DY4 and .100 in DY5)</td>
</tr>
</tbody>
</table>
| **Category 3 outcomes:** IT-10.2 Activities of Daily Living (DLA-20) Our goal is to have, at a minimum, 20% of the individuals served by the Mobile Crisis Outreach Teams showing improvement on the Activities of Daily Living (DLA-20) which demonstrates stabilizing the individual in the community thus reducing the need for inpatient hospitalization, emergency department utilization and incarceration.
**Project Description:**

Hill Country MHDD Centers does not currently have Mobile Crisis Outreach Teams within the eleven counties served by Hill Country from Regional Health Plan 6. Mobile Crisis Outreach Team services are would be available 24 hours/day, 7 days per week. According to *Evaluation Findings for the Crisis Services Redesign Initiative* published by Texas A&M University in January 2010, the development of Mobile Crisis Outreach Teams moves the focus from screening individuals for state hospitalization to considering other intervention strategies tailored to the needs of the particular situation thus increasing the likelihood that crises can be resolved in the community. Mobile Crisis Outreach Team (MCOT) activities include Crisis Assessment, Treatment Placement, and Preventive Crisis Support Services. MCOT staff not only help resolve crisis episodes, they also help recovering consumers regain stability and resiliency to avoid relapse by providing temporary supports, providing support and care for individuals in eminent danger of or following a crisis, and provide follow-up care for consumers recently released from a psychiatric hospital. Mobile Crisis Outreach Teams typically are comprised of a combination of Qualified Mental Health Professionals, Licensed Practitioners of the Healing Arts, psychiatrists, and nurses.

Hill Country MHDD Centers is planning to implement two Mobile Crisis Outreach Teams. Based on the number of consumers who had crisis calls during fiscal year 2012, one Mobile Crisis Outreach Team would be serve Gillespie and Kerr counties where 315 individuals had crisis episodes during the last year and one would serve Val Verde County along the Texas Mexico border where 129 individuals had crisis episodes during the last fiscal year.

**Challenges:**

The primary challenge for implementation of the project is recruiting behavioral health staff available on a 24 hour basis. Hill Country will address the challenge by offering incentive, if necessary, and utilizing Psychiatrists for consultation for the Mobile Crisis personnel through telephone and telemedicine.

**Goals:**

The goal of this project is to establish alternatives to reduce emergency department utilization, inpatient utilization, and incarceration by developing wrap around services within the community for individuals in psychiatric crisis. By the end of five years, Hill Country will have established two additional Mobile Crisis Outreach Teams which will have provided services to a minimum of 190 consumers within the community (30 in DY3; 60 in DY4 and 100 in DY5).

**Relationship to the Regional Goals:**

The goal of this project is to use Mobile Crisis Outreach Teams to provide behavioral health crisis services, wrap around and follow up services based on each individual’s needs within the community setting. By providing these services in the community, Hill Country will be meeting the regional goal of the Triple Aim by providing patients high-quality and patient-centered care, in the most cost effective way. In addition, the establishment of the Mobile Crisis Outreach Teams will help achieve the regional goal to improve the health care infrastructure to better serve the Medicaid and uninsured residents of Gillespie, Kerr and Val Verde counties.
Starting Point/Baseline:
Hill Country MHDD Centers currently operates a Mobile Crisis Outreach Team in Hays County which is outside of Regional Healthcare Partnership 6. Hill Country will utilize the experience and lessons learned from operation of the Hays County Mobile Crisis Outreach Team to establish two Mobile Crisis Outreach Teams in Regional Healthcare Partnership 6. The Hays County Mobile Crisis Outreach Team served 228 consumers during the most recent fiscal year. Hill Country MHDD Centers currently does not operate a Mobile Crisis Outreach Team within Regional Health Partnership 6. Therefore, the baseline number of participants begins at 0 in DY2.

Rationale:
Hill Country MHDD Centers is planning to implement two Mobile Crisis Outreach Teams. Based on the number of consumers who had crisis calls during fiscal year 2012, one Mobile Crisis Outreach Team would be serve Gillespie and Kerr counties where 315 individuals had crisis episodes during the last year and one would serve Val Verde County along the Texas Mexico border where 129 individuals had crisis episodes during the last fiscal year. Mobile Crisis Outreach Teams are designed to avoid psychiatric hospitalization whenever possible by providing services within the community.

Mobile Crisis Outreach Team (MCOT) activities include Crisis Assessment, Treatment Placement, and Preventive Crisis Support Services. MCOT staff not only help resolve crisis episodes, they also help recovering consumers regain stability and resiliency to avoid relapse by providing temporary supports, providing support and care for individuals in eminent danger of or following a crisis, and provide follow-up care for consumers recently released from a psychiatric hospital. Mobile Crisis Outreach Teams typically are comprised of a combination of Qualified Mental Health Professionals, Licensed Practitioners of the Healing Arts, psychiatrists, and nurses.

Project Components:
Through the Mobile Crisis Outreach Teams, Hill Country MHDD Centers proposes to meet all required project components:

A) Assess size, characteristics and needs of target population. Hill Country will collect and analyze information on individuals who have a behavioral health crisis and review contributing factors such as homelessness, noncompliance with medication, diagnosis, unemployment, economic struggles and other factors contributing to crisis episodes in order to determine appropriate staffing and skill sets necessary for service provision as well as specific locations for Mobile Crisis Outreach Teams.

B) Review literature / experience with populations similar to target population to determine community-based interventions that are effective in averting negative outcomes such as repeated or extended inpatient psychiatric hospitalization, decreased mental and physical functional status, nursing facility admission, forensic encounters and in promoting correspondingly positive health and social outcomes / quality of life. Based on the size, characteristics and needs for the target population, Hill Country will review appropriate literature and experiences regarding serving individuals in behavioral health crisis in order to provide targeted training for staff and to develop innovative wrap around services to help avert future crisis episodes.
C) **Develop project evaluation plan using qualitative and quantitative metrics to determine outcomes.** Hill Country will develop a project evaluation plan that will review items such as the number of individuals served, the issues leading to the crisis, the services received, the number of individuals receiving follow up services after the crisis episode, the number of individuals with recurring crisis episodes, and progression on the Activities of Daily Living assessment.

D) **Design models which include an appropriate range of community-based services and residential supports.** Based on the size, characteristics and needs for the target population, Hill Country will train Mobile Crisis Outreach Team staff in the most appropriate interventions to address the needs of the individuals and in connecting the individuals with other appropriate resources within the community.

E) **Assess the impact of interventions based on standardized quantitative measures and qualitative analysis relevant to the target population based on information from the Adult Needs and Strength Assessment and/or participant surveys, and identify opportunities to scale all or part of the intervention(s) to a broader patient population and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations.** Hill Country will utilize the Activities of Daily Living assessment to determine progression of individuals receiving Mobile Crisis Outreach Team services. In addition, Hill Country will do follow up surveys with individuals who receive Mobile Crisis Outreach Team services to determine satisfaction with services and to help ensure stabilization of symptoms in order to avert additional crisis episodes.

Unique community need identification number the project addresses:
CN.4 There is a shortage of high quality mental and behavioral health services that are integrated with physical health and/or provide crisis stabilization.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
Hill Country does not have a Mobile Crisis Outreach Team within Regional Healthcare Partnership 6. Through funding provided by the Texas Department of State Health Services, Hill Country provides a Crisis Hotline certified by the American Association of Suicidology and sends Qualified Mental Health Professionals to address the immediate needs of the crisis and determine if the individual is appropriate for psychiatric hospitalization. The addition of the Mobile Crisis Outreach Teams would give committed staff to providing ongoing crisis services in order to reduce the number psychiatric hospitalizations and avert recurrence of the psychiatric crisis.

**Related Category 3 Outcome Measure(s):**

OD-10 Quality of Life/Functional Status  
IT-10.2 Activities of Daily Living

Reasons/rationale for selecting the outcome measure:
Mobile Crisis Outreach Team service impacts an individual’s mental health and thus their quality of life.
of life. It impacts the individual’s self care as well as their ability to cope with their environment. When an individual is unable to properly care for themselves or to cope with their local environment, they are at greater risk of unemployment and poor health. The Activities of Daily Living will be utilized to provide an overview of functional status, determine activity limitations, establish a baseline for treatment, provide a guide for intervention planning, to evaluate interventions and monitor progress and to plan for future services and discharge.

The Activities of Daily Living will be measured utilizing the DLA-20 Functional Assessment.

The DLA-20 Functional Assessment is a functional assessment, proven to be reliable and valid, designed to assess what daily living areas are impacted by mental illness or disability. The assessment tool identifies where outcomes are needed so clinicians can address those functional deficits on individualized service plans. THE DLA-20 is intended to be used by all disabilities and ages. Developmental Disabilities and Alcohol/Drug Abuse forms are personalized for daily functional strengths and problems associated with those diagnoses.

THE DLA-20 utilizes the following 20 domains: Health Practices, Housing Stability and Maintenance, Communication, Safety, Managing Time, Nutrition, Problem Solving, Family Relationships, Alcohol/Drug Use, Leisure, Community Resources, Social Network, Sexuality, Productivity, Coping Skills, Behavior Norms, Personal Care/Hygiene, Grooming, and Dress. For the targeted population, individuals with Co-occurring Psychiatric and Substance Use Disorder, the DLA-20 will identify and address areas the disorders have impacted such as Alcohol/Drug Use, Social Network, Productivity, Housing Stability and Maintenance and Managing Money.

**Relationship to other Projects:**
Provision of Mobile Crisis Outreach Team services as an alternative to inpatient and emergency department services reinforces objectives for all other behavioral health services provided by Hill Country through Regional Healthcare Partnership 6 (1333340307.2.2 Psychiatric Consultation, 133340307.2.3 Co-occurring Psychiatric and Substance Use Disorder Services, and 133340307.2.4 Trauma Informed Care) by providing specialized services addressing crisis episodes and aimed at averting reoccurrence of crisis episodes experienced by an individual that if not addressed in the community may result in needing inpatient psychiatric services. Addressing the crisis episode in the community enables the individual to move forward with treatments and to be more successful in their recovery. In addition, by addressing crisis in the community, exacerbation of symptoms are reduced resulting in a reduction of Emergency Department utilization and potentially preventable hospital admissions (RD-1-3)

**Relationship to Other Performing Providers’ Projects in the RHP:**
Hill Country MHDD Centers is the local mental health authority that provides services within the following counties of Regional Healthcare Partnership 6: Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde. The other three local mental health authorities (Bluebonnet Trails, Camino Real, and Center for Healthcare Services) provides mental health services to the remaining counties within Regional Healthcare Partnership 6 and service areas do not overlap. Hill Country is committed to ongoing advancement of services for the individuals we serve and is willing to participate in a learning collaborative with other providers within the region to continually improve services and data collection and to identify how to address additional needs that may arise.
### Plan for Learning Collaborative:

Hill Country MHDD Centers will participate in a learning collaborative that meets annually to discuss local disparities in care and the ways they have successfully gathered relevant data and ultimately better served the populations in the projects.

### Project Valuation:

Project valuation is based on a weighted average of Achieving Waiver Goals, Addressing Community Needs, Project Scope, and Project Investment. The valuation is supported by cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). QALYs incorporate costs averted when known (e.g., emergency room visits that are avoided). The valuation on this project is based on 190 consumers over the life of the project resulting in a valuation overall of $15,642 per individual served.

**Year 2** (10/1/2012 – 9/30/2013)

**Milestone 1**
P-2: Design community-based specialized intervention for target population

**Metric 1 P-2.1:** Project plans based on evidence/experience and which address the project goals

- **Baseline:** No intervention has been designed
- **Goal:** Submission of project plan
- **Data Source:** Project documentation

**Milestone 1 Estimated Incentive Payment:** $626,102

**Year 3** (10/1/2013 – 9/30/2014)

**Milestone 2**

- **1-X:** Number of individuals beginning service during demonstration year

**Metric 1 1-X.1:** Number of targeted individuals beginning services during demonstration year (Mobile Crisis Outreach Teams)

- **Baseline/Goal:** Baseline - 0 individuals served; Goal - 30 individuals beginning service during DY3

**Data Source:** Hill Country MHDD records/EHR

**Milestone 2 Estimated Incentive Payment:** $653,159

**Year 4** (10/1/2014 – 9/30/2015)

**Milestone 3**
P-4: Evaluate and continuously improve interventions

**Metric 1 P4.1:** Project planning and implementation documentation demonstrates plan, do, study act quality improvement cycles

- **Baseline:** No evidence of improvement initiatives
- **Goal:** Documentation of how monthly real-time data is used to guide continuous quality improvement

**Data Source:** Hill Country MHDD records

**Milestone 3 Estimated Incentive Payment:** $329,955

**Year 5** (10/1/2015 – 9/30/2016)

**Milestone 5**
P-4: Evaluate and continuously improve interventions

**Metric 1 P4.1:** Project planning and implementation documentation demonstrates plan, do, study act quality improvement cycles

- **Baseline:** DY4 improvement initiatives
- **Goal:** Documentation of how monthly real-time data is used for rapid-cycle improvement to guide continuous quality improvement

**Data Source:** Hill Country MHDD records

**Milestone 5 Estimated Incentive Payment:** $337,550

**Project Summary:**

<table>
<thead>
<tr>
<th>Provider Description</th>
<th>Hill Country Community MHMR Center (dba Hill Country MHDD Centers) is a community mental health center providing mental health, substance use disorder, early childhood intervention and intellectual and developmental disability services to the following counties of RHP6 (Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde). Hill Country serves a 14,390 square mile area of RHP6 with a population of approximately 401,123 in 2012.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intervention(s)</td>
<td>This project will implement psychiatric and clinical guidance 24 hour a day, 7 day a week for primary care physicians and hospitals within the 11 counties served by Hill Country in RHP6 in order to help physicians identify and treat behavioral health symptoms earlier in order to avoid exacerbation of symptoms into a behavioral health crisis.</td>
</tr>
<tr>
<td>Need for the project</td>
<td>In meetings with the six general hospitals throughout Hill Country’s service area in RHP6, the hospitals noted that one of the greatest needs for their doctors is psychiatric consultation. In addition, ten of the eleven counties served by Hill Country in RHP6 are designated as Entire County Healthcare Provider Shortage Areas for Mental Health.</td>
</tr>
<tr>
<td>Target population</td>
<td>The target population is individuals within Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde counties who demonstrate behavioral health symptoms and seek treatment at area hospitals or with their primary care physician. Based on the population served in Hill Country’s behavioral health program in RHP6, approximately 32% of our behavioral health patients within RHP6 have Medicaid and approximately 82% have income below $15,000 per year.</td>
</tr>
<tr>
<td>Category 1 or 2 expected patient benefits</td>
<td>The project aims to establish psychiatric and clinical guidance 24 hours a day, 7 days a week for primary care physicians and hospitals with the 11 counties served by Hill Country in RHP6 which will provide psychiatric consultation and clinical guidance to primary care physicians and hospitals in order to identify behavioral health symptoms and to begin treatment as soon as possible. The project seeks to provide 4,000 psychiatric consultations by the end of DY5 (500 during DY3; 1,500 during DY4; and 2,000 during DY5) for the 11 counties served by Hill Country in RHP6.</td>

| Category 3 outcomes | IT-12.5 Other USPSTF-endorsed screening outcome measures (PHQ-A/BDI-PC) 5% of population between 12 and 18 years of age have had PHQ-A or BDI-PC screening performed in order to identify symptoms and treat adolescents with symptoms of depression. IT-12.5 Other USPSTF-endorsed screening outcome measures (PHQ-9) 5% of population over
18 years of age have had PHQ-9 screening performed in order to identify symptoms and treat adults with symptoms of depression

IT-12.5 Other USPSTF-endorsed screening outcome measures (CAGE/AUDIT) 5% of population over 18 years of age have had a CAGE or AUDIT screening performed in order to identify symptoms and treat adults with substance use disorder

**Project Description:**

According to *Mental Health Care by Family Physicians*, a paper prepared by the American Academy of Family Physicians, “Mental health issues are frequently unrecognized and even when diagnosed are often not treated adequately. Recognition and treatment of mental illness are significant issues for primary care physicians, who provide the majority of mental health care. In a recent national survey of mental health care, 18% of the surveyed population with and without a DSM-IV diagnosis of a mental health disorder sought treatment during a 12 month period, with 52% of those visits occurring in the general medical (all primary care) sector. Estimates are that 11% to 36% of primary care patients have a psychiatric disorder, with one recent survey of mental health conditions in urban family medicine practices revealing that over 40% of survey respondents met criteria for a mental health disorder.”

Recognition and treatment of mental illness are significant issues for primary care physicians, who provide the majority of mental health care. Due to ten of the eleven counties served by Hill Country MHDD Centers being designated as Mental Health Professional Shortage areas, there is a need to develop Psychiatric Consultation services and have them available for Primary Care Physicians and hospitals throughout the region to assist with complex psychiatric needs.

**Challenges:**
The greatest challenge of the project will be recruitment of necessary personnel due to being Mental Health Professional Shortage areas. Hill Country will address the challenge by offering incentives as necessary.

**Goals:**
The goal of this project is to provide PCPs and hospitals within Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde counties with the necessary resources and guidance to adequately treat patients who present with behavioral health conditions through Psychiatric Consultation. By the end of five years, Hill Country MHDD Centers will have an established psychiatric consultation service available for all primary care providers and hospitals within the eleven counties with at least fifty providers enrolled and a minimum of twenty percent of primary care physicians within the counties utilizing the service will be satisfied with the psychiatric consultation provided for patients in their care. Overall, the availability of Psychiatric Consultation should result in earlier identification and treatment of mental health issues and increase integration of services for individuals seeking psychiatric assistance in the primary care setting.

**Relationship to Regional Goals:**
The goal of this project is to establish Virtual Psychiatric and Clinical Guidance to Primary Care Physicians and Hospitals. By providing Virtual Psychiatric and Clinical Guidance in the community, Hill Country will be meeting the regional goal of the Triple Aim by providing...
patients high-quality and patient-centered care, in the most cost effective way. In addition, providing consultation and guidance to primary care physicians further develops and maintains a coordinated care delivery system.

### Starting Point/Baseline:

There are currently no dedicated resources for behavioral health consultation available to hospitals and primary care physicians within the eleven counties served by Hill Country within RHP 6. No formal structure currently exists for primary care physicians and hospitals to obtain clinical guidance regarding patients presenting with behavioral health issues.

### Rationale:

Hill Country MHDD Centers serves eleven counties (Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde) within Regional Healthcare Partnership 6. Ten of the eleven counties served by Hill Country MHDD Centers are designated as Entire County Healthcare Provider Shortage Areas for Mental Health (Bandera, Comal, Edwards, Gillespie, Kerr, Kinney, Medina, Real, Uvalde and Val Verde) As such, resources for psychiatric and clinical guidance to primary care providers delivering services to behavioral health patients is very limited and not formalized throughout the area.

The eleven counties served by Hill Country MHDD within RHP6 have a total population of 401,123 in 2012. Within the eleven counties, there are six general hospitals (CHRISTUS Santa Rosa New Braunfels, Hill Country Memorial, Peterson Regional Medical Center, Medina Regional Hospital, Uvalde Memorial Hospital, and Val Verde Regional Medical Center) and there are three hundred thirty-four physicians with their primary practice location listed in the area. Of these three hundred thirty-four physicians, ninety-five have their specialty listed as Family Practice or General Practice.

### Project Components:

As a formal structure for psychiatric consultation for primary care physicians and hospitals does not exist within the eleven counties, Hill Country MHDD Centers proposes to meet all required project components:

- **A) Establish the infrastructure and clinical expertise to provide remote psychiatric consultative services.** Hill Country will review and improve telecommunication equipment based on estimated volume of services and recruit appropriate clinical staff with the clinical expertise to provide remote psychiatric consultative services.

- **B) Determine the location of primary care settings with a high number of individuals with behavioral health disorders (mental health and substance abuse) presenting for services, and where ready access to behavioral health expertise is lacking. Identify what expertise primary care providers lack and what they identify as their greatest needs for psychiatric and/or substance abuse treatment consultation via survey or other means.** Hill Country will survey area hospitals and primary care physicians to determine the potential volume of consultation needed as well as the primary types of issues where consultation is needed. The survey will include areas of needed consultation, estimated of occurrences for consultation, as well as the means by which the primary care physician wishes to receive consultation.
C) Assess applicable models for deployment of virtual psychiatric consultative and clinical guidance models. Based on feedback from primary care physicians and hospitals, Hill Country will review successful models of psychiatric consultation and assess the models for applicability to the region being served to determine the most appropriate methods to implement.

D) Build the infrastructure needed to connect providers to virtual behavioral health consultation. Hill Country will review current telecommunication capacity and improve telecommunication and telemedicine equipment based on estimated volume of services and connections needed to perform consultation efficiently and effectively based on the volume of services estimated and the model of consultation being provided. Hill Country will also develop staffing patterns and acquire all necessary personnel to ensure appropriate clinical expertise is available for consultation regarding both adult and children’s mental health needs.

E) Ensuring staff administering virtual psychiatric consultative services are available to field communication from medical staff on a 24-hour basis. Hill Country will staff the program for 24 hour a day coverage, will survey hospitals and primary care physicians to ensure clinical guidance is available 24 hours a day as needed, and conduct random mystery calls for clinical guidance to ensure 24 hour virtual psychiatric consultative services are available.

F) Identify which medical disciplines within primary care settings (nursing, nursing assistants, pharmacists, primary care physicians, etc.) could benefit from remote psychiatric consultation. Based on the recommended model of implementation for the service area and feedback from primary care physicians, area hospitals and other medical providers, Hill Country will conduct needs assessments to determine which primary care settings could benefit from remote psychiatric consultation.

G) Provide outreach to medical disciplines in primary care settings that are in need of telephonic behavioral health expertise and communicate a clear protocol on how to access these services. Based on needs assessments and survey, Hill Country will develop protocol and enter memorandums of understanding which define a clear protocol on how to access the remote psychiatric consultation.

H) Identify clinical code modifiers and/or modify electronic health record data systems to allow for documenting the use of telephonic behavioral health consultation. Hill Country will add necessary service codes and modifiers to the EHR and other tracking documents within the agency to track all activity of the telephonic behavioral health consultation.

I) Develop and implement data collection and reporting standards for remotely delivered behavioral health consultative services. Hill Country will formalize procedures for collecting and reporting on activities associated with remotely delivered behavioral health consultative services.

J) Review the intervention(s) impact on access to telephonic psychiatric consults and identify “lessons learned,” opportunities to scale all or part of the intervention(s) to a broader patient population, and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations. Hill Country will continually review with primary care providers how the service has supported their practice, ways to improve the service, and how to expand the service to additional providers.

Unique community need identification number the project addresses:
CN.4 There is a shortage of high quality mental and behavioral health services that are integrated with physical health and/or provide crisis stabilization.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

There are currently no Virtual Psychiatric Consultation services available within the counties served by Hill Country in RHP.

**Related Category 3 Outcome Measure(s):**

**OD-12 Primary Care and Primary Prevention**

**IT-12.5 Other USPSTF-endorsed screening outcome measures (PHQ-A/BDI-PC)**

The number of PHQ-A/BDI-PC performed by Primary Care Physicians on patients/individuals enrolled to receive behavioral health consultation will be divided by the 12 to 18 year population of Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde as determined by Texas Department of State Health Services population estimates.

**IT-12.5 Other USPSTF-endorsed screening outcome measures (PHQ-9)**

The number of PHQ-9 performed by Primary Care Physicians on patients/individuals enrolled to receive behavioral health consultation will be divided by the population over 18 of Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde as determined by Texas Department of State Health Services population estimates.

**IT-12.5 Other USPSTF-endorsed screening outcome measures (CAGE and AUDIT)**

The number of CAGE/AUDIT performed by Primary Care Physicians on patients/individuals enrolled to receive behavioral health consultation will be divided by the population over 18 of Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde as determined by Texas Department of State Health Services population estimates.

Reasons/rationale for selecting the outcome measure:
The screening instruments above were selected as a method for primary care providers to identify issues that may require virtual psychiatric consultation. By performing the instruments, early diagnosis and intervention of potential symptoms may be addressed in order to avoid escalation of symptoms into a crisis episode.

**Relationship to other Projects:**

Provision of Virtual Psychiatric Consultation services reinforces objectives for all other behavioral health services provided by Hill Country through Regional Healthcare Partnership 6 (133340307.2.1 Mobile Crisis Outreach Teams, 133340307.2.3 Co-occurring Psychiatric and Substance Use Disorder Services, and 133340307.2.4 Trauma Informed Care) by providing specialized consultative services addressing behavioral health issues before they become a crisis. Addressing the behavioral health issues in the community enables the individual to move forward with treatments and to be more successful in their recovery. In addition, by addressing crisis in the community, exacerbation of symptoms are reduced resulting in a reduction of Emergency Department utilization and potentially preventable hospital admissions (RD-1-3).
**Relationship to Other Performing Providers’ Projects in the RHP:**

Hill Country MHDD Centers is the local mental health authority that provides services within the following counties of Regional Healthcare Partnership 6: Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde. The other three local mental health authorities (Bluebonnet Trails, Camino Real, and Center for Healthcare Services) provides mental health services to the remaining counties within Regional Healthcare Partnership 6 and service areas do not overlap. Hill Country is committed to ongoing advancement of services for the individuals we serve and is willing to participate in a learning collaborative with other providers within the region to continually improve services and data collection and to identify how to address additional needs that may arise.

**Plan for Learning Collaborative:**

Hill Country MHDD Centers will participate in a learning collaborative that meets annually to discuss local disparities in care and the ways they have successfully gathered relevant data and ultimately better served the populations in the projects.

**Project Valuation:**

Project valuation is based on a weighted average of Achieving Waiver Goals, Addressing Community Needs, Project Scope, and Project Investment. The valuation is supported by cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). QALYs incorporate costs averted when known (e.g., emergency room visits that are avoided). The valuation on this project is based on an estimated 4,000 consultations for individual patients over the life of the project (500 during DY3; 1,500 during DY4; and 2,000 during DY5) resulting in a valuation per patient of $1,486.04.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $5,228,544
Identifying Project and Provider Information:

Title: 2.13.1 Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specific setting: Co-occurring Psychiatric and Substance Use Disorder

Unique RHP ID#: 133340307.2.3 - PASS 1

Provider Name: Hill Country Community MHMR Center (dba Hill Country MHDD Centers)

TPI: 133340307

Project Summary:

Provider Description: Hill Country Community MHMR Center (dba Hill Country MHDD Centers) is a community mental health center providing mental health, substance use disorder, early childhood intervention and intellectual and developmental disability services to the following counties of RHP6 (Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde). Hill Country serves a 14,390 square mile area of RHP6 with a population of approximately 401,123 in 2012.

Intervention(s): This project will implement Co-occurring Psychiatric and Substance Use Disorder Services within the 11 counties served by Hill Country in RHP6 in order to meet the needs of individuals with psychiatric and substance use issues within the community setting in order to reduce emergency department utilization, inpatient utilization, and incarceration.

Need for the project: Of the 4,490 individuals receiving mental health services through Hill Country in RHP6, 924 report substance use while 351 report substance use at a level that interferes with their daily lives and/or medications. In meeting with area hospitals, individuals with psychiatric disorders who also abuse substances end up in their emergency departments.

Target population: The target population is individuals within Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde counties who have a psychiatric diagnosis and abuse substances. Based on the population served in Hill Country’s behavioral health program in RHP6, approximately 32% of our behavioral health patients within RHP6 have Medicaid and approximately 82% have income below $15,000 per year.

Category 1 or 2 expected patient benefits: The project aims to establish Co-occurring Psychiatric and Substance Use Disorder services within the 11 counties served by Hill Country in RHP6 which will provide psychiatric and substance use disorder services within the community setting in order to reduce emergency department utilization and incarceration. The project seeks to provide services to a minimum of 234 individuals entering service from the 11 counties served by Hill Country in RHP6 by the end of DY5 (new enrollees 50 in DY3; 84 in DY4; and 100 in DY5).

Category 3 outcomes: IT-10.2 Activities of Daily Living (DLA-20) Our goal is to have, at a minimum, 20% of the individuals served by the Co-occurring Psychiatric and Substance Use Disorder services showing improvement on the Activities of Daily Living (DLA-20) which demonstrates stabilizing the individual in the community thus reducing the need for inpatient hospitalization, emergency department utilization and incarceration.
Project Description:
According to SAMHSA statistics on co-occurring disorders, 25.7 percent of all adults with serious mental illness also suffer from substance use dependence and 19.7 percent of adults with any mental illness also suffer from substance use dependence. Hill Country currently serves over 4,490 adults with Severe and Persistent Mental Illness on an annual basis within eleven counties of RHP 6 (Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde). Of the 4,490 individuals served, 924 report substance use while 351 report substance use at a level that interferes with their daily lives and/or medication. Throughout the 22,000 square mile service delivery area of Hill Country MHDD Centers, there is one individual dedicated to Co-occurring service delivery. By expanding this service, Hill Country can better address the need of individuals with co-occurring psychiatric and substance use disorder.

Hill Country MHDD Centers is planning to add Co-occurring Psychiatric and Substance Use Disorder services throughout the eleven county area served by Hill Country in RHP6. Hill Country currently serves over 4,490 adults with Severe and Persistent Mental Illness on an annual basis within eleven counties of RHP 6 (Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde). Of the 4,490 individuals served, 924 report substance use while 351 report substance use at a level that interferes with their daily lives and/or medication. Throughout the 22,000 square mile service delivery area of Hill Country MHDD Centers, there is one individual dedicated to Co-occurring service delivery.

Challenges:
The primary challenge for implementation of the project is recruiting licensed staff. Hill Country will address the challenge by offering incentives as necessary.

Goals:
The goal of this project is to establish Co-occurring Psychiatric and Substance Use Disorder services throughout the eleven county area in order to reduce emergency department utilization, inpatient utilization, and incarceration by developing wrap around services within the community for the targeted population. By the end of five years, Hill Country will have established Co-occurring Psychiatric and Substance Use Disorder specialists which will have provided services to a minimum of 234 consumers within the community over the life of the project (new enrollees 50 in DY3; 84 in DY4; and 100 in DY5).

Relationship to the Regional Goals:
The goal of this project is to establish Co-occurring Psychiatric and Substance Use Disorder services based on each individual’s needs within the community setting. By providing these services in the community, Hill Country will be meeting the regional goal of the Triple Aim by providing patients high-quality and patient-centered care, in the most cost effective way. In addition, the establishment of Co-occurring Psychiatric and Substance Use Disorder services will help achieve the regional goal to improve the health care infrastructure to better serve the Medicaid and uninsured residents of the eleven counties served by Hill Country in RHP6.
Starting Point/Baseline:
Hill Country MHDD Centers currently has one individual specializing in delivering Co-occurring Psychiatric and Substance Use Disorder services who serves forty individuals on an annual basis. This project will expand the service to all 11 counties served by Hill Country in RHP6.

Rationale:
Hill Country will identify and train licensed chemical dependency counselors in the provision of co-occurring psychiatric and substance use disorder services such as substance abuse services, cognitive processing therapy, psychosocial rehabilitation and wrap around services to help the individual

Project Components:
Through the Co-occurring Psychiatric and Substance Use Disorder services, Hill Country MHDD Centers proposes to meet all required project components:

A. **Assess size, characteristics and needs of target population.** Hill Country will collect and analyze information on individuals who have co-occurring psychiatric and substance use disorder and review contributing factors to episodes in order to determine appropriate staffing and skill sets necessary for service provision as well as specific locations.

B. **Review literature / experience with populations similar to target population to determine community-based interventions that are effective in averting negative outcomes such as repeated or extended inpatient psychiatric hospitalization, decreased mental and physical functional status, nursing facility admission, forensic encounters and in promoting correspondingly positive health and social outcomes / quality of life.** Based on the size, characteristics and needs for the target population, Hill Country will review appropriate literature and experiences regarding serving individuals co-occurring psychiatric and substance use disorder in order to provide targeted training for staff. Primary concentration will be based on SAMSHA’s Integrated Treatment for Co-Occurring Disorders Evidence-Based Practices Kit.

C. **Develop project evaluation plan using qualitative and quantitative metrics to determine outcomes.** Hill Country will develop a project evaluation plan that will review items such as the number of individuals served, the services received, the number of individuals receiving follow up services, the number of individuals with recurring issues, and progression on the Activities of Daily Living assessment.

D. **Design models which include an appropriate range of community-based services and residential supports.** Based on the size, characteristics and needs for the target population, Hill Country will train Co-occurring Psychiatric and Substance Use Disorder specialists in the most appropriate interventions to address the needs of the individuals and in connecting the individuals with other appropriate resources within the community.

E. **Assess the impact of interventions based on standardized quantitative measures and qualitative analysis relevant to the target population based on information from the Adult Needs and Strength Assessment and/or participant surveys, and identify opportunities to scale all or part of the intervention(s) to a broader patient population and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations.** Hill Country will utilize the Activities of Daily Living assessment to determine progression of individuals receiving Co-occurring...
Psychiatric and Substance Use Disorder services. In addition, Hill Country will do follow up surveys with individuals who receive services to determine satisfaction with services and to help ensure stabilization of symptoms.

Unique community need identification number the project addresses:
CN.4 There is a shortage of high quality mental and behavioral health services that are integrated with physical health and/or provide crisis stabilization.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
Hill Country MHDD Centers currently has one individual specializing in delivering Co-occurring Psychiatric and Substance Use Disorder services who serves forty individuals on an annual basis. This individual is funded through the Texas Department of State Health Services contract which includes federal and state funds. This project will expand the service to all 11 counties served by Hill Country in RHP6.

**Related Category 3 Outcome Measure(s):**

- OD-10 Quality of Life/Functional Status
- IT-10.2 Activities of Daily Living

Reasons/rationale for selecting the outcome measure:
Co-occurring Psychiatric and Substance Use Disorder impacts an individual’s mental health and thus their quality of life. It impacts the individual’s self care as well as their ability to cope with their environment. When an individual is unable to properly care for themselves or to cope with their local environment, they are at greater risk of unemployment and poor health. The Activities of Daily Living will be utilized to provide an overview of functional status, determine activity limitations, establish a baseline for treatment, provide a guide for intervention planning, to evaluate interventions and monitor progress and to plan for future and for discharge. The Activities of Daily Living will be measured utilizing the DLA-20 Functional Assessment.

The DLA-20 Functional Assessment is a functional assessment, proven to be reliable and valid, designed to assess what daily living areas are impacted by mental illness or disability. The assessment tool identifies where outcomes are needed so clinicians can address those functional deficits on individualized service plans. THE DLA-20 is intended to be used by all disabilities and ages. Developmental Disabilities and Alcohol/Drug Abuse forms are personalized for daily functional strengths and problems associated with those diagnoses.

THE DLA-20 utilizes the following 20 domains: Health Practices, Housing Stability and Maintenance, Communication, Safety, Managing Time, Nutrition, Problem Solving, Family Relationships, Alcohol/Drug Use, Leisure, Community Resources, Social Network, Sexuality, Productivity, Coping Skills, Behavior Norms, Personal Care/Hygiene, Grooming, and Dress. For the targeted population, individuals with Co-occurring Psychiatric and Substance Use Disorder, the DLA-20 will identify and address areas the disorders have impacted such as Alcohol/Drug Use, Social Network, Productivity, Housing Stability and Maintenance and Managing Money.
### Relationship to other Projects:
Provision of Mobile Crisis Outreach Team services as an alternative to inpatient and emergency department services reinforces objectives for all other behavioral health services provided by Hill Country through Regional Healthcare Partnership 6 (133340307.2.1 Mobile Crisis Outreach Teams, 133340307.2.2 Psychiatric Consultation, and 133340307.2.4 Trauma Informed Care) by providing specialized services addressing Co-occurring Psychiatric and Substance Use Disorder for an individual that if not addressed in the community may result in needing inpatient psychiatric services. Providing the services in the community enables the individual to move forward with treatments and to be more successful in their recovery. In addition, by providing services in the community, exacerbation of symptoms are reduced resulting in a reduction of Emergency Department utilization and potentially preventable hospital admissions (RD-1-3).

### Relationship to Other Performing Providers’ Projects in the RHP:
Hill Country MHDD Centers is the local mental health authority that provides services within the following counties of Regional Healthcare Partnership 6: Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde, and Val Verde. The other three local mental health authorities (Bluebonnet Trails, Camino Real, and Center for Healthcare Services) provides mental health services to the remaining counties within Regional Healthcare Partnership 6 and service areas do not overlap. Hill Country is committed to ongoing advancement of services for the individuals we serve and is willing to participate in a learning collaborative with other providers within the region to continually improve services and data collection and to identify how to address additional needs that may arise.

### Plan for Learning Collaborative:
Hill Country MHDD Centers will participate in a learning collaborative that meets annually to discuss local disparities in care and the ways they have successfully gathered relevant data and ultimately better served the populations in the projects.

### Project Valuation:
Project valuation is based on a weighted average of Achieving Waiver Goals, Addressing Community Needs, Project Scope, and Project Investment. The valuation is supported by cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). QALYs incorporate costs averted when known (e.g., emergency room visits that are avoided). The valuation on this project is based on 234 consumers over the life of the project resulting in an overall value of $19,054 per individual served.
## 2.13.1 A-E

**Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specific setting: Co-occurring Psychiatric and Substance Use Disorder**

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $3,921,410**
Identifying Project and Provider Information:

Title: 2.13.1 Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specific setting: Trauma Informed Care
Unique RHP ID#: 133340307.2.4 – PASS 1
Provider Name: Hill Country Community MHMR Center (dba Hill Country MHDD Centers)
TPI: 133340307

Project Summary:

Provider Description: Hill Country Community MHMR Center (dba Hill Country MHDD Centers) is a community mental health center providing mental health, substance use disorder, early childhood intervention and intellectual and developmental disability services to the following counties of RHP6 (Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde). Hill Country serves a 14,390 square mile area of RHP6 with a population of approximately 401,123 in 2012.

Intervention(s): This project will implement Trauma Informed Care Services within the 11 counties served by Hill Country in RHP6 in order to meet the needs of individuals who have experienced trauma that is impacting their behavioral health. The project will incorporate community education on the impact of trauma through Mental Health First Aid training and Trauma Informed Care training, and will provide trauma services through interventions such as Seeking Safety, Trust Based Relational Intervention and Cognitive Processing Therapy in order to help individuals deal with trauma they have experienced.

Need for the project: Studies have shown that the majority of individuals who are incarcerated have suffered traumatic experiences and that individuals who suffer traumatic experiences are 300% more likely to develop ischemic heart disease. By treating trauma, individuals address the trauma in their life and reduce the chance of internalizing the trauma resulting in physical illnesses, a behavioral health crisis, or in reactions that may result in incarceration.

Target population: The target population is individuals within Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde counties who have suffered trauma. Based on the population served in Hill Country’s behavioral health program in RHP6, approximately 32% of our behavioral health patients within RHP6 have Medicaid and approximately 82% have income below $15,000 per year.

Category 1 or 2 expected patient benefits: The project aims to establish Trauma Informed Care within the 11 counties served by Hill Country in RHP6. Trauma Informed Care will provide community education on identifying trauma symptoms and treatment for individuals who have suffered from trauma in an effort to identify trauma symptoms early and begin treatment to avoid emergency department utilization and incarceration. The project seeks to provide services to a minimum of 200 individuals from the 11 counties served by Hill Country in RHP6 by the end of DY5 (number anticipated beginning service by year, DY3 40; DY4 60; DY5 100).

Category 3 outcomes: IT-10.2 Activities of Daily Living (DLA-20) Our goal is to have, at a minimum, 20% of the individuals served by the Trauma Informed Care showing improvement on the Activities of Daily Living (DLA-20) which demonstrates stabilizing the individual in the community thus reducing the need for inpatient hospitalization, emergency department
utilization and incarceration.

**Project Description:**

According to Dr. Eric Kandel’s New Intellectual Framework for Psychology, studies show that medication doesn’t change molecular structure of the brain – experiences do. When an individual is exposed to trauma over long periods, it drastically effects their mental health. Further research indicates that many children diagnosed with ADD and ADHD are actually suffering from trauma and PTSD. In the article *Diagnosis: ADHS – or Is It Trauma?*, it is noted that seven of 10 children have been exposed to at least one potentially traumatic event and that preschoolers who had experienced multiple traumatic events were 16 times more likely to have attention problems and 21 times more likely to be overly emotionally reactive including showing symptoms of depression and anxiety than children who had not had such experiences.

Traumatic experiences can be dehumanizing, shocking or terrifying, singular or multiple compounding events over time, and often include betrayal of a trusted person or institution and a loss of safety. Trauma can result from experiences of violence. Trauma includes physical, sexual and institutional abuse, neglect, intergenerational trauma, and disasters that induce powerlessness, fear, recurrent hopelessness, and a constant state of alert. Trauma impacts one's spirituality and relationships with self, others, communities and environment, often resulting in recurring feelings of shame, guilt, rage, isolation, and disconnection. In the July-Sept. 2012 Youth Law New, *Trauma-Informed Care Emerging as Proven Treatment for Children, Adults with Behavioral, Mental Health Problems*, states, “Children who are physically or sexually abused, or who go through other trauma-inducing experiences can develop mental health disorders and related problems. Indeed, trauma can fundamentally affect how a young person grows and develops.” According to a study cited in *Trauma among Girls in the Juvenile Justice System*, A person traumatized in childhood may resort to criminal behavior. When a survey of all juvenile detainees nationwide, 93.2% per cent of males and 84% of females reported having had a traumatic experience. In Kaiser’s Adverse Childhood Experiences (ACE) study researchers looked at patients with ACE scores of 7 or higher who didn’t smoke, didn’t drink to excess, and weren’t overweight. The study revealed that the risk of ischemic heart disease (the most common cause of death in the United States) was 360 percent higher than for patients who scored a 0 on the ACE. (Paul Tough, “The Poverty Clinic: Can a Stressful Childhood Make You a Sick Adult?”, The New Yorker, March 21, 2011).

Trauma-informed care is an approach to engaging people with histories of trauma that recognizes the presence of trauma symptoms and acknowledges the role that trauma has played in their lives. The National Center for Trauma Informed Care, a division of SAMHSA, facilitates the adoption of trauma-informed environments in the delivery of a broad range of services including mental health, substance use, housing, vocational or employment support, domestic violence and victim assistance, and peer support.

**Challenges:**

The primary challenge for implementation of the project is recruiting behavioral health staff. Hill Country will address the challenge by offering incentive as necessary.
Goals:
The goal of this project is to establish Trauma Informed Care throughout the eleven counties served by Hill Country in RHP6. The project will consist of developing Healthy Communities through the use of Mental Health First Aid Training and Trauma Informed Care training as a means to help the community understand the impact of trauma and to help identify symptoms of trauma for earlier treatment. In addition, a system of trauma counseling will be developed including practices such as Seeking Safety, Trust Based Relational Intervention, and Cognitive Processing Therapy in order to help individuals deal with trauma they have experienced. The primary challenge of the project will be recruitment and training of staff for initial implementation. By the end of five years, Hill Country’s goal is to have trained at least 500 individuals in Mental Health First Aid and/or Trauma Informed Care and will have established Trauma Informed Care throughout the eleven county service area and provided services to at least of 200 consumers within the community over the life of the project (number anticipated beginning service by year, DY3 40; DY4 60; DY5 100).

Relationship to the Regional Goals:
The goal of this project is to provide Trauma Informed Care within the community setting. By providing these services in the community, Hill Country will be meeting the regional goal of the Triple Aim by providing patients high-quality and patient-centered care, in the most cost effective way. In addition, the establishment of the Trauma Informed Care will help achieve the regional goal to improve the health care infrastructure to better serve the Medicaid and uninsured residents the counties Hill Country serves within the region.

Starting Point/Baseline:
Hill Country MHDD Centers currently provides Cognitive Behavioral Therapy to individuals suffering from Major Depression and Cognitive Processing Therapy for individuals who have experienced a crisis episode and suffer from Post Traumatic Stress Disorder. During fiscal year 2011, Hill Country MHDD Centers provided 1050 hours of Cognitive Behavioral Therapy and Cognitive Processing Therapy combined. This program would enable Hill Country to acquire and train additional clinicians to provide Cognitive Behavioral Therapy and Cognitive Processing Therapy to a broader population at an earlier stage to avoid the exacerbation of symptoms into a crisis episode resulting in utilization of Emergency Departments, potential psychiatric hospitalizations and utilization of the criminal justice system.

Rationale:
The approach Hill Country will take with this project will include building health communities by offering Mental Health First Aid Training and Trauma Informed Care training to schools, law enforcement, hospitals, physicians, and community organizations. The training will be aimed at helping individuals understand the role trauma plays in their lives and helping identify early warning signs of mental health issues. In addition, Hill Country will design programs to offer trauma counseling through evidence based practices such as Seeking Safety, Trust Based Relational Intervention, and Cognitive Processing Therapy in order to help individuals deal with trauma they have experienced.

Project Components:
Through the Trauma Informed Care services, Hill Country MHDD Centers proposes to meet all required project components:
A. **Assess size, characteristics and needs of target population.** Hill Country will collect and analyze information on individuals who have issues due to an experienced trauma and review contributing factors such as homelessness, noncompliance with medication, diagnosis, unemployment, economic struggles and other factors contributing to trauma in order to determine appropriate staffing and skill sets necessary for service provision as well as specific locations for service providers.

B. **Review literature/experience with populations similar to target population to determine community-based interventions that are effective in averting negative outcomes such as repeated or extended inpatient psychiatric hospitalization, decreased mental and physical functional status, nursing facility admission, forensic encounters and in promoting correspondingly positive health and social outcomes/quality of life.** Based on the size, characteristics and needs for the target population, Hill Country will review appropriate literature and experiences regarding serving individuals in Trauma Informed Care in order to provide targeted training for staff and to develop innovative wrap around services to help avert future impact of the trauma.

C. **Develop project evaluation plan using qualitative and quantitative metrics to determine outcomes.** Hill Country will develop a project evaluation plan that will review items such as the number of individuals served, the issues leading to the trauma, the services received, the number of individuals receiving follow up services, the number of individuals with recurring symptoms, and progression on the Activities of Daily Living assessment.

D. **Design models which include an appropriate range of community-based services and residential supports.** Based on the size, characteristics and needs for the target population, Hill Country will train Trauma Informed staff in the most appropriate interventions to address the needs of the individuals and in connecting the individuals with other appropriate resources within the community.

E. **Assess the impact of interventions based on standardized quantitative measures and qualitative analysis relevant to the target population based on information from the Adult Needs and Strength Assessment and/or participant surveys, and identify opportunities to scale all or part of the intervention(s) to a broader patient population and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations.** Hill Country will utilize the Activities of Daily Living assessment to determine progression of individuals receiving Trauma Informed Care. In addition, Hill Country will do follow up surveys with individuals who receive Trauma Informed Care services to determine satisfaction with services and to help ensure stabilization of symptoms in order to avert additional recurrence of trauma symptoms.

Unique community need identification number the project addresses:
CN.4 There is a shortage of high quality mental and behavioral health services that are integrated with physical health and/or provide crisis stabilization.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
Hill Country does not currently have a Trauma Informed Care initiative within Regional Healthcare Partnership 6. The addition of the Trauma Informed Care would give committed
staff to providing ongoing trauma services in order to reduce the number psychiatric hospitalizations and avert recurrence of the psychiatric crisis due to triggers related to past trauma.

**Related Category 3 Outcome Measure(s):**

OD-10 Quality of Life/Functional Status  
IT-10.2 Activities of Daily Living  

**Reasons/rationale for selecting the outcome measure:**  
Trauma impacts an individual’s mental health and thus their quality of life. It impacts the individual’s self care as well as their ability to cope with their environment. When an individual is unable to properly care for themselves or to cope with their local environment, they are at greater risk of unemployment and poor health. The Activities of Daily Living will be utilized to provide an overview of functional status, determine activity limitations, establish a baseline for treatment, provide a guide for intervention planning, to evaluate interventions and monitor progress and to plan for future and for discharge. The Activities of Daily Living will be measured utilizing the DLA-20.

The DLA-20 Functional Assessment is a functional assessment, proven to be reliable and valid, designed to assess what daily living areas are impacted by mental illness or disability. The assessment tool identifies where outcomes are needed so clinicians can address those functional deficits on individualized service plans. THE DLA-20 is intended to be used by all disabilities and ages.

THE DLA-20 utilizes the following 20 domains: Health Practices, Housing Stability and Maintenance, Communication, Safety, Managing Time, Nutrition, Problem Solving, Family Relationships, Alcohol/Drug Use, Leisure, Community Resources, Social Network, Sexuality, Productivity, Coping Skills, Behavior Norms, Personal Care/Hygiene, Grooming, and Dress. For the targeted population, individuals needing Trauma Informed Care, the DLA-20 will help identify areas the trauma has impacted in their lives such as coping skills, problem solving, family relationships, communication, and safety and be able to track improvement in the areas of the course of treatment.

**Relationship to other Projects:**

Provision of Trauma Informed Care services as an alternative to inpatient and emergency department services reinforces objectives for all other behavioral health services provided by Hill Country through Regional Healthcare Partnership 6 (133340307.2.1 Mobile Crisis Outreach Teams, 133340307.2.2 Psychiatric Consultation, and 133340307.2.3 Co-occurring Psychiatric and Substance Use Disorder Services.) by providing specialized services addressing trauma experienced by individuals that if not addressed in the community may result in needing inpatient psychiatric services. Addressing trauma symptoms in the community enables the individual to move forward with treatments and to be more successful in their recovery. In addition, by addressing trauma symptoms in the community, exacerbation of symptoms are reduced resulting in a reduction of Emergency Department utilization and potentially preventable hospital admissions (RD-1-3)

**Relationship to Other Performing Providers’ Projects in the RHP:**

Hill Country MHDD Centers is the local mental health authority that provides services within the
following counties of Regional Healthcare Partnership 6: Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde. The other three local mental health authorities (Bluebonnet Trails, Camino Real, and Center for Healthcare Services) provides mental health services to the remaining counties within Regional Healthcare Partnership 6 and service areas do not overlap. Hill Country is committed to ongoing advancement of services for the individuals we serve and is willing to participate in a learning collaborative with other providers within the region to continually improve services and data collection and to identify how to address additional needs that may arise.

**Plan for Learning Collaborative:**

Hill Country MHDD Centers will participate in a learning collaborative that meets annually to discuss local disparities in care and the ways they have successfully gathered relevant data and ultimately better served the populations in the projects.

**Project Valuation:**

Project valuation is based on a weighted average of Achieving Waiver Goals, Addressing Community Needs, Project Scope, and Project Investment. The valuation for this project was based on an economic evaluation model and extensive literature review conducted by professors at the University of Houston School of Public Health and University of Texas at Austin Center for Social Work Research. The valuation is supported by cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). QALYs incorporate costs averted when known (e.g., emergency room visits that area avoided). The valuation on this project is based on 200 consumers over the life of the project.

## Identifying Project and Provider Information:

| Title: | 2.18.1 Design, implement, and evaluate whole health peer support for individuals with mental health and/or substance use disorders: Whole Health Peer Support |
| Unique RHP ID#: | 133340307.2.5 – PASS 2 |
| Provider Name: | Hill Country Community MHMR Center (dba Hill Country MHDD Centers) |
| TPI: | 133340307 |

## Project Summary:

**Provider Description:** Hill Country Community MHMR Center (dba Hill Country MHDD Centers) is a community mental health center providing mental health, substance use disorder, early childhood intervention and intellectual and developmental disability services to the following counties of RHP6 (Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde). Hill Country serves a 14,390 square mile area of RHP6 with a population of approximately 401,123 in 2012.

**Intervention(s):** This project will implement Whole Health Peer Support services within the 11 counties served by Hill Country in RHP6 in order to meet the overall health needs of individuals who have behavioral health issues. The project will identify and train behavioral health peers on whole health risk assessments and working with peers to address overall health issues in order to treat symptoms prior to the need for utilization of emergency departments or inpatient hospitalization.

**Need for the project:** Individuals with severe and persistent mental illness die 25 years earlier than the general population. Identifying and addressing overall health symptoms, such as hypertension, diabetes, obesity, tobacco use and physical inactivity, of individuals with severe and persistent mental illness helps address this issue while reducing emergency department utilization and potentially preventable admissions to hospitals.

**Target population:** The target population is individuals within Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde counties who have severe and persistent mental illness and other health risk factors. Based on the population served in Hill Country’s behavioral health program in RHP6, approximately 32% of our behavioral health patients within RHP6 have Medicaid and approximately 82% have income below $15,000 per year.

**Category 1 or 2 expected patient benefits:** The project aims to establish Whole Health Peer Support within the 11 counties served by Hill Country in RHP6. Whole Health Peer Support will provide whole health risk assessments to individuals with severe and persistent mental illness in an effort to identify physical health issues early and begin treatment to avoid emergency department utilization and potentially preventable hospital admissions. The project seeks to provide services to a minimum of 250 individuals from the 11 counties served by Hill Country in RHP6 by the end of DY5 (25 in DY3; 100 in DY4 and 125 in DY5).

**Category 3 outcomes:** IT-10.2 Activities of Daily Living (DLA-20) Our goal is to have, at a minimum, 20% of the individuals served by the Whole Health Peer Support showing improvement on the Activities of Daily Living (DLA-20) which demonstrates stabilizing the individual in the community thus reducing the need for inpatient hospitalization and emergency...
Project Description:

Peers are one of the most valuable assets in helping consumers with mental illness gain hope and begin to progress on their road to recovery. The services they provide and supportive in nature. By expanding peer services as an integral portion of the seven mental health clinics operated by Hill Country MHDD Centers and including whole health risk assessments and supported services targeted to individuals with hypertension, diabetes, and health risks such as obesity, tobacco use and physical inactivity, improved Daily Living Activities and improved health outcomes can be achieved, helping address the disparate life expectancy and poor health outcomes and ultimately decreasing utilization of Emergency Departments.

Hill Country’s is planning to utilize consumers of mental health services who have made substantial progress in managing their own illness and recovering a successful life in the community to provide behavioral health services. Through Via Hope, a state wide organization established under the State’s Mental Health Transformation grant, consumers are being trained to serve as whole health peer support specialists. Upon completion of training, peers are working with consumers to set achievable goals to prevent chronic diseases such as diabetes or to address when they exist. While Hill Country has begun the process of incorporating peer support services, there have been challenges with maintaining peer support specialists and fully incorporating peer services throughout the treatment process. The advancement to Whole Health Peer Support is needed along with increased emphasis on peer services in order to help individuals advance in their recovery.

In implementing this project, Hill Country will continue to train and educate clinicians on the importance of peer services, recruit and train peer specialists in the provision of Whole Health Peer Support, and utilize peer services to identify health risks and provide appropriate education and referrals regarding the health risks identified. Peer services will be tracked in Hill Country’s information technology system (Anasazi) by location and consumer in order to monitor services delivered and outcomes of the services. In addition, Hill Country will conduct consumer satisfaction surveys for individuals receiving peer support services.

Challenges:
The challenges Hill Country has faced in establishing a robust peer support program have been in relation to retaining individuals in the positions for extended periods of time. Hill Country plans to address this challenge by shifting the focus of peer support to a whole health model that becomes more fully integrated into the regular practice of the mental health clinics. In addition, Hill Country intends to increase the percentage of full time equivalent for peer support specialists in order to increase retention.

Goals:
By the end of five years, Hill Country’s goal is to have peer support specialists at each mental health clinic with a minimum full time equivalency of 7.0 and to have 20% of the consumers who participate in whole health peer support experiencing improvement in standardized health measures. Currently, Hill Country has 1.80 full time equivalency for peer support services within RHP6.
Relationship to the Regional Goals:
The goal of this project is to use Whole Health Peer Support to provide guidance and support for the consumer’s journey of recovery based on each individual’s needs within the community setting. By providing these services in the community, Hill Country will be meeting the regional goal of the Triple Aim by providing patients high-quality and patient-centered care, in the most cost effective way. In addition, the establishment of the Whole Health Peer Support will help achieve the regional goal to improve the health care infrastructure to better serve the Medicaid and uninsured residents of Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde, and Val Verde counties.

Starting Point/Baseline:
Hill Country MHDD Centers has utilized Peer Specialists in a limited capacity over the past seven years as a means to help support individuals with behavioral health issues deal with their symptoms and advance in their recovery. Currently, Hill Country MHDD Centers currently has ten peer specialists with only four having certification through the state training program. The seven mental health clinics operated by Hill Country within RHP6 currently have 1.80 full-time equivalency for provision of peer support services. In order to reemphasize the importance of peer support services, to fully integrate peer support services into the network of services provided through the mental health clinics operated by Hill Country MHDD Centers within RHP6 and to expand the peer support services offered to include whole health interventions including health risk assessments, Hill Country will recruit additional peer specialists, arrange for appropriate training, and emphasis the peer specialists roles regarding whole health and serving as navigator for consumers.

Rationale:
Peers are one of the most valuable assets in helping consumers with mental illness gain hope and begin to progress on their road to recovery. The services they provide and supportive in nature. By expanding peer services as an integral portion of the seven mental health clinics operated by Hill Country MHDD Centers within RHP6 and including whole health risk assessments and supported services targeted to individuals with hypertension, diabetes, and health risks such as obesity, tobacco use and physical inactivity, improved Daily Living Activities and improved health outcomes can be achieved, helping address the disparate life expectancy and poor health outcomes and ultimately decreasing utilization of Emergency Departments. Through this project Hill Country will acquire and maintain Whole Health Peer Support Specialists equivalent to a minimum of 7.0 full time equivalency throughout the seven mental health clinics operated by Hill Country within RHP6.

Project Components:
Through the Whole Health Peer Support, Hill Country MHDD Centers proposes to meet all required project components.

A) **Train administrators and key clinical staff in the use of peer specialists as an essential component of a comprehensive health system.** Hill Country MHDD Centers is currently participating in the Person Centered Recovery Initiative through Via Hope. The initiative is designed to promote mental health system transformation by 1) helping organizations develop culture and practices that support and expect recovery, and 2) promoting
consumer voice in the transformation process and the future, transformed mental health system. On October 24th, 2012, the clinical leadership of Hill Country completed a one day training on integrating peer support and incorporating the patient in developing and implementing their treatment plan.

B) **Conduct readiness assessments of organization that will integrate peer specialists into their network.** Hill Country will review readiness at the Llano Mental Health Clinic within RHP8 and address any potential barriers to full integration of Whole Health Peer Support.

C) **Identify peer specialists interested in this type of work.** Hill Country will recruit peer specialists who have interest, first and foremost, in helping others on their journey of recovery and who also wish to receive training in providing whole health peer services and are interested in employment with Hill Country MHDD to provide whole health peer services.

D) **Train identified peer specialists in whole health interventions, including conducting health risk assessments, setting SMART goals, providing educational and supportive services to targeted individuals with specific disorders (e.g. hypertension, diabetes, or health risks (e.g. obesity, tobacco use, physical inactivity).** Hill Country MHDD Centers will make arrangements for interested peer specialists to attend Whole Health Peer Support trainings and certifications available through the state of Texas Via Hope program. If training space becomes restrictive, Hill Country will find or develop similar training to bring peer specialists on board until such time as the certification training is available.

E) **Implement health risk assessments to identify existing and potential health risks for behavioral health consumers.** Hill Country MHDD Centers will have trained peer specialists utilize the health risk assessment tool to determine potential or current health risks, will track the completion of health risk assessments in the information technology system, and will address potential health risks with the patient.

F) **Identify patients with serious mental illness who have health risk factors that can be modified.** Patients identified through the health risk assessment tool will receive education and information regarding potential health risks and, if appropriate, referred to primary care and preventive resources.

G) **Implement whole health peer support.** Hill Country will track the occurrence of health risk assessments by location and patient in order to determine the project is fully implemented.

H) **Connect patient to primary care and preventive services.** If risk factors or medical conditions are identified that require more than basic education, individuals will be referred to the appropriate primary care and preventive services.

I) **Track patient outcomes Review the intervention(s) impact on participants and identify “lessons learned,” opportunities to scale all or part of the interventions(s) to a broader patient population, and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations.** Hill Country will utilize the Daily Living Activities assessment to determine progression of individuals receiving Whole Health Peer Support services. In addition, Hill Country will do follow up surveys with individuals who receive Whole Health Peer Support services to determine satisfaction with services and to help ensure stabilization of symptoms.
Unique community need identification number the project addresses:
- CN.4 There is a shortage of high quality mental and behavioral health services that are integrated with physical

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
Hill Country MHDD Centers has utilized Peer Specialists in a limited capacity over the past seven years as a means to help support individuals with behavioral health issues deal with their symptoms and advance in their recovery. The seven mental health clinics operated by Hill country within RHP6 currently have 1.80 full-time equivalency of peer support services. In order to reemphasize the importance of peer support services, to fully integrate peer support services into the network of services provided through these mental health clinics within RHP6 and to expand the peer support services offered to include whole health interventions including health risk assessments, Hill Country will recruit additional peer specialists, arrange for appropriate training, and emphasis the peer specialists roles regarding whole health and serving as navigator for consumers.

Related Category 3 Outcome Measure(s):

OD-10 Quality of Life/Functional Status
IT-10.2 Activities of Daily Living

Reasons/rationale for selecting the outcome measure:
Whole Health Peer Support services impact an individual’s mental and physical health and thus their quality of life. It impacts the individual’s self care as well as their ability to cope with their environment. When an individual is unable to properly care for themselves or to cope with their local environment, they are at greater risk of unemployment and poor health. The Activities of Daily Living (DLA-20) will be utilized to provide an overview of functional status, determine activity limitations, establish a baseline for treatment, provide a guide for intervention planning, to evaluate interventions and monitor progress and to plan for future and for discharge. The Activities of Daily Living will be measured utilizing the DLA-20 Functional Assessment.

The DLA-20 Functional Assessment is a functional assessment, proven to be reliable and valid, designed to assess what daily living areas are impacted by mental illness or disability. The assessment tool identifies where outcomes are needed so clinicians can address those functional deficits on individualized service plans. THE DLA-20 is intended to be used by all disabilities and ages. Developmental Disabilities and Alcohol/Drug Abuse forms are personalized for daily functional strengths and problems associated with those diagnoses. THE DLA-20 utilizes the following 20 domains: Health Practices, Housing Stability and Maintenance, Communication, Safety, Managing Time, Nutrition, Problem Solving, Family Relationships, Alcohol/Drug Use, Leisure, Community Resources, Social Network, Sexuality, Productivity, Coping Skills, Behavior Norms, Personal Care/Hygiene, Grooming, and Dress.

Relationship to other Projects:
Provision of Whole Health Peer Support services as an alternative to inpatient and emergency department services reinforces objectives for all other behavioral health services provided by Hill Country through Regional Healthcare Partnership 6 (133340307.2.1 Mobile Crisis Outreach Teams, 1333340307.2.2 Psychiatric Consultation, 133340307.2.3 Co-occurring Psychiatric and Substance Use Disorder Services, 133340307.2.4 Trauma Informed Care, 133340307.2.6
Veteran Mental Health Services, and 133340307.2.7 Mental Health Courts) by providing specialized services addressing crisis episodes and aimed at averting reoccurrence of crisis episodes experienced by an individual that if not addressed in the community may result in needing inpatient psychiatric services. Addressing the crisis episode in the community enables the individual to move forward with treatments and to be more successful in their recovery. In addition, by addressing crisis in the community, exacerbation of symptoms are reduced resulting in a reduction of Emergency Department utilization and potentially preventable hospital admissions (RD-1-3).

**Relationship to Other Performing Providers’ Projects in the RHP:**

Hill Country MHDD Centers is the local mental health authority that provides services within the following counties of Regional Healthcare Partnership 6: Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde. The other three local mental health authorities (Bluebonnet Trails, Camino Real, and Center for Healthcare Services) provides mental health services to the remaining counties within Regional Healthcare Partnership 6 and service areas do not overlap. Hill Country is committed to ongoing advancement of services for the individuals we serve and is willing to participate in a learning collaborative with other providers within the region to continually improve services and data collection and to identify how to address additional needs that may arise.

**Plan for Learning Collaborative:**

Hill Country MHDD Centers will participate in a learning collaborative that meets annually to discuss local disparities in care and the ways they have successfully gathered relevant data and ultimately better served the populations in the projects.

**Project Valuation:**

Project valuation is based on a weighted average of Achieving Waiver Goals, Addressing Community Needs, Project Scope, and Project Investment. The valuation for this project was based on an economic evaluation model and extensive literature review conducted by professors at the University of Houston School of Public Health and University of Texas at Austin Center for Social Work Research. The valuation is supported by cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). QALYs incorporate costs averted when known (e.g., emergency room visits that are avoided). The proposed program’s value is based on the average of benefit-cost studies from Sari et al. 2008 and Kuyken et al. (2008) with an average benefit cost ratio of $23.36 for every dollar invested.

### Project Summary:

**Provider Description:** Hill Country Community MHMR Center (dba Hill Country MHDD Centers) is a community mental health center providing mental health, substance use disorder, early childhood intervention and intellectual and developmental disability services to the following counties of RHP6 (Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde). Hill Country serves a 14,390 square mile area of RHP6 with a population of approximately 401,123 in 2012.

**Intervention(s):** This project will implement Veteran Mental Health Services within the 11 counties served by Hill Country in RHP6 in order to meet the overall health needs of veterans dealing with behavioral health issues. The project will expand peer support services in an effort to identify veterans and their family members who need comprehensive community based wrap around behavioral health services, such as psychiatric rehabilitation, skills training, crisis intervention, supported housing and supported employment, that would complement, but not duplicate, potential services through the Veterans Administration and provide the community based wrap around behavioral health services for these veterans in order to treat symptoms prior to the need for utilization of emergency departments, inpatient hospitalization or incarceration.

**Need for the project:** Hill Country’s service area within RHP6 has a veteran population of 37,809 and veterans seeking behavioral health services currently have to travel over 300 miles and take a full day off of work to receive behavioral health services. Based on an average family size for the 11 counties served of 2.87, the veterans and their families are a total target population base for the project of 27,448. In addition, a recent study of death certificates in Texas revealed that the percentage of deaths by suicide for Texas veterans was nearly double the same rate for civilians.

**Target population:** The target population is veterans and their family members within Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde counties who have behavioral health issues. The target population consists of the 27,448 veterans and their families, including reservists who only receive Veteran Administration benefits for 180 days after federal deployment. Based on the population served in Hill Country’s behavioral health program in RHP6, approximately 32% of our behavioral health patients within RHP6 have Medicaid and approximately 82% have income below $15,000 per year.

- **Category 1 or 2 expected patient benefits:** The project aims to establish Veteran Mental Health Services within the 11 counties served by Hill Country in RHP6. Veteran Mental Health Services will provide wraparound behavioral health services to veterans and/or their family members within their local communities. The project seeks to provide services to a minimum of 180 veterans from the 11 counties served by Hill Country in RHP6 by the end of...
DY5. The cumulative anticipated number of veterans or their family members served by demonstration year is as follows: DY3 40; DY4 100; DY5 180. The anticipated number of individuals served is shown as an unduplicated number since services will carry over between demonstration years.

**Category 3 outcomes:** IT-10.2 Activities of Daily Living (DLA-20) Our goal is to have, at a minimum, 20% of the individuals served by the Veteran Mental Health Services showing improvement on the Activities of Daily Living (DLA-20) which demonstrates stabilizing the individual in the community thus reducing the need for inpatient hospitalization and emergency department utilization.

**Project Description:**

As the mental health authority for our service area, Hill Country is well aware of the challenges for Veteran’s requiring mental health services. Currently Veteran’s within the eleven counties served by Hill Country within RHP6, including over 543 Reserve Component Service members deployed to OEF/OIF, must travel to San Antonio to receive mental health services. For a majority of these veterans, this involves over 300 miles of travel and a full day off of work for a one hour appointment. Just this year, the Veteran’s Administration contracted with Hill Country to offer Telemedicine services at the Del Rio Mental Health Clinic in order to help reduce this additional strain on the Veteran’s in the far western portion of our service area.

According to 2012 population estimates from the Texas Department of State Health Services Population Data System for Texas Population Estimates Program and statistics from the Veteran’s Administration 9/30/08 Projection of Veteran’s by 110th Congressional District, Vet Pop 2012, the eleven counties served by Hill Country within RHP6 have a total population of 401,123 with a Veteran population of 37,809, or 9.4% of the total population.

According to a study completed by the Austin American Statesman on October 1, 2012, the percentage of deaths of Texas Veterans caused by suicide from 2003 through 2011 was 21.5% compared to 12.4% for the overall Texas population. Of Texas Veterans with a primary diagnosis of post-traumatic stress disorder who died during this period, 80% died of overdose, suicide or a single-vehicle crash. During discussions Hill Country held with County Veteran Service Officers within the region, it was noted that there is a need for Mental Health services for Veterans due to the transportation and time commitment needed to access Veteran Administration services as well as the reluctance of veterans to acknowledge a potential mental health issue with the Veterans Administration.

Hill Country currently has two Veteran Peer Coordinators who recruit volunteer Veterans to provide peer support services throughout Hill Country’s 19 county, 22,000 square mile service area. Through this project, Hill Country would acquire additional Veteran Peer Coordinators who can actively work to recruit and train veteran peer support providers in a concentrated area. The Veteran Coordinators acquired through this project will create liaisons within the counties, seek out veterans and establish drop-in centers, recruit volunteers, connect veterans with other community resources, create jail outreach and jail diversion for veterans involved with the criminal justice system, coordinate medical and behavioral health referrals as appropriate and serve as a liaison with the local National Guard and Reserve units. This project will also include
provision of comprehensive community based wrap around behavioral health services, such as psychiatric rehabilitation, skills training, crisis intervention, supported housing and supported employment, that would complement, but not duplicate, potential services through the Veterans Administration for both Veterans and their families in Blanco and Llano counties, including reservists who only receive Veteran Administration benefits for a few months after active deployment. Wrap around services will be delivered by clinicians who have been trained in cultural competency for the military environment. Wraparound services provided through this project in the local community will complement the Psychiatrist and Counselor services provided by the Veteran Administration at the VA clinics. During the last 6 months, the Veteran Peer Support services have referred 60 individuals for mental health treatment.

Hill Country MHDD Centers will expand Veteran Peer and Mental Health services throughout the eleven county area served by Hill Country in RHP6. In establishing the project, Hill Country will review literature and experiences regarding Veteran Peer and Mental Health services to establish appropriate training for staff on the most effective interventions for veteran services. Upon identifying needed training, Hill Country will recruit appropriate staff and provide targeted training for veteran peer and community based wrap around behavioral health services. As a means to determine the success of the interventions, a functional assessment (DLA-20) determining what impact the various stressors have on the individuals daily lives will be completed when a Veteran is referred for mental health services and at determined intervals during treatment. In order to track individuals receiving treatment in the program, Hill Country will establish specific units and subunits within its information technology system (Anasazi) that will enable reporting on Veteran Peer and Mental Health services delivered within the program as well as by location within the program.

Challenges:
The primary challenge for implementation of the project is recruiting licensed staff. Hill Country will address the challenge by offering incentives as necessary.

Goals:
The goal of this project is to expand Veteran Peer and Mental Health services throughout the eleven counties served by Hill Country in RHP6 in order to reduce emergency department utilization, inpatient utilization, and incarceration by developing wrap around services within the community for the targeted population.

Relationship to the Regional Goals:
The goal of this project is to establish Veteran Peer and Mental Health services based on each individual’s needs within the community setting. By providing these services in the community, Hill Country will be meeting the regional goal of the Triple Aim by providing patients high-quality and patient-centered care, in the most cost effective way.
Starting Point/Baseline:

Hill Country MHDD Centers currently has one two Veteran Peer Coordinators serving a 19 county, 22,000 square mile service area. This project will expand the service to add a concentrated Veteran Peer Coordinators to serve two to three counties each of the eleven counties served by Hill Country in RHP6 in order to recruit and train veteran peer service providers and provide identified mental health services as needed. The DLA20 assessment will be performed on each individual referred from veteran peer services to veteran mental health services as their baseline and the percentage of individuals who have improved DAL20 scores on a subsequent assessment after treatment will be utilized to show improvement.

Rationale:

Hill Country will identify and train Veteran Peer Coordinators in the provision of veteran peer support services including identifying and seeking out veterans needing services, recruit veteran peer support providers, creating drop-in centers for veterans, identify and connecting with current resources, and incorporating jail diversion as appropriate for veterans in touch with the criminal justice system.

Project Components:

Through the Veteran Mental Health services project, Hill Country MHDD Centers proposes to meet all required project components:

A) *Assess size, characteristics and needs of target population.* Hill Country will collect and analyze information on veterans with mental health issues and review contributing factors to episodes in order to determine appropriate staffing and skill sets necessary for service provision as well as specific locations.

B) *Review literature / experience with populations similar to target population to determine community-based interventions that are effective in averting negative outcomes such as repeated or extended inpatient psychiatric hospitalization, decreased mental and physical functional status, nursing facility admission, forensic encounters and in promoting correspondingly positive health and social outcomes / quality of life.* Based on the size, characteristics and needs for the target population, Hill Country will review appropriate literature and experiences regarding serving veteran mental health issues in order to provide targeted training for staff.

C) *Develop project evaluation plan using qualitative and quantitative metrics to determine outcomes.* Hill Country will develop a project evaluation plan that will review items such as the number of individuals served, the services received, the number of individuals receiving follow up services, the number of individuals with recurring issues, and progression on the Activities of Daily Living assessment(DLA-20).

D) *Design models which include an appropriate range of community-based services and residential supports.* Based on the size, characteristics and needs for the target population, Hill Country will train staff in the most appropriate interventions to address the needs of the individuals and in connecting the individuals with other appropriate resources within the community.

E) *Assess the impact of interventions based on standardized quantitative measures and qualitative analysis relevant to the target population based on information from the Adult*
Needs and Strength Assessment and/or participant surveys, and identify opportunities to scale all or part of the intervention(s) to a broader patient population and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations. Hill Country will utilize the Activities of Daily Living assessment (DLA-20) to determine progression of Veterans referred for Veteran Mental Health services. In addition, Hill Country will do follow up surveys with individuals who receive Veteran Peer Services to determine satisfaction with services and to help ensure stabilization of symptoms.

Unique community need identification number the project addresses:
CN.4 There is a shortage of high quality mental and behavioral health services that are integrated with physical

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
Hill Country MHDD Centers currently has one two Veteran Peer Coordinators serving a 19 county, 22,000 square mile service area. This project will expand the service to add a concentrated Veteran Peer Coordinators to serve the eleven counties served by Hill Country within RHP6 in order to recruit and train veteran peer service providers and provide identified mental health services as needed.

Related Category 3 Outcome Measure(s):

OD-10 Quality of Life/Functional Status
IT-10.2 Activities of Daily Living

Reasons/rationale for selecting the outcome measure:
Behavioral health issues impact veterans mental health and thus their quality of life. It impacts the individual’s self care as well as their ability to cope with their environment. When an individual is unable to properly care for themselves or to cope with their local environment, they are at greater risk of unemployment and poor health. The Activities of Daily Living will be utilized to provide an overview of functional status, determine activity limitations, establish a baseline for treatment, provide a guide for intervention planning, to evaluate interventions and monitor progress and to plan for future and for discharge. The Activities of Daily Living will be measured utilizing the DLA-20 Functional Assessment.

The DLA-20 Functional Assessment is a functional assessment, proven to be reliable and valid, designed to assess what daily living areas are impacted by mental illness or disability. The assessment tool identifies where outcomes are needed so clinicians can address those functional deficits on individualized service plans. THE DLA-20 is intended to be used by all disabilities and ages. Developmental Disabilities and Alcohol/Drug Abuse forms are personalized for daily functional strengths and problems associated with those diagnoses.

### Relationship to other Projects:

Provision of Veteran Mental Health services as an alternative to inpatient and emergency department services reinforces objectives for all other behavioral health services provided by Hill Country through Regional Healthcare Partnership 6 (133340307.2.1 Mobile Crisis Outreach Teams, 133340307.2.2 Psychiatric Consultation, 133340307.2.3 Co-occurring Psychiatric and Substance Use Disorder Services, 133340307.2.4 Trauma Informed Care, 133340307.2.5 Whole Health Peer Support and 133340307.2.7 Mental Health Courts) by providing specialized services addressing crisis episodes and aimed at averting reoccurrence of crisis episodes experienced by an individual that if not addressed in the community may result in needing inpatient psychiatric services. Addressing the crisis episode in the community enables the individual to move forward with treatments and to be more successful in their recovery. In addition, by addressing crisis in the community, exacerbation of symptoms are reduced resulting in a reduction of Emergency Department utilization and potentially preventable hospital admissions (RD-1-3).

### Relationship to Other Performing Providers’ Projects in the RHP:

Hill Country MHD Centers is the local mental health authority that provides services within the following counties of Regional Healthcare Partnership 6: Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde. The other three local mental health authorities (Bluebonnet Trails, Camino Real, and Center for Healthcare Services) provides mental health services to the remaining counties within Regional Healthcare Partnership 6 and service areas do not overlap. Hill Country is committed to ongoing advancement of services for the individuals we serve and is willing to participate in a learning collaborative with other providers within the region to continually improve services and data collection and to identify how to address additional needs that may arise.

### Plan for Learning Collaborative:

Hill Country MHDD Centers will participate in a learning collaborative that meets annually to discuss local disparities in care and the ways they have successfully gathered relevant data and ultimately better served the populations in the projects.

### Project Valuation:

Project valuation is based on a weighted average of Achieving Waiver Goals, Addressing Community Needs, Project Scope, and Project Investment. The valuation for this project was based on economic evaluation model and extensive literature review conducted by professors at the University of Houston School of Public Health and University of Texas at Austin Center for Social Work Research. The valuation is supported by cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). QALYs incorporate costs averted when known (e.g., emergency room visits that area avoided). The valuation on this project is based on 90 consumers over the life of the project.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $1,852,389**
Identifying Project and Provider Information:
Title: 2.13.1 Design, implement, and evaluate research-supported and evidence-based interventions tailored towards individuals in the target population: Mental Health Courts
Unique RHP ID#: 133340307.2.7 – PASS 2
Provider Name: Hill Country Community MHMR Center (dba Hill Country MHDD Centers)
TPI: 133340307

Project Summary:
Provider Description: Hill Country Community MHMR Center (dba Hill Country MHDD Centers) is a community mental health center providing mental health, substance use disorder, early childhood intervention and intellectual and developmental disability services to the following counties of RHP6 (Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde). Hill Country serves a 14,390 square mile area of RHP6 with a population of approximately 401,123 in 2012.

Intervention(s): This project will implement Mental Health Courts within the Comal, Medina, and Uvalde counties served by Hill Country in RHP6 in order to meet the overall health needs of individuals dealing with behavioral health issues who frequently utilize the emergency departments or criminal justice system. The project will have dedicated case workers to provide wraparound services for the identified individuals and will have dedicated courts to monitor the patient’s treatment compliance.

Need for the project: Comal, Medina, and Uvalde counties have approached Hill Country regarding establishing Mental Health Courts in order to increase treatment compliance of individuals with mental illness identified as having frequent utilization of emergency departments, the criminal justice system, and/or psychiatric inpatient services in an effort to deter inappropriate utilization of these services.

Target population: The target population is individuals with mental illness from within Comal, Medina, and Uvalde counties who are frequently utilize the emergency departments, criminal justice system, and/or psychiatric inpatient services. Based on the population served in Hill Country’s behavioral health program in RHP6, approximately 32% of our behavioral health patients within RHP6 have Medicaid and approximately 82% have income below $15,000 per year.

Category 1 or 2 expected patient benefits: The project aims to establish Mental Health Courts to serve Comal, Medina, and Uvalde counties within the RHP6. Mental Health Courts will monitor patient compliance with treatment protocol and provide wraparound behavioral health services to individuals in the program. The project seeks to provide services to a minimum of 120 individuals in RHP6 by the end of DY5 (number beginning service by DY: 20 in DY3; 40 in DY4; and 60 in DY5).

Category 3 outcomes: IT-10.2 Activities of Daily Living (DLA-20) Our goal is to have, at a minimum, 20% of the individuals served by the Mental Health Courts showing improvement on the Activities of Daily Living (DLA-20) which demonstrates stabilizing the individual in the community thus reducing the need for inpatient hospitalization and emergency department utilization.
### Project Description:

Comal, Medina and Uvalde counties have approached Hill Country MHDD Centers regarding establishing Mental Health Courts in order to increase treatment compliance of individuals with mental illness who are identified as having frequent utilization of Emergency Departments, the criminal justice system, and/or psychiatric inpatient services. Hill Country MHDD Centers would hire Community Health Workers to serve as Case Managers to deliver necessary community-based interventions according to the individuals need. Community-based interventions may include psychosocial rehabilitation, Cognitive Behavioral Therapy, Cognitive Processing Therapy, supported employment, transportation, peer support, and other services in accordance with the individuals needs. The identified consumers served through this project would appear regularly before the Mental Health court to increase the accountability of the individual to the necessary treatment in order to reduce utilization of the Emergency Department, the Criminal Justice system, or Psychiatric Inpatient settings.

The mental health court in Pittsburgh, which has been operating since 2001, determined that only 10% of individuals who completed the court were rearrested compared to a 68% national average for all defendants. According to the Bureau of Justice Assistance, *when it comes to mentally ill offenders, mental health courts have shown positive outcomes related to treatment and satisfaction with the process. A common perception is that the informality and decreased adversarial nature of the mental health court, when compared to traditional courts, decreases the barriers mentally ill offenders often face in receiving treatment through traditional courts. Mental health courts have been shown to provide more treatment, better treatment and faster linkages to appropriate treatment.*

In other studies, a 2003 study of the Broward County (Fla.) mental health court determined that the program increased defendants’ access to treatment services and that mental health court participants were more likely that non-participants to continue treatment after the program concluded. Another 2003 study of the Clark County (Wash.) mental health court, concluded participants had significantly more case management, outpatient service days, and medication monitoring after enrollment than before enrollment. Additionally, participants had fewer crisis intervention and inpatient treatment days post-enrollment.

In designing the Mental Health Courts, Hill Country will work with the courts to review other successful mental health courts, identify the target population to be served, have dedicated case managers for the courts, develop necessary legal agreements for court participation, create linkages for services beyond mental health services, and work with the courts in establishing ongoing procedures.

### Challenges:

The primary challenge for implementation of the project is recruiting qualified staff dedicated to working with the target population. Hill Country will address the challenge by offering incentives as necessary.

### Goals:

The goal of this project is to develop Mental Health Courts in Comal, Medina and Uvalde counties in order to reduce emergency department utilization, inpatient utilization, and
incarceration by developing wrap around services within the community for the targeted population.

Relationship to the Regional Goals:
The goal of this project is to establish Mental Health Courts within the community setting. By providing these services in the community, Hill Country will be meeting the regional goal of the Triple Aim by providing patients high-quality and patient-centered care, in the most cost effective way.

Starting Point/Baseline:
Hill Country MHDD Centers does not currently have a mental health court within its service area. This will be a new program for the area.

Rationale:
Comal, Medina and Uvalde counties have approached Hill Country MHDD Centers regarding establishing Mental Health Courts in order to increase treatment compliance of individuals with mental illness who are identified as having frequent utilization of Emergency Departments, the criminal justice system, and/or psychiatric inpatient services. Hill Country MHDD Centers would hire Community Health Workers to serve as Case Managers to deliver necessary community-based interventions according to the individuals need. Community-based interventions may include psychosocial rehabilitation, Cognitive Behavioral Therapy, Cognitive Processing Therapy, supported employment, transportation, peer support, and other services in accordance with the individuals needs. The identified consumers served through this project would appear regularly before the Mental Health court to increase the accountability of the individual to the necessary treatment in order to reduce utilization of the Emergency Department, the Criminal Justice system, or Psychiatric Inpatient settings.

In designing a program to address the needs of individuals with mental illness identified with frequent utilization of the Emergency Department, the Criminal Justice system, or Psychiatric Inpatient settings, Hill Country MHDD Centers will:

A) Assess size, characteristics and needs of individuals with mental illness identified with frequent utilization of the Emergency Department, the Criminal Justice system, or Psychiatric Inpatient settings, Hill Country will work with the local court systems to identify a target population that would gain the greatest benefit from participating in a mental health court to determine the size and characteristics of the population to be served. Hill Country will also review with the court the Sequential Intercept Model to determine the most appropriate level of entry for participants.

B) Review literature / experience with populations similar to target population to determine community-based interventions that are effective in averting negative outcomes such as repeated or extended inpatient psychiatric hospitalization, decreased mental and physical functional status, nursing facility admission, forensic encounters and in promoting correspondingly positive health and social outcomes / quality of life. Hill Country will visit successful mental health courts and review literature on lessons learned from other mental health courts in order to develop targeted services, forms and procedures in establishing the mental health courts and associated services.
C) **Develop project evaluation plan using qualitative and quantitative metrics to determine outcomes.** Hill Country will develop a project evaluation plan that will review items such as the number of individuals served, the services received, the number of individuals receiving follow up services, the number of individuals with recurring issues, and progression on the Activities of Daily Living assessment (DLA-20).

D) **Design models which include an appropriate range of community-based services and residential supports.** Based on the size, characteristics and needs for the target population, Hill Country will train staff in the most appropriate interventions to address the needs of the individuals and in connecting the individuals with other appropriate resources within the community.

E) **Assess the impact of interventions based on standardized quantitative measures and qualitative analysis relevant to the target population based on information from the ANSA and/or participant surveys, and identify opportunities to scale all or part of the intervention(s) to a broader patient population and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations.** Hill Country will utilize the Activities of Daily Living assessment (DLA-20) to determine progression of Mental Health Court participants. In addition, Hill Country will do follow up surveys with individuals who receive Mental Health Court services to determine satisfaction with services and to help ensure stabilization of symptoms.

Unique community need identification number the project addresses:
- CN.4 There is a shortage of high quality mental and behavioral health services that are integrated with physical

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
There are currently no mental health courts within Hill Country’s service area.

**Related Category 3 Outcome Measure(s):**

OD-10 Quality of Life/Functional Status  
IT-10.2 Activities of Daily Living  

Reasons/rationale for selecting the outcome measure:
Criminal justice involvement and recurrence of emergency department utilization impact an individuals mental health and thus their quality of life. It impacts the individual’s self care as well as their ability to cope with their environment. When an individual is unable to properly care for themselves or to cope with their local environment, they are at greater risk of unemployment and poor health. The Activities of Daily Living will be utilized to provide an overview of functional status, determine activity limitations, establish a baseline for treatment, provide a guide for intervention planning, to evaluate interventions and monitor progress and to plan for future and for discharge. The Activities of Daily Living will be measured utilizing the DLA-20 Functional Assessment.

The DLA-20 Functional Assessment is a functional assessment, proven to be reliable and valid, designed to assess what daily living areas are impacted by mental illness or disability. The assessment tool identifies where outcomes are needed so clinicians can address those functional
deficits on individualized service plans. THE DLA-20 is intended to be used by all disabilities and ages. Developmental Disabilities and Alcohol/Drug Abuse forms are personalized for daily functional strengths and problems associated with those diagnoses.

**Relationship to other Projects:**

Provision of Mental Health Court services as an alternative to inpatient and emergency department services reinforces objectives for all other behavioral health services provided by Hill Country through Regional Healthcare Partnership 6 (133340307.2.1 Mobile Crisis Outreach Teams, 133340307.2.2 Psychiatric Consultation, 133340307.2.3 Co-occurring Psychiatric and Substance Use Disorder Services, 133340307.2.4 Trauma Informed Care, 133340307.2.5 Whole Health Peer Support and 133340307.2.6 Veteran Mental Health Services) by providing specialized services addressing crisis episodes and aimed at averting reoccurrence of crisis episodes experienced by an individual that if not addressed in the community may result in needing inpatient psychiatric services. Addressing the crisis episode in the community enables the individual to move forward with treatments and to be more successful in their recovery. In addition, by addressing crisis in the community, exacerbation of symptoms are reduced resulting in a reduction of Emergency Department utilization and potentially preventable hospital admissions (RD-1-3).

**Relationship to Other Performing Providers’ Projects in the RHP:**

Hill Country MHDD Centers is the local mental health authority that provides services within the following counties of Regional Healthcare Partnership 6: Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde. The other three local mental health authorities (Bluebonnet Trails, Camino Real, and Center for Healthcare Services) provides mental health services to the remaining counties within Regional Healthcare Partnership 6 and service areas do not overlap. Hill Country is committed to ongoing advancement of services for the individuals we serve and is willing to participate in a learning collaborative with other providers within the region to continually improve services and data collection and to identify how to address additional needs that may arise.

**Plan for Learning Collaborative:**

Hill Country MHDD Centers will participate in a learning collaborative that meets annually to discuss local disparities in care and the ways they have successfully gathered relevant data and ultimately better served the populations in the projects.

**Project Valuation:**

Project valuation is based on a weighted average of Achieving Waiver Goals, Addressing Community Needs, Project Scope, and Project Investment. The valuation is supported by cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). QALYs incorporate costs averted when known (e.g., emergency room visits that area avoided). The valuation on this project is
based on 120 consumers over the life of the project.

</tr>
</tbody>
</table>

Project Summary:

Provider Description: The San Antonio Metropolitan Health District (Metro Health) is the public health agency charged by State law, City code, and County resolution with the responsibility for providing public health programs in San Antonio and unincorporated areas of Bexar County. Services include health code enforcement, food inspections, immunizations, clinical services, environmental monitoring, disease control, health education, dental health, and emergency preparedness. As a public health department Metro Health provides services to all residents, but has a particular focus on underserved populations and those experiencing health disparities which often include a higher representation of Medicaid funded individuals.

Intervention(s): The Metro Health teen pregnancy prevention project will include the following four components. 1) Educate adolescents in Bexar County zip codes that have high teen birth and STD rates using evidence-based teen pregnancy, STD & HIV prevention programs. 2). Expand access to affordable reproductive healthcare services for adolescents that may not be reached through existing provider practices and focusing on segments of the population with high teen birth and STD rates. 3). Conduct training to providers on the Adolescent Medical Home (AMH) model encouraging a team-based care approach to preventive adolescent health services. 4). Provide case management services to teen mothers through the evidence-based Healthy Outcomes through Perinatal Education and Support (HOPES) project to reduce repeat teen pregnancies. The project provides a diverse intervention spectrum ranging from intensive short term services to long-term follow-up over an extended period of time to best meet the needs of the target population. Milestones 4, 8, 12 and 16 for DY2-DY5 include CQI activities as a part of the RHP 6 learning collaborative.

Need for the project: San Antonio has a critical need for effective teen pregnancy prevention strategies in order to stimulate and sustain long-term changes in adolescent behavior and healthcare. The 2010 San Antonio’s Bexar County birth rate for females ages 10-14 was 0.7/1,000 and was 75% higher than the national rate 0.4/1,000. In 2010, the Bexar County teen childbearing cost was $69.9 million dollars in health care, child welfare, incarceration, and lost revenue.

Target population: The target population will be adolescents 13 to 19 years of age who reside in zip codes where teen births rates are over twice the national birth rate. The project intends to reach over 1,550 adolescents for each year (DY3 thru DY5) for a total of 4,650 adolescents reached. Approximately 80% of the target population are eligible for Medicaid and would benefit from preventive education and health services proven to change adolescent sexual behavior.

Category 1 or 2 expected patient benefits: For each year (DY3 thru DY5), the project seeks to reach 1,200 adolescents with evidence-based teen pregnancy, STD & HIV prevention education,
100 teen mothers with case management services, 250 adolescents with reproductive healthcare services, and 20 medical providers with education encouraging a team based care approach using an adolescent medical home model. The number of adolescents reached for each year (DY3 thru DY5) will be 1,550 for a total number of 4,650 adolescents reached.

**Category 3 outcomes:**

**OD-2 Potentially Preventable Admissions**

**IT-2.13 Other Admission Rate – Admissions for infant delivery among health education participants**

- A reduction in the proportion of adolescents reporting a teen pregnancy among those participating in the evidence-based teen pregnancy, STD, and HIV prevention education component compared to baseline.

**IT-2.13 Other Admission Rate – Admission for infant delivery among case management participants**

- A reduction in the proportion of repeat teen pregnancies among teen mothers participating in the HOPES case management component.

**Project Description:**

**Project Overview**

San Antonio Metropolitan Health District (Metro Health) submits this proposal with the overall goal to reduce the burden of adolescent pregnancy and improve the health status of adolescents in San Antonio, TX.

San Antonio has several challenges and has a critical need for effective teen pregnancy prevention strategies in order to stimulate and sustain long-term changes in adolescent behavior and healthcare. The 2010 San Antonio’s Bexar County birth rate for females ages 10-14 was 0.7/1,000 and was 75% higher than the national rate 0.4/1,000. According to the latest comparable data, Bexar County’s 2008 pregnancy rate for females ages 10-14 was 1.9/1,000 and was 36% higher than the national pregnancy rate of 1.4/1,000. The number of Syphilis and HIV cases among youth ages 13-19 increased by 77% in Bexar County from 2006 to 2010. During the same period, reported cases of Chlamydia and Gonorrhea increased to 31% and 29% respectively for the same age group. In 2010, seven zip codes had teen birth rates for females ages 15-19, 3 to 4 times the national teen birth rate of 76.9/1,000 females age 15–19.

In addition, funding for family planning and reproductive health services have been cut by two thirds in Texas, reducing access to services for adults and adolescents. One local health care provider has reported that state funding cuts have reduced preventive care and family planning services from more than 10,000 patients per year to approximately 2,300 today. Nearly 57% of Texas deliveries are paid for by Medicaid, and 47% of Texas births are the result of unplanned pregnancies.

This project will address the challenges with four components that will work in conjunction to support the project goal;

1. Educate adolescents in Bexar County zip codes that have high teen birth and STD rates using evidence-based teen pregnancy, STD & HIV prevention programs. The project will work with school districts and charter schools within Bexar County to implement district-wide, age and culturally appropriate evidence-based teen pregnancy, STD & HIV prevention education. Part of the prevention education will include information on where
adolescents can go for healthcare services.

2. Expand access to affordable reproductive healthcare services for adolescents that may not be reached through existing provider practices and focusing on segments of the population with high teen birth and STD rates. The project will work with local providers to increase the number of adolescents receiving reproductive healthcare services.

3. Conduct training to providers on the Adolescent Medical Home (AMH) model. The AMH model encourages a team-based care approach to preventive adolescent health services and making efforts to link payment to performance. The project will work with educating area providers on how to establish an AMH model in their practices to provide comprehensive healthcare services to new and existing adolescent patients.

4. Provide case management services to teen mothers through the evidence-based Healthy Outcomes through Perinatal Education and Support (HOPES) project to reduce repeat teen pregnancies. The HOPES Project is a client-centered, solution-focused, home visitation model implemented by a complement of Nurse and Social Worker staffing and based on the Inter-conception Health Promotion Initiative in Denver, CO. Health promotion is accomplished through identification of strengths on which to build, education, patient navigation, modeling, counseling, advocacy and motivational interviewing. The project will work with providers to identify and recruit teen mothers for the HOPES project.

**Goals and Relationship to Regional Goals**

**Project Goals:**
- 1. Reduce teen pregnancies among higher risk target populations
- 2. Reduce repeat teen pregnancies among teens in case management services

This project meets the following regional goals:

This project directly addresses the RHP 6 need to provide improved maternal and child health services within the region (CN.5).

**Challenges:**

San Antonio has several challenges and has a critical need for effective teen pregnancy prevention strategies in order to stimulate and sustain long-term changes in adolescent behavior and healthcare. The 2010 San Antonio’s Bexar County birth rate for females ages 10-14 was 0.7/1,000 and was 75% higher than the national rate 0.4/1,000.

These challenges will be addressed through a multipronged strategy to reduce teen pregnancy through evidence-based education, case management, clinical services and provider outreach and education.

**5-Year Expected Outcome for Provider and Patients:**
The five year expected outcome will be to reduce the Bexar County teen birth rate for females ages 15-19 by 15%.

---

### Starting Point/Baseline:

Currently teen pregnancy prevention services are provided by Metro Health and project partners as follows:

<table>

</tr>
<tr>
<td><strong>Teen Case Management Services</strong></td>
<td>This program does not currently exist. Baseline of 0 for DY2</td>
</tr>
</tbody>
</table>

### Rationale:

The Centers for Disease Control and Prevention (CDC) has listed teen pregnancy as a “Winnable Battle” if communities implement evidence-based prevention programs. However, only twelve Bexar County area schools are using evidence-based teen pregnancy, STD & HIV education programs. In addition, existing community health clinics have reached their capacity for adding new adolescent patients, while medical providers have limited funding to provide more comprehensive health evaluation, prevention health screenings and referrals. The Metro Health project components and outcomes were specifically selected to address these critical challenges and will significantly expand evidence-based prevention education, adolescent reproductive health services, provider knowledge on implementing an AMH model, and intensive case management for teen mothers.

**Unique community need identification number the project addresses:**

The Metro Health project rationale includes a wide reaching strategy for adolescent prevention education and health services currently lacking in Bexar County and associated with RHP 6 community need CN.5.

According to the National Campaign to Prevent Teen and Unplanned Pregnancy, parenthood is the leading cause of school dropout among teen girls and young teen mothers are much less likely to graduate from high school than those who wait to become parents.[4] The disparities in teen pregnancy and school drop outs are more notable among Latinos. In a May 2010 publication, The National Campaign reported that more than half (54%) of Latina teen mothers do not complete high school, compared to 34% of teen mothers overall.[5] In Bexar County, Hispanic teens have historically had teen birth rates well above national averages. In 2010, Metro Health recorded a birth rate of 64.0/1,000 births to Hispanic females ages 15-19 compared to the national rate of 55.7/1000.

Teen pregnancy affects the entire community, not just young mothers. As noted above, school dropout and adolescent pregnancy is closely linked. Teen fathers are also more likely to drop out
of school, have poor involvement with their children, engage in substance abuse and illegal activity, and conceive children with multiple women.\textsuperscript{64} In a study of children of mothers aged 17 and younger, it was found that these children had lower general knowledge scores compared with children of mothers age 20-21. Children of the youngest mothers also had significantly lower test and assessment scores than children of mothers aged 22-29, suggesting that as maternal age at birth increases, so do children’s cognition and knowledge levels by the time they reach kindergarten.\textsuperscript{65} There is an obvious economic impact on the families created by teen pregnancy, but also one that is spread community-wide. In Bexar County alone, in 2010, teen childbearing cost $69.9 million dollars in health care, child welfare, incarceration, and lost revenue.

In 2012, the City of San Antonio conducted a Community Survey among San Antonio residents in all ten City Council Districts. Teen pregnancy was ranked the highest concern among fifteen community issues and respondents felt that teen pregnancy was the most important for the City to address over the next two years.\textsuperscript{66} In 2011, Metro Health initiated a strategic planning process both internally and community-wide in which teen pregnancy was identified as one of the priority issues for San Antonio. In 2009, San Antonio Mayor, Julian Castro identified teen pregnancy as one of the most important issues to address within the SA2020 visioning process and has enlisted Metro Health to take the lead on moving the vision forward.

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This project would more than double the number of teens served through evidence-based health education programs and adolescent reproductive health care services. Additionally the addition of outreach and education to health care providers to promote an adolescent medical home model and case management services for teen mothers are new strategies for teen pregnancy prevention proposed in this project.

**Related Category 3 Outcome Measure(s):**

<table>
<thead>
<tr>
<th>OD-2 Potentially Preventable Admissions</th>
</tr>
</thead>
<tbody>
<tr>
<td>IT- 2.13 Other Admission Rate – Admissions for infant delivery among health education participants</td>
</tr>
<tr>
<td>IT-2.13 Other Admission Rate – Admission for infant delivery among case management participants</td>
</tr>
</tbody>
</table>

**Reasons/rationale for selecting the outcome measures:**
The Metro Health comprehensive strategy for teen pregnancy, STD, and HIV prevention project

\textsuperscript{65} Terry-Mumen, E., Manlove, J., Moore, K. January 2005. *How Children Born to Teen Mothers Fare*.

\textsuperscript{66} 2012 City of San Antonio Community Survey Final Report. ETC Institute.
has two Category 3 Outcomes. 1) A reduction in the proportion of adolescents reporting a teen pregnancy among those participating in the evidence-based teen pregnancy, STD, and HIV prevention education component compared to baseline. 2) A reduction in the proportion of repeat teen pregnancies among teen mothers participating in the HOPES project component. These will both be reported as potentially preventable hospital admissions to deliver infants, however additional healthcare costs and negative social outcomes will be averted by reducing teen pregnancies.

These Metro Health outcomes are a priority for the RHP as supported by local birth and STD data. According to 2010 birth certificate data collected by Metro Health, the Bexar County teen birth rate for females ages 10 to 14 (0.7/1,000) was 75% higher than the national rate of 0.4/1,000. The Bexar County teen birth rate for females 15 to 19 (50.3/1000) was 47% higher than the national rate of 34.3/1000. In 2010, Bexar County recorded 735 repeat births among females ages 19 and under (22% of all teen births were repeat births). In 2010, seven zip codes had teen birth rates for females ages 15-19, 3 to 4 times the national teen birth rate of 76.9/1,000 females age 15–19. Those zip codes were concentrated in the inner-city’s Westside, Eastside and Southside (78208, 78202, 78203, 78220, 78204, 78207, and 78214). The number of Syphilis and HIV cases among youth ages 13-19 increased by 77% in Bexar County from 2006 to 2010. During the same period, reported cases of Chlamydia and Gonorrhea increased to 31% and 29% respectively for the same age group. According to the latest comparable data.

The CDC is recommending that communities implement evidence-based strategies to prevent teen pregnancy. Metro Health is using the CDC and the locally produced Community Health Improvement Plan (CHIP) recommendations to implement proven prevention programs to decrease local teen birth rates. Strategies that include evidence-based prevention education, adolescent health services and case management, along with provider education and input are essential components of an effective strategy to combat teen pregnancy, STD/HIV transmission, and sustain long-term community change.

Compared to California, a state with similar demographics to Texas, the affect of different approaches to teen pregnancy prevention are clear. Beginning in 1990, California began implementing evidence based prevention programs, expanding teens’ access to healthcare services, and promoting media campaign messages. California teen birth rates dropped from 71/1,000 for females ages 15-19 in 1990 to 38/1,000 in 2008. Unfortunately, Texas did not follow the same strategy and saw the 1990 birth rate of 75/1,000 females ages 15-19 dropped to only 63/1,000 in 2008. Evidence-based prevention programs implemented in Bexar County could result in 1,700 fewer births each year and save five million dollars in direct costs, and thirty-three million in overall costs, annually. In addition, case management intervention has been proven effective in reducing repeat births by up to 17%, utilizing the HOPES Project model.

### Relationship to other Projects:
The Metro Health comprehensive strategy for teen pregnancy, STD, and HIV prevention supports Metro Health’s pass 2 proposed project (2.7.6) to expand Syphilis and HIV prevention and screening among high risk populations. The teen pregnancy prevention education component will build knowledge and resistance skills among adolescents to prevent STD and HIV, including information on testing. The provider education component on the AMH model will encourage provider–client discussions on STD prevention and testing. The expansion of adolescent healthcare services component will strengthen provider-client discussions on disease prevention, provide condoms for sexually active youth, and STD and HIV testing and treatment. The HOPES component will also support prevention education and encourage STD and HIV screening for teen mothers and their partners. In addition, the HOPES component will support and reinforce the Metro Health pass 2 proposed project (2.7.5) for breastfeeding promotion project to increase the percent of participating mothers’ who breastfeed for six months. Teen mothers in the HOPES project will participate in the peer support groups and baby café components of the breastfeeding project.

### Relationship to Other Performing Providers’ Projects in the RHP:
This project may align to goals of University Health System’s Healthy U School Based Clinic project in expanding access to adolescent focused clinical preventive services.

### Plan for Learning Collaborative:
Metro Health will foster Continuous Quality Improvement (CQI) through active participation in the RHP 6 learning collaborative working groups to support and enhance project quality improvement, evaluation and achievement of outcomes. CQI elements are specifically included through milestones 4, 8, 12 and 16 beginning in DY2. Additionally Metro Health will seek out project specific opportunities to collaborate with regional maternal and child health as well as other local health department performing providers in other Texas regions.

### Project Valuation:
In 2008, Texas taxpayer costs associated with children born to teen mothers included: $221 million for public health care (Medicaid and CHIP); $111 million for child welfare; and, for children who have reached adolescence or young adulthood, $175 million for increased rates of incarceration and $378 million in lost tax revenue due to decreased earnings and spending. According to the Health and Human Services Commission, Medicaid costs average $2,500 per infant delivery and as much as $45,000 for an infant treated in the Neonatal Intensive Care Unit.

Utilizing the methodology provided by the RHP 6 anchor, Metro Health assessed the following:

---

factors in assigning a value to this health promotion project: achievement of waiver goals, community need, project scope and the level of project investment.

- This project was ranked high on achievement of waiver goals given the strong research and high potential for reduction of healthcare costs associated with prenatal care and teen childbearing for Medicaid and other underserved populations in Bexar County. This project will expand access to health services, emphasize effective evidence-based preventive services, provide opportunities for coordinated care between public health, school, community clinics and private providers and reduce costs.

- This project was ranked high in regards to addressing a community need. Teen pregnancy prevention is consistently listed as the leading health and social need in Bexar County and has been established as one of four key priorities for Metro Health.

- This project was ranked high on project scope in that services will be broadly targeted to all local schools and healthcare providers in Bexar County serving potentially thousands of teens through a mix of population-based and individually focused health promotion services.

- This project was ranked high in regards to program investment driven by the broad scope of population-based project activities as well as the expense of intensive individual case management and/or clinical services that will be provided through this project. The project provides a diverse intervention spectrum ranging from intensive short term services to long-term follow-up over an extended period of time to best meet the needs of the target population.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $14,991,565**
Identifying Project and Provider Information:
Title: 2.6.4 Implement other evidence-based health promotion program in an innovative manner:
Neighborhood Based Physical Activity and Health Promotion Project
Unique RHP ID#: 091308902.2.2 - PASS 1
Performing Provider: San Antonio Metropolitan Health District
Performing Provider TPI: 082426001

Project Summary:
Provider Description: The San Antonio Metropolitan Health District (Metro Health) is the public health agency charged by State law, City code, and County resolution with the responsibility for providing public health programs in San Antonio and unincorporated areas of Bexar County. Services include health code enforcement, food inspections, immunizations, clinical services, environmental monitoring, disease control, health education, dental health, and emergency preparedness. As a public health department Metro Health provides services to all residents, but has a particular focus on underserved populations and those experiencing health disparities which often include a higher representation of Medicaid funded individuals.

Intervention(s): In order to address the obesity and diabetes rates within San Antonio/Bexar County, Metro Health will implement the Neighborhood Based Physical Activity and Health Promotion Project. This project will focus on primary prevention strategies at the community level to improve the health status of residents and increase community member engagement in a neighborhood-based approach for chronic disease prevention. Metro Health will identify 10 target area neighborhoods for this initiative based on the prevalence of risk factors for chronic disease, as well as the presence of a network of community based assets that will facilitate opportunities for resident-led health improvements. Each target neighborhood will encompass an average area of 2 square miles. Based on local population density of 1332 residents per square mile we expect that approximately 26,500 residents will be reached through community based programmatic and infrastructure improvements in health disparity neighborhoods. The project staff will work directly within target neighborhoods to engage residents in the assessment, planning, implementation and evaluation of health improvement strategies at the neighborhood level in line with the CDC’s community level strategies for Obesity Prevention as well as the Institute of Medicine’s recommended strategies for obesity prevention. Specifically, these include twenty-four specific community-level strategies in the following categories:

- Promote the availability of affordable health food and beverages
- Support healthy food and beverage choices
- Encourage breastfeeding
- Encourage physical activity or limit sedentary activity among children and youth
- Create safe communities that support physical activity
- Encourage communities to organize for change

Residents will participate in planning and selection from among these evidence-based strategies.

72 Centers for Disease Control and Prevention. Recommended Community Strategies and Measurements to Prevent Obesity I the United States. MMWR 2009; 58(No. RR-7).

73 Institute of Medicine (U.S.), Committee on Accelerating Progress in Obesity Prevention (2012). “Accelerating Progress in Obesity Prevention: Solving the weight of the nation”.

1022 ★ RHP 6 Plan ★ March 8, 2013 San Antonio Metropolitan Health District
based on the specific needs of their neighborhood through a coordinated resident-driven process utilizing the Asset Based Community Development Model\textsuperscript{74}. Through the combination of evidence-based obesity prevention strategies and a validated model for community engagement this project will incorporate two major overarching themes to support chronic disease prevention: the tangible application of policy, systems and environmental strategies, and a community-based participatory approach that leverages resident knowledge, experience and priorities to guide change through participation and empowerment.

Continuous Quality Improvement components required of this project will include project specific training and technical assistance to be provided by the Asset Based Community Development Institute as well as active participation in the RHP6 learning collaborative and internal Metro Health team to support CQI.

**Need for the project:** This project addresses the RHP 6 need to provide improved prevention of chronic diseases including diabetes within the region (CN.2). San Antonio/Bexar County experiences a high death and disease burden related to chronic illnesses, with significant health disparities in diabetes and obesity within the urban core. The *Neighborhood Based Physical Activity and Health Promotion Project* will allow Metro Health and its partners to target resources and programs within the most vulnerable communities/neighborhoods, and capitalize on resident assets and engagement to drive decision making. This approach will focus on increasing population-wide opportunities for physical activity and healthy eating within the urban core of San Antonio through a coordinated application of multiple evidence-based strategies that will be selected by allowing community members to fully engage in deciding which approaches will work best within their neighborhood.

**Target population:** Residents living within 10 defined target neighborhoods to be identified during the initial phases of the project. Community wide data indicates 15.4\% of the total population is Medicaid eligible, the percentage of Medicaid eligible residents is expected to be higher in target neighborhoods as these will be documented health disparity areas.

**Category 1 or 2 expected patient benefits:** This project will work to improve the health status of residents and increase community member engagement in a neighborhood-based approach for chronic disease prevention. The project aims to improve healthy eating practices and increase physical activity behaviors among residents in target neighborhoods in order to reduce the prevalence of obesity and ultimately obesity-related chronic diseases among adults, adolescents and children. Each target neighborhood will encompass an average area of 2 square miles. Based on local population density of 1332 residents per square mile we expect that approximately 26,500 residents will be reached through community based programmatic and infrastructure improvements in health disparity neighborhoods.

**Category 3 outcomes:**

OD – 12 Primary Care and Primary Prevention

---

\textsuperscript{74} Kretzmann, JP., McKnight JL. Building Communities from the Inside Out: A Path Toward Finding and Mobilizing a Community’s Assets. The Asset Based Community Development Institute, Northwestern University. 1993.
The outcome measures for the *Neighborhood Based Physical Activity and Health Promotion Project* include increasing the proportion of adults who engage in regular physical activity, and increase the proportion of adults who consume the recommended amount of fruits and vegetables, and decrease the proportion of adults that are overweight or obese (BMI>25). These indicators will be measured using the Behavior Risk Factor Surveillance System (BRFSS) survey questions.

- IT – 12.6 – Other Outcome Improvement Target – increase the % of adults who consume the recommended amount of fruits and vegetables
- IT – 12.6 – Other Outcome Improvement Target – increase in % of adults who are physically active
- IT – 12.6 – Other Outcome Improvement Target – Decrease the % of adults that are overweight or obese (BMI>25)

**Project Description:**

**Project Overview**

In order to address the obesity and diabetes rates within San Antonio/Bexar County, Metro Health will implement the *Neighborhood Based Physical Activity and Health Promotion Project*. This project will work to improve the health status of residents and increase community member engagement in a neighborhood-based approach for chronic disease prevention. This project addresses the RHP 6 need to provide improved prevention of chronic diseases including diabetes within the region (CN.2).

Metro Health will identify 10 target area neighborhoods for this initiative based on the prevalence of risk factors for chronic disease, as well as the presence of a network of community based assets that will facilitate opportunities for resident-led health improvements. The project staff will work directly within target neighborhoods to engage residents in the assessment, planning, implementation and evaluation of health improvement strategies at the neighborhood level in line with the CDC’s community level strategies for Obesity Prevention\(^1\) as well as the Institute of Medicine’s recommended strategies for obesity prevention\(^2\). Specifically, these include twenty-four specific community-level strategies in the following categories:

- Promote the availability of affordable health food and beverages
- Support healthy food and beverage choices
- Encourage breastfeeding
- Encourage physical activity or limit sedentary activity among children and youth
- Create safe communities that support physical activity
- Encourage communities to organize for change

Residents will participate in planning and selection from among these evidence-based strategies based on the specific needs of their neighborhood through a coordinated resident-driven process utilizing the Asset Based Community Development Model\(^3\). Through the combination of evidence-based obesity prevention strategies and a validated model for community engagement this project will incorporate two major overarching themes to support chronic disease prevention: the tangible application of policy, systems and environmental strategies, and a community-based participatory approach that leverages resident knowledge, experience and priorities to guide change through participation and empowerment.

This project will enhance and expand current public health efforts in community-based strategies for obesity prevention by specifically and intensively focusing on neighborhoods within the

---

1. CDC’s community level strategies for Obesity Prevention
2. Institute of Medicine’s recommended strategies for obesity prevention
3. Asset Based Community Development Model
geographic disparity areas of the city with the highest rates of chronic disease. The neighborhood focus of the strategies intends to increase ownership and adoption of the strategies within a context of local community scaled interventions. The project staff will include two Team Leaders (Management Analysts) and ten Neighborhood Liaisons (Health Program Specialists), which will each be assigned a target neighborhood in which to engage residents in the assessment, planning, implementation and evaluation of health improvement strategies for obesity prevention.

The project is structured in three phases of activity: Phase I: Community Selection and Assessment; Phase II: Resident Engagement; and Phase III: Implementation of Community Driven Interventions.

Phase I (Community Selection), will include the development of selection criteria to identify target area neighborhoods. The criteria will give higher priority to areas of health and socioeconomic disparities, and will also prioritize the presence of social networks. Phase I will also include the development of target area neighborhood health assessment reports. These reports will be compiled for each target area neighborhood and will include health and socioeconomic data for the population within the target area.

Phase II (Resident Engagement) will include the development of a neighborhood engagement process based on the principles of Asset Based Community Development. The process will incorporate the following five principles: the mapping of individual, community, and organizational assets; building relationships among local assets; mobilizing the local assets for health improvement and information sharing; convening a broad representation from the community to build a community vision and plan; and leveraging activities, investments and resources from outside the community to support community driven health improvement. Once the community engagement process is established, the recruitment and formation of resident leadership groups will take place. The purpose of these groups will be to increase participation and engagement from residents in chronic disease prevention initiatives.

Phase III (Implementation of Community Driven Interventions) will allow the resident leadership groups to identify and select evidence based obesity and chronic disease prevention strategies from among the CDC and IOM recommended approaches within the target area. The resident leadership groups will utilize consensus building methods to make decisions. The programs and initiatives will be focused on reducing obesity by increasing the proportion of adults who engage in regular physical activity and increasing the proportion of adults who consume the recommended amount of fruits and vegetables.

Throughout the three phases technical assistance, program documentation, and continuous quality improvement activities will occur through a partnership with the ABCD Institute to assure fidelity to the model and to support ongoing program improvements to achieve high levels of resident engagement and successful accomplishment of project health outcomes (BMI reduction).

Goals and Relationship to Regional Goals
Project Goals:
This project will work to improve the health status of residents and increase community member engagement in a neighborhood-based approach for chronic disease prevention.

This project meets the following regional goals:
This project addresses the RHP 6 need to provide improved prevention of chronic diseases including diabetes within the region (CN.2).

Challenges:
While ABCD methodologies have been proven effective in increasing resident engagement in chronic disease prevention, it represents a new approach for Metro Health to engage specific neighborhoods in identifying, planning, implementing and evaluation health promotion efforts.

To address these challenges in implementing this approach significant staff training and development has been planned for in the project implementation. Additionally, as interventions will be driven by resident priorities staff will seek to balance flexibility and responsiveness to community needs with consistency in timing and evaluation of health outcomes.

5-Year Expected Outcome for Provider and Patients:
Improved self-efficacy, knowledge and resources to support health among neighborhood residents. Improved healthy eating and physical activity levels in target neighborhoods. Reductions in BMI among residents leading to decreased risk of obesity-related chronic disease.

Starting Point/Baseline:
This project represents a new approach to health promotion planning and implementation. Therefore the baseline number of neighborhoods and participants begins at 0 in DY2.

Rationale:
San Antonio/Bexar County experiences a high death and disease burden related to chronic illnesses, with significant health disparities in diabetes and obesity within the urban core. In 2009, the five distinct leading causes of death in Bexar County for adults aged 25 and older were heart disease, malignant neoplasms, chronic lower respiratory diseases, cerebrovascular diseases, and diabetes mellitus (Metro Health, Health Profiles 2009). These causes accounted for 65% of all deaths in adults aged 25 and older, many of which can be attributed to unhealthy lifestyle behaviors related to poor nutrition, physical inactivity, and tobacco use. According to 2010 Behavioral Risk Factor Surveillance System (BRFSS) data, more than 67% of Bexar County respondents are overweight or obese, which includes disproportionate representation by African American and Hispanic residents. Approximately three-quarters of African American (72%) and Hispanic residents (76%) are overweight or obese, compared to 61% of Whites. Morbid obesity was reported in 20% of African Americans and 16% of Hispanics, but only 8% among Whites. Additional self-reported health status and behaviors according to the 2010 BRFSS found that 14% were diagnosed with diabetes, 28% are daily smokers, and only 22% consume five servings of fruits and vegetables per day, while 7% consume fruits and vegetables never or once daily. Access to fresh fruits and vegetables is limited in many locations. Fifty-seven percent of the individuals surveyed reported that there are no farmers markets in their community and 46% shop in small stores and corner stores, the majority of which do not sell any fresh fruits or vegetables. In terms of physical activity, 73% reported that they had participated in some...
physical activity during the past month. Most (84%) reported that there are sidewalks in their neighborhood, while only 36% reported that there were walking trails in their neighborhoods. Over one-third of the respondents stated that lack of time and motivation were the reasons that respondents gave for not walking. As with the local obesity demographics, there are significant income and geographic disparities for those diagnosed with diabetes. Diabetes was also found to be highest among those making less than $15,000 per year (21%) as compared to other income categories (ranging from 5-17%), with the highest incidence within the south, east and west sides of the inner city. Within Bexar County, Hispanics have twice the rate of diabetic amputations compared to white non Hispanics (117 vs. 54 per 100,000). These socioeconomic, racial and ethnic disparities in disease burden and complication rates are reflective of the gaps in linguistically and culturally appropriate community-based preventive services for chronic disease and diabetes that exists in San Antonio.

As a public health agency it is appropriate that Metro Health focus on primary prevention and community based strategies, consistent with CDC evidence-based strategies, to address obesity and obesity-related chronic diseases. The Neighborhood Based Physical Activity and Health Promotion Project will allow Metro Health and its partners to target resources and programs within the most vulnerable communities/neighborhoods, and capitalize on resident assets and engagement to drive decision making. This approach will focus on increasing opportunities for physical activity and healthy eating by allowing community members to fully engage in deciding what approach will work best within their neighborhood.

Racial and socioeconomic health disparities are presented in sharpest focus in the neighborhoods where low-income families and racial minorities live, and this project intends to improve the contexts within these neighborhoods and resultant effects on obesity. The higher rates of obesity and chronic disease in these areas are a direct consequence of lack of safe and public space and opportunities for physical activity in the physical environment, reduced access to healthy food resources, and levels of social capital that often are in short supply. Individuals that perceive their neighborhoods to be unsafe report lower levels of physical activity, especially racial minority adults and the elderly. Residents in poor neighborhoods would likely participate in more physical activity and walking in their neighborhoods if measures were taken to increase safety in those areas. Furthermore, children whose parents felt the neighborhood was unsafe had an increased tendency towards obesity by age seven. An increase of social cohesion has direct effect on criminal behavior within neighborhoods, as “close knit” communities where there is trust between neighbors have been shown to be more apt to organize in union against crime. Likewise, communities with strong social union are also more successful in advocating

---

for their collective well being, such as fighting for improved services and resources, such as sidewalks and access to stores that sell healthy food. Lack of availability of healthy choices at corner stores and limited transportation to larger grocery stores affect minority communities tremendously in terms of chronic disease health outcomes. Metro Health has a proven track record on increasing access to healthy foods at the community level, namely through our healthy corner store initiative and healthy menu labeling initiative at restaurants. The project will increase our efforts to promote healthy eating using these or other evidence-based strategies in the target neighborhoods. The increase in social capital that asset-based community development promotes can have a positive effect on the acceptance of preventive health and health promotion measures within a community by building upon trust and also exerting positive social pressures.

Unique community need identification number the project addresses:
This project addresses the RHP 6 need to provide improved prevention of chronic diseases including diabetes within the region (CN.2).

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
The Neighborhood Based Physical Activity and Health Promotion Project represents a new strategic approach by Metro Health to focus chronic disease prevention efforts in small geographic areas disproportionately affected by health disparities. This approach represents a departure from more typical community wide or large area public health interventions. Metro Health intends to leverage resident engagement at the outset of the planning process in order to allow residents to lead decision making. In an effort to maximize resident engagement, Metro Health will recruit and hire the project staff from the health disparity areas within the community.

Related Category 3 Outcome Measure(s):

<table>
<thead>
<tr>
<th>OD – 12 Primary Care and Primary Prevention</th>
</tr>
</thead>
<tbody>
<tr>
<td>IT – 12.6 – Other Outcome Improvement Target – increase the % of adults who consume the recommended amount of fruits and vegetables</td>
</tr>
<tr>
<td>IT – 12.6 – Other Outcome Improvement Target – increase in % of adults who are physically active</td>
</tr>
<tr>
<td>IT – 12.6 – Other Outcome Improvement Target – Decrease the % of adults that are overweight or obese (BMI&gt;25)</td>
</tr>
</tbody>
</table>

### Reasons/rationale for selecting the outcome measures:
The outcome measures for the *Neighborhood Based Physical Activity and Health Promotion Project* include increasing the proportion of adults who engage in regular physical activity, and increasing the proportion of adults who consume the recommended amount of fruits and vegetables. These indicators will be measured using the Behavior Risk Factor Surveillance System (BRFSS) survey.

In addition to the oversampling done in intervention neighborhoods for this project the BRFSS is administered by the Centers for Disease Control and Prevention (CDC) on an annual basis. BRFSS is the world’s largest, on-going telephone health survey system, tracking health conditions and risk behaviors in the United States annually since 1984. The availability of county wide data and historical data will provide important opportunities to compare intervention neighborhood outcomes with those of the community as a whole over time.

These specific outcome measures were selected because they represent significant risk factors for several chronic diseases, and if impacted can help accelerate prevention of obesity-related chronic diseases such as diabetes and cardiovascular disease within the target neighborhoods. Increasing physical activity and fruit and vegetable consumption within the target neighborhoods and decreasing BMI have been shown effective in decreasing chronic disease rates.

### Relationship to other Projects:
The *Neighborhood Based Physical Activity and Health Promotion Project* and Metro Health’s Community Diabetes Program (Category 2 project: 091308902.2.3) intend to work in tandem within 10 target area neighborhoods to address health disparities. This project will focus on a primary prevention strategy to improve health behaviors and reduce obesity while the Community Diabetes Program will focus on secondary and tertiary prevention of a critical obesity-related chronic disease. The staff members within the two projects will work together to capitalize on the connections made within the neighborhoods, and will utilize the asset based community development model to build neighborhood level community support systems for individuals impacted by chronic disease.

### Relationship to Other Performing Providers’ Projects in the RHP:
This project does not appear to have a direct relationship to other RHP 6 projects but opportunities may arise to collaborate as specific neighborhood health priorities and needs are identified.

### Plan for Learning Collaborative:
Metro Health will foster Continuous Quality Improvement (CQI) through active participation in the RHP 6 learning collaborative working groups to support and enhance project quality improvement, evaluation and achievement of outcomes. CQI elements are specifically included through milestones 3, 6, 8 and 10 beginning in DY2. Additionally Metro Health will seek out project specific opportunities to collaborate with regional maternal and child health as well as other local health department performing providers in other Texas regions.

Metro Health will participate in the establishment of Learning Collaboratives to support and encourage information sharing and technical assistance related to obesity prevention, increasing opportunities for physical activity, improving the built environment, and increasing neighborhood engagement. The Learning Collaborative will allow Metro Health to share...
experiences and best practices with other providers in Bexar County and surrounding counties. Metro Health can assist in creating the Learning Collaborative, establishing goals and communication strategies, organizing events for information sharing, and adopting metrics to measure success.

Project Valuation:
Many of the demographic risk factors associated with chronic disease as well as high burdens of chronic disease morbidity and mortality are concentrated in neighborhoods within San Antonio and Bexar County that have traditionally lacked infrastructure to support healthy living and experienced higher rates of poverty. The approach that Metro Health will take in the Neighborhood Based Physical Activity and Health Promotion Project will focus on providing a comprehensive neighborhood-based approach to chronic disease prevention. Ten specific target areas will be selected for this initiative that have significant risk factors for chronic disease, but more importantly have a network of community agency and resident engagement assets that will facilitate opportunities for health improvement over the four years of the initiative. While these communities may have community cohesion and identity, additional resources are necessary to address health disparities. Special consideration will be given to address populations and geographic areas within the county that experience a poorer health status than the general population. Each of the 10 target neighborhood areas will include approximately 26,500 residents and will each cover a small geographic area defined by neighborhood boundaries, and natural or physical boundaries. The neighborhood boundaries will be self-defined, with an average scale of 2 square miles. The implementation of evidence-based obesity prevention strategies and infrastructure improvements to the built environment (such as side walk improvements, bike routes, cross walks, lighting, walking trail expansion, park improvements, and increasing linkages) will benefit community safety and health by increasing opportunity and access for physical activity. These strategies and improvements will have an intended reach well beyond the target neighborhood boundaries, as migration between neighborhoods is expected. By allowing residents to prioritize, select, and be involved in planning the projects and initiatives though the resident engagement process, the community needs will be addressed. This will also increase community ownership of the projects, which will help to ensure successful implementation and sustainability.

Utilizing the methodology provided by the RHP 6 anchor, Metro Health assessed the following factors in assigning a value to this health promotion project: achievement of waiver goals, community need, project scope and the level of project investment.

- This project was ranked high on achievement of waiver goals given the high potential for improved and long-term change in neighborhoods that would support a reduction in obesity-related chronic diseases.
- This project was ranked high in regards to addressing a community need. Obesity and obesity-related chronic disease is consistently listed as the leading health and social concern in Bexar County and has been established as one of four key priorities for Metro Health. San Antonio and Bexar County have placed increasing emphasis on obesity prevention for children and adults through the SA2020 goals, Community Health Improvement Plan and the work of the Mayor’s Fitness Council. Additionally the ABCD model for designing and implementing specific interventions will further emphasize community needs in project activities.
This project was ranked high on project scope in that services will be broadly targeted to all residents and visitors to the 10 target neighborhoods, with potential for additional resident impact outside of the intervention area. This approach is supported by an increasingly strong evidence-base for policy, systems, and environmental change approaches to health promotion, and in particular obesity prevention.

This project was ranked high in regards to program investment driven by the broad scope of population-based project activities as well as the expense associated with permanent infrastructure elements to support long-term neighborhood transformation that are likely to be part of the policy, systems and environmental change strategies applied in the intervention neighborhoods.

Identifying Project and Provider Information:

Title: 2.6.2 Establish self-management programs and wellness using evidence-based designs: Community Diabetes Project
Unique RHP ID#: 091308902.2.3 - PASS 1
Provider Name: San Antonio Metropolitan Health District
TPI: 082426001

Project Summary:

Provider Description: The San Antonio Metropolitan Health District (Metro Health) is the public health agency charged by State law, City code, and County resolution with the responsibility for providing public health programs in San Antonio and unincorporated areas of Bexar County. Services include health code enforcement, food inspections, immunizations, clinical services, environmental monitoring, disease control, health education, dental health, and emergency preparedness. As a public health department Metro Health provides services to all residents, but has a particular focus on underserved populations and those experiencing health disparities which often include a higher representation of Medicaid funded individuals.

Intervention(s): The San Antonio Metropolitan Health District (Metro Health) will implement the Community Diabetes Project, that will expand access to the Stanford Chronic Disease Self Management and Diabetes Self Management Programs for individuals living with diabetes and their family members/caregivers as well as those that are at risk for developing diabetes. The Stanford Chronic Disease Self Management and Diabetes Self Management Programs are staff intensive six–week long, two and a half hours per week process driven workshops that are meant to build patients’ self-efficacy in managing their conditions. The workshops are co-facilitated by two lay leaders with chronic conditions of their own, with the intent on building peer support. The project aims to improve disease management outcomes by expanding the reach of its current chronic disease self management program through increasing the number of locations and courses offered as well as to increase the number of certified lay-leaders and trainers throughout the community, with the goal of improving the physical and emotional health of participants while reducing health care costs in targeted neighborhoods with the highest incidence of chronic disease. Metro Health will also establish a sub-contract with the YMCA of Greater San Antonio to implement diabetes prevention intervention and education courses across the community. With support and training from YMCA of the USA, the YMCA of Greater San Antonio will replicate the National YMCA Diabetes Prevention Program (YDPP). YDPP helps those at high risk of developing type-2 diabetes adopt and maintain healthy lifestyles by eating healthier, increasing physical activity, and losing a modest amount of weight. The YDPP has a 12-month duration, which begins with an intensive 16 weekly core sessions and is followed by 8 months of monthly maintenance sessions. Together, these positive changes help reduce their chances of developing the disease. The YMCA also implements the parallel program Y Living for those who do not meet the clinical eligibility for YDPP but are diagnosed with or at risk for chronic disease. This program will also be utilized for those individuals referred but ineligible for YDPP.

Need for the project: San Antonio/Bexar County experiences a high death and disease burden related to chronic illnesses, with significant health disparities in diabetes and its complications. These socioeconomic, racial and ethnic disparities in disease burden and complication rates are reflective of the gaps in linguistically and culturally appropriate community-based preventive services for chronic disease and diabetes that exists in San Antonio. The proposed interventions

1036 ★ RHP 6 Plan ★ March 8, 2013
San Antonio Metropolitan Health District
will fill those gaps in community-based preventive services and provide expanded services more in line with community demand for services and disease burden in San Antonio.

**Target population:** The *Community Diabetes Project* will be provided throughout the city of San Antonio, with an emphasis on neighborhoods within the central urban core which has a high burden of diabetes and prediabetes within geographic disparity areas. These areas correspond with those sectors of the city with higher percentages of minorities (Hispanic and African American), low educational attainment and household income, along with high rates of uninsured or underinsured.

**Category 1 or 2 expected patient benefits:** This project will work to improve self-efficacy for managing or preventing diabetes, improved health behaviors and reduced health care utilization and costs among program participants and their caretakers by increasing availability of evidence-based disease self-management programs and provide the National YMCA Diabetes Prevention Program (YDPP) at multiple locations throughout the city. 1700 participants per year will be served by the two interventions for a total of at least 5100 participants over the waiver term.

**Project Description:**

**Project Overview**

The San Antonio Metropolitan Health District (Metro Health) aims to expand access to the Stanford Chronic Disease Self Management and Diabetes Self Management Programs for individuals living with diabetes and their family members/caregivers as well as those that are at risk for developing diabetes. Ultimately, the project aims to improve disease management outcomes by expanding the reach of its current chronic disease self management program through increasing the number of locations and courses offered as well as to increase the number of certified lay-leaders and trainers throughout the community.

Metro Health will also establish a sub-contract with the YMCA of Greater San Antonio to implement diabetes prevention intervention and education courses across the community. With support and training from YMCA of the USA, the YMCA of Greater San Antonio will replicate the National YMCA Diabetes Prevention Program (YDPP) at eighteen locations. YDPP helps those at high risk of developing type-2 diabetes adopt and maintain healthy lifestyles by eating healthier, increasing physical activity, and losing a modest amount of weight. Together, these positive changes help reduce their chances of developing the disease. YDPP is based on research funded by the National Institutes of Health and the Centers for Disease Control and Prevention. The YMCA also implements the parallel program Y Living for those who do not meet the clinical eligibility for YDPP but are diagnosed with or at risk for chronic disease. This program will also be utilized for those individuals referred but ineligible for YDPP.
The Stanford Chronic Disease and Diabetes Self-Management Programs were developed and evaluated over the past 30 years at the Stanford University School of Medicine’s Patient Education Center. Stanford has developed and offered programs that have been tested for effectiveness through randomized, controlled trials that are funded by research grants and span two to five years. Their programs are not licensed for use outside of Stanford unless they are proven through rigorous research standards to be evidenced-based. The aim of their research-driven programs is to improve the physical and emotional health of participants while reducing health care costs.

Expanded staff capacity can train many additional lay leaders to hold Stanford Chronic Disease and Diabetes Self-Management workshops within their own communities and to their peer groups, making it possible to reach many more of the neighborhoods that experience the highest rates of disease burden. Both staff and community lay leaders will facilitate the six-week, two and a half hour long workshops, in addition to a two hour session added at the week before the workshop for biometric data collection and registration. Community lay leaders will be recruited from targeted neighborhoods with the highest incidence of chronic disease, and will facilitate self-management workshops within these neighborhoods along with expanded Metro Health staff. Metro Health staff will supplement the chronic disease and diabetes self-management workshops with specialized outreach and preventive education on the complications of diabetes to include heart disease, kidney disease, neuropathy, and eye complications. Metro Health staff will also establish a referral system to appropriate community-based lifestyle interventions for all participants and caregivers that go through the workshops. They will receive intensive training on health disparities and the social determinants of health as related to the communities in which they work. Preference will be given in hiring staff that is reflective of the socioeconomic, racial, and ethnic diversity of intervention communities.

The YMCA Diabetes Prevention Program (YDPP) has been shown to reduce the risk of developing type-2 diabetes by up to 58%. The success of the program was supported by the evidence based use of small group activities and Social Support Interventions. During the CDC’s Diabetes Prevention Program, the risk reduction was even greater—71%—among adults aged 60 years or older. The YMCA of Greater San Antonio will provide the YDPP at eighteen YMCA locations and affiliated community sites throughout San Antonio to include childcare sites, schools and churches. Participants in the YDPP gather regularly in small groups facilitated by a trained lifestyle coach. In small groups, participants discuss healthy eating, physical activity, and other behavior changes that, over the one-year course, will help reduce their risk of developing type-2 diabetes. In the supportive environment, individual activities are a primary component of the YDPP’s 12-month course. During 16 weekly core sessions and up to 8 months of maintenance sessions, individuals cover topics such as: healthy eating; getting started with physical activity; overcoming stress; and staying motivated. After the initial core sessions, participants meet monthly for added support in maintaining their progress for lifestyle behavior change.

**Goals and Relationship to Regional Goals**

**Project Goals:**
Ultimately, the project aims to improve disease management outcomes by expanding the reach of its current chronic disease self-management program through increasing the number of locations and courses offered as well as to increase the number of certified lay-leaders and trainers.
This project meets the following regional goals:
This project directly addresses the RHP 6 need to provide improved prevention and management of chronic diseases including diabetes within the region (CN.2).

**Challenges:**
San Antonio faces significant challenges with high number of diabetes, pre-diabetics and persons with poorly controlled diabetes.

This project represents a significant expansion of self-management activities by Metro Health and YDPP will be a new program to be implemented by the Greater YMCA of San Antonio. Both programs have a very strong evidence-base for improving outcomes among diabetics and pre-diabetes. Staff experience and support for both activities is high and should provide good support for program expansion.

**5-Year Expected Outcome for Provider and Patients:**
Improved self-efficacy for managing diabetes, improved health behaviors and reduced health care utilization and costs among program participants.

**Starting Point/Baseline:**
In the past two years Metro Health has increased internal capacity to provide Stanford Chronic Disease and Diabetes Self-Management programming in Bexar County. Staff have completed eighteen community-based workshops of seven weeks in lengths, reaching 192 total participant workshop completers and contacts of over 1,300 community members with or at risk of chronic disease, diabetes, and their caretakers/family members. These workshops have taken place in churches, community centers, and senior centers. In a local environment with limited community- based and culturally sensitive preventive services, geographic areas of pronounced chronic disease and diabetes disparities, and a primary care and patient-centered medical home shortage in the inner city. These services have been supported by state grant funds which will expire in March 2013.

The YMCA of Greater San Antonio is presently not offering the YDPP program but is gearing up for the insurance- based arm of YDPP in partnership with United Healthcare in the coming months. This proposed project would provide access to an effective intervention in a community- based setting for at- risk uninsured and underinsured individuals to prevent the onset of diabetes.

**Rationale:**
Bexar County experiences a high death and disease burden related to chronic illnesses. There is a significant need for evidence-based disease self-management programs offered within community settings at no cost to participants.

In 2009, the five distinct leading causes of death in Bexar County for adults aged 25 and older were heart disease, malignant neoplasms, chronic lower respiratory diseases, cerebrovascular diseases, and diabetes mellitus (Metro Health, Health Profiles 2009). These causes accounted for 65% of all deaths in adults aged 25 and older, many of which can be attributed to unhealthy lifestyle behaviors related to poor nutrition, physical inactivity, and tobacco use. According to 2010 Behavioral Risk Factor Surveillance System (BRFSS) data, more than 67% of Bexar County respondents are overweight or obese, which includes disproportionate representation by
African American and Hispanic residents. Approximately three-quarters of African American (72%) and Hispanic residents (76%) are overweight or obese, compared to 61% of Whites. Morbid obesity was reported in 20% of African Americans and 16% of Hispanics, but only 8% among Whites. Additional self-reported health status and behaviors according to the 2010 BRFSS found that 14% were diagnosed with diabetes, 28% are daily smokers, and only 22% consume five servings of fruits and vegetables per day, while 7% consume fruits and vegetables never or once daily. In terms of physical activity, 73% reported that they had participated in some physical activity during the past month. Over one-third of the respondents stated that lack of time and motivation was the reasons that respondents gave for not walking. As with the local obesity demographics, there are significant income and geographic disparities for those diagnosed with diabetes. Diabetes was also found to be highest among those making less than $15,000 per year (21%) as compared to other income categories (ranging from 5-17%), with the highest incidence within the south, east and west sides of the inner city. Within Bexar County, Hispanics have twice the rate of diabetic amputations compared to white non Hispanics (117 vs. 54 per 100,000). These socioeconomic, racial and ethnic disparities in disease burden and complication rates are reflective of the gaps in linguistically and culturally appropriate community-based preventive services for chronic disease and diabetes that exists in San Antonio.

**Unique community need identification number the project addresses:**
This project directly addresses the RHP 6 need to provide improved prevention and management of chronic diseases including diabetes within the region (CN.2).

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
The proposed intervention to increase availability of evidence-based disease self-management programs and provide the National YMCA Diabetes Prevention Program (YDPP) at multiple locations throughout the city will fill those gaps in community-based preventive services and provide expanded services more in line with community demand for services and disease burden in San Antonio. The health educators and community-based lay leaders will complete eighty-eight Stanford Chronic Disease and Diabetes Self-Management Workshops throughout the city with an emphasis on disparity areas. These workshops will reach over 1320 individual participants with 7,392 individual contacts. Community capacity to provide disease self-management workshops will be increased to 24 lay leaders, and their retention will be aided in the provision of a small stipend. The YMCA of Greater San Antonio will provide 36 sixteen week intensive lifestyle intervention programs at the community level to reach over 500 individuals and their families who are at risk of developing diabetes.

**Related Category 3 Outcome Measure(s):**

**OD-1 Primary Care and Chronic Disease Management**

IT- 1.10 - Diabetes Care: HbA1c poor control (>9.0%)

**OD – 9 Right Care, Right Setting**

IT – 9.2 – ED Appropriate Utilization (reduce ED visits for Diabetes)

**OD – 10 Quality of Life and Functional Status**
Reasons/rationale for selecting the outcome measures:
The Category 3 Outcome Measures selected for the community diabetes project are Hemoglobin A1c poor control (9.0%); reduced emergency department visits related to diabetes; and improved self-reported overall health status. Participants in the Stanford University Self-Management Programs and YMCA Diabetes Prevention Program participants will be assessed for these metrics at baseline and at six and twelve months. HbA1c in poor control is associated with increased incidence of the complications from diabetes, including but not limited to cardiovascular disease, nephropathy, neuropathy, and retinopathy. As HB A1c measures average plasma glucose concentration over prolonged periods of time, it is a more accurate indicator of average blood glucose levels in the months prior to the test.

Emergency Department visits will be assessed at baseline and at six and twelve months for all program participants using validated questions that have been used in Stanford program evaluations. Enhanced self-efficacy, improved communication with healthcare providers and social supports will result in lowered percentages in diabetes related emergency department visits for all participants, which is vital in a population with high healthcare costs. Improved community based education on the primary and secondary prevention of diabetes and its complications will reduce utilization and associated costs by promoting lifestyle interventions (YDPP Program) and patient-empowerment in the primary healthcare setting (Stanford Self-Management Programs).

Finally, overall self-reported health status will be assessed among participants in both programs at baseline, six months and twelve months. While this is a general reflection of health rather than specific to diabetes, it will encompass changes associated with both the Stanford and YDPP curricula including nutritional changes, physical activity, self-efficacy and other components. Additionally Stanford DMSMP research has found this item to be a strong predictor of future health. The wording from the Behavioral Risk Factor Surveillance Survey will be used to allow for comparisons to community wide data collected for Bexar County.

Relationship to other Projects:
The expansion of the Stanford Chronic Disease Self Management and Diabetes Self Management Programs and new provision of the YMCA Diabetes Prevention Program (YDPP) at the community-level throughout San Antonio will work in concert with and enhance Metro Health’s proposed Neighborhood Based Physical Activity and Health Promotion Project (Category 2 project: 091308902.2.2) by building neighborhood level community support systems for individuals living with chronic disease, diabetics, and individuals and families at risk of developing diabetes.

Relationship to Other Performing Providers’ Projects in the RHP:
Metro Health will coordinate community-based self-management and chronic disease prevention programs with regional partners including University Health System’s diabetes registry project, the UTHSCSA’s chronic care management and community health worker projects.
Plan for Learning Collaborative:

Metro Health will foster Continuous Quality Improvement (CQI) through active participation in the RHP 6 learning collaborative working groups to support and enhance project quality improvement, evaluation and achievement of outcomes. CQI elements are specifically included through milestones 2, 4, 6 and 8 beginning in DY2. Additionally, Metro Health will seek out project specific opportunities to collaborate with regional maternal and child health as well as other local health department performing providers in other Texas regions.

Project Valuation:

Bexar County hospital discharge data estimated that hospitalizations directly related to diabetes in 2009 accounted for $100 million in costs, which excludes care for emergency room visits that did not result in hospitalization, as well as frequency of doctor visits. Overall, San Antonio as a community bears a very heavy economic toll from diabetes when indirect costs such as disability from complications, work loss, and premature death from related complications are taken into account.

This proposed project will reach at least 5100 individuals and involves a significant time commitment of project staff and participants in each cohort. The Stanford Chronic Disease Self Management and Diabetes Self Management Programs are staff intensive six –week long, two and a half hours per week process driven workshops that are meant to build patients’ self-efficacy in managing their conditions. The workshops are co-facilitated by two lay leaders with chronic conditions of their own, with the intent on building peer support. The YDPP has a 12-month duration, which begins with an intensive 16 weekly core sessions and is followed by 8 months of monthly maintenance sessions.

Utilizing the methodology provided by the RHP 6 anchor, Metro Health assessed the following factors in assigning a value to this health promotion project: achievement of waiver goals, community need, project scope and the level of project investment.

- This project was ranked high on achievement of waiver goals given the strong research and high potential for reduction of healthcare costs associated with diabetes prevention and management for Medicaid and other underserved populations in Bexar County.
- This project was ranked moderately in regards to addressing a community need. While diabetes in particular, and chronic diseases in general, are high priority community health issues, this project focuses more on secondary and tertiary prevention rather than primary prevention relative to other proposed Metro Health projects.
- This project was ranked moderately on project scope in that services will be widely available to residents but the number of participants in both the Stanford and YDPP groups will be limited by class capacity rather than impacting the broader community.
- This project was ranked moderately in regards to program investment since the interventions require ongoing participant interaction and evaluation over a somewhat extended period of time even though the per episode cost of the intervention is conservative.

[P-6]: Participate in at least bi-weekly interactions (meetings, conference calls, or webinars) with other providers and the RHP to promote collaborative learning around shared or similar projects.

**Metric 1 [P-6.1]:** Number of bi-weekly meetings, conference calls, or webinars organized by the RHP that the provider participated in.
*Baseline/Goal:* Participate in collaborative learning around shared or similar projects.
*Data Source:* Documentation of weekly or bi-weekly phone meetings, conference calls, or webinars including agendas for phone calls, slides from webinars, and/or meeting notes

**Metric 2 [P-6.2]:** Share challenges and solutions

**Milestone 12 Estimated Incentive Payment:** $903,319.33

### Milestone 13
[P-6]: Participate in at least bi-weekly interactions (meetings, conference calls, or webinars) with other providers and the RHP to promote collaborative learning around shared or similar projects.

**Metric 1 [P-6.1]:** Number of bi-weekly meetings, conference calls, or webinars organized by the RHP that the provider participated in.
*Baseline/Goal:* Participate in collaborative meetings/calls.
*Data Source:* Documentation of weekly or bi-weekly phone meetings, conference calls, or webinars including agendas for phone calls, slides from webinars, and/or meeting notes

**Metric 2 [P-6.2]:** Share challenges and solutions

**Milestone 12 Estimated Incentive Payment:** $903,319.33
webinars including agendas for phone calls, slides from webinars, and/or meeting notes

**Metric 2 [P-6.2]**: Share challenges and solutions successfully during this bi-weekly interaction. Baseline/Goal: Share challenges and solutions in collaborative meetings/calls. Data Source: Catalogue of challenges, solutions, tests, and progress shared by the participating provider during each bi-weekly interaction.

Milestone 3 Estimated Incentive Payment: $837,755.66

Milestone 10 Estimated Incentive Payment: $882,995.00

**Year 2 Estimated Milestone Bundle Amount:** $2,513,267

**Year 3 Estimated Milestone Bundle Amount:** $2,621,886

**Year 4 Estimated Milestone Bundle Amount:** $2,648,985

**Year 5 Estimated Milestone Bundle Amount:** $2,709,958

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $10,494,096
### Identifying Project and Provider Information:

| Title: | 2.7.6 Implement other evidence-based disease prevention programs in an innovative manner: HIV and Syphilis Reduction in Bexar County |
| Unique RHP ID#: | 091308902.2.4 - PASS 2 |
| Performing Provider: | San Antonio Metropolitan Health District |
| Performing Provider TPI: | 082426001 |

### Project Summary:

**Provider Description:** The San Antonio Metropolitan Health District (Metro Health) is the public health agency charged by State law, City code, and County resolution with the responsibility for providing public health programs in San Antonio and unincorporated areas of Bexar County. Services include health code enforcement, food inspections, immunizations, clinical services, environmental monitoring, disease control, health education, dental health, and emergency preparedness. As a public health department Metro Health provides services to all residents, but has a particular focus on underserved populations and those experiencing health disparities which often include a higher representation of Medicaid funded individuals. The STD/HIV Branch serves individuals through STD surveillance, contact investigation and clinic services. Each year over 16,000 STD reports are submitted, over 8000 contact investigations are conducted and approximately 11,000 patient visits occur in the clinic.

**Intervention(s):** This project will focus on reducing HIV and Syphilis infections with a special focus on high risk populations in Bexar County. This project will utilize four components that will work in conjunction to support the project goal.

1. Develop and implement a new outreach unit to focus on education and screening in the field for HIV and Syphilis among high risk adults and adolescents (13 years of age or greater). This may include probation or drug treatment settings in addition to other geographic areas and settings identified through surveillance data.
2. Conduct clinical case management and case investigations of all high risk pregnant women to assure appropriate prenatal care and third trimester syphilis screening to prevent congenital syphilis cases and other STD transmission. High risk women are defined as any that present to the Metro Health STD clinic for any reason or that are referred to Metro Health STD surveillance staff by community physicians.
3. Conduct education and outreach to local medical providers to encourage the adoption of third trimester syphilis testing among all pregnant women in Bexar County.
4. Expand STD clinic capacity (hours and/or staff per shift) to receive additional patients identified through community outreach activities and provide prompt and appropriate screening and treatment for syphilis and other sexually transmitted diseases.

**Need for the project:** San Antonio has several challenges and a critical need for enhanced, targeted HIV and syphilis prevention, control and treatment strategies. This will reduce the burden of sexually transmitted diseases and HIV and improve the health status of adolescents and adults 13 years of age and greater in San Antonio, Texas. The Bexar County rate of HIV infection is 21.2 per 100,000 population which is 1.25 times higher than the state rate of 16.9. Bexar County’s primary and secondary syphilis rate in 2011 was 2.3 times higher than the national and state rates. With 18 cases in 2012, the congenital syphilis rate in Bexar County was...

---

75.3 per 100,000 live births, a rate far surpassing any recent year. From 2008-2011 the Bexar County annual rate was 40.9 per 100,000 live births, which is 30% higher than the average rate for Texas for that same period (at 28.6 per 100,000 live births) and five times the national average (8.5 per 100,000 in 2011).

Target populations: The target populations for this project include: high risk adults and adolescents (13 years of age or greater), high risk pregnant women, persons exposed or infected with HIV or Syphilis, and local medical providers. Of the patients currently seen in the STD Clinic, approximately 80% are either Medicaid eligible or indigent. We expect similar or higher numbers in the high risk targeted populations.

Category 1 or 2 expected patient benefits: The project’s goal is to screen 800 high risk persons per year for HIV and Syphilis, assure third trimester syphilis screening to prevent congenital syphilis, and provide coordination of clinical services for individuals that are identified as infected. Clinic services will be expanded by approximately 20% to see an additional 2000 clinic visits per year. In total this project is expected to support services to 8760 individuals.

Category 3 outcomes:
OD-12 Primary Care and Primary Prevention
- IT- 12.5 Other USPSTF Endorsed Screening Outcome Measure – HIV Screening in High Risk Adults and Adolescents
- IT- 12.5 Other USPSTF Endorsed Screening Outcome Measure – Syphilis Screening in High Risk Adults and Adolescents
- IT – 12.6 Other Outcome Improvement Target – Third Trimester Syphilis Screening in High Risk Women

Project Description:
Project Overview
San Antonio Metropolitan Health District (Metro Health) submits this proposal with the overall goal to reduce the burden of sexually transmitted diseases and HIV and improve the health status of adolescents and adults 13 years of age and greater in Bexar County, Texas.

Bexar County has several challenges and has a critical need for enhanced disease prevention and control strategies in an effort to promote and encourage long-term behavior changes in adolescents and adults 13 years of age and greater. This funding will support new strategies to address local communicable disease rates. These would include increasing clinical services in the STD clinic, expanding services to the field, adding case management to prevent congenital syphilis infections and conducting provider education. Additionally, targeted HIV and syphilis testing will be notably increased by funding staff that will provide screening, health education and risk reduction counseling.

In 2011, the overall rate of newly diagnosed HIV cases for Bexar County was 21.2 cases per 100,000, compared to a 2010 state rate of 16.9 per 100,000. This county rate is 25% higher than the state rate. Newly diagnosed HIV cases in Bexar Country disproportionately affect two minority populations: Hispanics and Non Hispanic African Americans. In Bexar County at the end of 2011, Metro Health reported 4,312 persons living with HIV infection; this is 263.7 cases per 100,000 people. The CDC estimates 20% of persons infected with HIV do not know their
status. Targeted HIV testing will identify and link these individuals to care, leading to the goal of decreasing community viral load, and interrupting the spread of HIV. Bexar County’s primary and secondary syphilis rate in 2011 was 2.3 times higher than the national and state rate. There was a 309% increase in primary and secondary syphilis cases, between the year 2002 and 2011 in the county. Additionally, disparities among racial/ethnic groups in Bexar County are deep, with the 2011 rate for non-Hispanic African Americans, the highest at 20.4, compared to 11.8 for Hispanics and 6.2 for the non-Hispanic Whites. Additionally, the number of Syphilis and HIV cases among youth ages 13-19 increased by 77% in Bexar County from 2006 to 2010. During the same period, reported cases of Chlamydia and Gonorrhea increased to 31% and 29% respectively for the same age group. Regarding congenital syphilis, since 2008, Bexar county’s congenital syphilis rate has increased. From 2008-2011 the Bexar County annual rate was 40.9 per 100,000 live births, which is 30% higher than the average rate for Texas for that same period (at 28.6 per 100,000 live births) and five times the national average (8.5 per 100,000 in 2011). In 2012, 18 cases of congenital syphilis were confirmed for a rate of 75.3 per 100,000 live births, a rate far surpassing any recent year.

This project will address these challenges with four components that will work in conjunction to support the project goal;

1. Develop and implement a new outreach unit to focus on education and screening in the field for HIV and Syphilis among high risk adults and adolescents (13 years of age or greater). This may include probation or drug treatment settings in addition to other geographic areas and settings identified through surveillance data.

2. Conduct clinical case management and case investigations of all high risk pregnant women to assure appropriate prenatal care and third trimester syphilis screening to prevent congenital syphilis cases and other STD transmission. High risk women are defined as any that present to the Metro Health STD clinic for any reason or that are referred to Metro Health STD surveillance staff by community physicians.

3. Conduct education and outreach to local medical providers to encourage the adoption of third trimester syphilis testing among all pregnant women in Bexar County. 81

4. Expand STD clinic capacity (hours and/or staff per shift) to receive additional patients identified through community outreach activities and provide prompt and appropriate screening and treatment for syphilis and other sexually transmitted diseases.

Goals and Relationship to Regional Goals

Project Goals:

1. Reduce HIV infections in high risk adults and adolescents (13 years of age or greater),

2. Reduce syphilis infections in high risk adults and adolescents (13 years of age or greater)

3. Reduce congenital syphilis infections

4. Increase the efficiency of treatment services by provision or referral for sexually transmitted diseases and HIV

This project meets the following regional goals:

This project directly addresses the RHP 6 need to address high rates of communicable diseases within the region (CN.6).

---

**Challenges:**
Bexar County has several challenges and a critical need for enhanced, targeted HIV and syphilis prevention, control and treatment strategies. This will reduce the burden of sexually transmitted diseases and HIV and improve the health status of adolescents and adults 13 years of age and greater in Bexar County, Texas. Rates of HIV and syphilis infections increased in Bexar County, both are higher than the state and national levels. The Bexar County rate of HIV infection is 21.2 per 100,000 population which is 1.25 times higher than the state rate of 16.9. Bexar County’s primary and secondary syphilis rate in 2011 was 2.3 times higher than the national and state rates. With 18 cases in 2012, the congenital syphilis rate in Bexar County was 75.3 per 100,000 live births, a rate far surpassing any recent year. From 2008-2011 the Bexar County annual rate was 40.9 per 100,000 live births, which is 30% higher than the average rate for Texas between for that same period (at 28.6 per 100,000 live births) and five times the national average (8.5 per 100,000 in 2011).

Metro Health will seek to address these significant community challenges through expanded and targeted HIV and Syphilis prevention efforts focused on high risk adults, adolescents and pregnant women.

**5-Year Expected Outcome for Provider and Patients:**
- increase in high risk adults and adolescents (13 years of age or greater) screened for HIV infection
- increase in high risk adults and adolescents (13 years of age or greater) screened for Syphilis infection
- increase in third trimester syphilis testing to prevent congenital syphilis

**Starting Point/Baseline:**
Currently the Metro Health STD/HIV Branch receives local, state and federal-pass through funding to support STD surveillance and case investigation activities. Additionally local funds provide support to operate the STD clinic for 32 hours each week. Funding is not currently available to expand clinic hours, expand field testing for high risk populations or conduct case management or education activities to support congenital syphilis prevention. This funding will expand the clinical services in the STD/HIV Branch and provide funding to support new STD prevention strategies among high risk populations. The clinic provides approximately 11,000 patient visits annually. The baseline for case management and provider education is zero. The STD Branch has periodically provided field testing for special events such as World AIDS day but does not have a routine field testing operation. However new grant funds have recently been awarded that will provide approximately 1100 HIV field tests annually. The services proposed under this project will provide additional high risk testing and include both HIV and syphilis testing.

**Rationale:**
Rates of HIV and syphilis infections increased across Bexar county, levels of which are higher than both the state and national level, for both conditions. From 2002-2011 there was a 309% increase in primary and secondary syphilis cases in Bexar County. There was a drop in HIV infections in 2010 to 281 new infections diagnosed in Bexar County; yet in 2011, the number jumped to 361 new HIV infections diagnosed, the highest in the past ten years. With 18 cases in 2012, the congenital syphilis rate in Bexar County was 75.3 per 100,000 live births, a rate far...
surpassing any recent year. From 2008-2011 the Bexar County annual rate was 40.9 per 100,000 live births, which is 30% higher than the average rate for Texas for that same period (at 28.6 per 100,000 live births) and five times the national average (8.5 per 100,000 in 2011).

One of the first steps to HIV and STD prevention is for the individual to know their status of infection—and that is accomplished with screening. The challenges that Bexar County faces with HIV and syphilis are the reasons why this project option was developed. Metro Health aims to reduce the rates of HIV and syphilis infection by focusing on targeted testing among residents of Bexar County, especially those adults and adolescents at high risk for infection of HIV and syphilis and high risk pregnant women in order to prevent congenital syphilis cases. The Centers for Disease Control and Prevention (CDC) has identified HIV infection as one of the “winnable battles” that can be won with evidence based strategies.82

Metro Health joins the battle against HIV infection and syphilis by developing a project with three major components: community-based HIV and Syphilis prevention, case management, and clinical services. These components were chosen so that the Bexar County community receives high quality, efficient, and effective prevention and clinical services to address the high rates of HIV and STD in the community. Outcomes, milestones, and metrics selected for this project not only address each of the three components, but they also help Metro Health monitor their efforts in achieving their outcomes. Such efforts also support the RHP 6 in controlling the spread of these diseases that are extremely preventable. Furthermore, Metro Health’s efforts in addressing HIV and syphilis infection rates helps strengthen the health care infrastructure, representing an option for Bexar county residents to gain access to quality care.

**Unique community need identification number the project addresses:**

Metro Health’s multipronged project addresses RHP 6 Community Need CN.6 through targeted HIV and syphilis testing and coordination of care. These actions serve as a safety net for providers in the region and allow the many uninsured or underinsured residents of Bexar County gain access to critical screening, case management and treatment services.

Sexual health has become a priority within Bexar County. In cooperation with the Health Collaborative, Metro Health has identified Sexual Health as one of the five data-driven health priorities through the 2010 Bexar County Community Health Improvement Plan (CHIP). The sexual health goal is to “ensure that males and females have access to education and resources to promote sexual health.” Additionally specific objectives identified in the CHIP include decreasing the rate of syphilis, congenital syphilis and HIV and increasing the rates of HIV testing.

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**

Through innovative strategies, Metro Health is proactive in connecting with these hard-to-reach and hard-to-find individuals. This project will significantly enhance existing delivery systems. The unique way in which Metro Health will accomplish this is through linkages with the three existing areas of the STD/HIV program: Surveillance, Disease Intervention, and Clinic. Targeted HIV and syphilis testing will be notably increased by funding staff that will

---

provide screening, health education and risk reduction counseling. This funding will also support specific efforts to reduce the incidence of congenital syphilis through case management and provider outreach. The new HIV/Syphilis Prevention team will collaborate with the HIV/STD Disease Intervention team, the HIV/STD Surveillance team, and the Clinical team through monthly meetings about disease trends, new locations for holding screenings, and enhancing the coordination of care for clients seen in the clinic. This coordination will allow project staff to focus outreach and testing strategies on “real time” disease trends; it will also significantly enhance the clinic’s ability to serve more people and serve them more efficiently. Overall it is expected that 2920 individuals will receive new services each year (DY3-DY5) for a total of 8760 over the course of the project.

**Related Category 3 Outcome Measure(s):**

**OD-12 Primary Care and Primary Prevention**

IT- 12.5 Other USPSTF Endorsed Screening Outcome Measure – HIV Screening in High Risk Adults and Adolescents  
IT- 12.5 Other USPSTF Endorsed Screening Outcome Measure – Syphilis Screening in High Risk Adults and Adolescents  
IT – 12.6 Other Outcome Improvement Target – Third Trimester Syphilis Screening in High Risk Women

**Reasons/rationale for selecting the outcome measures:**

The Metro Health comprehensive strategy for this STD and HIV prevention project has three Category 3 Outcomes. 1) Increase in high risk adults and adolescents (13 years of age or greater) screened for HIV infection 2) increase in high risk adults and adolescents (13 years of age or greater) screened for Syphilis infection and 3) increase in pregnant women screened for syphilis during the third trimester. Additional healthcare costs and negative social outcomes will be averted by preventing and controlling the spread of HIV and Syphilis infections in Bexar County, including significant clinical and developmental issues associated with congenital syphilis infection.

These Metro Health outcomes are a priority for the RHP as supported by local STD and HIV data. Bexar County’s primary and secondary syphilis rate in 2011 was 2.3 times higher than the national and state rate. Bexar County’s rate of new HIV infections in 2011, 21.2 cases/100,000 population, was 1.3 times the state rate of 16.9. This county experienced a 27% increase in new HIV infections diagnosed in 2011 compared to 2010. With 18 cases in 2012, the congenital syphilis rate in Bexar County was 75.3 per 100,000 live births, a rate far surpassing any recent year. From 2008-2011 the Bexar County annual rate was 40.9 per 100,000 live births, which is 30% higher than the average rate for Texas for that same period (at 28.6 per 100,000 live births) and five times the national average (8.5 per 100,000 in 2011).

The United States Preventive Services Task Force (USPSTF) recommends screening for syphilis and HIV in high risk adults and adolescents.  

---

[http://www.uspreventiveservicestaskforce.org/3rduspstffyphilis/syphilis.htm](http://www.uspreventiveservicestaskforce.org/3rduspstffyphilis/syphilis.htm)  
[http://www.uspreventiveservicestaskforce.org/uspsf/uspsahiv.htm](http://www.uspreventiveservicestaskforce.org/uspsf/uspsahiv.htm)
recommended guidelines from the CDC for providing expanded STD clinical services and targeted syphilis screening.\textsuperscript{85} Metro Health will also follow nationally recommended guidelines from the CDC for HIV screening and linkage to care.\textsuperscript{86} The White House’s National HIV/AIDS Strategy, strongly encourages intensification of HIV prevention activities in communities most affected by HIV.\textsuperscript{87} Due to Bexar County’s high prevalence of syphilis and increased rates of congenital syphilis, Metro Health will follow CDC’s STD Treatment Guidelines that recommend providers to add third trimester syphilis testing for all pregnant women in high prevalence areas for syphilis.\textsuperscript{88}

According to a recent analysis by the Centers for Disease Control and Prevention, rates of HIV infection were associated with areas with low income residents, those with lower socioeconomic status. Within Bexar County, zip codes with the highest counts of new HIV infections were also areas with generally low income/higher poverty residents. The outcomes in this project will focus on targeted HIV and syphilis screening in these areas where hard to reach individuals may reside. The activities of this project will help Metro Health address these challenges and the health of low-income populations including Medicaid eligible populations.

**Relationship to other Projects:**

The Metro Health comprehensive strategy to expand syphilis and HIV prevention screening and treatment among high risk populations supports Metro Health’s pass 1 proposed project for teen pregnancy, STD, and HIV prevention. The syphilis and HIV prevention, screening and treatment program will build knowledge and skills through risk reduction counseling among adolescents to decrease teen pregnancies. Clients in need of access to affordable reproductive healthcare services will be provided referrals. Staff in the syphilis and HIV prevention project will be available to provide or assist with STD/HIV education to the teen mothers and their partners participating in the evidence-based Healthy Outcomes through Perinatal Education and Support (HOPES) project to reduce repeat teen pregnancies.

**Relationship to Other Performing Providers’ Projects in the RHP:**

Aside from the teen pregnancy prevention project there are no other RHP 6 projects that appear to have a direct linkage to this proposed project, however HIV/STD project staff will be available to support any related STD prevention efforts should they arise among the primary care, specialty or mental health services projects proposed. Other regional performing providers may be particular partners for high risk screening activities and provider education to support third trimester syphilis testing and will be engaged throughout the project period.

Plan for Learning Collaborative:

Metro Health will foster Continuous Quality Improvement (CQI) through active participation in the RHP 6 learning collaborative working groups to support and enhance project quality improvement, evaluation and achievement of outcomes. CQI elements are specifically included through milestones 3, 6, 9 and 12 beginning in DY2. Additionally Metro Health will seek out project specific opportunities to collaborate with regional maternal and child health as well as other local health department performing providers in other Texas regions.

Project Valuation:

The project selected addresses a need to screen for HIV and syphilis within high risk populations in Bexar County. Based on recommendations from the United States Preventive Services Task Force (USPSTF) screening for syphilis is important for detecting new syphilis cases and increased opportunities to treat these individuals. If left untreated, even during pregnancy, the syphilis infection can lead to a multitude of costly complications for the individual and especially the newborn baby.

One in three Texans with HIV received a late diagnosis of their infection. With earlier diagnosis of HIV infection, therapy can be initiated before severe immunologic compromise occurs. Screening can be cost-effective even before including the important public health benefit from reduced transmission to sex partners. Linking patients who have received a diagnosis of HIV infection to prevention and care is essential. HIV screening without such linkage confers little or no benefit to the patient. Although moving patients into care incurs substantial costs, it also triggers sufficient survival benefits that justify the additional costs. Even if only a limited fraction of patients who receive HIV-positive results are linked to care, the survival benefits per dollar spent on screening represent good comparative value. Mean cumulative treatment expenditures ranged from $27,275 to $61,615 higher for late than early presenters. After seven to eight years in care, the difference was still substantial. Therefore, screening these individuals for HIV and syphilis is a valued strategy.

Based on locally obtained data for 2011, the average cost to deliver and treat an infant born with congenital syphilis was $54,677. The average length of hospital stay in these cases was 14 days (ranging from 1 to 45 days). These costs do include the costs to the mother or of ongoing care needed for infants that may be born with significant physical and/or developmental disabilities. Using the 2011 average cost to an infant, the projected cost of care to the 18 infants with a presumptive diagnosis of congenital syphilis in 2012 would be $984,186. Bexar county hospitals

91 Branson, B.M., et.al. (2006) Revised Recommendations for HIV Testing of Adults, Adolescents, and Pregnant Women in Health-Care Settings. MMWR 55 (RR14);1-17. available at: http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5514a1.htm?iframe=true&width=80%&height=80%
92 Branson, B.M., et.al. (2006) Revised Recommendations for HIV Testing of Adults, Adolescents, and Pregnant Women in Health-Care Settings. MMWR 55 (RR14);1-17. available at: http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5514a1.htm?iframe=true&width=80%&height=80%
could see these costs reduced when a pregnant woman with syphilis is also tested for syphilis in the third trimester, in accordance with CDC STD treatment guidelines\textsuperscript{93} to prevent congenital syphilis in the infant.

Utilizing the methodology provided by the RHP 6 anchor, Metro Health assessed the following factors in assigning a value to this health promotion project: achievement of waiver goals, community need, project scope and the level of project investment.

- This project was ranked high on achievement of waiver goals given the high potential for reduction of healthcare costs through primary prevention outreach activities, and early identification of infections leading to treatment and avoidance of complications such as congenital syphilis cases.
- This project was ranked moderate in regards to addressing a community need. Rates of HIV and STDs are increasing and are higher than state levels. Sexual health has been identified as one of the five priority areas through the Bexar County Community Health Improvement Plan.
- This project was ranked moderate on project scope in that services will be significantly expanded but will be targeted to those geographic and demographic segments of the population that have been shown to be at higher risk for infection based on local data sources.
- This project was ranked moderate in regards to program investment as project will focus on the relatively low-cost intervention of field-based education and testing and include coordination of existing HIV and STD prevention resources. Additional clinic-based treatment and case management activities will be more resource intensive.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $8,279,090**
Identifying Project and Provider Information:

Title: 2.7.5 Implement innovative evidence-based strategies to reduce and prevent obesity in children and adolescents – Breastfeeding Promotion for Childhood Obesity Prevention
Unique RHP ID#: 091308902.2.5 - PASS 2
Performing Provider: San Antonio Metropolitan Health District
Performing Provider TPI: 082426001

Project Summary:

Provider Description: The San Antonio Metropolitan Health District (Metro Health) is the public health agency charged by State law, City code, and County resolution with the responsibility for providing public health programs in San Antonio and unincorporated areas of Bexar County. Services include health code enforcement, food inspections, immunizations, clinical services, environmental monitoring, disease control, health education, dental health, and emergency preparedness. As a public health department Metro Health provides services to all residents, but has a particular focus on underserved populations and those experiencing health disparities which often include a higher representation of Medicaid funded individuals. Metro Health is one of four local agencies that provide WIC services. The Metro Health WIC program serves over 45,000 women per month.

Intervention(s): This project will implement the Baby Café Model in San Antonio to increase breastfeeding rates and thus reduce childhood obesity rates. The City of San Antonio’s Women, Infants and Children Special Supplemental Nutrition Program (WIC) recognizes the need to motivate and empower women to continue breastfeeding for as long as possible. Thus, WIC would like to propose to establish a “Baby Café” breastfeeding drop-in center to expand services and attract mothers of all ages and from all sectors of the community. This will be done by providing breastfeeding help and support, from both skilled health professionals, para-professionals, and other mothers, in a friendly, non-clinical, café style environment. The approach is to deliver breastfeeding help at “drop-in centers” to mothers from areas of disadvantage and health inequality. The model has been replicated with great success, in large part because of the casual, relaxed atmosphere offered together with a high level of professionalism underpinned by evidence-based information. This environment would enhance the “Loving Support” Model currently used by the WIC program in promoting breastfeeding. Thus the primary goals of this intervention would be: (1) to promote the physical and psychological health of mothers and children through education and training regarding breastfeeding (2) to advance the general public’s knowledge of the health benefits, immediate and long term, of breastfeeding. Additionally satellite Baby Café sites will be established at five WIC clinic sites throughout the City. This project seeks to foster extensive cooperation between the Baby cafe (Popping Dr., Rittiman, Buena Vista, Pecan Valley, Centromed-Military Dr.). Additionally, all four WIC Agencies in San Antonio have agreed to refer clients to the Baby Café for breastfeeding support services.

Women are welcome to receive ongoing support services with as many visits to Baby Café as they wish and are encouraged to participate regularly over an extended period to support breastfeeding duration. Specific activities occurring within the Baby Café visit include:

1. Welcoming a mother to the Baby Café, orienting her to the facility and services, and assessing her needs.
2. If mother is not having breastfeeding problems she will be matched with another mother of similar locality and age to provide peer support on: managing daily life and meeting...
the baby’s changing needs, breastfeeding outside the home, and night time needs and options.

3. If a mother is having breastfeeding problems then she will be assessed by a lactation consultant who will determine the best course of action to resolve the issues the mother is having. The mother will then either meet with a peer counselor or a lactation consultant to resolve breastfeeding problems. At the same time she will also be invited to participate in group discussion sessions with other breastfeeding mothers, as well as given access to resources (handouts, books, pamphlets, videos) at the Baby Café. For mothers with extreme breastfeeding needs/issues a care plan will be developed and follow-up appointments with the lactation consultants will be made as need.

4. Outside referrals will be made to participating mothers who need additional help outside of the Baby Café’s scope of service.

In addition to these individual client services Baby Café staff will conduct community outreach to key partners including hospitals, WIC sites and the local breastfeeding coalition to expand the referral network and promote additional services and resources aimed at increasing breastfeeding rates.

Need for the project: San Antonio has high childhood obesity rates and low breastfeeding rates. Higher breastfeeding initiation and duration rates have been shown to reduce the incidence of childhood obesity and the Baby Café will help improve breastfeeding rates. It is well documented and supported by research that breastfeeding and breast milk are the optimum methods in providing infants the best start in life. Studies suggest that breastfeeding is associated with children and teenagers having less of a chance of being overweight. There are several factors in which breastfeeding reduces the risk of overweight among which include: that breastfed infants are better able to control their intake and better self-regulate and that breastfed infants have higher levels of leptin (an appetite inhibiting hormone) thus lower ratios of body fat. According to CDC the longer the duration of breastfeeding, the lower the odds of a child being overweight. (Harder et al.) “For each month of breastfeeding up to age of 9 months the odds of overweight decreases by 4%. This decline results in more than a 30% decrease in the odds of overweight for a child breastfed for 9 month when compared with a child who was never breastfed.” (Harder et al.)

Target population: The target population will be pregnant and postpartum women throughout San Antonio. Community wide data indicates 15.4% of the total population is Medicaid eligible. A central and accessible location for the Baby Café will be identified and secured during DY2. Additionally to ensure that the Medicaid/indigent population has the opportunity to receive services provided by the Baby Café, satellite Baby Café sites will be established at five WIC clinic sites throughout the City (Popping Dr., Rittiman, Buena Vista, Pecan Valley, Centromed-Military Dr.). Additionally, all four WIC Agencies in San Antonio have agreed to refer clients to the Baby Café for breastfeeding support services.

Category 1 or 2 expected patient benefits: The project seeks to provide services at the Baby Café to at least 500-700 per year in DY3, DY4 and DY5 for a total of at least 1800 women over the term of the waiver.

Category 3 outcomes: OD-8 Perinatal Outcomes
  o IT-8.9 Other Perinatal Outcome – postpartum women who initiate breastfeeding
  o IT-8.9 Other Perinatal Outcome – postpartum women who breastfeed exclusively
**Project Description:**

**Project Overview**

It is well documented and supported by research that breastfeeding and breast milk are the optimum methods in providing infants the best start in life. Studies suggest that breastfeeding is associated with children and teenagers having less of a chance of being overweight. There are several factors in which breastfeeding reduces the risk of overweight among which include: that breastfed infants are better able to control their intake and better self-regulate and that breastfed infants have higher levels of leptin (an appetite inhibiting hormone) thus lower ratios of body fat. According to CDC the longer the duration of breastfeeding, the lower the odds of a child being overweight. (Harder et al.) “For each month of breastfeeding up to age of 9 months the odds of overweight decreases by 4%. This decline results in more than a 30% decrease in the odds of overweight for a child breastfed for 9 month when compared with a child who was never breastfed.” (Harder et al.)

In the United States, according to the CDC’s 2012 “Breastfeeding Report Card”, 81% of women who deliver attempt to breastfeed; however, exclusively breastfeeding at the end of 6 months decreases to only 25.5%. In response to the sharp drop in mothers who initiate breastfeeding versus the number of mothers who continue to breastfeed 6 months postpartum, Healthy People 2020 have set out several benchmark goals to increase breastfeeding duration at 3 months, 6 months, and 1 year postpartum. Hence the need to improve the duration of breastfeeding among mothers who initiate breastfeeding is apparent and interventions to assist in meeting increased duration goals put into effect. It is documented in the CDC’s report that Mother-to-Mother support is essential to the success and satisfaction a mother experiences while breastfeeding. Those who receive support have longer duration rates and thus have infants whose risk for obesity is decreased. Therefore, evidence based interventions that facilitate mother to mother support as well as professional support would be ideal in addressing and meeting breastfeeding duration goals.

**Goals and Relationship to Regional Goals**

The City of San Antonio’s Women, Infants and Children Special Supplemental Nutrition Program (WIC) recognizes the need to motivate and empower women to continue breastfeeding for as long as possible. Thus, the Metro Health WIC program would like to propose to establish a “Baby Café” breastfeeding drop-in center to expand services and attract mothers of all ages and from all sectors of the community. Services will be available to all women regardless of enrollment in WIC. This will be done by providing breastfeeding help and support, from both skilled health professionals, para-professionals, and other mothers, in a friendly, non-clinical, café style environment. The approach is to deliver breastfeeding help at “drop-in centers” to mothers from areas of disadvantage and health inequality. The model has been replicated with great success, in large part because of the casual, relaxed atmosphere offered together with a high level of professionalism underpinned by evidence-based information. This environment would enhance the “Loving Support” Model currently used by the WIC program in promoting breastfeeding. Thus the primary goals of this intervention would be: (1) to promote the physical and psychological health of mothers and children through education and training regarding breastfeeding (2) to advance the general public’s knowledge of the health benefits, immediate and long term, of breastfeeding. Overall the Baby Café will seek to increase breastfeeding initiation, duration with a goal of up to 12 months of breastfeeding, and exclusivity to support
childhood obesity prevention efforts.

This project meets the following regional goals:
This project directly addresses the RHP 6 need to improve services that affect maternal and child health within the region (CN.5).

Challenges/Plans to Address Challenges:

1. **Issue**: Despite benefits for both mothers and infants, rates of breastfeeding in the United States remain suboptimal, as per a 2004 CDC Survey showing only 74% of infants born in 2004 initiated breastfeeding, 42% continued breastfeeding at 6 months, and 21% breastfeeding at 12 months of age.
   
   **Response**: In the CDC’s 2012 “Breastfeeding Report Card”, 81% of women who deliver attempt to breastfeed; however, exclusively breastfeeding at the end of 6 months decreases to only 25.5%. In 2011 data provided by the Huddersfield Baby Café (Huddersfield, West Yorkshire, UK), the services provided by the Baby Café helped improve breastfeeding duration rates at 6 months from the United Kingdom’s average of 25% at 6 months to over 50% at 6 months. By providing essential support and help during the initial stages of breastfeeding and subsequently through individual counseling and group support the Baby Café was able to impact breastfeeding duration rates in Huddersfield. With the same model and intervention the San Antonio Baby Café will positively impact breastfeeding outcomes and improve breastfeeding rates, as seen at the Huddersfield Baby Café.

2. **Issue**: Insufficient education by Health Providers on the benefits of breastfeeding to include decrease in obesity among children, less ear infections etc.
   
   **Response**: The Baby Café will help fill this gap by proving women information on short and long term benefits of breastfeeding during visits to the Baby Café. Additionally, during Baby Café group sessions, individual counseling and guest speakers this information will be reiterated by Licensed Professional Staff and Peer Counselors.

3. **Issue**: Lack of discussion on how it benefits mothers such as less incidence of Breast cancer, uterus shrinkage, less bleeding, etc.
   
   **Response**: Providing information and resources via literature, journals, books, and through on-line resources is one of the benefits that the Baby Café will provide to breastfeeding mothers in the community. Because of the relaxed/café type environment a Baby Café is the perfect setting for women to come together to learn one on one or through the resources that are available.

4. **Issue**: Breastfeeding initiation rates continue to improve, however many women still chose to Breastfeed and supplement with formula thus resulting in lower breastfeeding duration rates.
   
   **Response**: The CDCs Guide to Breastfeeding Interventions include peer support, educating mothers, and professional support among the effective evidence based interventions to increase initiation, exclusivity and duration of breastfeeding. All these interventions are a major part of what the Baby Café offers, and women who utilize the Baby Café will receive peer encouragement, and support and education by professionals that understand the needs of a breastfeeding mom.

5. **Issue**: The availability of formula is an enabler to steer away from breastfeeding.
   
   **Response**: By partnering with local WIC agencies (a main provider of formula in the community) and setting up satellite Baby Café sites within WIC clinics, the Baby Café should be able to educate and help mothers who are considering discontinuing breast feeding.
milk in lieu of formula. Many mothers turn to formula as a feeding alternative due to unresolved breastfeeding problems which can impede a mother’s ability to naturally breastfeed. Hence, the Baby Café’s staff’s ability to provide resources, to educate, and to guide and support women during their prenatal visits, transition after delivery and thereafter will help to keep mother’s breastfeeding instead of formula feeding.

6. **Issue:** Hospital protocols need to ensure mothers receive the quality of care needed to have a successful breastfeeding experience prior to discharge.

   **Response:** By partnering with the San Antonio Breastfeeding Coalition, the Baby Café will have a direct link to communicate with lactation consultants and nurses who run maternity wards at hospitals within the City. This interaction will enable both entities to provide feedback and support to improve protocols and address the needs of breastfeeding mothers.

7. **Issue:** Support system need to be in place for all women 24/7 by the hospital where they deliver. Quite often upon discharge babies go through a transition period and have difficulties that were not encountered during their hospital stay.

   **Response:** The Baby Café is staffed with Professionals that understand hospital protocol and continuation of care of a mom and her newborn. By reaching out to her local Baby Café mothers will have access to a help line (via phone) and will be able to visit during evening hours and Saturdays. This accessibility will support her during those hours that she is not able to access services that operate on traditional work schedules.

5-Year Expected Outcome for Provider and Patients:
The five year expected outcome will be to increase breastfeeding rates for the women served by the Baby Café. At least 1800 women per year will receive Baby Café services.

**Starting Point/Baseline:**
The City of San Antonio Metropolitan Health District does not offer drop in breastfeeding services. The current breastfeeding initiation rate for the City of San Antonio Metropolitan Health District WIC program is 70%.

**Rationale:**

Rationale
Obesity is a national public health problem that not only afflicts adults but also the pediatric population. As per the CDC’s 2007 report: “Does Breastfeeding Reduce the Risk of Pediatric Overweight?” it is well documented that breastfeeding is associated with decreased risk of pediatric overweight. Initiation, duration, and exclusivity of breastfeeding all impact the reduced risk of pediatric overweight in that those infants who initiate breastfeeding, are breastfed over a longer period (duration), and/or have been exclusively breastfed all display reduced odds of pediatric overweight. The CDC’s report also provides examples of effective evidence based interventions which include: peer support, educating mothers, professional support, and media and social marketing.

The Baby Café model is set up to provide peer support, to educate mothers through counseling and available educational materials, to provide professional support through lactation consultants, dietitians, nurses, and peer counselors. The Baby Café has been shown to be effective in improving breastfeeding outcomes, and currently the model has been adapted at 137 sites across 6 countries. In 2011, the Huddersfield Baby Café (Huddersfield, West Yorkshire, UK) Annual Report revealed that out of the 250 participants surveyed, 78% indicated that attending the Baby Café helped them continue to breastfeed. Additionally, over 84% of the respondents breastfed their babies for six weeks or longer, 71% breastfed their babies for 3
months or longer, and over 50% continued to breastfeed at 6 months. A 2005 United Kingdom (UK) Infant Feeding Survey showed that at 6 weeks of age only 48% of UK babies were breastfed and that number dropped to 25% at 6 months of age. Hence, the Huddersfield Baby Café was able to improve breastfeeding duration rates at 6 weeks and 6 months of age above the UK’s national averages. Another report from the UK’s Infant Mortality National Support Team found that the Calderdale Baby Café (Calderdale, West Yorkshire, United Kingdom) was able to increase breastfeeding initiation rates by 10 percentage points and breastfeeding duration rates by six percentage points between 2002 and 2009. In the US, Baby Café USA reported that in 2011 the Baby Cafés in Massachusetts (one church based and one WIC based) were able to impact breastfeeding exclusivity rates among participating mothers. The Massachusetts Baby Cafes had breastfeeding exclusivity rates of 91% at birth – 3 weeks, 94% at 3 months, and 97% at 6 months versus the Statewide rates of 76.9 % at birth, 42.8 % at 3 months, and 14.1 % at 6 months. In San Antonio, the University Health System briefly hosted a Baby Café at a Metro Health WIC Clinic from November 2010 to August 2011, and during that time was able to increase breastfeeding initiation rates at that site from 81% to 90% (services were discontinued when a state grant ended). The Baby Café model has a strong evidence base for positively impact breastfeeding outcomes and more specifically has been shown to increase initiation, duration, and exclusivity of breastfeeding. Given the consistency with CDC breastfeeding support guidelines, history in a variety of communities nationally and internationally, and due the local support for partnership with local hospitals and WIC sites the San Antonio Metropolitan Health District would like to implement it in the San Antonio Community.

Unique community need identification number the project addresses:
This project directly addresses the RHP 6 need to improve services that affect maternal and child health within the region (CN.5).

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
San Antonio Metropolitan Health District’s WIC Program previously hosted a Baby Café sponsored by University Health System’s grant from the Texas Department of Health Services. The grant ran for six months and significantly impacted breastfeeding rates at the clinic in which it was housed. Breastfeeding initiation rates went from 81% to 90%, and through the intervention this clinic site continues to report the highest breastfeeding initiation rate for all Metro Health WIC sites. Unfortunately, due to budget cuts at the State level, the money for the grant ran out and so the program ended in December 2011. The Department of State Health Services WIC Program endorses the Baby Café as an effective model and has encouraged WIC sites in Dallas, Houston, Austin, El Paso, and the Rio Grande Valley to open lactation sites/Baby Cafes.

Related Category 3 Outcome Measure(s):

<table>
<thead>

<tbody>
<tr>
<td>IT-8.9 Other Perinatal Outcome – postpartum women who initiate breastfeeding</td>
</tr>
<tr>
<td>IT-8.9 Other Perinatal Outcome – postpartum women who breastfeed exclusively</td>
</tr>
<tr>
<td>IT-8.9 Other Perinatal Outcome – duration of breastfeeding among postpartum women</td>
</tr>
</tbody>
</table>

Reasons/rationale for selecting the outcome measures:
Metro Health’s WIC Program has seen the positive effects that the intervention provided by the
Baby Café can have on a mother’s choice to initiate breastfeeding, and with an ongoing program that is open to all expectant mothers in the San Antonio Community the possibility of reproducing these outcomes on a larger scale exists. Hence, Metro Health has developed three Category 3 Outcomes: (1) increase breastfeeding initiation for those mothers serviced at the Baby Café (2) increase breastfeeding duration for those mothers serviced at the Baby Café (3) increase breastfeeding exclusivity for those mothers serviced at the baby café.

As per the CDC’s 2007 report: “Does Breastfeeding Reduce the Risk of Pediatric Overweight?” breastfeeding initiation, duration, and exclusivity are key in reducing pediatric overweight. The CDC’s meta-analysis of nine studies showed that infants who initiated breastfeeding resulted in a significant overall reduced risk of overweight. Furthermore, the report states that the protection against overweight from being initially breastfed versus being given formula may persist into teenage years and adulthood. Additionally, the meta-analysis goes on to state that breastfeeding is inversely related to pediatric overweight, and that for each month an infant is breastfed (up to nine months) the odds of overweight decreased by 4%. This results in up to a 30% decrease in odds of pediatric overweight if breastfed up to nine months compared to a child who was never breastfed. Moreover, the report finds that in a study conducted by Harder et al., that exclusive breastfeeding showed a stronger protective effect in decreasing the odds of overweight by 6% for each month of exclusive breastfeeding.

The mentioned outcomes are a priority for the RHP as supported by local obesity and breastfeeding data. According to 2007 Metro Health WIC obesity data, of the children serviced by the program 31% were overweight or obese, compared to the 2007 State Average of 21.3%. Additionally, breastfeeding initiation rates for Metro Health WIC average 70% where as the State average is 82%. As per the Children’s Hospital Association of Texas, in 2005 national Medicaid spending to treat childhood obesity hospitalization was $118.1 million, a 120% increase since 2001. Hence, at this same rate of increase by the year 2009 Medicaid would have spent $260 million on childhood obesity hospitalization. Because of the high cost spent by Medicaid to treat childhood obesity the need for more interventions to address this problem is apparent. Metro Health’s statistics confirm a high obesity rate for children ages 2-5 and also confirm a lower breastfeeding initiation rate. Thus, the outcomes proposed by this intervention will help in addressing obesity in both Medicaid and WIC populations (lower income) but will also address the problem within Bexar County as a whole.

**Relationship to other Projects:**
The Metro Health Baby Café intervention will support the Metro Health project 091308902.2.1 on teen pregnancy prevention by recruiting teen mothers served in the case management arm of the project to participate in Baby Café drop in sessions, education, and counseling.

<tr>
<th>Plan for Learning Collaborative:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metro Health will foster Continuous Quality Improvement (CQI) through active participation in the RHP 6 learning collaborative working groups to support and enhance project quality improvement, evaluation and achievement of outcomes. CQI elements are specifically included through milestones 3, 6, 9 and 12 beginning in DY2. Additionally Metro Health will seek out project specific opportunities to collaborate with regional maternal and child health as well as other local health department performing providers in other Texas regions.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Project Valuation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Breastfeeding is not only the most nutritious way of feeding an infant but also cost effective. Breastfeeding can save parents anywhere between $700 to $3000 dollars during the first year of life (on money not spent on formula). A study by Montgomery et al. also showed that breastfed infants had a cost saving of $112 in Medicaid expenditures during the first six month of life versus formula fed infants. A 2010 UNICEF report assessing the economic benefits of breastfeeding estimated that around $13 billion would be saved if breastfeeding were increased from current levels (13.3%) to 90 percent of women breastfeeding exclusively for six months.</td>
</tr>
<tr>
<td>Utilizing the methodology provided by the RHP 6 anchor, Metro Health assessed the following factors in assigning a value to this health promotion project: achievement of waiver goals, community need, project scope and the level of project investment.</td>
</tr>
<tr>
<td>• This project was ranked high on achievement of waiver goals given the strong research and high potential for reduction of healthcare costs associated with childhood obesity for Medicaid and other underserved populations in Bexar County. This project has the potential to significantly improve breastfeeding rates which have been shown in the research to reduce the risk of childhood obesity, among other health benefits.</td>
</tr>
<tr>
<td>• This project was ranked low in regards to addressing a community need. Childhood obesity has been demonstrated as a particular concern, and local breastfeeding rates are below the state average, however breastfeeding as a strategy to address obesity rates has not been well recognized yet by local providers and residents.</td>
</tr>
<tr>
<td>• This project was ranked low on project scope in that services will be available to all postpartum women from a variety of referral sources however anticipated numbers of clients served is relatively small compared to other proposed projects.</td>
</tr>
<tr>
<td>• This project was ranked low in regards to program investment given the relatively low cost of the intervention for participants.</td>
</tr>

In the Agency for Healthcare Research and Quality’s 2011 report, Texas ranks last in the nation on health care quality. In the same report, Texas scored particularly weak on diabetes care. Diabetes is in the top list of causes of death in RHP6. Diabetes care management is in the targets listed in RHP 6 Community Needs plan.

Process milestones:

Process milestones 1-4 were chosen to take our current MSO patient population and calculate a
baseline rate of % of patients with diabetes that have an A1C <9%. By implementing a call back system for follow-up testing and adjusting diabetes care as indicated, we can improve this measure for our MSO patient base. By adding incremental primary care sites and providers, we will care for more of our RHP patient population and yet have a mechanism in place to monitor and improve their diabetes control through focused follow-up care by our primary care physicians.

**Improvement target:**

Improvement target is the measure itself and we want to grow the % < 9% which indicates the patient’s diabetes is in control.

This is a relevant outcome measure for project 1.1 Expand Primary Care Capacity.

**Outcome Measure Valuation:**

Baptist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

Since diabetes disease and lack of quality management is identified as a high need in RHP 6RGs, focus on successful management resulting in reduced # of patients with A1c > 9 improves the patient health status, reduces costs and avoids admissions, thus creating greater access for the RHP 6 underserved patient population.

</tr>
<tr>
<td>TPI: 159156201</td>
</tr>
</tbody>
</table>

**Outcome Measure Description:**

**Outcome Measure Description:**

IT-3.2 Congestive Heart Failure 30 day readmission rate

**Process Milestones:**

- **DY2**
  - Process Milestone 1 P-1 Project planning-engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
  - Establish CHF Navigator Program
  - Process Milestone 2 P-7 Other Activities
  - Inventory post acute care providers for CHF management programs
- **DY3**
  - Process Milestone 3 P-7 Other Activities
  - Establish formal post acute care provider relationships for CHF Management programs and utilize these providers
  - Process Milestone 4 P-7 Other Activities
  - Implement extensive CHF teaching program for patients and families

**Outcome Improvement Targets for each year:**

- **DY4**
  - IT -3.2 Show improvement through 3% reduction in 30 day all cause readmissions for CHF patients over baseline rate for 12 months ending 12-31-11 which =12.4%
- **DY5**
  - IT- 3.2 Show improvement through 5% reduction in 30 day all cause readmissions for CHF patients over baseline rate for 12 months ending 12-31-11 which =12.4%

**Rationale:**

Patients with acute or chronic CHF consume major healthcare resources with repeat hospital stays. Readmission rates increase as the patient ages and with the number of co-morbidities. Reducing preventable readmissions helps reduce costs and improve quality of care and life for the patient and family. BHS will institute a care coordination process that extends to the CHF patient’s home and into other health-care facilities
Process milestones:

Process milestones 1-4 were chosen because a key aspect of this care delivery system seeks to provide a smooth transition from the hospital setting through partnership with other health care providers to “transition” the patient instead of simply “handing-off” the patient. Education of the patient and family caregivers and ensuring proper follow-up with the primary care physician is critical. Facilitating the appropriate level of care at time of discharge begins upon admission and is a major focus for our Case Management team. BHS will also focus on hospice and palliative care models to assist CHF patient in terminal phase to avoid hospitalizations while maintaining a high quality end-of-life care.

Improvement target:

Improvement targets are listed above in Outcome Description.

This is a relevant outcome measure for Category 1 Project 1.9 Expand Specialty Care as our cardiologists and other specialists work with the hospitals’ case managers and post acute care providers to manage their chronic CHF patients in an OP setting and prevent hospitalizations.

Outcome Measure Valuation:

Baptist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

Since CHF is a high volume DRG and is also a high volume diagnosis in other DRGs, focus on successful management resulting in reduced 30 day readmissions benefits the patient, family, providers, and community by improving the patient health status, reducing costs and avoidable readmissions, thus creating greater access for the RHP 6 underserved patient population.

    - Prior to discharge secure PCP follow-up appointment scheduled within 3-7 days of discharge
    - Process Milestone 2 P-4 Conduct Plan, Do, Study, Act cycles to improve data collection and intervention activities
    - Review 100% of all AMI 30 day readmissions for transitional failure

- **DY3**
  - Process Milestone 3 P-5 Disseminate findings, including lessons learned and best practices, to stakeholders
  - Share data from DY 2 readmission reviews with providers and identify correctional improvements
  - Process Milestone 4 P-7 Other Activities
  - Implement at least 2 new processes following review and data sharing for improved transitional care

Outcome Improvement Targets for each year:

- **DY4**
  - IT-3.5 Show improvement through 3% reduction in 30 day all cause readmissions for AMI patients over baseline rate for 12 months ending 12-31-11 which = 9.4%

- **DY5**
  - IT-3.5 Show improvement through 5% reduction in 30 day all cause readmissions for AMI patients over baseline rate for 12 months ending 12-31-11 which = 9.4%

Rationale:

Patients with AMI are more likely to be readmitted within 30 days as complicated by patient age, frailty and frequent comorbid conditions. The rate for readmission in post AMI patients has increased per a 2010 study in “Cardiovascular Quality and Outcomes” but is due to higher non cardiovascular complications. Bexar County has a higher incidence of comorbid conditions such as hypertension, renal failure with dialysis, COPD and diabetes. Additional factors such as pneumonia or impeded swallowing function can also impact readmission rates.
Process milestones:

Process milestones 1-4 were chosen as methods for reducing preventable readmissions which reduces costs and improves quality of care and life for the patient and family. BHS will institute a care coordination process for the AMI patient focusing on a thorough “transition” from the hospital setting through partnership with other health care providers instead of simply “handing-off” the patient. Education of the patient, family, and caregivers and ensuring the timely follow-up with the primary/specialty care physician is critical for successful management in the AMI’s patients post acute status.

Improvement target:

Improvement targets are listed above in Outcome Description.

This is a relevant outcome measure for Category 1 Project 1.9 Expand Specialty Care as our cardiologists and other specialists work with the hospitals’ case managers and post acute care providers to manage their chronic CHF patients in an OP setting and prevent hospitalizations.

Outcome Measure Valuation:

Baptist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

Cardiovascular disease (CAD) is prevalent in the RHP 6 patient population. Comorbidities complicating CAD impact serious acute inpatient conditions such as Acute Myocardial Infarctions (AMI) and improved, successful management of AMI resulting in reduced 30 day readmissions benefits the patient, family, providers, and community by improving the patient health status, reducing costs and avoidable readmissions, thus creating greater access for the RHP 6 underserved patient population.

# Identifying Outcome Measure and Provider Information:

**Title of Outcome Measure (Improvement Target):** IT-3.2 Congestive Heart Failure 30 day readmission rate  
**RHP Outcome Identification Number:** 159156201.3.4 – PASS 1  
**Provider Name:** VHS San Antonio Partners, LLC d/b/a Baptist Health System  
**TPI:** 159156201

## Outcome Measure Description:

**IT-3.2 Congestive Heart Failure 30 day readmission rate**

## Process Milestones:

- **DY2**
  - Process Milestone 1 P-1 Project planning-engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans  
  - Establish CHF Navigator Program  
  - Process Milestone 2 P-7 Other Activities  
  - Inventory post acute care providers for CHF management programs

- **DY3**
  - Process Milestone 3 P-7 Other Activities  
  - Establish formal post acute care provider relationships for CHF Management programs and utilize these providers  
  - Process Milestone 4 P-7 Other Activities  
  - Implement extensive CHF teaching program for patients and families

## Outcome Improvement Targets for each year:

- **DY4**  
  - IT-3.2 Show improvement through 3% reduction in 30 day all cause readmissions for CHF patients over baseline rate for 12 months ending 12-31-11 which =12.4%

- **DY5**  
  - IT-3.2 Show improvement through 5% reduction in 30 day all cause readmissions for CHF patients over baseline rate for 12 months ending 12-31-11 which =12.4%

## Rationale:

Patients with acute or chronic CHF consume major healthcare resources with repeat hospital stays. Readmission rates increase as the patient ages and with the number of co-morbidities. Reducing preventable readmissions helps reduce costs and improve quality of care and life for the patient and family. BHS will institute a care coordination process that extends to the CHF patient’s home and into other health-care facilities.

## Process milestones:

Process milestones 1-4 were chosen because a key aspect of this care delivery system seeks to provide a smooth transition from the hospital setting through partnership with other health care providers to “transition” the patient instead of simply “handing-off” the patient. Education of the
patient and family caregivers and ensuring proper follow-up with the primary care physician is critical. Facilitating the appropriate level of care at time of discharge begins upon admission and is a major focus for our Case Management team. BHS will also focus on hospice and palliative care models to assist CHF patient in terminal phase to avoid hospitalizations while maintaining a high quality end-of-life care.

Improvement targets are listed above in Outcome Description.

This is a relevant outcome measure for Category 1 Project 1.10 Enhance PI. Equipping both hospital staff and physicians with a variety of process improvement tools to improve processes and care enables project 2.8 Apply PI to Improve Quality and Efficiency where we have identified wide variation in CHF management (LOS, pharmaceuticals, and diagnostic testing) one of the three identified clinical areas targeted for focused improvement using PI tools through the new Office of Operations Improvement.

**Outcome Measure Valuation:**

Baptist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

Since CHF is a high volume DRG and is also a high volume diagnosis in other DRGs, focus on successful management resulting in reduced 30 day readmissions benefits the patient, family, providers, and community by improving the patient health status, reducing costs and avoidable readmissions, thus creating greater access for the RHP 6 underserved patient population.

**Outcome Measure Description:**

IT-3.5 Acute Myocardial Infarction (AMI) 30 day readmission rate

**Process Milestones:**

- **DY2**
  - Process Milestone 1 P-7 Other Activities
  - Prior to discharge secure PCP follow-up appointment scheduled within 3-7 days of discharge
  - Process Milestone 2 P-4 Conduct Plan, Do, Study, Act cycles to improve data collection and intervention activities
  - Review 100% of all AMI 30 day readmissions for transitional failure

- **DY3**
  - Process Milestone 3 P-5 Disseminate findings, including lessons learned and best practices, to stakeholders
  - Share data from DY 2 readmission reviews with providers and identify correctional improvements
  - Process Milestone 4 P-7 Other Activities
  - Implement at least 2 new processes following review and data sharing for improved transitional care

**Outcome Improvement Targets for each year:**

- **DY4-**
  - IT- 3.5 Show improvement through 3% reduction in 30 day all cause readmissions for AMI patients over baseline rate for 12 months ending 12-31-11 which = 9.4%

- **DY5-**
  - IT-3.5 Show improvement through 5% reduction in 30 day all cause readmissions for AMI patients over baseline rate for 12 months ending 12-31-11 which = 9.4%

**Rationale:**

Patients with AMI are more likely to be readmitted within 30 days as complicated by patient age, frailty and frequent comorbid conditions. The rate for readmission in post AMI patients has increased per a 2010 study in “Cardiovascular Quality and Outcomes” but is due to higher non cardiovascular complications. Bexar County has a higher incidence of comorbid conditions such as hypertension, renal failure with dialysis, COPD and diabetes. Additional factors such as pneumonia or impeded swallowing function can also impact readmission rates.
**Process milestones:**

Process milestones 1-4 were chosen as methods for reducing preventable readmissions which reduces costs and improves quality of care and life for the patient and family. BHS will institute a care coordination process for the AMI patient focusing on a thorough “transition” from the hospital setting through partnership with other health care providers instead of simply “handing-off” the patient. Education of the patient, family, and caregivers and ensuring the timely follow-up with the primary/specialty care physician is critical for successful management in the AMI’s patients post acute status.

**Improvement target:**

Improvement targets are listed above in Outcome Description.

This is a relevant outcome measure for Category 1 Project 1.10 Enhance PI. By equipping both hospital staff and physicians with a variety of process improvement tools, the healthcare team can identify and improve processes in care and for efficiency which are utilized in project 2.8 Apply PI to Improve Quality and Efficiency.

This enables all to provide effective transitional care for post AMI patients and equips the patient/family with resources to successfully manage the AMI patient’s health status outside of the hospital.

**Outcome Measure Valuation:**

Baptist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

Cardiovascular disease (CAD) is prevalent in the RHP 6 patient population. Comorbidities complicating CAD impact serious acute inpatient conditions such as Acute Myocardial Infarctions (AMI) and improved, successful management of AMI resulting in reduced 30 day readmissions benefits the patient, family, providers, and community by improving the patient health status, reducing costs and avoidable readmissions, thus creating greater access for the RHP 6 underserved patient population.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $1,375,634**
Identifying Outcome Measure and Provider Information:
Title of Outcome Measure (Improvement Target): IT-3.2 Congestive Heart Failure 30 day readmission rate
RHP Outcome Identification Number: 159156201.3.6- PASS 1
Provider Name: VHS San Antonio Partners, LLC d/b/a Baptist Health System
TPI: 159156201

Outcome Measure Description:
IT-3.2 Congestive Heart Failure 30 day readmission rate

Process Milestones:
- DY2
  Process Milestone 1 P-1 Project planning-engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
  Establish CHF Navigator Program
  Process Milestone 2 P-7 Other Activities
  Inventory post acute care providers for CHF management programs
- DY3
  Process Milestone 3 P-7 Other Activities
  Establish formal post acute care provider relationships for CHF Management programs and utilize these providers
  Process Milestone 4 P-7 Other Activities
  Implement extensive CHF teaching program for patients and families

Outcome Improvement Targets for each year:
- DY4
  IT-3.2 Show improvement through 3% reduction in 30 day all cause readmissions for CHF patients over baseline rate for 12 months ending 12-31-11 which =12.4%
  3% was selected since there is less ability to control all cause readmissions while specifically working initiatives to prevent readmissions from same or primary cause
- DY5-
  IT-3.2 Show improvement through 5% reduction in 30 day all cause readmissions for CHF patients over baseline rate for 12 months ending 12-31-11 which =12.4%
  5% was selected since there is less ability to control all cause readmissions while specifically working initiatives to prevent readmissions from same or primary cause.
  However this is a 67% increase in improvement over DY4.
**Rationale:**

Patients with acute or chronic CHF consume major healthcare resources with repeat hospital stays. Readmission rates increase as the patient ages and with the number of co-morbidities. Reducing preventable readmissions helps reduce costs and improve quality of care and life for the patient and family. BHS will institute a care coordination process that extends to the CHF patient’s home and into other health-care facilities.

**Process milestones:**

Process milestones 1-4 were chosen because a key aspect of this care delivery system seeks to provide a smooth transition from the hospital setting through partnership with other health care providers to “transition” the patient instead of simply “handing-off” the patient. Education of the patient and family caregivers and ensuring proper follow-up with the primary care physician is critical. Facilitating the appropriate level of care at time of discharge begins upon admission and is a major focus for our Case Management team. BHS will also focus on hospice and palliative care models to assist CHF patient in terminal phase to avoid hospitalizations while maintaining a high quality end-of-life care.

Improvement targets are listed above in Outcome Description.

This is a relevant outcome measure for Category 1 Project 1.10 Enhance PI. Equipping both hospital staff and physicians with a variety of process improvement tools to improve processes and care enables project 2.8 Apply PI to Improve Quality and Efficiency where we have identified wide variation in CHF management (LOS, pharmaceuticals, and diagnostic testing) one of the three identified clinical areas targeted for focused improvement using PI tools through the new Office of Operations Improvement.

**Outcome Measure Valuation:**

Baptist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

Since CHF is a high volume DRG and is also a high volume diagnosis in other DRGs, focus on successful management resulting in reduced 30 day readmissions benefits the patient, family, providers, and community by improving the patient health status, reducing costs and avoidable readmissions, thus creating greater access for the RHP 6 underserved patient population.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $1,375,634
Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-3.5 Acute Myocardial Infarction (AMI) 30 day readmission rate
RHP Outcome Identification Number: 159156201.3.7 – PASS 1
Provider Name: VHS San Antonio Partners, LLC d/b/a Baptist Health System
TPI: 159156201

Outcome Measure Description:

IT-3.5 Acute Myocardial Infarction (AMI) 30 day readmission rate

Process Milestones:

- DY2
  Process Milestone 1 P-7 Other Activities
  Prior to discharge secure PCP follow-up appointment scheduled within 3-7 days of discharge
  Process Milestone 2 P-4 Conduct Plan, Do, Study, Act cycles to improve data collection and intervention activities
  Review 100% of all AMI 30 day readmissions for transitional failure

- DY3
  Process Milestone 3 P- 5 Disseminate findings, including lessons learned and best practices, to stakeholders
  Share data from DY 2 readmission reviews with providers and identify correctional improvements
  Process Milestone 4 P-7 Other Activities
  Implement at least 2 new processes following review and data sharing for improved transitional care

Outcome Improvement Targets for each year:

- DY4-
  IT- 3.5 Show improvement through 3% reduction in 30 day all cause readmissions for AMI patients over baseline rate for 12 months ending 12-31-11 which = 9.4%

- DY5-
  IT-3.5 Show improvement through 5% reduction in 30 day all cause readmissions for AMI patients over baseline rate for 12 months ending 12-31-11 which = 9.4%

Rationale:

Patients with AMI are more likely to be readmitted within 30 days as complicated by patient age, frailty and frequent comorbid conditions. The rate for readmission in post AMI patients has increased per a 2010 study in “Cardiovascular Quality and Outcomes” but is due to higher non cardiovascular complications. Bexar County has a higher incidence of comorbid conditions such as hypertension, renal failure with dialysis, COPD and diabetes. Additional factors such as
pneumonia or impeded swallowing function can also impact readmission rates.

**Process milestones:**

Process milestones 1-4 were chosen as methods for reducing preventable readmissions which reduces costs and improves quality of care and life for the patient and family. BHS will institute a care coordination process for the AMI patient focusing on a thorough “transition” from the hospital setting through partnership with other health care providers instead of simply “handing-off” the patient. Education of the patient, family, and caregivers and ensuring the timely follow-up with the primary/specialty care physician is critical for successful management in the AMI’s patients post acute status.

**Improvement target:**

Improvement targets are listed above in Outcome Description.

This is a relevant outcome measure for Category 2 Project 8 Apply Process Improvement Methodology to Improve Quality/Efficiency. Using these tools, staff and physicians can assess current processes and care patterns for improvements, collect and analyze data related to failures and adjust/implement changes for improved outcomes in managing the AMI patient for successful, post acute care transition and avoid readmissions, improve patient health status and quality of life for patient and family.

**Outcome Measure Valuation:**

Baptist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

Cardiovascular disease (CAD) is prevalent in the RHP 6 patient population. Comorbidities complicating CAD impact serious acute inpatient conditions such as Acute Myocardial Infarctions (AMI) and improved, successful management of AMI resulting in reduced 30 day readmissions benefits the patient, family, providers, and community by improving the patient health status, reducing costs and avoidable readmissions, thus creating greater access for the RHP 6 underserved patient population.

<tbody>
<tr>
<td>Reduce pediatric Emergency Department visits (CHIPRA Core Measure)</td>
</tr>
</tbody>
</table>

Process Milestones:

- DY2:
  - P-3 – Develop and test data systems
- DY3:
  - P-2 – Establish Baseline rates

Outcome Improvement Targets for each year:

- DY4:
  - IT-9.2 Reduce pediatric Emergency Department visits – Target to be determined.
- DY5:
  - IT-9.2 Reduce pediatric Emergency Department visits – Target to be determined.

Rationale:

The emergency department frequently becomes the focal point in the health care system when care is poorly coordinated. With shortages in many pediatric specialties, chronic disease management is a critical area of concern due to the impact it can have on ED utilization. The primary objective of project (TPI Pending) 1.3 (Pediatric Specialty Care Expansion) is to improve access by establishing pediatric specialty practices, clinics and other sites of services. By providing a more geographically dispersed network of specialty care, patients with chronic diseases will have greater access to these much needed services, which will reduce ED utilization. For this reason, improvement target ED appropriate utilization will be used as an improvement measure for this project. As stated above, improvement targets will be implemented in DY3-5. CH of SA chose the reduction in pediatric emergency cases as an outcome measure for this project because the introduction of pediatric specialties should reasonably lead to better and more available treatment, and untimely less admittance to the ED. The process milestones of developing and testing systems as well establishing a baseline rate are logistically necessary for the successful completion of the his project.

Outcome Measure Valuation:

In valuing this project, Children’s Hospital of San Antonio took into account the extent to which Pediatric Subspecialty Expansion project would potentially meet the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.
The RHP 6 Community Needs Assessment identified the high prevalence of chronic diseases and lack of provider shortages as two major issues facing the region. According to a recent analysis conducted by 3d Health, the San Antonio MSA alone has an estimated deficit of 20 pediatric subspecialists. The emergency department frequently becomes the focal point in the health care system when patients have trouble accessing specialty care providers. By providing a more geographically dispersed network of specialty care, Children’s Hospital of San Antonio can increase the capacity for pediatric sub-specialty care services, which will reduce unnecessary ED utilization, improve quality and efficiency and reduce costs.

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-9.2 ED appropriate Utilization
Unique RHP Outcome ID: (TPI Pending)3.2 – PASS 1
Performing Provider: Children’s Hospital of San Antonio
TPI: 020844903

Outcome Measure Description:

IT-9.2 – ED appropriate utilization
- Reduce pediatric Emergency Department visits (CHIPRA Core Measure)

Process Milestones:
- DY2:
  - P-3 – Develop and test data systems
- DY3:
  - P-2 – Establish Baseline rates

Outcome Improvement Targets for each year:
- DY4:
  - IT-9.2 Reduce pediatric Emergency Department visits – Target to be determined
- DY5:
  - IT-9.2 Reduce pediatric Emergency Department visits – Target to be determined

Rationale:

According to a recent physician demand analysis, there is an estimated shortage of 40 pediatricians in Bexar County. This shortage of pediatricians can cause significant access issues, forcing parents/guardians to use the ED as their child’s primary care provider for acute illness management and preventative care needs. The primary goal of project (TPI Pending)1.4 (Pediatric Primary Care expansion) is to help established practices expand, replace retiring physicians, and add new practices in areas with significant access issues. The ED Appropriate Utilization improvement target is an accurate measure for determining the impact this increased access has on ED utilization. As stated above, improvement targets will be implemented in DY3-5. The reduction of pediatric emergency room visits is a reasonable measure of the success of this program because the access to primary care that will be the result of this project can reasonably expect to reduce ED admissions. Additionally, the two process milestones selected are logistically necessary to implement this project.

Outcome Measure Valuation:

In valuing this project, Children’s Hospital of San Antonio took into account the extent to appropriate ED utilization would potentially meet the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.

The RHP 6 Community Needs Assessment identified the lack of provider shortages as two major issues facing the region. According to a recent analysis conducted by 3d Health, Bexar County alone has an estimated deficit of 40 pediatricians. The emergency department frequently becomes the focal point in the health care system when patients have trouble accessing primary care. By providing a more geographically dispersed network of pediatric primary care services,
Children’s Hospital of San Antonio can increase the capacity for these services, which will reduce unnecessary ED utilization, improve quality and efficiency and reduce costs.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $2,407,360
Identifying Outcome Measure and Provider Information:
Title of Outcome Measure (Improvement Target): IT-9.2 ED Appropriate Utilization
Unique RHP Outcome ID: 020844901.3.1 – PASS 1
Performing Provider: CHRISTUS Santa Rosa Health System
TPI: 020844901

Outcome Measure Description:
IT-9.2 – ED appropriate utilization

• Reduce all ED visits

Process Milestones:
• DY2:
  o P-3 – Develop and test data systems
• DY3:
  o P-2 – Establish Baseline rates

Outcome Improvement Targets for each year:
• DY4:
  o IT-9.2 Reduce the number of unnecessary emergency department visits - Target to be determined.
• DY5:
  o IT-9.2 Reduce the number of unnecessary emergency department visits - Target to be determined.

Rationale:
The growing shortage of primary care workforce personnel in Texas is a critical problem that has contributed to increased wait times in hospitals, community clinics, and other care settings. Patients with non-emergent issues are using the ED for their primary care needs, which is a costly burden to the health care system. The primary goal of project 020844901.1.2 is to expand access by adding an additional clinic and hiring additional primary care providers, which will help address this substantial shortage, therefore giving patients a less costly alternative to the ED. As stated above, improvement targets will be implemented in DY3-5.

Outcome Measure Valuation:
In valuing this project, CHRISTUS Santa Rosa took into account the extent to which appropriate ED utilization would potentially meet the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.

The inappropriate use of EDs (particularly as sites of primary care) is a pervasive inefficiency in the healthcare delivery system adding a costly burden to the health care system. By reducing inappropriate use of EDs, CHRISTUS Santa Rosa can help lower the cost of healthcare in the community and in the State, and free up healthcare emergency healthcare resources for patients who truly need them.

<td>CHRISTUS Santa Rosa Health System</td>
</tr>
<tr>
<td>TPI:</td>
<td>020844901</td>
</tr>
</tbody>
</table>

### Outcome Measure Description:

### IT-1.10 – Diabetes Care: HbA1c Poor Control

- Percentage of patients 65 to 75 years of age with diabetes (Type 1 or type 2) who had hemoglobin A1c (HbA1c) control >9%.

### Process Milestones:

- **DY2:**
  - P-3 – Develop and test data systems

- **DY3:**
  - P-2 – Establish Baseline rates

### Outcome Improvement Targets for each year:

- **DY4:**
  - IT-1.10 decrease the percentage of patients 65 to 75 years of age with diabetes (Type 1 or type 2) who have HbA1c control >9% - % to be determined.

- **DY5:**
  - IT-1.10 decrease the percentage of patients 65 to 75 years of age with diabetes (Type 1 or type 2) who have HbA1c control >9% - % to be determined.

### Rationale:

Diabetes is one of the most costly and highly prevalent chronic diseases in the United States. Diabetes control can improve the quality of life for millions of Americans and save billions of health care dollars. In addition, other chronic conditions are common among people with diabetes and account for much of the morbidity these patients face. Comorbidities can have profound effects on patients’ ability to manage their self-care. A major goal of Project 020844901.2.4 (Patient-Centered Medical Home) is to improve adherence to care plans by offering comprehensive preventative and primary care services that cater to the complex, chronic care needs of the population 65 and older. This outcome measure will track the progress of the Medical Home project because it gauges the management of one of the most prevalent chronic diseases in the community. The process milestones selected are necessary to logistically implement the project. CHRISTUS needs a baseline and data in order to measure the outcome.

### Outcome Measure Valuation:

In valuing this project, CHRISTUS Santa Rosa took into account the extent to which the appropriate management of diabetes in the 65-75 year old population would potentially meet the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.

Through better management of diabetes in the, CHRISTUS Santa Rosa can ensure patient compliance with managing their diabetes, resulting in improved HbA1C levels, which ultimately
drives improved outcomes.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $1,604,907**
Identifying Outcome Measure and Provider Information:
Title of Outcome Measure (Improvement Target): IT-3.2 Congestive Heart Failure 30 day readmission rate
Unique RHP Outcome ID: 020844901.3.3 – PASS 1
Performing Provider: CHRISTUS Santa Rosa Health System
TPI: 020844901

Outcome Measure Description:
IT-3.2 – Congestive Heart Failure 30 day readmission rate

- The number of readmissions (for patients 18 years and older), for any cause, within 30 days of discharge from the index HF admission.

Process Milestones:
- DY2:
  - P-3 – Develop and test data systems
- DY3:
  - P-2 – Establish Baseline rates

Outcome Improvement Targets for each year:
- DY4:
  - IT-3.2. decrease the number of admissions (for patients 18 years and older), for any cause, within 30 days of discharge from the index HF admission – Target to be determined
- DY5:
  - IT-3.2. decrease the number of admissions (for patients 18 years and older), for any cause, within 30 days of discharge from the index HF admission - Target to be determined

Rationale:
Monitoring the potentially preventable readmission rates for Congestive Heart Failure is a key indication and barometer of ongoing healthcare improvements in the community. During the last decades, heart failure treatment has improved rapidly. There are now a number of drugs recommended along with non-pharmacological interventions such as changes in lifestyle and monitoring of symptoms to improve mortality and morbidity in patients with heart failure. The responsibility of health care professionals is to prescribe treatment according to guidelines and to dedicate additional time and effort to encourage and support patient to comply with a multi-faceted treatment program. Congestive Heart Failure is one of the principal diagnoses that will be targeted by the care transitions program, which makes improvement target IT-3.2 Congestive Heart Failure 30-Day Readmission Rate a suitable measurement for this project. As stated above, improvement targets will be implemented in DY3-5. The process milestones were chosen because they are logistically necessary for the successful implementation of this project. Specifically, data and a baseline are both necessary components to measure he reduction in CHF readmissions.
**Outcome Measure Valuation:**

In valuing this project, CHRISTUS Santa Rosa took into account the extent to which the reduction in potentially preventable readmissions due to Congestive Heart Failure would potentially meet the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.

According to the RHP 6 Community Needs Assessment, there is a high prevalence of chronic disease and related health disparities that require greater prevention efforts and management. By reducing the unplanned re-admissions for the target population with congestive heart failure and target those with pneumonia and acute myocardial infarction CHRISTUS Santa Rosa will be adding significantly to the quality of life and the health outcomes of this population. These conditions are increasingly common in an aging population, are associated with substantial mortality and morbidity, and have considerable variation in outcomes across U.S. hospitals. A reduction in hospital readmission rates will be a reliable indicator of improved health status for this population.

## Identifying Outcome Measure and Provider Information:

<table>
<thead>
<tr>
<th>Title of Outcome Measure (Improvement Target):</th>
<th>IT-2.13 Behavioral Health Admission Rate for Youth. This is a custom/optional measure ONLY because measure 2.4 is designed for patients 18 and over. Our measure is for children ages 3-17 in the service area. Specific information on the numerator and denominator are noted in narrative and in the table.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique RHP Outcome ID:</td>
<td>112742503.3.1 – PASS 1</td>
</tr>
<tr>
<td>Performing Provider:</td>
<td>Clarity Child Guidance Center</td>
</tr>
<tr>
<td>TPI:</td>
<td>112742503</td>
</tr>
</tbody>
</table>

## Outcome Measure Description:

- **IT 2.13 Behavioral Health Admission Rate for Youth**

  The numerator would include discharges where the primary and secondary diagnosis was behavioral health from our acute, inpatient hospital. This would be applied against a denominator of all youth 3-17 who received any service following assessment, including a referral, individual, family or group therapy, medication evaluation, medication management, psychological assessment and/or consultation or partial hospitalization as alternatives to acute care hospitalization. A baseline would be established in DY3, and reporting would commence in DY4, with improvements TBD based on the data analyzed in DY3. This measure was required to be optional primarily because the other preventable admissions measures applied to patients 18 and over, and our focus is children and adolescents. Clarity Child Guidance Center currently provides services for approximately 7,000 children. Some of those children who are assessed are admitted to our acute inpatient hospital, while others require partial hospitalization or outpatient therapy. Our goal is to provide the right care in the right setting, thereby offering a continuum of services. Today, 1,300 children and adolescents present at local emergency rooms with no access to psychiatric care at that facility. We anticipate screening >300 patients annually who divert to our regional psychiatric service.

  A request was sent to HHSC on 10/1/12, follow-up on 10/2/12 and 10/3/12 about the appropriate measure to utilize. University Health System was copied on all requests.

  **Process Milestones:**

  - **DY2:**
    - P-1 Project planning, engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
  - **DY3:**
    - P-2 Establish baseline rates
      - IT-2.13: Behavioral Health Admission Rate for Youth; decrease admissions by TBD percentage below baseline

  **Outcome Improvement Targets for each year:**

  - **DY4:**
    - IT-2.13: Behavioral Health Admission Rate for Youth; decrease admissions by TBD percentage below baseline
  - **DY5:**
    - IT-2.13: Behavioral Health Admission Rate for Youth; decrease admissions by TBD percentage below baseline
### Rationale:

Process milestones P-1 and P-2 were chosen to effectively address reporting requirements, by creating solid processes and then establishing baselines. The process milestones also align with milestones indicated in Category 1, creating synergy in the Plan Do Study Act processes. P-1 will be approached in DY2, with DY3 creating baseline rates in order to report on outcomes in the latter part of DY3, and full year reporting in DY4 and DY5.

The creation of a children’s psychiatric emergency service located at Clarity Child Guidance Center will increase access to multiple treatment options and support the philosophy of the “right care, right setting”. Rather than the estimated 1,300 children and adolescents presenting at local emergency departments that do not provide psychiatric care and being “boarded” for an average of 12 hours, youth would present at our facility for an appropriate assessment. Many times, in the triage and assessment process, other less intensive treatment options can be provided, such as outpatient therapy or day treatment. These options would reduce hospital admissions, the key outcome metric noted within IT 2.4, which was customized as 2.13 to measure youth admissions.

### Outcome Measure Valuation:

The approach calculating values for milestones is based on our decades of service to children ages 3-17 with mental health problems. We are affiliated with The University of Texas Health Science Center’s Department of Psychiatry and plan to expand the affiliation to the Department of Pediatrics in order to integrate care.

Children served through our triage approach to care, resulting in “right care, right setting” will save local hospitals countless dollars. As an example, most Emergency Departments can turn an ER bed within a 2-hour window, versus “boarding” psychiatric patients ages 3-17 for an average of 12 hours. A child with a mental health crisis presenting at a local hospital for ED services is far more costly than our “right care, right setting” approach, even if the child is admitted for acute psychiatric services. However, we believe that a significant percentage of patients presenting to us can be diverted to less intensive behavioral health treatment services, such as outpatient therapy or day treatment.

Our project also aligns with the Community Needs Assessment, specifically to the following identification areas:

- **CN.1** Texas ranks last in the nation on health care quality.
- **CN.2** Many residents of RHP 6 lack access to medical and dental care due to high rates of uninsurance and health care provider shortages.
- **CN.4** There is a shortage of high quality mental and behavioral health services that are integrated with physical health services and/or provide crisis stabilization.

Local funding will occur through our IGT partner, University Health System, and through self-funding.

Note: During dialogue with HHSC, we would have benefited from the utilization of the OD-9 outcome measures for “right care, right setting”. However, the measure uses “member months” as part of the calculation and that approach is for managed care and not a typical measure used with hospitals.

### Outcome Measure Description:

| Outcome Measure Description: |
| IT-1.6 Cholesterol Management for patients with Cardiovascular Conditions |

### Process Milestones:

| DY2: |
| 1. P-1 - Project Planning-engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans |

| DY 3: |
| 1. P-2 – Establish Baseline rates |
| 2. P-3 – Develop and test data systems |

| DY-4 |
| 1. IT-1.6: Increase in percentage of patients receiving LDL-C screening test and LDL-C level less than 100mg/dL (Target TBD) |

| DY-5 |
| 1. IT-1.6: Increase in percentage of patients receiving LDL-C screening test and LDL-C level less than 100mg/dL (Target TBD) |

### Rationale:

Process milestones P-1 through P-3 were chosen due to the lack of accurate reports currently available to monitor and manage cholesterol levels for patients at Connally Memorial Medical Center. In order to report accurate data and establish baselines, P-1, P-2 and P-3 must be approached in DY2-DY3. In DY3 we will establish baselines and test data systems.

Improvement targets were chosen for DY4 and DY5 based on research of similar interventions and recommended guidelines. These guidelines include the need for close monitoring of LDL cholesterol in patients with coronary heart disease and set a target for LDL-C of less than or equal to 100 mg/dL for such patients. The outcome measures being addressed can largely be affected by lifestyle factors as well as new medications that offer tangible means for reducing cholesterol and the risk of heart disease.
### Outcome Measure Valuation:

One of the community needs addressed in our RHP Plan is that the high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions. Additionally, the leading causes of death in Wilson county are related to cardiovascular conditions (30% of all deaths) and heart diseases (24%). This project and associated outcomes’ focus on disease management and risk reduction allows Connally Memorial Medical Center the opportunity to achieve our RHP goals of Improves outcomes while containing cost growth. This project will also help meet our goal to assure patients receive high-quality and patient-centered care in the most cost effective way.

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure: IT-6.1 Percent improvement over baseline of Patient Satisfaction scores
Unique RHP outcome identification number: 135151206.3.2 – PASS 2
Provider name: Connally Memorial Medical Center
TPI: 135151206

Outcome Measure Description:

Outcome Measure Description:
IT-6.1 Percent improvement over baseline of Patient Satisfaction scores

Process Milestones:

DY2:
2. P-1 - Project Planning-engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

DY 3:
3. P-2 – Establish Baseline rates
4. P-3 – Develop and test data systems

DY-4
1. IT-6.1: Increase in patient satisfaction scores for one or more of the patient satisfaction domains (Target TBD)

DY-5
1. IT-6.1: Increase in patient satisfaction scores for one or more of the patient satisfaction domains (Target TBD)

Rationale:

Process milestones P-1 through P-3 were chosen due to the lack of accurate reports currently available to monitor and patient satisfaction scores throughout the entire organization, including outpatient services. In order to report accurate data and establish baselines, P-1, P-2 and P-3 must be approached in DY2-DY3. In DY3 we will establish baselines and test data systems.

Improvement targets were chosen for DY4 and DY5 in order to produce comparable data on the patient’s perspective of care that allows objective and meaningful comparisons between institutions on domains that are important to consumers. Public reporting of the survey results is designed to create incentives for institutions to improve their quality of care. Public reporting will serve to enhance public accountability in health care by increasing the transparency of the quality of institutional care provided in return for the public investment.

Outcome Measure Valuation:

One of the community needs addressed in our RHP Plan is that the high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions. Additionally, the leading causes of death in Wilson county are related to cardiovascular conditions (30% of all deaths) and heart diseases (24%). Patient satisfaction with healthcare services is largely related to the utilization of these services. Understanding strengths, needs and receiving patient feedback allows for providers and staff to better understand how to tailor care delivery to meet their patient’s needs.

Identifying Outcome Measure and Provider Information:
Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores (all questions within a survey need to be answered to be a stand-alone measure)
Unique RHP outcome identification number: 112690603.3.1 - PASS 1
Performing Provider: Dimmit Regional Hospital
TPI: 112690603

Outcome Measure Description:
IT-6.1- Percent improvement over baseline of patient satisfaction.
Measures the percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool.
- Rate 1: (3) patient’s rating of doctor access to a specialist. Percent improvement TBD in DY 3 using DY 2 baseline data.

Process Milestones:
- DY2:
  - P-1 – Project planning: engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
  - P-3 – Develop and test data systems
- DY3:
  - P-4 – Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities
  - P-2 – Establish baseline rates for rate 1

Outcome Improvement Targets for each year:
- DY4:
  - IT-6.1 Rate 1: (3) – Improve patient’s rating of doctor access to a specialist. Percentage improvement or point increase expected will be set after the completion of process milestone 4 [P-2] in DY 3
- DY5:
  - IT-6.1 Rate 1: (3) – Improve patient’s rating of doctor access to a specialist. Percentage improvement or point increase expected will be set after the completion of process milestone 4 [P-2] in DY 3

Rationale:
Process Milestones – DY 2: P-1 was chosen because a project similar to this project has never been implemented in the past. There is a great need for stakeholder engagement in the development and support of a 4 year project plan to ensure achievement of Cat. 3 improvement targets. This plan will provide the foundation and vision for achievement of the improvement targets in DY 4-5. The accomplishment of P-3 during DY 2 is necessary for accurate completion of P-4 and P-2 in DY 3. Ensuring that data systems have been developed, tested, and are reliable is vital to the accuracy of the reported numbers and success of the project. DY 3: Completion of P-4 is necessary for accurate and efficient data collection. Achievement of this milestone will improve the data collection process through identifying collection practices/data prone to error and recommending necessary changes. P-2 achievement will allow accurate improvement targets to be set for IT-6.1 in DY 4 and DY 5.
Improvement Targets – Outcome improvement targets for DY 4-5 were chosen based on their ability to accurately assess the performance and impact of the associated category 1 project 112690603.1.9 from the perspective of the patient (OD-6). Patient satisfaction, specifically with regard to access to specialty care, is important to measure as this is the exact community need DRH desires to meet. In other words, DRH desires to increase and improve rural access to specialty care in its service region. There is not a Cat.3 outcome measure that reflects fulfillment of this goal better than IT-6.1. This improvement target is centered on the patient’s perception of access and care. Also, the impact of cycle time and provider productivity improvements achieved by P-17 in DY 4 and DY 5 is also reflected in specialty care patient satisfaction scores – (3) patient’s rating of doctor access to a specialist

Outcome improvement targets with their specific percentage or point increases in patient satisfaction scores will be determined in DY 3 after the accomplishment of P-2.

Outcome Measure Valuation:

The outcome measure and associated improvement target below were valued based on how closely associated the measure was with the chosen project. Additional methods used to value the project hinged on the valuation methodology weights provided by the RHP 6 Anchor facility, University Health System. The valuation methodology included across four categories: Achieves Waiver Goals, Addresses Community Needs(s), Project Scope and Project Investment. This outcome measure received the highest score across all categories

Patient satisfaction is difficult if not impossible to value on a cost avoidance basis. However, DRH is of the opinion that increases in patient satisfaction scores will have the greatest impact on access to quality healthcare for the region. It is the only measure which completely ensures care is “patient-centered” and meets the waiver goals.

TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $1,915,956
**Identifying Outcome Measure and Provider Information:**

Title of Outcome Measure (Improvement Target): IT-9.2 Reduce all ED visits (including ACSC)

Unique RHP outcome identification number: 112690603.3.2 – PASS 2

Provider Name: Dimmit Regional Hospital

TPI: 112690603

**Outcome Measure Description:**

IT-9.2: Reduce all ED visits (including ACSC)

**Process Milestones:**

- **DY2:**
  - P-1: Project planning – engage stakeholders, identify current capacity and needed resources
  - P-3: Develop and test data systems

- **DY3:**
  - P-4: Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities
  - P-2: Establish baseline rates

**Outcome Improvement Targets for each year:**

- **DY4:**
  - IT-9.2 Reduce unnecessary ED visits or ED visits by patients with non-emergent conditions. The actual % reduction in ED visits will be determined in DY 3 after the completion of process milestone 4 [P-2].

- **DY5:**
  - IT- Reduce unnecessary ED visits or ED visits by patients with non-emergent conditions. The actual % reduction in ED visits will be determined in DY 3 after the completion of process milestone 4 [P-2].

**Rationale:**

Process Milestones – DY 2: P-1 was chosen because a project similar to this project has never been implemented in the past. There is a great need for stakeholder engagement in the development and support of a 4 year project plan to ensure achievement of Cat. 3 improvement targets. This plan will provide the foundation and vision for achievement of the improvement targets in DY 4-5. The accomplishment of P-3 during DY 2 is necessary for accurate completion of P-4 and P-2 in DY 3. Ensuring that data systems have been developed, tested, and are reliable is vital to the accuracy of the reported numbers and success of the project. DY 3: Completion of P-4 is necessary for accurate and efficient data collection. Achievement of this milestone will improve the data collection process through identifying collection practices/data prone to error and recommending necessary changes. P-2 achievement will allow accurate improvement targets to be set for IT-6.1 in DY 4 and DY 5.

Improvement Targets – Outcome improvement targets for DY 4-5 were chosen based on their ability to accurately assess the performance and impact of the associated category 1 project 112690603.1.2. There is not a Cat.3 outcome measure that measures performance of the associated Cat. 1 project better than IT-9.2. This improvement target will reduce costs for patients and for the Medicare program. A decrease in the average number of ED visits will ensure this cost reduction and ensure that the right care is occurring in the right setting.
Utilization of an urgent medical advice line with an ED fast track system (cat. 1 project) will reduce the number of ED visits while reducing cycle time (ED wait time) and improving provider productivity.

The actual % reduction in ED visits will be determined in DY 3 after the completion of process milestone 4 [P-2].

**Outcome Measure Valuation:**

The outcome measure and associated improvement target below were valued based on how closely associated the measure was with the chosen project. Additional methods used to value the project hinged on a valuation methodology. The valuation methodology included across four categories: Achieves Waiver Goals, Addresses Community Needs(s), Project Scope and Project Investment. This outcome measure received the highest score across all categories.

Dimmit Regional Hospital also values each outcome based on the following factors: the potential impact on health of our population, the resources necessary to achieve the outcome, and level of improvement anticipated in overall patient satisfaction. Dimmit Regional Hospital also took into account the extent to which reducing ED waiting times and reducing the volume of non-emergent ED patient visits would potentially meet the goals of the region and the Waiver.

</tr>
<tr>
<td>- a negative retinal exam</td>
</tr>
<tr>
<td>The denominator is members 18-75 years old with diabetes.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Rationale:</th>
</tr>
</thead>
<tbody>
<tr>
<td>The measure was selected due to the high incidence of diabetes in both Frio County and RHP 6. Frio County has a 32% adult obesity rate, low access to healthy foods, an elderly population, a 25% uninsured population, a lower per capita income and a high percentage of Hispanics. The above factors ALL lead to an increased prevalence of diabetes. In the RHP itself, diabetes is one of the leading causes of death. Disease management and screening are paramount to improving health outcomes in this population.</td>
</tr>
</tbody>
</table>

Addressing quality care and improvement of screening exams in the diabetic population will also lead to an improvement in potentially preventable admissions. (Between 2005 and 2010 HHSC found that RHP 6 had over 125,000 potentially preventable hospitalizations.)

The ability to access primary care clinics and providers, i.e. ease of availability, is key in reaching patients in Frio County. Improved access to providers will lead to increased visits and therefore increased screenings. Diabetes is both prevalent and costly, with many patients going undiagnosed. Complications lead to increased emergency room utilization and increased costs overall. Many of those complications such as blindness, can be prevented with early screening and detection. Diabetes screening can improve the health outcomes of a substantial amount of residents in Frio County.

Our goal is increased eye exams (retinal or dilated eye exams) in DSRIP year 4 (DY4) and in DY5 over the baseline established. After establishing the baseline rates, outcome improvement targets will be determined.

To deliver these outcomes, process milestones were carefully selected. These milestones define the activities that will be undertaken to prepare MRH to report outcomes in DY4 and DY5. The two process milestones selected are:

P-1: Project Planning – Engage stakeholders, identify current capacity and needed resources, determine timeliness and document implementation plans.

P-2: Establish Baseline Rates

To effect change in both provider adherence to protocols and patient compliance, this project must be planned and organized with all stakeholders on board. These stakeholders include physicians, mid-level providers, staff, management, administration, and Medina County...
residents. Baseline rates must be established to allow for the measurement of progress in the screening compliance of retinal eye exams.

**Outcome Measure Valuation:**

Diabetes is a terribly expensive disease. A recent study from the CDC predicts a dramatic increase in diabetes between now and 2050. The Institute for Alternative Futures estimates that the number of Texans with diabetes will increase by 66% by 2025. The resulting medical and societal cost will be over $51 billion – a 78% increase from 2010. Diabetes can lead to heart failure, blindness, heart attack, kidney failure and amputations. From the Texas Diabetes Council, Medicaid reimbursement for diabetes related services (2006) reached $443 million. In 2010, 373,000 Texans were visually impaired due to diabetes; 5,570 had renal failure, and 7,840 lower extremity amputations. From the “Institute of Alternative Futures”, the total cost of diabetes care in Texas was $28.8 billion in 2010. Treating and preventive screening could drastically reduce this number (cost-avoidance) both in Texas, RHP 6, and in Frio County. The rural health clinics reported over 47,000 visits in FY 2012, and if 13% of the patients had diabetes as a diagnosis, early screening could prevent numerous complications, hospitalization, and emergency department utilization. From the American Diabetes Association, “people with diabetes incur $6,649 annually attributable to diabetes”. $1 in $5 of healthcare dollars in the United States is spent caring for someone with diabetes. If 50% of diabetic patients received high quality medical care in a primary care setting and complied with physician orders, the number of lower extremity amputations could be reduced by over 2,220/year and 31,000 fewer people could develop end-stage renal disease. With an estimated 13% of patients in Frio County living with diabetes, the cost savings and improved quality of life certainly justifies this project.

**Identifying Outcome Measure and Provider Information:**

| Title of Outcome Measure (Improvement Target): 3.IT – 1.13 Diabetes Care: Foot Exam |
|----------------------------------|----------------------------------|
| Unique RHP Outcome ID # 112688002.3.2 – PASS 1 |
| Frio Regional Hospital            |
| TPI: 112688002                    |

**Outcome Measure Description:**

This measure includes diabetic patients who received a foot exam (visual, sensory or pulse) during the measurement year.

The denominator is the number of patients 18-75 years old who have a diagnosis of diabetes.

The process measurements selected are: P-1 Project Planning and P-2 Establish Baseline Rates.

**Rationale:**

The measure was selected due to the high incidence of diabetes in both Medina County and RHP 6. Frio County has a 32% adult obesity rate, low access to healthy foods, an elderly population, a 25% uninsured population, a lower per capita income and a high percentage of Hispanics. The above factors ALL lead to an increased prevalence of diabetes. In the RHP itself, diabetes is one of the leading causes of death. Disease management and screening are paramount to improving health outcomes in this population.

Addressing quality care and improvement of screening exams in the diabetic population will also lead to an improvement in potentially preventable admissions. (Between 2005 and 2010 HHSC found that RHP 6 had over 125,000 potentially preventable hospitalizations.)

The ability to access primary care clinics and providers, i.e. ease of availability, is key in reaching patients in Frio County. Improved access to providers will lead to increased visits and therefore increased screenings. Diabetes is both prevalent and costly, with many patients going undiagnosed. Complications lead to increased emergency room utilization and increased costs overall. Many of those complications such as amputations, can be prevented with early screening and detection. Diabetes screening can improve the health outcomes of a substantial amount of residents in Frio County.

Our goal is increased eye exams (retinal or dilated eye exams) in DSRIP year 4 (DY4) and in DY5 over the baseline established. After establishing the baseline rates, outcome improvement targets will be determined.

To deliver these outcomes, process milestones were carefully selected. These milestones define the activities that will be undertaken to prepare FRH to report outcomes in DY4 and DY5. The two process milestones selected are:

P-1: Project Planning – Engage stakeholders, identify current capacity and needed resources, determine timeliness and document implementation plans.

P-2: Establish Baseline Rates

To effect change in both provider adherence to protocols and patient compliance, this project must be planned and organized with all stakeholders on board. These stakeholders include physicians, mid-level providers, staff, management, administration, and Medina County.
baseline rates must be established to allow for the measurement of progress in the screening compliance of retinal eye exams.

Outcome Measure Valuation:

Diabetes is a terribly expensive disease. A recent study from the CDC predicts a dramatic increase in diabetes between now and 2050. The Institute for Alternative Futures estimates that the number of Texans with diabetes will increase by 66% by 2025. The resulting medical and societal cost will be over $51 billion – a 78% increase from 2010. Diabetes can lead to heart failure, blindness, heart attack, kidney failure and amputations. From the Texas Diabetes Council, Medicaid reimbursement for diabetes related services (2006) reached $443 million. In 2010, 373,000 Texans were visually impaired due to diabetes; 5,570 had renal failure, and 7,840 lower extremity amputations. From the “Institute of Alternative Futures”, the total cost of diabetes care in Texas was $28.8 billion in 2010. Treating and preventive screening could drastically reduce this number (cost-avoidance) both in Texas, RHP 6, and in Frio County. The rural health clinics reported over 47,000 visits in FY 2012, and if 13% of the patients had diabetes as a diagnosis, early screening could prevent numerous complications, hospitalization, and emergency department utilization. From the American Diabetes Association, “people with diabetes incur $6,649 annually attributable to diabetes”. $1 in $5 of healthcare dollars in the United States is spent caring for someone with diabetes. If 50% of diabetic patients received high quality medical care in a primary care setting and complied with physician orders, the number of lower extremity amputations could be reduced by over 2,220/year and 31,000 fewer people could develop end-stage renal disease. With an estimated 13% of patients in Frio County living with diabetes, the cost savings and improved quality of life certainly justifies this project.

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): 3.IT – 1.14 Diabetes Care: Microalbumin/Nephropathy
Unique RHP Outcome ID #112688002.3.3 – PASS 1
Frio Regional Hospital
TPI: 112688002

Outcome Measure Description:

This measure includes diabetic patients who had a nephropathy screening test or evidence of nephropathy. The denominator is the number of patients 18-75 years old who have evidence of nephropathy or a nephropathy screening. The baseline will be established and outcome numbers for DY4 and DY5 will be determined.

The process measurements selected are: P-1 Project Planning and P-2 Establish Baseline Rates.

Rationale:

The measure was selected due to the high incidence of diabetes in both Frio County and RHP 6. Frio County has a 32% adult obesity rate, low access to healthy foods, an elderly population, a 25% uninsured population, a lower per capita income and a high percentage of Hispanics. The above factors all lead to an increased prevalence of diabetes. In the RHP itself, diabetes is one of the leading causes of death. Disease management and screening are paramount to improving health outcomes in this population.

Addressing quality care and improvement of screening exams in the diabetic population will also lead to an improvement in potentially preventable admissions. (Between 2005 and 2010 HHSC found that RHP 6 had over 125,000 potentially preventable hospitalizations.)

The ability to access primary care clinics and providers, i.e. ease of availability, is key in reaching patients in Frio County. Improved access to providers will lead to increased visits and therefore increased screenings. Diabetes is both prevalent and costly, with many patients going undiagnosed. Complications lead to increased emergency room utilization and increased costs overall. Many of those complications such as kidney failure, can be prevented with early screening and detection.

Diabetes screening can improve the health outcomes of a substantial amount of residents in Frio County. Our goal is increased eye exams (retinal or dilated eye exams) in DSRIP year 4 (DY4) and in DY5 over the baseline established. After establishing the baseline rates, outcome improvement targets will be determined.

To deliver these outcomes, process milestones were carefully selected. These milestones define the activities that will be undertaken to prepare FRH to report outcomes in DY4 and DY5. The two process milestones selected are:

</tr>
</tbody>
</table>

### Outcome Measure Description:

This measure focuses on reducing the readmission rate for those patients with a diagnosis of congestive heart failure. The numerator is the number of readmissions (for patients 18 years and older), for any cause, within 30 days of discharge from the index of heart failure admission. The denominator is the number of admissions (for patients 18 years and older) for patients discharged from the hospital with a principle diagnosis of heart failure and with a complete claims history for the 12 months prior to admission. The baseline will be established and outcome numbers for DY4 and DY5 will be determined.

### Rationale:

The measure was selected due to the high incidence of documented heart failure in both Frio County and RHP 6. There are many factors which influence this. Frio County has a 32% adult obesity rate, low access to healthy foods, an elderly population, a 25% uninsured population, a lower per capita income, a high level of diabetes and a high percentage of Hispanics. The above factors all lead to an increased prevalence of heart failure. In the RHP itself, diabetes is one of the leading causes of death. Disease management and screening are paramount to improving health outcomes in this population.

Addressing quality care and improvement in assessing patients with heart failure will also lead to an improvement in potentially preventable admissions. (Between 2005 and 2010 HHSC found that RHP 6 had over 125,000 potentially preventable hospitalizations.)

The ability to access to specialists as well as primary care clinics and providers, i.e. ease of availability, is key in reaching patients in Frio County. Improved access to providers will lead to increased visits and therefore increased screenings. Heart failure is both prevalent and costly, with many patients going undiagnosed. Complications lead to increased emergency room utilization and increased costs overall. Many of those complications and readmissions can be prevented with early screening and detection, as well as life style changes. Better assessment of heart failure patients can improve the health outcomes of a substantial amount of residents in Frio County. Our goal is to reduce the readmission rate for patients with heart failure in DSRIP year 4 (DY4) and in DY5 over the baseline established. After establishing the baseline rates, outcome improvement targets will be determined.

To deliver these outcomes, process milestones were carefully selected. These milestones define the activities that will be undertaken to prepare FRH to report outcomes in DY4 and DY5. The two process milestones selected are:

- **P-1:** Project Planning – Engage stakeholders, identify current capacity and needed resources, determine timeliness and document implementation plans.
- **P-2:** Establish Baseline Rates
To effect change in both provider adherence to protocols and patient compliance, this project must be planned and organized with all stakeholders on board. These stakeholders include physicians, mid-level providers, staff, management, administration, and Frio County residents.Baseline rates must be established to allow for the measurement of progress in the screening compliance of retinal eye exams.

**Outcome Measure Valuation:**

Heart failure creates a strain of local resources. Unfortunately, many of the associated risk factors for CHF are increasing in our community. Factors such as diabetes, obesity, and hypertension have been on the rise. A recent study from the CDC predicts a dramatic increase in diabetes between now and 2050. The Institute for Alternative Futures estimates that the number of Texans with diabetes will increase by 66% by 2025. The resulting medical and societal cost will be over $51 billion – a 78% increase from 2010. From the Texas Diabetes Council, Medicaid reimbursement for diabetes related services (2006) reached $443 million. In 2010, 373,000 Texans were visually impaired due to diabetes; 5,570 had renal failure, and 7,840 lower extremity amputations. From the “Institute of Alternative Futures”, the total cost of diabetes care in Texas was $28.8 billion in 2010. Treating and preventive screening could drastically reduce this number (cost-avoidance) both in Texas, RHP 6, and in Frio County. The rural health clinics reported over 47,000 visits in FY 2012, and if 13% of the patients had diabetes as a diagnosis, early screening could prevent numerous complications, hospitalization, and emergency department utilization. From the American Diabetes Association, “people with diabetes incur $6,649 annually attributable to diabetes”. With an estimated 13% of patients in Frio County living with diabetes, and that many in pre-diabetic condition, the cost savings and improved quality of life certainly justifies this project.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $89,544
Identifying Outcome Measure and Provider Information:

Title of outcome measure (Improvement Target): IT-1.10 Diabetes Care: HbA1c poor control (>9.0%) NQF 0059 (standalone measure)
RHP identification number: 138411709.3.1 – PASS 1
Performing Provider: Guadalupe Regional Medical Center
TPI: 138411709

Outcome Measure Description:

Outcome Improvement Target selected for Category 3 is: 1.10 Diabetes Care: HbA1c poor control (>9.0%) under the Outcome Domain: Primary Care and Chronic Disease Management.

Process Milestones will occur in DY2 & DY3.

DY 2 – project planning - will consist of relocating and establishing the clinic in its new setting on the hospital campus, hiring and training staff, and developing a process in conjunction with the hospital’s EMR to accurately track patients with diabetes. We plan to specifically implement these plans through a coordinated team effort by drawing from hospital administrative staff, Christian Free Clinic stakeholders who currently operate the clinic, hospital information technology staff, maintenance staff, and human resource staff to ensure a safe transition occurs between clinic locations. Meetings will be held with these parties to formulate a reasonable relocation timeline, and determine details of clinic operational needs (computers, phones, software etc.), supplies (blood pressure cuffs, otoscopes, etc.). Other details that will be coordinated with the appropriate individuals from this group will include staff screening, hiring and training. Once clinic staff are hired they will be responsible for developing the patient scheduling and tracking mechanism in the EMR system to enable us to accurately track patient information including, lab and imaging results, and view current medications.

DY3 – establish baseline rates - will consist of collaborating with key clinic physicians and the primary physician extender who will be operating the clinic to determine the patient database and determine the patient baseline for improvement. The baseline will be derived from the third year’s patient volume of visits, which we expect to be at least 20 to 30 patient visits a week. This is based on current patient volume from the Christian Free Clinic, which treats 6-10 patients one evening a week.

DYs 4 and 5 will focus on the outcome improvement targets, which will be the health of those patients with poor A1c levels (>9.0%). Specific improvement target goals will be decided in year three once a patient baseline has been determined and health data has been collected on the diabetic patients receiving treatment from the clinic.

Year 2 – Process Milestone 1: P-1 - Project Planning

Milestone 1 - Engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plan.

Data Source: Written planning documentation and /or meeting minutes

Year 3- Process Milestone 2: P-2 Establish baseline rates

Milestone 2: Establish baseline rates by utilizing visit logs and tracking patient volume.

Data Source: Visit Logs / patient activity reports.
Year 4 – Outcome Improvement Target 1: IT – 1.10 Diabetes care: *HbA1c poor control (>9.0%) - NQF 0059 (Standalone measure)*

The expected outcome from each of these years is to see a reduction in uncontrolled A1c levels in the patients that are being treated in the clinic. The various methods that will be utilized to achieve this outcome will include: quarterly appointment follow ups with these patients, free A1c lab checks to be interpreted at the patient’s quarterly visit, and personal calls to ensure patients have received their medications, taking them correctly, and are receiving ongoing diabetic education.

**Rationale:**

Diabetes is one of the most costly and highly prevalent chronic diseases in the United States. Approximately 20.8 million Americans have diabetes, and half of these cases are undiagnosed. Complications from the disease cost the country approximately $100 billion annually. In addition, diabetes accounts for nearly 20 percent of all deaths in people over 25 years of age. Many complications, such as amputation, blindness, and kidney failure, can be prevented if detected and addressed in the early stages. Although many people live with diabetes years after diagnosis, it is a costly condition that leads to serious and potentially fatal health complications. Diabetes control can improve the quality of life for millions of Americans and save billions of healthcare dollars.

The outcome improvement target to control diabetic HbA1c levels was chosen in conjunction with our process improvement measures of expanding primary care access, clinic hours and staffing as a way to make the greatest impact on community need. Due to the high prevalence of uncontrolled diabetic cases in the Seguin community, it was determined that creating a system to identify patients through this newly established clinic with one of the goals being to improve and/or manage patient diabetic A1c levels. Specific target improvement goals will be decided in DY three based on the number of patient visits and data collected on diabetic patients receiving treatment from the clinic.

**Outcome Measure Valuation:**

The scope of this project should be categorized as large, due to the various coordination efforts and data collection processes that will need to be developed to manage and achieve short and long-term goals. The number of diabetic related ER visits and patient admissions is frequent due to the lack of primary care access for those patients who are uninsured, and unable to pay for their diabetic medications. This populations’ education level also presents challenges for long-term success and adds to the complexity of this project, because of their ability to understand the importance of their disease and their need to comply with treatment.

The lack of diabetic resource management in the community is a real issue. By implementing this project and improvement target, we will help reduce the level of chronic disease currently recognized in the community, and hopefully, reduce the future rise of this illness. GRMC is currently receiving no local funding to support the management of this type of project.

### Year 2
(10/1/2012 – 9/30/2013)

**Process Milestone 1**
Project Planning – P-1: Engage stakeholders, identify current capacity and needed resources to relocate primary care clinic and expand hours. Determine timelines and document implementation plans.

**Data Source:**
Written planning documentation &/or meeting minutes

**Process Milestone 1 Estimated Incentive Payment:** $132,770

### Year 3
(10/1/2013 – 9/30/2014)

**Process Milestone 2**
P-2: Establish baseline rates

**Data Source:**
Written planning documentation &/or meeting minutes, registry data

**Estimated Incentive Payment:** $76,949

### Year 4
(10/1/2014 – 9/30/2015)

**Outcome Improvement Target 1**
[IT-1.10]: Diabetes Care: HbA1c poor control (>9.0%)
Improvement Target: TBD

**Data Source:** Patient Registry & Administrative Data

**Numerator:** % of patients 18-75 years of age with diabetes (type 1 or type 2) who had hemoglobin A1c (HbA1c) control >9.0%

**Denominator:** Patients 18-75 years of age as of December 31 of the measurement year with diabetes (type 1 and type 2) who attended the clinic

**Outcome Improvement Target 1 Estimated Incentive Payment:** $246,952

### Year 5
(10/1/2015 – 9/30/2016)

**Outcome Improvement Target 2**
[IT-1.10]: Diabetes Care: HbA1c poor control (>9.0%)
Improvement Target: TBD

**Data Source:** Patient Registry & Administrative Data

**Numerator:** % of patients 18-75 years of age with diabetes (type 1 or type 2) who had hemoglobin A1c (HbA1c) control >9.0%

**Denominator:** Patients 18-75 years of age as of December 31 of the measurement year with diabetes (type 1 and type 2) who attended the clinic

**Outcome Improvement Target 2 Estimated Incentive Payment:** $590,537

### Year 2 Estimated Outcome Amount: $132,770

### Year 3 Estimated Outcome Amount: $153,898

### Year 4 Estimated Outcome Amount: $246,952

### Year 5 Estimated Outcome Amount: $590,537

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $1,124,157
## Identifying Outcome Measure and Provider Information:

| Title of Outcome Measure (Improvement Target): IT-3.1 All cause 30 Day readmission Rate |
| Unique RHP outcome identification number: 138411709.3.2 – PASS 1 |
| Performing Provider: Guadalupe Regional Medical Center |
| TPI: 138411709 |

## Outcome Measure Description:

**The outcome measure for this project is unplanned all-cause 30-day readmissions for patients aged 18 years and older.**

**Year 2 – Process Milestone 1: P-1 - Project Planning**

**Milestone 1** - Engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plan.

**Data Source:** meeting minutes and related policies and procedures, submission of established Policies and procedures of care transitions program materials

**Year 3 - Process Milestone 2: P-2 Establish baseline rates**

**Milestone 2** - Determine baseline for unplanned all-cause readmissions for patients 18 years and older as a percentage of total admissions for same age group. This milestone measures the hospital-level, risk-standardized rate of unplanned, all-cause readmission after admission for any eligible condition within 30 days of hospital discharge (RSRR) for patients aged 18 and older.

**Numerator:** (Note: This outcome measure does not have a traditional numerator and denominator like a core process measure (e.g., percentage of adult patients with diabetes aged 18-75 years receiving one or more hemoglobin A1c tests per year); thus, we use this field to define the measure outcome.)

The outcome for this measure is unplanned all-cause 30-day readmission. We defined a readmission as an inpatient admission to any acute care facility which occurs within 30 days of the discharge date of an eligible index admission. All readmissions are counted as outcomes except those that are considered planned.

**Denominator:** Admissions to acute care facilities for patients aged 65 years or older

**Data Source:** EMR, Claims

**Rationale:** This measure identifies the hospital’s standardized risk ratio (SRR) for readmissions within 30 days of discharge for patients aged 18 years and older; utilizing this baseline data the organization will be able to measure progress toward outcome goals

**Exclusions:**

1. Admissions for patients without 30 days of post-discharge data
   **Rationale:** This is necessary in order to identify the outcome (readmission) in the dataset.

2. Admissions for patients lacking a complete enrollment history for the 12 months prior to admission
   **Rationale:** This is necessary to capture historical data for risk adjustment.

3. Admissions for patients discharged against medical advice (AMA)
   **Rationale:** Hospital had limited opportunity to implement high quality care.

4. Admissions for patients to a PPS-exempt cancer hospital
   **Rationale:** These hospitals care for a unique population of patients that is challenging to compare to other hospitals.

5. Admissions for patients with medical treatment of cancer (See Table 3 in Section 2a1.9)
Rationale: These admissions have a very different mortality and readmission profile than the rest of the Medicare population, and outcomes for these admissions do not correlate well with outcomes for other admissions. (Patients with cancer who are admitted for other diagnoses or for surgical treatment of their cancer remain in the measure).

6. Admissions for primary psychiatric disease (see Table 4 in Section 2a1.9)
Rationale: Patients admitted for psychiatric treatment are typically cared for in separate psychiatric or rehabilitation centers which are not comparable to acute care hospitals.

7. Admissions for “rehabilitation care; fitting of prostheses and adjustment devices”
Rationale: These admissions are not for acute care or to acute care hospitals.

- **Year 4 – Outcome Improvement-IT-3.1 All cause 30 day readmission rate- NQF 1789 (Standalone measure)**
  - Metric: Achieve a 3% reduction from baseline in unplanned all-cause readmissions for patients 18 years and older as a percentage of total admissions for same age group. % decrease will be determined from baseline is measured in Y2.
    - Numerator: Number of unplanned readmissions within 30 days of discharge for patients 18 years and older
    - Denominator: Total number of admissions for patients 18 years of age and older
    - Data Source: EMR, Claims
    - Rationale: This measure identifies the degree to which the targeted interventions implemented with this project have been successful

- **Year 5 – Outcome Improvement-IT-3.1 All cause 30 day readmission rate- NQF 1789 (Standalone measure)**
  - Metric: Achieve a 5% reduction from baseline in unplanned all-cause readmissions for patients 18 years and older as a percentage of total admissions for same age group. 5% decrease will be determined after baseline is measured in Y2.
    - Numerator: Number of unplanned readmissions within 30 days of discharge for patients 18 years and older
    - Denominator: Total number of admissions for patients 18 years of age and older
    - Data Source: EMR, Claims
    - Rationale: This measure identifies the degree to which the targeted interventions implemented with this project have been successful

**Rationale:**

Acute care readmissions within 30 days of discharge create an economic and capacity hardship for the healthcare system. The Centers for Medicare and Medicaid Services (CMS) estimates the cost of avoidable readmissions at more than $17 billion each year. Additionally, such readmissions have a negative impact on the quality of life for patients and their families. The ability to coordinate care across the continuum is increasingly recognized as an indicator of the effectiveness of healthcare organizations. Adequately preparing patients for discharge and providing support during the transition process has been shown to contribute significantly to that coordination.

With the aforementioned above, GRMC will monitor EMR, Transitional Care Patient Tracking Logs, and Case Management outcome logs to extrapolate the data. This data will be compiled to document and report the outcome data as it relates to the Transitional Care Program.
**Outcome Measure Valuation:**

Literature has shown that organizations with a high readmission rate for one diagnosis group are likely to have high rates with others as well. GRMC has a CHF readmission rate that is in the fourth (lowest) quartile in the state of Texas for the period of 2006-2007. Our rural service area includes many low income and uninsured/under-insured individuals and families. Significantly reducing readmission rates will improve the quality of life for our community as well as contribute to the continued viability of our organization and opportunities to expand services.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $1,124,158**
Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-9.2 ED Appropriate Utilization (standalone measure)
RHP Outcome Identification Number: 138411709.3.3 – PASS 2
Performing Provider: Guadalupe Regional Medical Center (GRMC)
Performing Provider TPI #: 138411709

Outcome Measure Description:
The outcome measure that is a part of IT-9.2 that we are choosing to focus on is Reducing Emergency Department visits for target conditions. The condition chosen is Behavioral Health/Substance Abuse. By implementing the Patient Navigation System, GRMC ED would like to decrease the unnecessary ED visits for behavioral health/substance abuse by 3% by year 5.

- **Year 2- Process Milestone 1: P-1 – Project planning**– engage stakeholders, identify current capacity and needed resources, determine timelines, and document implementation plans
  - Data source: meeting minutes and related policies and procedures

- **Year 3- Process Milestone 2 P-2: Establish baseline rates**– Identify the amount of unnecessary visits for behavioral health/substance abuse per quarter in the ED
  - Data source: Meditech reports tailored for specific ICD9 codes, nursing documentation, claims
  - Baseline: # of patients identified

- **Year 4- Outcome Improvement Target 1- IT-9.2: ED appropriate utilization** (standalone measure) - Decrease the amount of unnecessary visits for behavioral health/substance abuse in the ED by 1% from baseline determined in Year 3
  - Data source: Meditech reports tailored for specific ICD9 codes, nursing documentation, claims

- **Year 5- Outcome Improvement Target 2- IT-9.2: ED appropriate utilization** (standalone measure)-Decrease the amount of unnecessary visits for behavioral health/substance abuse in the ED by 3% from baseline determined in Year 3
  - Data source: Meditech reports tailored for specific ICD9 codes, nursing documentation, claims

Rationale:
Unnecessary use of the ED is a large financial hardship for the institution, especially for those patients that are uninsured. The milestone was chosen because it seems as if a large number of people are utilizing the ED for unnecessary visits that would be appropriate in a different location such as a doctors’ office or clinic. Behavioral health/substance abuse was chosen as the target condition for the group to focus their efforts in order to steer patients to a behavioral health clinic that uses behavioral health evidence based practices such as: cognitive behavioral therapy, motivational enhancement therapy, motivational interviewing.

Outcome Measure Valuation:
The Navigation Program will assist to manage behavior health/substance abuse patients through outpatient resources, clinics and counseling services outside of the emergency department. Guadalupe County is federally designated as a mental health professional shortage area. An additional report by the Agency for Healthcare Research and Quality, completed in 2010 that mental disorders/substance abuse related visits equal 1 of every 8 emergency department cases. According to a study completed by Salinski and Loftis (2007), Mental health related ER visits increased 75% from 1992 to 2003. MSNBC also reported in 2009, that only 9 patients accounted for 2700 ER visits in a one year period in Austin, Texas. Agency for Healthcare Research and Quality also completed a report in 2010 showing that mental disorders/substance abuse related visits equal 1 of
every 8 emergency department cases. The lack of resources for the mental health patients is not only traumatic for them, but it also takes scarce resources away from the patient with medical emergencies.

TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $ 600,761
### Identifying Outcome Information:

Title of Outcome Measure (Improvement Target): IT-12.2 Cervical Cancer Screening (HEDIS 2012)

Unique RHP Outcome Identification Number: 136430906.3.1 – PASS 1

Provider Name: Hill Country Memorial Hospital

TPI: 136430906

### Narrative Description:

**Outcome Measure**

IT-12.2, Cervical Cancer Screening  
- **Numerator:** Number of women aged 21 to 64 that have received a PAP in the measurement year or two prior years.  
- **Denominator:** Women aged 21 to 64 in the patient or target population. Women who have had a complete hysterectomy with no residual cervix are excluded.

**Process Milestones**

- **DY 2:** P-1 Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.  
- **DY 3:** P-3 Develop and test data systems

**Outcome Improvements for Each Year**

**DY 4:** IT-12-2, Cervical Cancer Screening (HEDIS 2012)  
- Improvement Target: 40% of all eligible women in the target population of 500 employed uninsured.

**DY 5:** IT-12.2: Cervical Cancer Screening (HEDIS 2012)  
- Improvement Target: 100% of all eligible women in the target population of 500 employed uninsured.

**Starting Point/Baseline (if applicable):**

There currently is no baseline percentage available for the target population since they have not been evaluated for preventive care.

### Rationale:

The process measures for this project include (1) Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans and (2) Develop and test data systems. These steps are key to achievement of the outcome.  
An assessment of parts of the community and businesses with the greatest need will need to be done as well as a plan for ensuring that the key needs for preventive care and wellness are met.  
An outreach strategy as well as a continuity of care detailed strategy will need to be developed at this time. At the moment, a system for collecting client data has not been selected. Options, such as use of systems already in use by the hospital or 501a clinics, may be considered as well as others. For long-term patient and program management, a clear system for managing patient information will be crucial.

The outcome measure of the number of women who have been screened for cervical cancer was chosen because there is currently such limited data available on the health outcomes of the target population. Once we can begin to provide needed preventive care services, we can begin to track the health of the uninsured population in our community with greater accuracy. Though we anticipate that major changes in the health of our community resulting from the program and its continuation past the project period, we do not believe that the screening services we will provide will demonstrate these outcomes in community health data immediately. We will
continue to monitor the health of our community, specifically the uninsured, past the project period, and expect to see a major shift in the overall health of the target population.

The Quality Improvement process for these measures will also include participation in the Learning Collaborative set up in our RHP for those with similar projects. There are a number of others in the RHP focusing their efforts on preventive care, so we look forward to both learning from, and sharing our discoveries with, these other healthcare providers in our region.

<table>
<thead>
<tr>
<th><strong>Outcome Measure Valuation:</strong></th>
</tr>
</thead>
</table>
| This Category 3 outcome measure is valued at $213,203 over the 5 year period. Of the 500 individuals in the target population, one can estimate that about half will be females, at least thirty percent of which will not have had a cervical cancer screening in the last three years. This means, that in addition to the many other health screenings that will be completed on these patients, at least 75 women will be screened for cervical cancer. About 6% will have precancerous results (Risser, Mokry, & Bowcock, et. al., 2010), and will be navigated through appropriate treatment routes. This will prevent, at least $300,000 in costs if those cases had advanced to cervical cancer (Risser, Mokry, & Bowcock, et. al., 2010). Beyond this, it will assist in preventing illness, loss of productivity, and even deaths related to a very preventable disease. Also, the Cancer Prevention Research Institute of Texas found that the uninsured population tends to have a much lower rate of compliance with preventive screening measures (as low as 20%), so it is likely that up to 80% of the women in the target population will require cervical cancer screening. Meeting this need for such a large number in our community will significantly improve the potential for community health. Screening for cancer implies testing for early stages of disease before symptoms occur. It involves application of an early detection test to a large number of apparently healthy people to identify those having unrecognized cancer. People with positive screening tests are subsequently investigated with diagnostic tests and those with confirmed disease are offered appropriate treatment and follow-up. The objective of screening is to reduce incidence of and/or death from cancer by detecting early preclinical disease when treatment may be easier and more effective than for advanced cancer diagnosed after the symptoms occur. It is important to evaluate the efficacy of a given screening approach to reduce disease burden, harm and cost, as well as its overall cost-effectiveness, before it is considered for widespread implementation in large population settings. The only justification for a screening program is early diagnosis that leads to a cost-effective and significant reduction in disease burden.

“Of all cancers, cervical cancer is one of the most preventable and detectable through regular screening. Yet, cervical cancer remains a serious threat to the lives of Texas women.
- In 2010, an estimated 1,219 Texas women were diagnosed with invasive cervical cancer and 378 women will die of the disease.
- The rates of women being diagnosed with and dying from cervical cancer in Texas are higher than those of the United States overall.
- The estimated direct cost of invasive cervical cancer in Texas for 2007 was $77.4 million.
- Hispanic women have the highest incidence rate of cervical cancer, followed by blacks, non-Hispanic whites, and Asian/Pacific Islanders.
- Blacks have the highest age-adjusted cervical cancer mortality rate, followed by Hispanics, non-Hispanic whites and Asian/Pacific Islanders.
• Hispanic women in the Texas-Mexico border counties have a slightly higher cervical cancer mortality rate than Hispanics in non-border counties.
• Incidence and mortality rates of cervical cancer are higher in rural counties than in urban counties. Overall, the incidence rate of cervical cancer was higher in rural counties (11.6 per 100,000) compared to urban counties (9.5 per 100,000). The overall mortality rate for cervical cancer was higher in rural counties (3.6 per 100,000) compared to urban counties (3.1 per 100,000).
• Eighty percent of women reported having had a Pap test within the past three years. The lowest prevalence of having had a recent Pap test was among women with less than a high school education and women living along the Texas-Mexico border.

As with most cancers, the stage of diagnosis for cervical cancer determines treatment options as well as the prognosis for survival: The earlier the stage in which a tumor is detected, the better the patient’s chance of survival. Relative to the general population, the five-year survival rate among Texas women with localized cervical cancer is almost 90 percent. However, the rate is less than 20 percent for women with distant disease (Figure 1)

From 2003–2007, a total of 5,397 cases of invasive cervical cancer were newly diagnosed in Texas women, with an average of 1,079 cases per year.
• The age-adjusted incidence rate in Texas was 9.7 per 100,000 women. In comparison, the rate from the National Cancer Institute’s Surveillance Epidemiology and End Results (SEER) program was 8.1 per 100,000 (Figure 2). Despite being virtually preventable, cervical cancer killed an average of 340 women in Texas annually from 2002–2006.
• The age-adjusted mortality rate in Texas was 3.1 deaths per 100,000 women compared to 2.5 per 100,000 women in SEER.”

TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $213,202
Identifying Outcome Information:

Title of Outcome Measure (Improvement Target): IT-12.3 Colorectal Cancer Screening (HEDIS 2012)
Unique RHP Outcome Identification Number: 136430906.3.2 – PASS 1
Provider Name: Hill Country Memorial Hospital
TPI: 136430906

Narrative Description:

Outcome Measure
IT-12.3: Colorectal Cancer Screening
   Numerator: Number of adults aged 50 to 75 that have received one of the following screenings. Fecal occult blood test yearly, Flexible sigmoidoscopy every five years, Colonoscopy every 10 years.
   Denominator: Number of adults aged 50 to 75 in the patient or target population. Adults with colorectal cancer or total colectomy are excluded.

Process Milestones
   DY 2: P-1 Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.
   DY 3: P-3 Develop and test data systems

Outcome Improvements for Each Year
DY 4: [IT-12-3]: Colorectal Cancer Screening (HEDIS 2012)
   Improvement Target: 40% of all eligible individuals in the target population of 500 employed uninsured.
DY 5: [IT-12-3]: Colorectal Cancer Screening (HEDIS 2012)
   Improvement Target: 100% of all eligible individuals in the target population of 500 employed uninsured.

Starting Point/Baseline (if applicable):
There currently is no baseline percentage available for the target population since they have not been evaluated for preventive care.

Rationale:
The process measures for this project include (1) Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans and (2) Develop and test data systems. These steps are key to achievement of the outcome. An assessment of parts of the community and businesses with the greatest need will need to be done as well as a plan for ensuring that the key needs for preventive care and wellness are met. An outreach strategy as well as a continuity of care detailed strategy will need to be developed at this time. At the moment, a system for collecting client data has not been selected. There are a number of others in the RHP focusing their efforts on preventive care, so we look forward to both learning from, and sharing our discoveries with, these other healthcare providers in our region.

**Outcome Measure Valuation:**

This Category 3 outcome measure is valued at $213,203 over the 5 year period. Of the 500 individuals in the target population, one can estimate that at least 50% will not have been screened for colorectal cancer within the appropriate timeframe. This means, that in addition to the many other health screenings that will be completed on these patients, at least 250 men and women will be screened for colorectal cancer.

Regular cancer screening is extremely important for colorectal cancer. Not only can colorectal cancer screening help detect cancers early, which can improve survival, but it can even prevent cancer from developing by removing noncancerous polyps before they become cancer. It is very important for colorectal cancer to be detected and treated early since stage at diagnosis is the most significant prognostic factor in survival. It is estimated that approximately half of the deaths from colorectal cancer could have been prevented through screening. Preventing just one case of colorectal cancer can save up to $350,000 in costs to the patient and community.

**Reference:**

Screening for cancer implies testing for early stages of disease before symptoms occur. It involves application of an early detection test to a large number of apparently healthy people to identify those having unrecognized cancer. People with positive screening tests are subsequently investigated with diagnostic tests and those with confirmed disease are offered appropriate treatment and follow-up. The objective of screening is to reduce incidence of and/or death from cancer by detecting early preclinical disease when treatment may be easier and more effective than for advanced cancer diagnosed after the symptoms occur. It is important to evaluate the efficacy of a given screening approach to reduce disease burden, harm and cost, as well as its overall cost-effectiveness, before it is considered for widespread implementation in large population settings. The only justification for a screening program is early diagnosis that leads to a cost-effective and significant reduction in disease burden.

• Colorectal cancer is the third most commonly diagnosed cancer in men and women and the second leading cause of cancer deaths overall.
• In 2010 it is estimated that 10,366 Texans will be newly diagnosed with invasive colorectal cancer, and 3,578 will die of the disease.
• The estimated total cost of colorectal cancer in Texas for 2007 was almost $3.6 billion.
• Blacks have the highest colorectal cancer incidence and mortality rates, followed by non-Hispanic whites and Hispanics.
• Non-Hispanic whites and Hispanics along the Texas-Mexico border have lower incidence and
mortality rates than non-Hispanic whites and Hispanics in non-border counties.
• There are higher colorectal cancer incidence and mortality rates in rural counties compared to urban counties.
• In Texas, 44.5 percent of adults aged 50 years and older reported having a sigmoidoscopy or colonoscopy in the last five years, and 14.1 percent reported having an annual blood stool test.
• Of the 9,170 average annual cases of colorectal cancer diagnosed among Texans between 2003–2007, 7,338 (80.1 percent) were diagnosed in persons aged 55 years and older.
• More than 50% of the residents of Gillespie County are over the age of 45

**Process Milestones**

DY 2: P-1 Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.

DY 3: P-3 Develop and test data systems

**Outcome Improvements for Each Year**

DY 4: IT-12.5, Other USPSTF-endorsed screening outcome measures: Screening for high blood pressure in adults aged 18 and older.

- **Improvement Target:** 40% of all eligible individuals in the target population of 500 employed uninsured.

DY 5: IT-12.5, Other USPSTF-endorsed screening outcome measures: Screening for high blood pressure in adults aged 18 and older.

- **Improvement Target:** 100% of all eligible individuals in the target population of 500 employed uninsured.

**Starting Point/Baseline (if applicable):**

There currently is no baseline percentage available for the target population since they have not been evaluated for preventive care.

**Rationale:**

The process measures for this project include (1) Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans and (2) Develop and test data systems. These steps are key to achievement of the outcome. An assessment of parts of the community and businesses with the greatest need will need to be done as well as a plan for ensuring that the key needs for preventive care and wellness are met. An outreach strategy as well as a continuity of care detailed strategy will need to be developed at this time. At the moment, a system for collecting client data has not been selected. Options, such as use of systems already in use by the hospital or 501a clinics, may be considered as well as others. For long-term patient and program management, a clear system for managing patient information will be crucial.

The outcome measure of the number of adults who have been screened for hypertension was chosen because there is currently such limited data available on the health outcomes of the target population. Once we can begin to provide needed preventive care services, we can begin to track the health of the uninsured population in our community with greater accuracy. Though we
anticipate that major changes in the health of our community resulting from the program and its
continuation past the project period, we do not believe that the screening services we will provide
will demonstrate these outcomes in community health data immediately. We will continue to
monitor the health of our community, specifically the uninsured, past the project period, and expect
to see a major shift in the overall health of the target population.

The Quality Improvement process for these measures will include participation in the Learning
Collaborative set up in our RHP for those with similar projects. There are a number of others in the
RHP focusing their efforts on preventive care, so we look forward to both learning from, and
sharing our discoveries with, these other healthcare providers in our region.

**Outcome Measure Valuation:**

This Category 3 outcome measure is valued at $213,203 over the 5 year period. Of the 500
individuals in the target population, one can estimate that at least 95% will not have been screened
for hypertension within the past year. This means, that in addition to the many other health
screenings that will be completed on these patients, at least 475 men and women will be screened
for hypertension. About 32% of Americans are hypertensive (http://www.cdc.gov/nchs/fastats/hyptens.htm) and 31% of those are not aware of it, while 17%
are not being treated. This means that at least 48 individuals will be diagnosed with hypertension
for the first time and almost 80 will be navigated to appropriate care and management of the
disease.

Hypertension is a very prevalent condition that contributes to significant adverse health outcomes,
including premature deaths, heart attacks, renal insufficiency, and stroke. The USPSTF found good
evidence that blood pressure measurement can identify adults at increased risk for cardiovascular
disease due to high blood pressure. “The USPSTF found good evidence that treatment of high
blood pressure in adults substantially decreases the incidence of cardiovascular events. The
USPSTF concludes that there is high certainty that the net benefit of screening for high blood
pressure in adults is substantial. In the United States, hypertension is responsible for 35 percent of
all cardiovascular events (myocardial infarction and stroke), 49 percent of all episodes of heart
failure, and 24 percent of all premature deaths.¹ Patients with hypertension have 2 to 4 times more
risk for stroke, myocardial infarction, heart failure, and peripheral vascular disease than patients
without hypertension.² Additionally, they have an increased risk for end-stage renal disease,
retinopathy, and aortic aneurysm.¹³⁴ This substantial burden of suffering from hypertension, in
combination with a feasible and accurate means of detection and a clear benefit from
treatment,⁵ have led to a widespread recommendation for screening for hypertension.

In 1996, the U.S. Preventive Services Task Force (USPSTF) reviewed the evidence regarding
screening for hypertension.⁵ Based on its review, the USPSTF strongly recommended screening
adults 21 and older using standard office sphygmomanometry. Although they did not recommend a
specific interval for screening, they noted that measurement every 2 years for patients with
previously normal blood pressures and every year in persons with borderline levels may be
prudent.” (http://www.uspreventiveservicestaskforce.org/3rduspstf/highbloodsc/hibloodrev.htm)

One third of all deaths in Gillespie County are related to cardiovascular disease
(http://www.dshs.state.tx.us/hquery/report/?mode=summ&areas=86_255_271).

“Strong indirect evidence supports screening adults for hypertension. Hypertension is an important
contributor to CVD morbidity and mortality. It is predictive of CHD events and is reliably detected
through screening blood pressure measurements using a standard arm blood pressure cuff and
sphygmomanometer. Additionally, treatment of adult hypertensive patients with drug therapy and
possibly nonpharmacological interventions can reduce blood pressure and the incidence of
cardiovascular events, including myocardial infarction, heart failure, and stroke. The degree of risk reduction depends on patients' levels and possibly duration of blood pressure elevation, their other risk factors for CVD, and the choice of antihypertensive treatment. Additionally, despite relatively clear evidence supporting screening and the widespread use of clinical blood pressure measurement, identification and treatment of hypertension remains suboptimal for the U.S. population as a whole. A recent population-based study using National Health and Nutrition Exam Survey (NHANES III) data reported that 31 percent of hypertensive Americans are unaware that they have hypertension, 17 percent are aware of their diagnosis but are not being treated, and 29 percent are being treated but have not controlled their blood pressure. \(^6\) Healthy People 2010 aims to reduce all of these numbers to 5 percent. \(^7\) Substantial progress in organization of care and access to care will be required to approach the Healthy People 2010 goals."

TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $213,205
Identifying Outcome Measure and Provider Information:

Title of Outcome measure (Improvement Target): 3.IT – 1.12 Diabetes Care: Retinal eye exam
Unique RHP Outcome ID #133260309.3.1 – PASS 1
Performing Provider: Medina Healthcare System (Medina Regional Hospital)
TPI: 212140201

Outcome Measure Description:

Outcome Measure Description:
IT-1.12-Diabetes Care: Retinal Eye Exam

- a) Numerator: An eye screening for diabetic retinal disease as identified by administrative data. This includes diabetics who had one of the following:
  - A retinal or dilated eye exam by an eye care professional (optometrist or ophthalmologist) in the measurement year, or
  - A negative retinal exam (no evidence of retinopathy) by an eye care professional in the year prior to the measurement year.

- b) Denominator: Members 18-75 years of age as of December 31 of the measurement year with diabetes (type 1 or type 2).

Process Milestones:

- DY2:
  - P-1 Project Planning-engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.
- DY3:
  - P-2 Establish Baseline Rates

Outcome Improvement Targets for each year:

- DY4:
  - Increase the percent (TBD) of qualified patients who had a retinal or dilated eye exam by an eye care professional (optometrist or ophthalmologist) in the measurement year.

- DY5:
  - Increase the percent (TBD) of qualified patients who had a retinal or dilated eye exam by an eye care professional (optometrist or ophthalmologist) in the measurement year.

Rationale:

Process milestones – P-1 through P-2 were chosen because stakeholders must be identified and engaged to affect the outcomes needed. The amount of resources that will be needed must also be identified.

To effect change in both provider adherence to protocols and patient compliance, this project must be planned and organized with all stakeholders on board. These stakeholders include physicians, mid-level providers, staff, management, administration, and Medina County residents. Resources needed must be determined and plans implemented to improve the outcomes.
A baseline number of patients who are receiving a retinal or dilated eye exam must be determined to compare improvements made in DY4 and DY5.

Improvement targets:
The measure was selected due to the high incidence of diabetes in both Medina County and RHP 6. Medina County has a 30% adult obesity rate, low access to healthy foods, an elderly population, a 27% uninsured population, a lower per capita income and a high percentage of Hispanics. The above factors ALL lead to an increased prevalence of diabetes. In the RHP itself, diabetes is one of the leading causes of death. Disease management and screening are paramount to improving health outcomes in this population.

Addressing quality care and improvement of screening exams in the diabetic population will also lead to an improvement in potentially preventable admissions. (Between 2005 and 2010 HHSC found that RHP 6 had over 125,000 potentially preventable hospitalizations.)

The ability to access primary care clinics and providers, i.e. ease of availability, is key in reaching patients in Medina County. Improved access to providers will lead to increased visits and therefore increased screenings. Diabetes is both prevalent and costly, with many patients going undiagnosed. Complications lead to increased emergency room utilization and increased costs overall. Many of those complications such as blindness, can be prevented with early screening and detection.

Diabetes screening can improve the health outcomes of a substantial amount of residents in Medina County.

Improvement targets were chosen based on the timeframes of implementation. As eye exams are extremely important in the care of diabetic patients, the outcome measure (IT-1.12) was selected.

Outcome Measure Valuation:

Diabetes is a terribly expensive disease. A recent study from the CDC predicts a dramatic increase in diabetes between now and 2050. The Institute for Alternative Futures estimates that the number of Texans with diabetes will increase by 66% by 2025. The resulting medical and societal cost will be over $51 billion – a 78% increase from 2010. Diabetes can lead to heart failure, blindness, heart attack, kidney failure and amputations. From the Texas Diabetes Council, Medicaid reimbursement for diabetes related services (2006) reached $443 million. In 2010, 373,000 Texans were visually impaired due to diabetes; 5,570 had renal failure, and 7,840 lower extremity amputations. From the “Institute of Alternative Futures”, the total cost of diabetes care in Texas was $28.8 billion in 2010. Treating and preventive screening could drastically reduce this number (cost-avoidance) both in Texas, RHP 6, and in Medina County.

The rural health clinics reported over 47,000 visits in FY 2012, and if 13% of the patients had diabetes as a diagnosis, early screening could prevent numerous complications, hospitalization, and emergency department utilization. From the American Diabetes Association, “people with diabetes incur $6,649 annually attributable to diabetes”. $1 in $5 of healthcare dollars in the United States is spent caring for someone with diabetes. If 50% of diabetic patients received high quality medical care in a primary care setting and complied with physician orders, the number of lower extremity amputations could be reduced by over 2,220/year and 31,000 fewer people could develop end-stage renal disease. With an estimated 13% of patients in Medina County living with diabetes, the cost savings (avoidance) and improved quality of life certainly justifies this project.

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): 3.IT – 1.13 Diabetes Care: Foot Exam
Unique RHP Outcome ID # 133260309.3.2 – PASS 1
Performing Provider: Medina Healthcare System (Medina Regional Hospital)
TPI: 212140201

Outcome Measure Description:

IT-1.13 Diabetes Care

- a) Numerator: Percentage of patients 18-75 years of age with diabetes (type 1 or type 2) who received a foot exam (visual inspection, sensory exam with monofilament, or pulse exam) during the measurement year.
- b) Denominator: Patients 18-75 years of age as of December 31 of the measurement year who had a diagnosis of diabetes (type 1 or type 2).

Process Milestones:

- DY2:
  - P-1 Project Planning-engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.
- DY3:
  - P-2 Establish Baseline Rates

Outcome Improvement Targets for each year:

- DY4:
  - IT-1.13: Increase the percent (TBD) of qualified patients who receive a foot exam.
- DY5:
  - IT-1.13: Increase the percent (TBD) of qualified patients who receive a foot exam.

Rationale:

Process milestones – P-1 through P-2 were chosen because stakeholders must be identified and engaged to affect the outcomes needed.

To effect change in both provider adherence to protocols and patient compliance, this project must be planned and organized with all stakeholders on board. These stakeholders include physicians, mid-level providers, staff, management, administration, and Medina County residents.

A baseline number of diabetic patients receiving a foot exam must be determined to assess what is currently being accomplished. Improvements will be made from the baseline percent.

Improvement targets:
The measure was selected due to the high incidence of diabetes in both Medina County and RHP 6. Medina County has a 30% adult obesity rate, low access to healthy foods, an elderly population, a 27% uninsured population, a lower per capita income and a high percentage of Hispanics. The above factors ALL lead to an increased prevalence of diabetes. In the RHP itself, diabetes is one of the leading causes of death. Disease management and screening are paramount to improving health outcomes in this population.
Addressing quality care and improvement of screening exams in the diabetic population will also lead to an improvement in potentially preventable admissions. (Between 2005 and 2010 HHSC found that RHP 6 had over 125,000 potentially preventable hospitalizations.)

The ability to access primary care clinics and providers, i.e. ease of availability, is key in reaching patients in Medina County. Improved access to providers will lead to increased visits and therefore increased screenings. Diabetes is both prevalent and costly, with many patients going undiagnosed. Complications lead to increased emergency room utilization and increased costs overall. Many of those complications such as amputations, can be prevented with early screening and detection. Diabetes screening can improve the health outcomes of a substantial amount of residents in Medina County.

Our goal is increased foot exams in DSRIP year 4 (DY4) and in DY5 over the baseline established. After establishing the baseline rates, outcome improvement targets will be determined.

To deliver these outcomes, process milestones were carefully selected. These milestones define the activities that will be undertaken to prepare MRH to report outcomes in DY4 and DY5. The two process milestones selected are:

P-1: Project Planning – Engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.

P-2: Establish Baseline Rates

**Outcome Measure Valuation:**

Diabetes is a terribly expensive disease. A recent study from the CDC predicts a dramatic increase in diabetes between now and 2050. The Institute for Alternative Futures estimates that the number of Texans with diabetes will increase by 66% by 2025. The resulting medical and societal cost will be over $51 billion – a 78% increase from 2010. Diabetes can lead to heart failure, blindness, heart attack, kidney failure and amputations. **TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD**: $184,014
## Identifying Outcome Measure and Provider Information:

**Title of Outcome Measure (Improvement Target):** 3.IT – 1.14 Diabetes Care: Microalbumin/Nephropathy  
**Unique RHP Outcome ID #:** 133260309.3.3 – PASS 1  
**Performing Provider:** Medina Healthcare System (Medina Regional Hospital)  
**TPI:** 212140201

## Outcome Measure Description:

**IT-1.14-Diabetes Care: Microalbumin/Nephropathy**

- **a)** Numerator: Percentage of patients 18-75 years of age with diabetes (type 1 or type 2) who had a nephropathy screening test or evidence of nephropathy.
- **b)** Denominator: Patients 18-75 years of age as of December 31 of the measurement year who had a diagnosis of diabetes (type 1 or type 2).

This measure includes diabetic patients who had a nephropathy screening test or evidence of nephropathy. The denominator is the number of patients 18-75 years old who have evidence of nephropathy or a nephropathy screening. The baseline will be established and outcome numbers for DY4 and DY5 will be determined.

### Process Milestones:

- **DY2:**
  - P-1 Project Planning: engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.
- **DY3:**
  - P-2 Establish Baseline Rates

### Outcome Improvement Targets for each year:

- **DY4:**
  - Increase the percent (TBD) of qualified patients who had a nephropathy screening test or evidence of nephropathy.
- **DY5:**
  - Increase the percent (TBD) of qualified patients who had a nephropathy screening test or evidence of nephropathy.

### Rationale:

Process milestones – P-1 through P-2 were chosen because stakeholders must be identified and engaged to affect the outcomes needed. The amount of resources that will be needed must also be identified. A baseline number of patients who currently qualify and are receiving a nephropathy screening test must be determined to compare improvements made in DY4 and DY5.

To effect change in both provider adherence to protocols and patient compliance, this project must be planned and organized with all stakeholders on board. These stakeholders include physicians, mid-level providers, staff, management, administration, and Medina County residents. Baseline rates must be established to allow for the measurement of progress in the number nephropathy screening tests.
Improvement targets:
The measure was selected due to the high incidence of diabetes in both Medina County and RHP 6. Medina County has a 30% adult obesity rate, low access to healthy foods, an elderly population, a 27% uninsured population, a lower per capita income and a high percentage of Hispanics. The above factors ALL lead to an increased prevalence of diabetes. In the RHP itself, diabetes is one of the leading causes of death. Disease management and screening are paramount to improving health outcomes in this population.

Addressing quality care and improvement of screening exams in the diabetic population will also lead to an improvement in potentially preventable admissions. (Between 2005 and 2010 HHSC found that RHP 6 had over 125,000 potentially preventable hospitalizations.)

The ability to access primary care clinics and providers, i.e. ease of availability, is key in reaching patients in Medina County. Improved access to providers will lead to increased visits and therefore increased screenings. Diabetes is both prevalent and costly, with many patients going undiagnosed. Complications lead to increased emergency room utilization and increased costs overall. Many of those complications such as kidney failure, can be prevented with early screening and detection.

Diabetes screening can improve the health outcomes of a substantial amount of residents in Medina County. Our goal is increased nephropathy screening tests in DSRIP year 4 (DY4) and in DY5 over the baseline established. After establishing the baseline rates, outcome improvement targets will be determined.

**Outcome Measure Valuation:**
Diabetes is a terribly expensive disease. A recent study from the CDC predicts a dramatic increase in diabetes between now and 2050. The Institute for Alternative Futures estimates that the number of Texans with diabetes will increase by 66% by 2025. The resulting medical and societal cost will be over $51 billion – a 78% increase from 2010. Diabetes can lead to heart failure, blindness, heart attack, kidney failure and amputations. From the Texas Diabetes Council, Medicaid reimbursement for diabetes related services (2006) reached $443 million. In 2010, 373,000 Texans were visually impaired due to diabetes; 5,570 had renal failure, and 7,840 lower extremity amputations. From the “Institute of Alternative Futures”, the total cost of diabetes care in Texas was $28.8 billion in 2010. Treating and preventive screening could drastically reduce this number (cost-avoidance) both in Texas, RHP 6, and in Medina County. The rural health clinics reported over 47,000 visits in FY 2012, and if 13% of the patients had diabetes as a diagnosis, early screening could prevent numerous complications, hospitalization, and emergency department utilization. From the American Diabetes Association, “people with diabetes incur $6,649 annually attributable to diabetes”. $1 in $5 of healthcare dollars in the United States is spent caring for someone with diabetes. If 50% of diabetic patients received high quality medical care in a primary care setting and complied with physician orders, the number of lower extremity amputations could be reduced by over 2,220/year and 31,000 fewer people could develop end-stage renal disease. With an estimated 13% of patients in Medina County living with diabetes, the cost savings (avoidance) and improved quality of life certainly justifies this project.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $184,012**
Identifying Outcome Measure and Provider Information:

Title of Outcome measure (Improvement Target): IT-12.1 Breast Cancer Screening
Unique RHP Outcome ID #133260309.3.4 – PASS 2
Performing Provider: Medina Healthcare System (Medina Regional Hospital)
TPI: 212140201

Outcome Measure Description:

IT-12.1 Breast Cancer Screening

- **Numerator:** Number of women aged 40-69 that have received an annual mammogram during the reporting period.
- **Denominator:** Number of women aged 40-69 in the patient or target population (women who have had a bilateral mastectomy are excluded).

Process Milestones:

- **DY2:**
  - P-1 Project Planning-Engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.

- **DY3:**
  - P-2 Establish Baseline Rates

Outcome Improvement Targets for each year:

IT-12.1

- **DY4:**
  - Increase the number of women aged 40-69 that receive an annual mammogram during the reporting period. The goal is (TBD) % increase in DY4 over baseline.

- **DY5:**
  - Increase the number of women aged 40-69 that receive an annual mammogram. The goal is (TBD) % improvement over baseline.

Rationale:

Process milestones – P-1 through P-2 were chosen because stakeholders must be identified and engaged for the successful outcomes of this project. Needed resources, including people and technology, must be determined to manage the process. Plans certainly must be discussed, agreed upon, and implemented. To measure improvement, baseline data must first be determined. Medina Regional Hospital will work with the medical staff, mid-levels and clinic personnel to increase the number of patients who receive mammograms.

Improvement targets:

This is a relevant outcome measure for Category 1, Project: Enhancing Performance Improvement and Reporting Capacity. By educating and equipping staff with a variety of improvement tools, the healthcare team can identify ways to increase the number of females completing mammograms. The objective of the screening is to reduce the incidence of and death from cancer by early detection.
Outcome Measure Valuation:

Medina Regional Hospital values each project based on community needs, the projected health outcomes, relationship to RHP, and resources needed to affect the outcomes.

According to the “Agency for Healthcare Research and Quality’s 2011 report”, Texas scored WEAK on preventive measures and average on cancer measures. Cancer is one of the leading causes of death in RHP6. Of the 16,000 deaths in 2008, 60% were due to potentially preventable causes. Screenings and preventive measures to reducing mortality and morbidity are critical.

Breast cancer is the second leading cause of death from cancer in American women. According to the National Cancer Institute, screening mammography can help reduce the number of deaths from breast cancer among women ages 40 to 70; getting a high quality screening mammogram on a regular basis is one of the most effective ways to detect breast cancer early.

According to a recent cancer study, early detection and advances in technology (for women in Wisconsin), resulted in death rates plunging by 20% for breast cancer.

The estimated per lifetime/per patient cost of breast cancer range from $23,000-$31,000 (The cost of treating breast cancer in the US; a synthesis of published evidence-Pharmacoeconomics, 2009). As in all preventive measures, early detection is key in treatments and is cost savings. Multiple studies have confirmed that costs increased with increased stage of the disease.

This outcome measure is justified by a decreased mortality in the community affecting a larger percent of the female population, a possible decrease in hospitalizations and a decrease in costs with early detection (cost-avoidance).

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $49,168**
Identifying Outcome Measure and Provider Information:

| Title of Outcome measure (Improvement Target): | IT-12.2 Cervical Cancer Screening |
| Unique RHP Outcome ID # | 133260309.3.5 – PASS 2 |
| Performing Provider: | Medina Healthcare System (Medina Regional Hospital) |
| TPI: | 212140201 |

Outcome Measure Description:

| Outcome Measure Description: |
| IT-12.2 Cervical Cancer Screening |
| - Numerator: Number of women aged 21-64 that have received a PAP in the measurement year or two prior years. |
| - Denominator: Women aged 21-64 in the patient or target population (women who have had a complete hysterectomy with no residual cervix are excluded). |

Process Milestones:

- DY2:
  - P-1 Project Planning-Engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.
- DY3:
  - P-2 Establish Baseline Rates

Outcome Improvement Targets for each year:

| IT-12.2 |
| - DY4:
  - Increase the number of women aged 21 to 64 that have received a PAP in the measurement year or two years prior. The goal is (TBD) % increase in DY4 over baseline. |
| - DY5:
  - Increase the number of women aged 21 to 64 that have received a PAP in the measurement year or two years prior. The goal is (TBD) % increase over baseline. |

Rationale:

Process milestones – P-1 through P-2 were chosen because stakeholders must be identified and engaged for the successful outcomes of this project. Needed resources, including people and technology, must be determined to manage the process. Plans certainly must be discussed, agreed upon, and implemented. To measure improvement, baseline data must first be determined. Medina Regional Hospital will work with the medical staff, mid-levels and clinic personnel to increase the number of PAPs.

Improvement targets:

This improvement target was selected for a number of reasons. This is a relevant outcome measure for Category 1, Project 1.10, Enhance Performance Improvement Capacity and Reporting. By educating and equipping both staff and physicians with a variety of process
improvement tools, the healthcare team can identify and improve the number of PAP exams. Reporting can be more precise with closer and more rigorous follow-through.

This outcome target is important, as cancer is one of the leading causes of death in RHP6. Cancer screening tests are effective when they can detect disease early. The incidence of PAPs will be increased by (TBD) % in DY4 and (TBD) % over baseline in DY5.

**Outcome Measure Valuation:**

Medina Regional Hospital values each project based on community needs, relation to RHP6, and resources needed to affect the outcome.

This project serves women at Medina Regional Hospital who are 21-64 years of age. Detecting disease early can lead to more effective treatment. Of all the gynecologic cancers, only cervical cancer has a screening exam – the PAP test. This test also helps prevent cervical cancer by finding pre-cancers. Dysplasia, a pre-cancerous condition, detected by PAP test, is 100% treatable.

Worldwide, cervical cancer is the third most common type of cancer in women. Early cervical cancer can be cured. Pap smears effectively spot changes, but they must be done regularly (A.D.A.A. Medical Encyclopedia). According to the National Cancer Institute, the estimated new cases of cervical cancer (2012) is 12,170; 4,220 deaths. As reported in “Women’s Health Issues” (2010), total Medicaid costs at 6 months after diagnosis were $3,807, $23,187, $35,853, and $45,028 for in situ, local, regional, and distant cancers respectively.

It was concluded that given the great differences in cost of early vs. late-stage cancers, interventions aimed at increasing screening among low-income women are likely to be cost effective (cost-avoidance).

TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $49,170
### Identifying Outcome Measure and Provider Information:

| Title of Outcome measure (Improvement Target): | IT-12.4 Pneumonia vaccination status for older adults. |
| Unique RHP Outcome ID #133260309.3.6 – PASS 2 | Performing Provider: Medina Healthcare System (Medina Regional Hospital) |
| TPI: 212140201 | |

### Outcome Measure Description:

**IT-12.4 Pneumonia vaccination status for older adults**

- Numerator: Number of adults aged 65 and older that have ever received a pneumonia vaccine.
- Denominator: Number of adults aged 64 and older in the patient or target population.

### Process Milestones:

- **DY2:**
  - P-1 Project Planning-Engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.
- **DY3:**
  - P-2 Establish Baseline Rates

### Outcome Improvement Targets for each year:

**IT-12.4**

- **DY4:**
  - Increase the number of adults aged 65 and older that have ever received a pneumonia vaccine. Increase by (TBD) % over DY3 baseline.

- **DY5:**
  - Increase the number of adults aged 65 and older that have ever received a pneumonia vaccine. Increase by (TBD) % over baseline.

### Rationale:

Process milestones – P-1 through P-2 were chosen because stakeholders must be identified and engaged for the successful outcomes of this project. Needed resources, including people and technology, must be determined to manage the process. Plans certainly must be discussed, agreed upon, and implemented. To measure improvement, baseline data must first be determined. Medina Regional Hospital will work with the medical staff, mid-levels and clinic personnel to increase the number of pneumonia vaccinations.

**Improvement targets:**

This improvement target was selected for numerous reasons: lack of access to primary care in RHP6, 12% of the residents are over age 65, and a low per capita income, adding barriers to preventive care. Under the category of “Type of Care” (according to the Agency for Healthcare Research and Quality’s 2011 report), Texas scored WEAK on preventive measures. Between 2005-2110, The Texas HHS commission found that RHP 6 had 125,090 potentially preventable hospitalizations. If individuals had access to preventive care, many of these could be avoided. Thus, these improvement targets were selected to increase the amount of older adults receiving the...
pneumonia vaccine. Our goal in DY4 and DY5 is to improve access to care, and increase these vaccines, utilizing a formal process improvement model developed (1.10).

This is a relevant outcome measure for Category 1, Project: Enhance Performance Improvement. By educating and equipping staff with a variety of process improvement tools, the healthcare team can identify ways to increase the number of vaccines given.

**Outcome Measure Valuation:**

Older adults are especially vulnerable to certain diseases such as influenza and pneumonia. In 2008, the CDC reported that adults aged 65 and older comprised 90% of the deaths that occur every year from complications related to these. Vaccinations help older adults protect themselves from getting pneumonia and other illnesses. According to the National Institute of Health, October 15, 2012, pneumococcal pneumonia can be contagious and is responsible for as many as 302,000 hospitalizations in the U.S. every year. In 2009, pneumonia ranked 8th among the 15 leading causes of death in the U.S.

As reported in “Respiratory Reviews” (Vol. 5, #5), pneumococcal vaccination of high risk groups, especially elderly, leads to a substantial reduction in mortality. This report states that the vaccination was associated with a 43% reduction in hospitalizations for pneumonia, a 29% reduction in mortality, and a cost savings of $113-$512/person vaccinated.

This outcome measure is justified by decreased mortality in the community affecting a large percentage of the population; a decrease in hospitalizations (cost avoidance); and a decrease in the spread of pneumonia. This is obviously a community need for Medina County as well as RHP6.

</tr>
<tr>
<td>Performing Provider Name:</td>
<td>Methodist Hospital</td>
</tr>
<tr>
<td>TPI:</td>
<td>094154402</td>
</tr>
</tbody>
</table>

### Outcome Measure Description:

**Title of Outcome Measure**: IT-6.1 Percent improvement over baseline of patient satisfaction scores

**Process Milestones**:

- **DY2**:
  - P-1 – Appoint an executive accountable for experience performance or create a percentage of time in existing executive position for experience performance
  - P-4 - Integrate patient experience into employee training

- **DY3**:
  - P-7 – Assess the organizational baseline for measuring patient/family and/or employee experience and utilizing results in quality improvement

**Outcome Improvement Targets for each year**:

- **DY4**:
  - IT-6.1 Percent improvement over baseline of patient satisfaction scores on their rating of doctor access to specialist of 2% over baseline.

- **DY5**:
  - IT-6.1 Percent improvement over baseline of patient satisfaction scores on their rating of doctor access to specialist of 4% over baseline.

Methodist Healthcare System will measure if the patient’s access to care was improved over baseline visits. The baseline will be determined in DY3. Subsequent years will attempt to improve access to care by end of waiver.
### Rationale:

Process Milestones P-1 through P-3 were chosen due to the lack of accurate reports and resources currently available to measure and monitor Telemedicine. In order to report accurate data and establish baselines, P-1 and P-3 must be approached in DY2-DY3. In DY3 we will establish baseline to determine if access to care has improved using Telemedicine. The improvement measure will be determined by patient access before Telemedicine was implemented.

Currently, patients receive a specialist consult via telephone with the attending physician in another facility. We feel that we can significantly increase the quality of care by having a specialist see and communicate with the patient in order to best assess their ability for local care or the need to start therapy and transport to a regional facility.

This measures the increased volume of visits and is a method to assess the ability for the Performing Provider to increase capacity to provide care.

### Outcome Measure Valuation:

Methodist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

In valuing the project, Methodist took into account the extent to which a telemedicine program would potentially meet the goals of the Wavier (improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and costs necessary to implement the project.

**Identifying Outcome Measure and Provider Information:**

| Title of Outcome Measure (Improvement Target): IT-6.1 Patient Satisfaction |
| Unique RHP outcome ID: 094154402.3.2 – PASS 1 |
| Performing Provider Name: Methodist Hospital |
| TPI: 094154402 |

**Outcome Measure Description:**

To improve how the patient experiences the care and the patient's satisfaction with the care provided by ultimately exceeding the patient’s expectations for customer service by utilizing the HCAPS ED Loyalty Composite score. Emergency room baseline will be determined in DY 3 with 4% improvement by DY5.

**Rationale:**

Positive outcomes in healthcare are dependent not only upon the clinical success of treatment, but also upon the patient's perception of the overall experience, which improves compliance and understanding. This experience is comprised, in part, of communication with the caregivers regarding different aspects of the process, as well as the level of service with respect to clean/quiet environment for healing and a responsive staff aimed at meeting needs in a timely manner. In order to better partner with our patients to round out this overall experience, focus upon patient satisfaction metrics and methods to achieve improvement thereof is necessary. We utilize the Gallup survey tools, as well as other internal, more real-time solutions in order to obtain feedback regarding all aspects of the patient experience.

This process milestone was chosen to improve how the patient experiences the care and the patient’s satisfaction with the care provided. The overall approach to redesigning the patient experience will be to improve patient experience scores over baseline. The intent of the HCAHPS initiative is to provide a standardized survey instrument and data collection methodology for measuring patients' perspectives on hospital care. The surveys are designed to produce comparable data on the patient's perspective on care that allows objective and meaningful comparisons between institutions on domains that are important to consumers. Public reporting of the survey results is designed to create incentives for institutions to improve their quality of care. Public reporting will serve to enhance public accountability in health care by increasing the transparency of the quality of institutional care provided in return for the public investment.

**Outcome Measure Valuation:**

We will measure our emergency room patients that receive service at this freestanding emergency room, according to the inclusion criteria that a national polling organization uses for emergency room services. This survey will include a sampling of patients that receive services at this center. The community benefits by us gaining more real-time feedback (available immediately after patient contact made) in order to improve processes and procedures for the good of the care experience. The project seeks to provide increased emergency room visits in an area of community need by 2,053 visits in DY 3, 4,721 visits in DY 4, and 5,132 visits in DY5.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $2,407,360**
Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores
Unique RHP outcome identification number: 094154402.3.3 – PASS 1
Performing Provider: Methodist Hospital
TPI: 094154402

Outcome Measure Description:
To improve how the patient experiences the care and the patient's satisfaction with the care provided by ultimately improving the Customer Engagement (CE1) score of “Overall Satisfaction” with Inpatient Services score by 4%, as measured by patient survey. This will be accomplished by improving 1-2% each year within the project timeframe. We will measure our inpatient adult and pediatric patients discharged from Methodist Hospital, according to the inclusion criteria the patient survey vendor uses nation-wide. This includes approximately 1,600 patient interviews per quarter across all service lines and all six campuses. The community benefits by us gaining more real-time feedback (available immediately after patient contact made) in order to improve processes and procedures for the good of the care experience.

MHS Customer Engagement survey differs from the HCAHPS survey tool utilized by CMS in a variety of different manners: One, it is a much broader measurement tool. The CE1 includes measurements of patient experiences Inpatient, Outpatient Surgery, Emergency and Test and Treatment areas of the healthcare environment. Two, it asks a much larger variety of questions regarding the experience, which ultimately culminate in the “overall satisfaction” question. And three, the composite values are weighted according to the overall impact each area of the patient volume has on the overall facility flow.

Rationale:
Patient experience is directly correlated with quality of care and thus, the overall health of a community. For example, positive outcomes in healthcare are dependent not only upon the clinical success of treatment, but also upon a patient's perception of the overall experience, which improves compliance and understanding. This experience is comprised, in part, of communication with the caregivers regarding different aspects of the process, as well as the level of service with respect to clean/quiet environment for healing and a responsive staff aimed at meeting needs in a timely manner. In order to better partner with our patients to round out this overall experience, focus upon patient satisfaction metrics and methods to achieve improvement thereof is necessary. We utilize the patient survey tools, as well as other internal, more real-time solutions in order to obtain feedback regarding all aspects of the patient experience.

Methodist chose a process milestone to develop and test data systems and establish a baseline because these two processes are logistically essential to the completion of the project. Additionally, Methodist chose the target percentage for the selected ITs at 2% and 4%, because while customer engagement is very important, it is often difficult to predict. Therefore, Methodist feels that even a small increase in customer engagement is beneficial and worthwhile to pursue.

Public reporting will serve to enhance public accountability in health care by increasing the transparency of the quality of institutional care provided in return for the public investment.

### Identifying Outcome Measure and Provider Information:

| Title of Outcome Measure (Improvement Target): | IT-4.8  Sepsis mortality |
| Unique RHP ID: | 094154402.3.4 – PASS 1 |
| Performing Provider Name: | Methodist Hospital |
| TPI: | 094154402 |

### Outcome Measure Description:

Outcome measure will be Number of patients expiring during current month with sepsis / Number of patients identified that month with sepsis. Goal is to improve mortality rates to at or below expected rates (observed/expected mortality ratio to 1.0 or lower) by the end of the waiver. The process milestones to achieve this will be development of an Early Sepsis Recognition form to be used in the ED and in-hospital for patients suspected of sepsis. This will be completed by nursing staff in the ED as well as floor nurses as part of the Rapid Response Team. We will also develop evidence-based order sets for Rapid Sepsis Resuscitation for initial therapy and Sepsis Maintenance Protocol order sets for on-going hospital care. Compliance with these data forms and order sets will help in early recognition, early aggressive resuscitation and appropriate on-going care with evidenced-based protocols. This has been proven to reduce sepsis mortality.

### Rationale:

Implement an innovative and evidence based intervention that will lead to reductions in Sepsis Complications (mortality, prevalence and incidence) for providers that have demonstrated need or unsatisfactory performance in this area.

Rationale for selecting this sepsis project is the high mortality rate in this population and the known evidenced-based care bundles for decreasing mortality in this population. In CY 2010, MH served 2046 patients with a primary diagnosis of sepsis in DRG 870 and 871. In DRG 870 (Severe Sepsis with Mechanical Ventilation > 96 hours), there were 209 patients with a mortality rate of 32.2% and an expected rate of 30.47%. In DRG 871 (Severe Sepsis without Mechanical Ventilation) there were 1837 patients with a mortality rate of 16.05% and an expected rate of 18.37%. The observed/expected mortality rate for DRG 870 is 1.06 (6% above expected) and for DRG 871 observed/expected mortality is 0.87 (13% below expected).

The goal for the 5 year project is a mortality rate at or below expected for a select group of sepsis patients identified at baseline DY3.

The improvement requires significant planning, development of metrics, tools and education of all stakeholders. This is expected to be a 5 year process. This addresses Category 2.8.11, Applying Process Improvement methodology to Improve Quality/Efficiency. This project is timely for our Hospital and has been identified as a key element in our Clinical Efficiency (CE) hospital plan. Outcome improvement targets will be determined in DY2 for implementation in DY3.

### Outcome Measure Valuation:

In valuing this project, Methodist took into account the extent to which the Improvement in Sepsis would potentially meet the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.

The Improvement in Sepsis Mortality will save lives of citizens in the community. This directly
addresses the goals by implementing proven evidenced-based clinical methodology to improve care in this devastating illness. Methodist took these factors into account when determine the incentive value of this project.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $2,407,360**
Identifying Outcome Measure and Provider Information:

| Title of Outcome Measure (Improvement Target): IT-12.1 Primary Care and Primary Prevention: Breast Cancer Screening |
| Unique RHP ID#: 112676501.3.1 – PASS 1 |
| Performing Provider: Nix Health Care System |
| Performing Provider TPI: 297342201 (old TPI 112676501) |

Outcome Measure Description:

**Outcome Measure**

IT-12.1 Breast Cancer Screening: Number of women aged 40 to 69 that have received an annual mammogram during the reporting period (non-standalone measure)

- **Numerator:** Number of women aged 40 to 69 that have received an annual mammogram during the reporting period.
- **Denominator:** Number of women aged 40 to 69 in the target population. Women who have had a bilateral mastectomy are excluded.

**Process Milestones**

- **DY2**
  - P-1: Project planning – engage stakeholders, identify current capacity and needed resources, determine timeliness and document implementation plans.
- **DY3**
  - P-2: Establish baseline rates

**Outcome Improvement Targets for Each Year**

- **DY4**
  - IT-12.1: Improve Breast Cancer Screening Rate for Category 2.1 project patient population (% improvement TBD)
- **DY5**
  - IT-12.1: Improve Breast Cancer Screening Rate for Category 2.1 project patient population (% improvement TBD)

**Rationale:**

Screening for cancer implies testing for early stages of disease before symptoms occur. It involves application of an early detection test to a large number of apparently healthy people to identify those having unrecognized cancer. People with positive screening tests are subsequently investigated with diagnostic tests and those with confirmed disease are offered appropriate treatment and follow-up. The objective of screening is to reduce incidence of and/or death from cancer by detecting early preclinical disease when treatment may be easier and more effective than for advanced cancer diagnosed after symptoms occur.

According to the American College of Radiology, Even for women over 50, skipping a mammogram every other year would miss up to 30% of cancers. Through the Medical Home Model, by taking a more active role in the health and disease prevention of their patients, physicians and support staff should proactively remind patients of the importance of preventive screenings is a key role in improving outcomes. This outcome measure is key to monitoring the success of those reminders.
P-1 was chosen since engaging stakeholders and identifying necessary resources is critical to the success of this outcome in subsequent years. P-2 was chosen since no baseline data currently exists. Baselines will be established in DY3 and improvement targets will be set for DY4-DY5.

**Improvement Targets**

Improvement targets will be established in DY3, along with the baseline rate, for implementation in DY4-DY5

**Outcome Measure Valuation:**

In order to value the effect of annual screening mammograms, we utilized a cost-avoidance approach. Treatment costs for breast cancer are considerably lower when a tumor is discovered at its early stages, which proves the economic value of screening mammograms. A recent California study showed that stage at diagnosis had an important impact on lifetime cancer-attributable costs, with costs increasing substantially for women diagnosed at later stages. Lifetime Medicare cancer-attributable costs increased from $21,320 for women diagnosed with in situ cancer, to $26,747 for localized cancer, $40,096 for regional cancer, and $52,288 for distant cancer\(^1\).

For every 1,000 screening mammograms, 5 patients will be diagnosed with breast cancer, according to the American College of Radiology\(^2\). So for every 1,000 screening mammograms that are done, the cost savings of catching the cancer early would be \(5 \times ($52,288 - $21,320)\). Assuming a patient panel of around 1,900 for DY2 and 50% female, we can estimate that roughly 5 cancers may be caught through annual screening mammograms at a cost savings of $154,840 for DY2.

In addition, the valuation criteria used for the corresponding Category 2 project are also applicable to this metric.

### Identifying Outcome Measure and Provider Information:

| Title of Outcome Measure (Improvement Target): IT-12.3: Colorectal Cancer Screening |
| Unique RHP ID#: 112676501.3.2 – PASS 1 |
| Performing Provider: Nix Health Care System |
| Performing Provider TPI: 297342201 (old TPI 112676501) |

### Outcome Measure Description:

**Outcome Measure**
- IT-12.2 Colorectal Cancer Screening (HEDIS 2012) Non-standalone measure
  - **Numerator**: Number of adults aged 50 to 75 that have received one of the following screenings. Fecal occult blood test yearly, flexible sigmoidoscopy every five years, Colonoscopy every 10 years.
  - **Denominator**: Number of adults aged 50 to 75 in the patient or target population. Adults with colorectal cancer or total colectomy are excluded

**Process Milestones**
- **DY2**
  - P-1: Project planning – engage stakeholders, identify current capacity and needed resources, determine timeliness and document implementation plans.
- **DY3**
  - P-2: Establish baseline rates

**Outcome Improvement Targets for Each Year**
- **DY4**
  - IT-12.3: Improve Colorectal Cancer Screening Rate for Category 2.1 project patient population (% improvement TBD)
- **DY5**
  - IT-12.3: Improve Colorectal Cancer Screening Rate for Category 2.1 project patient population (% improvement TBD)

### Rationale:

Screening for cancer implies testing for early stages of disease before symptoms occur. It involves application of an early detection test to a large number of apparently healthy people to identify those having unrecognized cancer. People with positive screening tests are subsequently investigated with diagnostic tests and those with confirmed disease are offered appropriate treatment and follow-up. The objective of screening is to reduce incidence of and/or death from cancer by detecting early preclinical disease when treatment may be easier and more effective than for advanced cancer diagnosed after symptoms occur. Cancer is one of the leading causes of death in Region 6 and routine preventive screenings can help improve the outcomes for patients that are diagnosed with colon cancer by catching the cancer early.

**Process Milestones**

P-1 was chosen since engaging stakeholders and identifying necessary resources is critical to the success of this outcome in subsequent years. P-2 was chosen since no baseline data currently exists. Baselines will be established in DY3 and improvement targets will be set for DY4-DY5.
Improvement targets will be established in DY3, along with the baseline rate, for implementation in DY4-DY5

**Outcome Measure Valuation:**

In order to value the effect of routine screenings, we utilized a cost-avoidance approach. Treatment costs for colon cancer are considerably lower when a cancer is discovered at its early stages, which proves the economic value of screening exams. A recent study by the American Society of Clinical Oncology showed that stage at diagnosis had an important impact on lifetime cancer-attributable costs, with costs increasing substantially for those diagnosed at later stages. Lifetime cancer-attributable costs increased from $20,731 for those diagnosed with Stage I Colon cancer, to $24,038 for Stage II, $30,260 for Stage III, and $35,663 for Stage IV\(^1\).

The age-adjusted incidence rate is 0.05% of men and women per year\(^2\). So if the Medical Home has a panel of 1900 patients in DY2, it could be expected that 10 people may be diagnosed per year. Through preventive screenings, catching the colon or rectal cancer earlier would result in better outcomes and less costly treatments. So for every 1,000 colorectal screenings done, the cost savings of catching the cancer early would be 5*($35,663 minus $20,731). Assuming a patient panel of around 1,900 for DY2, we can estimate that roughly 5 cancers may be caught through annual screening at a cost savings of $74,660 for DY2 and increasing thereafter.

In addition, the valuation criteria used for the corresponding Category 2 project are also applicable to this metric.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $670,725**
Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-12.4: Pneumonia Vaccination Status for Older Adults
Unique RHP ID#: 112676501.3.3 – PASS 1
Performing Provider: Nix Health Care System
Performing Provider TPI: 297342201 (old TPI 112676501)

Outcome Measure Description:

Outcome Measure
IT-12.4 Pneumonia vaccination status for older adults (HEDIS 2012) (Non-standalone measure)
  • Numerator: Number of adults aged 65 and older that have ever received a pneumonia vaccine.
  • Denominator: Number of adults age 64 and older in the patient or target population.
Outcome improvement targets to be established in DY2 and DY3

Process Milestones
  • DY2
    • P-1: Project planning – engage stakeholders, identify current capacity and needed resources, determine timeliness and document implementation plans.
  • DY3
    • P-2: Establish baseline rates

Outcome Improvement Targets for Each Year
  • DY4
    • for Category 2.1 project patient population (% improvement TBD)
  • DY5
    • IT-12.4: Improve Pneumonia Vaccination Status Rate for Category 2.1 project patient population (% improvement TBD)

Rationale:
The pneumonia vaccine prevents against 88% of the pneumococcal bacteria that cause pneumonia. People age 65 and older are at a high risk for bacterial pneumonia – two to three times more likely than the general population. Patients with chronic diseases, such as heart and lung disease or diabetes, are also at an increased risk. Of the patients over 65 that have pneumococcal pneumonia and develop bacteremia as a complication, and at least 20 % die from it, despite antibiotic treatment. Through vaccination, the risks can be lowered and outcomes improved.

Process Milestones
P-1 was chosen since engaging stakeholders and identifying necessary resources is critical to the success of this outcome in subsequent years. P-2 was chosen since no baseline data currently exists. Baselines will be established in DY3 and improvement targets will be set for DY4-DY5.

Improvement Targets
Improvement targets will be established in DY3, along with the baseline rate, for implementation in DY4-DY5
Outcome Measure Valuation:

In order to value the effect of pneumonia vaccinations, we utilized a cost-avoidance approach. The American Lung Association reported that the estimation of bacterial pneumonia occurrence in patients age 65 and older is 95 per 10,000 patients\(^1\). Based on the current Medicare rates, hospitalization for treatment of simple pneumonia without complications is $5,336 but treatment for cases with major complications is $11,334. If the patient develops bacteremia or septicemia, the cost of hospitalization can up over $14,000.

So in DY2 with approximately 1900 patients enrolled in the Medical Home, all of whom will be in the target age for a pneumonia vaccine, I could be estimated that 18 of them would suffer from bacterial pneumonia during the year. With vaccination, that number could easily be cut by 75%. With an assumed average cost per hospitalization of $11,000, and a reduction of 13.5 admissions, the value can be calculated conservatively at $148,500.

In addition, the valuation criteria used for the corresponding Category 2 project are also applicable to this metric.

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-3.1 Reduce All-Cause Readmission Rate
Unique RHP ID#: 112676501.3.4 – PASS 1
Performing Provider: Nix Health Care System
Performing Provider TPI: 297342201 (old TPI 112676501)

Outcome Measure Description:

Outcome Measure
IT-3.1 All cause 30 day readmission rate – NQF 1789 (standalone measure)
• Numerator: Unplanned all-cause 30-day readmissions to acute care facilities for patients aged 65 year or older
• Denominator: All Admissions to acute care facilities for patients aged 65 years or older

Process Milestones
• DY2
  • P-1: Project planning – engage stakeholders, identify current capacity and needed resources, determine timeliness and document implementation plans.
  • P-2: Establish baseline rates

Outcome Improvement Targets for Each Year
• DY3
  • IT-3.1 Reduce All-Cause Readmission Rate for applicable Category 2.8 project patient population (% reduction TBD)
• DY4
  • IT-3.1 Reduce All-Cause Readmission Rate for applicable Category 2.8 project patient population (% reduction TBD)
• DY5
  • IT-3.1 Reduce All-Cause Readmission Rate for applicable Category 2.8 project patient population (% reduction TBD)

Rationale:
This measure estimates the hospital-level, risk-standardized rate of unplanned, all-cause readmission after admission for any eligible condition within 30 days of hospital discharge for patients aged 65 and older. Through our ACE Program, we will be implementing several process improvement initiatives aimed at improving the quality of care received by our elderly patients. Many of the steps that we will take during their hospitalization will also affect their readmission rate and we estimate that we will be able to greatly influence the all-cause readmission rate of the ACE Program patients. Outcome improvement targets will be determined in DY2 for implementation in DY3.

Process Milestones
P-1 was chosen since engaging stakeholders and identifying necessary resources is critical to the success of this outcome in subsequent years. P-2 was chosen since no baseline data currently exists. Baselines will be established in DY2 and improvement targets will be set for DY3-DY5.

Improvement Targets
Improvement targets will be established in DY2, along with the baseline rate, for implementation in DY3-DY5.
Outcome Measure Valuation:

As stated by the NQF, "Multiple factors affect readmission rates and other measures including: the complexity of the medical condition and associated therapies; effectiveness of inpatient treatment and care transitions; patient understanding of and adherence to treatment plans; patient health literacy and language barriers; and the availability and quality of post-acute and community-based services, particularly for patients with low income. Readmission measurement should reinforce national efforts to focus all stakeholders’ attention and collaboration on this important issue." Our process improvement initiatives through the ACE program will address each of these issues and one of the primary measurable outcomes will be a reduction in preventable readmissions. Research has shown that an avoidable hospital readmission can mean prolonged illness, emotional distress, and loss of productivity for the patient. The factors mentioned above can be especially impactful on those of low income. According to the NQF, the national Medicare beneficiary all-cause readmission rate is around 20%, which costs about $15 billion annually.

In order to value the reduction in preventable readmissions, we utilized a cost-avoidance approach. In a recent ‘Solicitation for Applications’ by CMS for Community-based Care Transitions Programs, CMS recommended using $9,600 as the average cost of a hospital readmission\(^1\). While we will be establishing our baseline and targets in DY2, we expect that our ACE Program initiatives will reduce the readmission rate for the patients enrolled in the ACE program (assuming 533 in DY2 and increasing to 733 by DY5). Assuming the national average of 20%, a reduction to 15% would equate to 27 avoided readmissions in DY2 at a value of $259,200.

In addition, the valuation criteria used for the corresponding Category 2 project are also applicable to this metric.

### Identifying Outcome Measure and Provider Information:

| Title of Outcome Measure (Improvement Target): IT-9.2: ED appropriate utilization (Standalone measure) for Diabetes |
| Unique RHP ID#: 112676501.3.5 – PASS 2 |
| Performing Provider: Nix Health Care System |
| Performing Provider TPI: 297342201 (old TPI 112676501) |

### Outcome Measure Description:

**Outcome Measure**

IT-9.2 ED appropriate utilization (Standalone measure) for the following targeted conditions:

- Diabetes

  - Numerator: Number of Patient Navigator enrollees with a diagnosis of one of the Diabetes that have one or more ED visit for diabetes during the measurement period
  - Denominator: All active Patient Navigator enrollees with a diagnosis of diabetes

**Process Milestones**

- **DY2**
  - P-1: Project planning – engage stakeholders, identify current capacity and needed resources, determine timeliness and document implementation plans.

- **DY3**
  - P-2: Establish baseline rates

**Outcome Improvement Targets for Each Year**

- **DY4**
  - IT-9.2 Reduce percentage of ED utilization for diabetes for applicable Category 2.8 project patient population (% reduction TBD)

- **DY5**
  - IT-9.2 Reduce percentage of ED utilization for diabetes for applicable Category 2.8 project patient population (% reduction TBD)

### Rationale:

This measure estimates the impact that the Patient Navigator Program is having on helping patients receive the right care in the right setting. The Patient Navigators will help facilitate connections between patients and primary care physicians, as well as work with patients to identify outpatient and community resources available to them to help them manage their conditions on a proactive basis. These actions should lessen the occurrence of these patients presenting to the ED for treatment of their underlying conditions. Outcome improvement targets will be determined in DY3 for implementation in DY4.

**Process Milestones**

P-1 was chosen since engaging stakeholders and identifying necessary resources is critical to the success of this outcome in subsequent years. P-2 was chosen since no baseline data currently exists. Baselines will be established in DY3 and improvement targets will be set for DY4 and DY5.

**Improvement Targets**

Improvement targets will be established in DY3, along with the baseline rate, for implementation in DY4 and DY5.
Outcome Measure Valuation:

In 2005, Texas Health and Human Services Commission identified that 47.2% of the Medicaid emergency room visits were classified as non-emergent episodes. Often, patients seek care in an Emergency Department rather than in a Primary Care Physician’s office due to extended hours of operation, not being required to pay copays or deductibles before being treated or because they have not established a relationship with a PCP. HHSC determined that the state could have saved over $26M if patients had sought treatment for their non-emergent conditions through PCP offices instead. While the focus of this review was on conditions such as common cold, sore throat, vomiting, headache, etc., it still speaks to the point that developing a relationship with a PCP to treat non-urgent conditions can provide cost-savings opportunities across all patients.

Through the Patient Navigator Program, patients that are at high risk for disconnect from the system will be identified and enrolled in the program where they will be encouraged to utilize a primary care physician for their ‘medical home’ (even if the PCP is not formally a medical home accredited practice). These patients, who will likely have multiple medical conditions, will be connected with resources to assist them in managing any chronic or underlying conditions.

In order to value the program, we utilized a cost-avoidance approach and assumed each ED visit avoided would save of $1,318. Also, through more proactive management of their diseases, the patients’ general health will be improved. In addition, the valuation criteria used for the corresponding Category 2 project are also applicable to this metric.

### Identifying Outcome Measure and Provider Information:

**Title of Outcome Measure (Improvement Target):** IT-9.2 Reduce Emergency Department visits for target condition Diabetes  
**Unique RHP ID#:** 127294003.3.1 – PASS 1  
**Performing Provider:** Peterson Regional Medical Center  
**Performing Provider TPI:** 127294003

### Outcome Measure Description:

IT-9.2 Reduce Emergency Department visits for target condition Diabetes. OD-9 Right Care, Right Setting and IT 9.2 was chosen as the projects outcome domain based on 19% of overall diabetic population visits were in the Emergency Department setting.

Improved transition of care for the diabetic population can help reduce emergency department (ED) visits. High ED utilization is a considerable concern for the increasing cost of health care. Frequent and inappropriate use of hospital EDs is extremely costly and care could be provided in less expensive settings. Patients resort to ED use for a variety of reasons: lack of regular or preventative care and inability to book timely follow-up appointments. Appropriate care transitions and patient education will provide diabetic patients with the tools and understanding to seek care with their primary care physician, clinic or specialist for non-emergency conditions. Patients who better understand their diabetes and the importance of continuity of their care will recognize the benefit of consistent, quality care.

### Process Milestones:

- **DY2:**  
  - P-1 – Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
- **DY3:**  
  - P-4 - Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities

### Outcome Improvement Targets for Each Year:

- **DY4:**  
  - IT-9.2: Reduce total ED visits as a percentage of all diabetic visits by 5%
- **DY5**  
  - IT-9.2: Reduce total ED visits as a percentage of all diabetic visits by 5%

### Rationale:

Process milestones:
- P-1 Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans; and P-3 Develop and test data systems, were chosen because they coincide with the needs of process milestones that were set for Category 2. Therefore, in order to be successful and achieve desired outcomes it was decided that P-1 and P-4 would be the most appropriate to execute.

Outcome Improvement Targets:  
IT-9.2 Reduce Emergency Department visits for target condition Diabetes (standalone measure) will be executed in DY4 and DY5. 19% of overall diabetic population visits were in the Emergency Department setting. Proper implementation of Category 2 process improvements
within the diabetic population group will improve transition of care resulting in an expected decrease in emergency department visits for our diabetic population (regardless of primary reason for visit) by 5% in DY4 and an additional 5% in DY5.

**Outcome Measure Valuation:**

The implementation cost of this project, to include Categories 2 – 4, for DY1-DY2 is estimated to be $434,292 total. Each year thereafter has an estimated cost of $267,272 to continue project operations. In calendar year 2012 PRMC’s baseline diabetic population group had a total of 3,719 patients with 1,863 emergency department visits for a total of $3.73 million in charges. Once project outcomes have been reached, we estimate an average annual community healthcare savings of $373 thousand by reducing the ED total number of visits by 10% within our defined target group. This community savings comes from the amount of healthcare dollars that will be saved once the targeted population starts becoming more in control of their disease process and their self-management. Emergency Room resources will not be utilized as often and we anticipate seeing an increase in the use of outpatient services such as primary care visits and diabetic education resources provided within PRMC or the community. This project will address many of the discovered community health care needs by strategically implementing components of an evidence-based care transition model. With this process in place, we anticipate seeing an increase in diabetic patient self-managed care with improved care transitions reducing emergent and acute care needs.

This model will be used to assist in closing the gap in health care services of Kerr County residents causing them to utilize more costly inpatient services versus less costly outpatient services. The shortage of primary care in Kerr County has contributed to an increase us of inpatient services. Patients with chronic diseases who are not established with primary care provider are more likely to show up in the emergency department in crisis, which often results in an inpatient admission. The components of Project Red will prepare patients to better understand their disease process and address individual needs enabling them to better care for themselves. After a patient has been admitted to the hospital they are usually motivated to learn more about their illness; it is crucial that healthcare providers take advantage of this opportunity to educate and coordinate care during and beyond the hospital setting. This will allow patients to feel more involved and increasing potential compliance with their own healthcare needs. By utilizing a more patient-centered discharge model patients will experience more buy in to improve and maintain their own health at home.

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-9.2 Reduce Emergency Department visits for target condition Diabetes
Unique RHP ID#: 127294003.3.4 – PASS 2
Provider Name: Peterson Regional Medical Center (PRMC)
TPI: 127294003

Outcome Measure Description:

IT-9.2 Reduce Emergency Department visits for target condition-Diabetes. OD-9 Right Care, Right Setting and IT 9.2 was chosen as the projects outcome domain based on 19% of overall diabetic population visits were in the Emergency Department setting. OD-9 Right Care, Right Setting and IT 9.2 was chosen as the projects outcome domain based on 19% of overall diabetic population visits were Emergency Department setting. One goal of collecting meaningful data is to identify the frequency and cost of care of emergency department visits in PRMC’s diabetic population group. Once proper reports are generated we can identify trends which contributed to diabetic patients not seeking the right care in the right setting.

- **Numerator:** ED visits within diabetic population group
- **Denominator:** Total visits within the diabetic population group
- **Data Source:** EMR
- **Rationale/Evidence:** If an organization is able to care for the patients in the appropriate setting, preventing unnecessary Emergency Department visits, admissions and/or readmissions, then cost of care will be cheaper in the lower intensity of service area.

Process Milestones:

**DY2:**
- P-1 – Project Planning – engage stakeholders, identify current capacity and needed resources

**DY3:**
- P-4- Conduct PDSA cycles to improve data collection and intervention activities

Outcome Improvement Targets for Each Year:

**DY4:**
- IT-9.2 Reduce total ED visits as a percentage of all diabetic visits by 5%

**DY5**
- IT-9.2 Reduce total ED visits as a percentage of all diabetic visits by 5%

Rationale:

Process milestones:

P-1 Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans; and P-4 Conduct PDSA cycles to improve data collection and intervention activities, were chosen because they coincide with the needs of our process milestones that were set for Category 1.

Outcome Improvement Targets:

IT-9.2 Reduce Emergency Department visits for target condition-Diabetes (*standalone measure*) will be executed in DY4 and DY5. 19% of overall diabetic population visits were in the Emergency Department setting. Proper implementation of Pass I relies on successful Pass II implementation. Meaningful data collection is required to assure the process improvements within
the diabetic population group implemented in Pass I are working to improve transition of care resulting in an expected decrease in Emergency Department visits by 5% in DY4 and an additional 5% in DY5.

Outcome Measure Valuation:

In calendar year 2012 PRMC’s baseline diabetic population group had a total of 3,719 patients with 1,863 emergency department visits for a total of $3.73 million in charges. Once project outcomes have been reached from PASS I process improvements, we estimate an average annual community healthcare savings of $373 thousand by reducing the ED total number of visits by 10% within our defined target group. Meaningful data collection is required to assure the process improvements within the diabetic population group implemented in Pass I are working to improve transition of care resulting in an expected decrease in Emergency Department visits by 5% in DY4 and an additional 5% in DY5.

### Identifying Outcome Measure and Provider Information:

| Title of Outcome Measure (Improvement Target): | IT- 8.2 Percentage of Low Birth-Weight Births |
| Unique RHP Outcome Identification Number: | 136491104.3.1 – PASS 1 |
| Performing Provider: | Southwest General Hospital |
| TPI: | 136491104 |

### Outcome Measure Description:

**IT- 8.2 Percentage of Low-Birth Weight Births**

Low birth weights will be defined as babies born weighing <2,500 grams at birth.

**Process Milestones:**

- **DY2:**
  - P-1 - Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines, and document implementation plans
  - P-3 – Develop and test data systems

- **DY3:**
  - P-2 - Establish baseline rates
  - P-3 – Develop and test data systems

**Outcome Improvement Target for each year:**

- **DY4:**
  - IT-8.2 Percentage of Low-Birth Weight Births
    - Decrease the percentage of babies born weighing >2,500 grams at birth by mothers with Gestational Diabetes by 2% below baseline

- **DY5:**
  - IT-8.2 Percentage of Low Birth-Weight Births
    - Decrease the percentage of babies born weighing <2,500 grams at birth by 3% below baseline

### Rationale:

Process Milestones: P1 – P3 were chosen due to the lack of available systems to track and monitor percentages of low birth weights within the Iasis Healthcare Corporation. Identifying, testing, and analyzing available data sources are critical in DY2-DY-3. With the implementation of a sound database system, DY3 can then establish baseline low birth weight in the study population.

Improvement processes were chosen based on the timeframe allowed to put in place proper resources and processes needed to collect data. In addition the outcome measure being addressed is affected by multiple factors. Prenatal visit are critical to ongoing education and maintenance of this patient population. Through early identification and intervention screening, non diabetic mothers can be educated on the importance of prenatal care and working to achieve adequate health and maturation of the fetus.

It is anticipated that the incidence of low birth weight babies will decrease in the study population. DY 3 would serve as baseline for patients screened by the Gestational Diabetes
Team. DY 4 and DY 5 would demonstrate a low incidence of low birth weight babies as a result of the screening program and proper referral for diabetes care and/or appropriate prenatal care. The goal for the rate of decrease for low birth weight deliveries is conservatively set at 2% in the first year from baseline (DY4) and show gradual improvement in DY% to 3%.

**Outcome Measure Valuation:**

- **Addresses Community Needs:**

  As previously outlined the community and the RHP as a whole are critically challenged provide timely prenatal care and reduce the incidence of gestational diabetes. Of the 36,000 live births in RHP 6 in 2008, only 59% of mothers received prenatal care within the first trimester, leading to the assumption, access to medical care remains difficult regardless of clinic resources. The potential for gestational diabetes going unidentified is extremely high in the region. The screening, identification, education and provision of prenatal care are critical to impact the above outcome measures.

  **Project Scope:**

  Southwest General Hospital has a known reputation on the Southside of San Antonio related to obstetrical care. In late 2011, the organization launched a maternal fetal medicine program which has enhanced the ability to reach outlying regions and establish a program to identify and manage gestational diabetes in a manner which demonstrates practices based on evidence and supported by clinical outcomes. The expansion of the program to outlying communities will further enhance care but also extend high quality preventive care and education for the region. The program framework is developed and requires the expansion and planning to serve and identify a larger patient base and establish outreach programs to impact care for the patient population.

- **Project Investment:**

  Many of the resources required to support the physician component of the proposed project is in place. The major investment centers on midlevel care provider recruitment and salaries. Additionally, support staff, space, additional equipment needs, travel, marketing, and educational materials will require hospital dollars to support program implementation and sustainability.

RHP 6 Community Needs Assessment, September 2012.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $467,852**
Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT 9.2 – ED appropriate utilization: Reduce ED visits for target conditions: Cardiovascular Disease/Hypertension
Unique RHP Outcome Identification Number: 136491104.3.2 – PASS 1
Performing Provider: Southwest General Hospital
TPI: 136491104

Outcome Measure Description:

IT 9.2 – ED appropriate utilization: Reduce ED visits for target conditions: Cardiovascular Disease/Hypertension

Process Milestones:
- **DY2:**
  - P-1 - Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines, and document implementation plans
  - P-3 – Develop and test data systems
- **DY3:**
  - P-2 - Establish baseline rates
  - P-3 – Develop and test data systems

Outcome Improvement Target for each year:
- **DY4:**
  - Decrease the percentage of patients utilizing the Southwest General Hospital Emergency Department for Cardiovascular Disease/Hypertension by 3.5% from DY 3 baseline
- **DY5:**
  - Decrease the percentage of patients utilizing the Southwest General Hospital Emergency Department for Cardiovascular Disease/Hypertension by 7% from DY 4 baseline

Rationale:

Process Milestones: P1 – P3 were chosen due to the lack of available systems to track and monitor percentages of ED utilization for specific disease entities within the Iasis Healthcare Corporation. Identifying, testing, and analyzing available data sources are critical in DY2-DY-3. With the implementation of a sound database system, DY3 can then establish baseline ED utilization for identified diagnoses related to Cardiovascular Disease/Hypertension.

Improvement processes were chosen based on the timeframe allowed to put in place proper resources and processes needed to collect data. In addition, the outcome measure being addressed is affected by multiple factors. Through early identification and intervention of screened residents for cardiovascular disease, intervention, further testing, and treatment can be implemented to impact disease progression and symptom management. A community impact on ED utilization from communities of the RHP 6 region participating in screening clinics will be evaluated for utilization.

It is predicted that the utilization of the ED will decrease in the study population. DY 3 would serve...
Outcome Measure Valuation:

Achieve Waiver Goals:

Waiver goals include increasing the capacity to provide specialty care services and the availability of targeted specialty providers to better accommodate the high demand for specialty care services so that patients have increased access to specialty services.

In support of the goal, Southwest General Hospital will develop a mobile specialty care unit dedicated to vascular screening. Through this service the surrounding rural communities will have the opportunity to access a vital health resource to identify potentially serious cardiovascular events in a timely and cost effective manner. The program will provide a mobile vascular screening service which will provide non-invasive screenings. Tests will be performed by vascular technologists. Results and follow-up plan, as necessary, provided at the time of screening.

Addresses Community Needs:

As previously stated, early identification and management of potential life threatening cardiovascular conditions (Stroke; Carotid Artery Disease; Peripheral Vascular Insufficiency, as well as access for services and treatment otherwise not available is critical to meeting the healthcare needs of RHP 6. The shortage of health care providers has led to high emergency room utilization. This is a very costly means of health care delivery, and often results in a delay seeking treatment until the illness is severe and advanced. In addition, access to primary care has become increasingly difficult within the region, resulting in poor overall management of the population’s health. Through the development of a mobile specialty care unit by Southwest General Hospital, dedicated to vascular screening, the surrounding rural communities will have the opportunity to access a vital health resource to identify potentially serious cardiovascular events in a timely and cost effective manner.

Project Scope:

Southwest General Hospital has provided care to the residents of South San Antonio since 1978. In late 2012, the organization achieved Chest Pain Accreditation and currently is preparing for PCI Accreditation with the Center. The expansion of the program to outlying communities will further enhance care but also extend high quality preventive care and education for the region. The program framework for cardiovascular services is developed and supports acute care needs for the area. Program development requires the expansion and planning to serve and identify a larger patient base and establish outreach programs to impact care for the patient population. Through the development of a mobile specialty care unit by Southwest General Hospital, dedicated to vascular screening, the surrounding rural communities will have the opportunity to access a vital health resource to identify potentially serious cardiovascular events in a timely and cost effective manner.
Project Investment:

Many of the resources required to support the physician component of the proposed project is in place. The need to recruit and hire midlevel care providers is a key investment in manpower to support the endeavor. The purchase of additional noninvasive diagnostic equipment and a van to support the program will be a $190,000 investment by Southwest General Hospital to launch the program for its current patient population and the RHP 6 proposed project.

Outcome Measure Description:

IT- 11.1 Improvement in Clinical Indicator in identified disparity group

Process Milestones:

- **DY2:**
  - P-1 – Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

- **DY3:**
  - P-2 – Establish baseline rates for rate 1 and rate 2

Outcome Improvement Targets for each year:

- **DY4:**
  - IT-11.1: Improvement in clinical indicator in identified disparity group. Improvement Target: 3% improvement in LTBI treatment completion by TB patients in urban DSHS Region 8 and rural DSHS Region 4/5N relevant minority populations over baseline

- **DY5:**
  - IT-11.1: Improvement in clinical indicator in identified disparity group. Improvement Target: 5% improvement in LTBI treatment completion by TB patients in urban DSHS Region 8 and rural DSHS Region 4/5N relevant minority populations over baseline

Rationale:

Category 3 process outcomes selected for DY2 and DY3 are directly related to initial components of the initiative to achieve comprehensive, evidence based TB care of TB for urban and rural minority communities in Texas. This initiative will undertake a series of steps which incorporate core project components to achieve this collaboration between Department of State Health Services (DSHS), The University of Texas Health Science Center at Tyler (UTHSCT), Texas Center for Infectious Disease (TCID) and the Heartland National TB Center (HNTC) as follows:

1) Provide predictable and reliable expert physician support for DSHS personnel at all levels of TB care.
2) Increase overall access to TB care by minority populations
3) Increase targeted testing for LTBI in high risk minority communities
4) Provide routine testing for LTBI with interferon gamma release assays instead of tuberculin skin testing to minimize false positive tests in BCG vaccinated patients and avoid unnecessary LTBI therapy
5) Provide routine treatment of LTBI through a 12 dose, 12 week regimen administered by DOT to...
improve patient adherence with and completion of LTBI therapy
6) Provide expert consultation and direct patient oversight of all active TB cases
7) Facilitate continuity of TB care through all phases including LTBI therapy, outpatient TB therapy and, when necessary, inpatient therapy
8) Facilitate hospitalization for TB care of those few patients who cannot be successfully treated as outpatients
9) Provide a model for statewide TB management through complete integration of TB resources between DSHS (TCID) and UTHSCT, including HNTC.

Category 3 process outcomes include project planning (P-1), establishing baseline rates (P-2), and conducting a PDSA cycle to improve data collection and intervention activities (P-4) as a quality improvement effort. In DY4 and DY5, the standalone measure selected was IT-11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider. The disparity group is minority (Black and Hispanic) urban and rural populations at risk for TB in DSHS HSR #8 and #4/5N. The clinical indicators to be improved include 1) percentage of TB patients receiving therapy of active TB by DOT and 2) improved LTBI treatment completion rates.

**Outcome Measure Valuation:**

This represents an innovative and ambitious project to enhance and expand the control of TB in minority communities in 2 DSHS Health Service Regions (HSRs) in Texas that encompass both urban and rural minority populations. This proposal incorporates the existing public health infrastructure of DSHS and the extensive TB expertise of UT physicians at UTHSCT, TCID and HNTC in a collaboration that promotes expert, cost-effective, evidence-based TB control with seamless continuity of care at every level. The expertise of UT physicians with evidence-based CDC and DHHS treatment guidelines insures avoidance of unnecessary and costly diagnostic and treatment strategies while the application of new diagnostic (IGRA testing) and treatment strategies (12 week LTBI therapy) further reduce costs by focusing resources on interventions of proven public health value at a lower financial cost. The value of this project is justifiable on the basis of:

1) Enhanced access to a comprehensive fully integrated TB care process that utilizes the existing DSHS public health infrastructure and physician expertise from UT.
2) Implementation of universal LTBI testing with IGRA thereby limiting the expense and potential drug toxicity of false + TSTs in BCG vaccinated populations.
3) Implementing universal 12 week, 12 dose LTBI therapy to improve LTBI treatment completion rates over baseline, 3% in DY 4 and 5% in DY 5, and decrease future TB burden.
4) Insure universal application of evidence based treatment guidelines from CDC and DHHS for LTBI and TB disease and improve active TB disease therapy completion rates over baseline, 3% in DY 4 and 5% in DY 5.
5) The DY 4 and DY 5 targets for the proposed strategies were determined by considering recent trends in LTBI and TB disease epidemiology in Texas and the funding available for the state TB program, both of which have been relatively unchanged with a realistic assessment of the potential for any intervention to significantly improve in the context of these static trends.

</tr>
<tr>
<td>Performing Provider: University Hospital</td>
</tr>
<tr>
<td>TPI: 136141205</td>
</tr>
</tbody>
</table>

## Outcome Measure Description:

The proposed program will address the Category 3 outcome measure associated with timeliness of prenatal/postnatal care within the first trimester (or within 42 days) of enrollment in the organization and a postpartum visit for a pelvic exam or postpartum care on or between 21 and 56 days post delivery. This measure is a CHIPRA Core Measure/NQF #1517).

IT-8.1 Timeliness of Prenatal/Postnatal Care262 (CHIPRA Core Measure/NQF #1517) *(Non-stand alone measure)*

a. Numerator: Deliveries of live births for which women receive the following facets of prenatal and postpartum care:
   - Rate 1: Received a prenatal care visit as a member of the organization in the first trimester or within 42 days of enrollment in the organization.
   - Rate 2: Had a postpartum visit for a pelvic exam or postpartum care on or between 21 and 56 days after delivery.

b. Denominator: Deliveries of live births between November 6 of the year prior to the measurement year and November 5 of the measurement year

c. Data source: EHR, claims

d. Rationale/Evidence: The percentage of deliveries of live births between November 6 of the year prior to the measurement year and November 5 of the measurement year. For these women, the measure assesses the following facets of prenatal and postpartum care.
   - **Rate 1:** Timeliness of Prenatal Care. The percentage of deliveries that received a prenatal care visit as a member of the organization in the first trimester or within 42 days of enrollment in the organization.
   - **Rate 2:** Postpartum Care. The percentage of deliveries that had a postpartum visit on or between 21 and 56 days after delivery.

## Process Milestones:

- **P-1** Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

- **P-2** Establish baseline rates

## Outcome Improvement Targets for each year

In DY4: Increase the timeliness of prenatal/postnatal care for women who had live births between November 6 of the year prior to the measurement year and November 5 of the measurement year by TBD% from baseline
In DY5: Increase the timeliness of prenatal/postnatal care for women who had live births between November 6 of the year prior to the measurement year and November 5 of the measurement year by TBD% from baseline

**Rationale:**
Early initiation of Prenatal Care (PNC) during pregnancy has been shown to significantly reduce the potentially deleterious effects of both normal and high-risk pregnancy outcomes including: 1) premature birth, 2) low birth weight, 3) maternal hypertension and 4) gestational diabetes (Alexander and Korenbrot, 1995; Tossounian, Schoendorf and Kiely, 1997; Alexander and Kotelchuck, 2001; Atrash et al., 2006). In addition, the delivery of postnatal care primarily through preventive screening conducted at specific developmental milestones can help reduce maternal death or disability as a result of undiagnosed conditions (Healthy People 2020). Determining a process for gathering the data and developing baseline will be conducted in DY2 and DY3. After the baseline is established, goals will be set for outcomes measured in DY 4 and DY5. We expect to increase timeliness of prenatal/postnatal care by 5% in DY 4 and DY5 from the previous year for Northwest clinic patients.

**Outcome Measure Valuation:**
Increasing access to prenatal and postnatal care is central to improving preventive health services that respond to the needs of an underserved, largely Hispanic population. Many women in our target population struggle with poverty, receive only acute or emergency healthcare services, and do not have an established relationship with a provider. Increased access to primary care allows women much needed prenatal care and education aimed at improving maternal and child health in Bexar County, Texas.

### Identifying Outcome Measure and Provider Information:

| Title of Outcome Measure (Improvement Target): | IT-8.5 Frequency of ongoing prenatal care |
| Unique RHP ID: | 136141205.3.2 – PASS 1 |
| Performing Provider: | University Hospital |
| TPI: | 136141205 |

### Outcome Measure Description:

The proposed program will address the Category 3 outcome measure associated with frequency of ongoing prenatal care. Medicaid-enrolled women who had live births during the past year will be tracked to determine the percentage of recommended prenatal visits they had. Complications can arise at any time during pregnancy. For that reason, continued monitoring throughout pregnancy is necessary. Frequency and adequacy of ongoing prenatal visits are important factors in minimizing pregnancy problems. This measure is AHRQA266/CHIPRA267.

**IT-8.5 Frequency of ongoing prenatal care (AHRQ266/CHIRPA267) (Non-stand alone measure)**

- **a. Numerator:** Women in the denominator sample who had an unduplicated count of less than 21%, 21-40%, 41-60%, 61-80%, or more than 81% of expected visits, adjusted for the month of pregnancy at enrollment and gestational age.
- **b. Denominator:** Women who delivered a live birth during the measurement yr.
- **c. Data source:** EHR, Claims
- **d. Rationale/Evidence:** This measure looks at the use of prenatal care services. It tracks Medicaid-enrolled women who had live births during the past year to determine the percentage of recommended prenatal visits they had. Complications can arise at any time during pregnancy. For that reason, continued monitoring throughout pregnancy is necessary. Frequency and adequacy of ongoing prenatal visits are important factors in minimizing pregnancy problems. The American College of Obstetricians and Gynecologists recommends that prenatal care begin as early as possible in the first trimester of pregnancy. Visits should follow a schedule.
  - Every 4 weeks for the first 28 weeks of pregnancy
  - Every 2 to 3 weeks for the next 7 weeks
  - Weekly thereafter until delivery

### Process Milestones:

- **P-1 Project planning** - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
- **P-2 Establish baseline rates**

#### Outcome Improvement Targets for each year

In DY4: Increase the frequency of ongoing prenatal care for women who had live births during the measurement year by TBD% from baseline

In DY5: Increase the frequency of ongoing prenatal care for women who had live births during the measurement year by TBD% from baseline
**Rationale:**

It is estimated that every year nearly one million American women deliver babies without receiving adequate medical care. Studies find that babies born to mothers who received no prenatal care are three times more likely to be born at low birth weight, and five times more likely to die, than those whose mothers received prenatal care (Health Resources and Services Administration, 2012). Early initiation of prenatal care (PNC) during pregnancy has been shown to significantly reduce the potentially deleterious effects of both normal and high-risk pregnancy outcomes including: 1) premature birth, 2) low birth weight, 3) maternal hypertension and 4) gestational diabetes (Alexander and Korenbrot, 1995; Tossounian, Schoendorf and Kiely, 1997; Alexander and Kotelchuck, 2001; Atrash et al., 2006).

In addition, the risk of maternal and infant mortality and pregnancy-related complications can be reduced by increasing access to quality preconception (before pregnancy) and interconception (between pregnancies) care (Healthy People 2020). Evidence further suggests that facilitation of healthy decision-making by individuals can be enhanced through timely access to interventions that encourage group support, adherence to preventive care, and positive interactive dialogue. Within the areas of maternal health and clinical preventive services, the 2011 National Prevention Strategy recommends health service interventions that support a healthy pregnancy through timely and ongoing access/early entry into clinical preventive care alongside systems of support that address the individual’s social and emotional well-being (Department of Health and Human Services, 2011). Combined, these practices can encourage and empower individuals to make healthy decision-making that can lead to improved health outcomes for both the mother and child.

Determining a process for gathering the data and developing baseline will be conducted in DY2 and DY3. After the baseline is established, goals will be set for outcomes measured in DY 4 and DY5. We expect to decrease the rate of women who receive late or no prenatal care by TBD% in DY 4 and DY5.

**Outcome Measure Valuation:**

Increasing the proportion of women who receive ongoing prenatal care is central to responding to the needs of an underserved, largely Hispanic population. Many women in our target population struggle with poverty, receive only acute or emergency healthcare services only, and do not have an established relationship with a provider. Increased access to primary care allows women much needed prenatal care and education aimed at improving maternal and child health in Bexar County, Texas.

**Outcome Measure Description:**

**IT-8.2 Percentage of Low Birth Weight Births**

Numerator: the number of babies born weighing <2,500 grams at birth  
Denominator: All births  
Data source: HER, claims

**Process Milestones:**

- **P-1** Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

- **P-2** Establish baseline rates

**Outcome Improvement Targets for each year**

- In DY4: Decrease percentage of low birth weight births by TBD% from baseline

- In DY5: Decrease percentage of low birth weight births by TBD% from baseline

**Rationale:**

It is estimated that every year nearly one million American women deliver babies without receiving adequate medical care. Studies find that babies born to mothers who received no prenatal care are three times more likely to be born at low birth weight, and five times more likely to die, than those whose mothers received prenatal care (Health Resources and Services Administration, 2012). Early initiation of Prenatal Care (PNC) during pregnancy has been shown to significantly reduce the potentially deleterious effects of both normal and high-risk pregnancy outcomes including: 1) premature birth, 2) low birth weight, 3) maternal hypertension and 4) gestational diabetes (Alexander and Korenbrot, 1995; Tossounian, Schoendorf and Kiely, 1997; Alexander and Kotelchuck, 2001; Atrash et al., 2006). In addition, the delivery of postnatal care primarily through preventive screening conducted at specific developmental milestones can help reduce maternal death or disability as a result of undiagnosed conditions (Healthy People 2020).

Evidence further suggests that facilitation of healthy decision-making by individuals can be enhanced through timely access to interventions that encourage group support, adherence to preventive care, and positive interactive dialogue. Within the areas of maternal health and clinical preventive services, the 2011 National Prevention Strategy recommends health service interventions that support a healthy pregnancy through timely and ongoing access/early entry into clinical preventive care alongside systems of support that address the individual’s social and...
emotional well-being (Department of Health and Human Services, 2011). Combined, these practices can encourage and empower individuals to make healthy decision-making that can lead to improved health outcomes for both the mother and child.

Determining a process for gathering the data and developing baseline will be conducted in DY2 and DY3. After the baseline is established, goals will be set for outcomes measured in DY 4 and DY 5. We expect to decrease the rate of women who receive late or no prenatal care by TBD% in DY 4 and DY 5.

**Outcome Measure Valuation:**

Decreasing low birth weight is central to responding to the needs of an underserved, largely Hispanic population. Many women in our target population struggle with poverty, receive only acute or emergency healthcare services only, and do not have an established relationship with a provider. Increased access to primary care allows women much needed prenatal care and education aimed at improving maternal and child health in Bexar County, Texas.

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-9.2 ED Appropriate Utilization (standalone measure)
Unique RHP ID#: 136141205.3.4 – PASS 1
Performing Provider: University Hospital
TPI: 136141205

Outcome Measure Description:

IT-9.2 ED appropriate utilization *(Standalone measure)*
- Reduce all ED visits (including ACSC)
- Reduce pediatric Emergency Department visits (CHIPRA Core Measure)
- Reduce Emergency Department visits for target conditions:
  - Chronic Obstructive Pulmonary Disease
  - Behavioral Health
  - Diabetes
  - Asthma

Determining a process for gathering the data and developing baseline will be conducted in DY2 and DY3. After baseline established, goals will be set for outcomes measure in DY 4 and DY5.

Process Milestones:
DY2:
  P-1 – Project Planning – engage stakeholders, identify current capacity and needed resources, determine timeliness and document implementation plans.

DY3:
P-2- Establish baseline rates for reduction in ED visits for targeted conditions

Outcome Improvement Targets for each year:
DY4:
  Reduce ED visits for targeted conditions by a TBD percentage from baseline Y3.

DY5:
  Reduce ED visits for targeted conditions by a TBD percentage from baseline Y3.

Rationale:
High emergency room (ER) utilization is a considerable concern for the increasing cost of health care. Frequent and inappropriate use of hospital ERs is extremely costly and care could be provided in a less expensive setting. Patients, when possible, should be treated by their primary care provider for non-emergency conditions in order to promote consistent, quality care. The targeted population will be the CareLink members assigned to University Health System patient centered medical homes. CareLink is a financial assistance program for uninsured residents of Bexar County. The program was created in 1997 to help address the needs of Bexar County residents without health care coverage who were not eligible for Medicaid or other public or private funding. While CareLink is not an insurance product per se, it has many similar advantages in terms of promoting access to preventive health services, encouraging a long lasting relationship with a primary care provider, and instilling a sense of shared responsibility between
member and staff for the member’s health. As of December 31, 2011, there were 54,256 members enrolled in CareLink.

Process Milestones P1 and P2 were chosen to allow time for necessary project planning and data collection activities to understand our patients who will benefit the most from expanded primary care into their neighborhoods. It will also allow us to set up the necessary processes to effectively reach out and work with chronic disease patient as we expand our primary care capacity.

The improvement targets of reducing avoidable ED visits for specific medical conditions selected because of the evidence base associated with access to primary care and the reduction of unnecessary ED visits. Having a regular source of primary care increases the probability that patients with chronic medical conditions will have less exacerbations, better control of their disease, and therefore fewer ED visits caused by uncontrolled symptoms. Since this is an expansion of primary care in an existing patient population we know which patients to target for more outreach, and care management to reach our goals.

**Outcome Measure Valuation:**

This outcome will be valued based on the number of emergency visits avoided by patients with COPD, behavioral health diagnoses, diabetes exacerbations, and asthma. The rational is expanded primary care and acute care through University Health System’s ExpressMed clinics will support patients in controlling these chronic conditions and reduce avoidable emergency center visits. It will also support the achievement of Waiver goals: a) improving the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further developing and maintaining a coordinated care delivery system; c) contributing to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and serving as a powerful tool to help providers improve outcomes and reduce ED utilization (containing cost growth).

### Outcome Measure Description:

**IT-9.2 ED appropriate utilization *(Standalone measure)***
- Reduce all ED visits (including ACSC)271
- Reduce pediatric Emergency Department visits (CHIPRA Core Measure)272
- Reduce Emergency Department visits for target conditions
  - Congestive Heart Failure
  - Diabetes
  - End Stage Renal Disease
  - Cardiovascular Disease /Hypertension
  - Behavioral Health/Substance Abuse
  - Chronic Obstructive Pulmonary Disease
  - Asthma

**Process Milestones**
- **DY2**
  - P-1: Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

- **DY3**
  - P-3: Develop and test data systems.

**Improvement Targets**
- **DY4**
  - IT-9.2: Reduce Emergency Department visits by 5% (300 visits/yr) for adult and pediatric asthma/COPD registry patients assigned to three target clinics

- **DY5**
  - IT-9.2: Reduce Emergency Department visits by 15% for adult and pediatric asthma/COPD registry patients assigned to three target clinics

### Rationale:
The rationale for selecting the following process milestones reflect the methodical approach that will be undertaken to engage stakeholder, identify needed resources, develop an implementation and project monitoring plan to ensure an appropriate alignment with improving and reporting of data and systems to produce performance measures that accurately reflect ED appropriate utilization.

**Process Milestones**
Process Milestone 1, Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans, ensures that the appropriate resources and personnel are available to provide data synthesis and reporting.

The Health System is in the early stages of its Population Health Infrastructure Initiative (PHII) and creating the registry for asthma under the Waiver will be a new activity. Process milestone 2, Develop and test data systems, was chosen as a critical step in the registry development process, allowing for rapid cycle improvements where appropriate prior to implementation.

**Improvement Targets**

This outcome improvement measure was chosen for its direct relation to the goals of the Waiver by a) improve the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further develop and maintain a coordinated care delivery system; c) contribute to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and d) serve as a powerful tool to help providers improve outcomes and reduce ED utilization (containing cost growth).

**Outcome Measure Valuation:**

Success of the registry program in the form of reduced ED utilization for asthma/COPD patients will be an indicator for achievement of Waiver goals: a) improving the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further developing and maintaining a coordinated care delivery system; c) contributing to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and serving as a powerful tool to help providers improve outcomes and reduce ED utilization (containing cost growth). When fully implemented – beyond DY5 – which includes registries for other highly prevalent chronic conditions, such as diabetes and CHF, as well as eventually sharing the technology among the region’s Performing Providers, the larger scope of the project should impact proper utilization in the form of increased routine and follow-up patient visits and encounters and reduced ED utilization. This project requires investment as it is an enhancement to current HIE funding goals. The hardware, software applications, human resources, and time to implement are of the highest organizational priority for the Health System. This particular project targets asthma/COPD, but the scope of utilization for other chronic diseases and in other health care settings is potentially huge.
### ED Appropriate Utilization (Standalone Measure)

| Process Milestone 1 [P-1]: Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans | Process Milestone 2 [P-3]: Develop and test data systems.

### Identifying Outcome Measure and Provider Information:

<table>
<thead>
<tr>
<th>Title of Outcome Measure (Improvement Target): IT-2.8 Diabetes Long Term Complications Admission Rate-PQI3 (Standalone measure)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique RHP outcome identification number: 136141205.3.6 – PASS 1</td>
</tr>
<tr>
<td>Performing Provider: University Hospital</td>
</tr>
<tr>
<td>TPI: 136141205</td>
</tr>
</tbody>
</table>

### Outcome Measure Description:

**IT- IT-2.8 Diabetes Long Term Complications Admission Rate-PQI3**

- **Numerator:** discharges age 18 years and older with a principal diagnosis code for long-term complications (renal, eye, neurological, circulatory, or complications not otherwise specified.
- **Denominator:** Population in Metro Area or county, age 18 years and older.
- **Data Source:** EHR, Claims

### Process Milestones:

**DY2:**

Process Milestone 1: Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans, relates directly to the milestones outlined in the Health System’s Category 1 Table for 136141205.1.4 This will be an expansion and enhancement program. The Health System is already a partner in employing telemedicine in the Bexar County Adult Detention Center, reaching a population that is both literally and figurative difficult to reach. The experience gives us confidence that enhancing and expanding this capability to our current clinic patient population and in partnership with the other performing providers in RHP6 will vastly improve management of diabetes. The IS Chief Medical Information officer will be the project lead and, using the Health System’s established Project Charter process, create the plan.

**DY3:**

Process Milestone 2: Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities. Process Milestone 2 affords the opportunity to engage in quality improvements, share lessons learned, and effect rapid cycle improvements as appropriate.

### Outcome Improvement Targets:

Category 3 Outcome: Diabetes Long Term Complications Admission Rate-PQI3 populates both DYs 4 and 5 in anticipation of continuous improvement. The outcome improvement targets are yet to be determined (TBD) for DYs 4 and 5.

### Rationale:

Process Milestone 1: Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans. As noted above, the Health System currently employs telemedicine on a pilot basis for the Bexar County Adult Detention Center inmates. Expanding the technology to patient clinic sites, as well as to regional partners in the future, however, requires a completely new planning process.

Process Milestone 2: Conduct Plan Do Study Act (PDSA) cycles to improve data collection and
intervention activities. As mentioned, Process Milestone 2 affords the opportunity to engage in quality improvements, share lessons learned, and effect rapid cycle improvements as appropriate. This milestone is the natural extension to creation of the project plan as the steps to implementation are completed.

The outcome improvement targets for the selected Category 3 Outcome, “Diabetes Long Term Complications Admission Rate-PQI3,” in both DY 4 and 5, will be determined in DY 2 for implementation in DY 3. This outcome improvement measure was chosen for its direct relation to the goals of the Waiver by a) improve the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further develop and maintain a coordinated care delivery system; c) contribute to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and d) serve as a powerful tool to help providers improve outcomes and reduce hospital admissions (containing cost growth).

**Outcome Measure Valuation:**

Success of the telemedicine program in the form of reduced preventable hospital admissions for adults with diabetes will be an indicator for achievement of Waiver goals: a) improving the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further developing and maintaining a coordinated care delivery system; c) contributing to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and serving as a powerful tool to help providers improve outcomes and reduce ED utilization (containing cost growth). When fully implemented – beyond DY5 – which includes telemedicine initiatives for other highly prevalent chronic conditions, such as CHF, as well as eventually sharing the technology among the region’s Performing Providers, the larger scope of the project should impact proper utilization in the form of increased routine and follow-up patient visits and encounters and reduced preventable hospital admissions.

This project requires investment as it complements HITECH funding goals. The hardware, software applications, human resources, and time to implement are of the highest organizational priority for the Health System. This particular project targets diabetes, but the scope of utilization for other chronic diseases and in other health care settings is potentially huge.

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-1.18 Follow-Up After Hospitalization for Mental Illness- NQF 0576 (Standalone measure).
Unique RHP outcome identification number: 136141205.3.7 – PASS 1
Performing Provider: University Hospital
TPI: 136141205

Outcome Measure Description:

**IT-1.18 Follow-Up After Hospitalization for Mental Illness- NQF 0576236 (Standalone measure)**

a. Numerator:
Rate 1: An outpatient visit, intensive outpatient encounter or partial hospitalization with a mental health practitioner within 30 days after discharge. Include outpatient visits, intensive outpatient encounters or partial hospitalizations that occur on the date of discharge.

Rate 2: An outpatient visit, intensive outpatient encounter or partial hospitalization with a mental health practitioner within 7 days after discharge. Include outpatient visits, intensive outpatient encounters or partial hospitalizations that occur on the date of discharge.

b. Denominator: Members 6 years and older as of the date of discharge who were discharged alive from an acute inpatient setting (including acute care psychiatric facilities) with a principal mental health diagnosis on or between January 1 and December 1 of the measurement year. The denominator for this measure is based on discharges, not members. Include all discharges for members who have more than one discharge on or between January 1 and December 1 of the measurement year.

Mental health readmission or direct transfer: If the discharge is followed by readmission or direct transfer to an acute facility for a mental health principal diagnosis (within the 30-day follow-up period, count only the readmission discharge or the discharge from the facility to which the member was transferred. Although re-hospitalization might not be for a selected mental health disorder, it is probably for a related condition.

c. Data Source: EHR, Claims

d. Rationale/Evidence: This measure assesses the percentage of discharges for members 6 years of age and older who were hospitalized for treatment of selected mental health disorders and who had an outpatient visit, an intensive outpatient encounter or partial hospitalization with a mental health practitioner. Two rates are reported.

Rate 1. The percentage of members who received follow-up within 30 days of discharge
Rate 2. The percentage of members who received follow-up within 7 days of discharge.

Process Milestones

- **DY2- Process Milestone P-2: Establish baseline rates.** Collaborate with Information Technology Services to determine means by which the following are defined:
  Numerator- number of patients 6 years and older discharged from University Hospital inpatient settings with certain principle behavioral health diagnoses within the project population securing follow-up appointments with a mental health practitioner in University Hospital.
Health System outpatient medical homes within the specified time frame (Rate 1: Percentage of members who received follow-up within 30 days of discharge; Rate 2: Percentage of members who received follow-up within 7 days of discharge). 

**Denominator:** all patients 6 years or older who receive primary care in University Health System Medical Homes who are discharged from inpatient settings in University Hospital with certain principle behavioral health diagnoses.

Note - Mental health readmission or direct transfer: If the discharge is followed by readmission or direct transfer to an acute facility for mental health principal diagnosis (within the 30-day follow-up period), count only the readmission discharge or the discharge from the facility to which the member was transferred.

- **DY3- Process Milestone P-3: Develop and test data systems.** Assess all processes and procedures related to securing outpatient appointments with mental health practitioners following discharge from inpatient settings for the project population. Include all stakeholders, (inpatient and outpatient), and include evaluation of barriers faced. Refine the diagnostic codes as necessary to determine behavioral health diagnoses in the discharged population. Develop a written protocol for the defined population to include EMR documentation related to discharge planning and process for securing outpatient follow-up appointments. Vet with all stakeholders.

**Outcome Improvement Milestones for each year:**

- **DY4-** Increase IT-1.18 Follow-Up After Hospitalization for Mental Illness by TBD over baseline year those securing outpatient mental health practitioner appointments within 7 days and 30 days after discharge for the project targeted population.

- **DY5-** Increase IT-1.18 Follow-Up After Hospitalization for Mental Illness by TBD over baseline year those securing outpatient mental health practitioner appointments within 7 days and 30 days after discharge for the project targeted population.

**Rationale:**
The rationale for selecting the process milestones reflect the methodical approach that will be undertaken to engage stakeholder, identify needed resources, develop an implementation and project monitoring plan to ensure an appropriate alignment with improving and reporting on patient satisfaction.

**In DY 2 and DY 3 process milestones will be addressed as follows:**

Outpatient follow-up with specialty behavioral health practitioners after discharged from the hospital allows for maintenance of stability of mental illness, continued assessment of need for support services, encouragement of compliance with treatment, and engagement in a system of care outside the hospital setting. The time period shortly after release form the hospital tends to be a high risk time for decompensation if timely follow-up is not provided. Cost avoidance relates to potentially avoided
readmission and ER visits. Having outpatient psychiatric care within the medical home/neighborhood clinics supports engagement of the patient in treatment for mental health and physical health needs in one setting.

This measure assesses the percentage of discharges for members 6 years of age and older who were hospitalized for treatment of selected mental health disorders and who have an outpatient encounter with a mental health practitioner within 7 days and 30 days of discharge from the hospital.

**Outcome Measure Valuation:**

Outcome measure valuation for *follow-up after hospitalization for mental illness* by directly responding to waiver goals including the triple aim and improving the health delivery infrastructure to better serve the Medicaid and uninsured residents of the community and region. This includes providing care in the right setting at the right time and enhancing the ability to treat mental health disorders earlier in the course of illness, both of which may contribute to avoidance of unnecessary admissions and ER visits that might be due to untreated mental illness.

**Identifying Outcome Measure and Provider Information:**

| Title of Outcome Measure (Improvement Target): IT – 12.5 Other USPSTF-endorsed screening outcome measures (Screening for obesity in children and adolescents) |
| Unique RHP outcome identification number: 136141205.3.8– PASS 1 |
| Performing Provider: University Hospital |
| TPI: 136141205 |

**Outcome Measure Description:**

Outcome Measure Description:

IT – 12.5 Other USPSTF-endorsed screening outcome measures *(Screening for obesity in children and adolescents)*

This measure includes:

**Numerator:** Number of children ages 6 years and older screened and referred to comprehensive behavioral interventions to promote weight status.

**Denominator:** Number of children ages 6 and older from the target population.

**Data Source:** EHR, Claims

The process measurements selected are: P-1 Project Planning and P-2 Establish Baseline Rates.

**Process Milestones:**

**DY2:**

P-1: Project Planning – Engage stakeholders, identify current capacity and needed resources, determine timeliness and document implementation plans.

**DY3:**

P-2: Establish Baseline Rates for screening for obesity in children and adolescents

**Outcome Improvement Targets for each year:**

This outcome improvement measure was chosen for its direct relationship to the goals of the Waiver by a) improve the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further develop and maintain a coordinated care delivery system; c) contribute to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and d) serve as a powerful tool to help providers improve outcomes and reduce ED utilization (containing cost growth).

**DY4:**

IT-12.5: TBD Percent improvement over baseline of number of children and adolescents screened for obesity

**DY5:**

IT-12.5: TBD Percent improvement over baseline of number of children and adolescents screened for obesity

**Rationale:**

Since the 1970s, childhood and adolescent obesity has increased three- to six fold. Approximately
12% to 18% of 2 to 19-year-old children and adolescents are obese (defined as having an age and gender-specific BMI at ≥95th percentile). The US Preventive Services Task Force (USPSTF) recommends that clinicians screen children aged 6 years and older for obesity and offer them or refer them to comprehensive, intensive behavioral interventions to promote improvement in weight status. The USPSTF found that effective comprehensive weight-management programs incorporated counseling and other interventions that targeted diet and physical activity. Interventions also included behavioral management techniques to assist in behavior change. Interventions that focused on younger children incorporated parental involvement as a component.

In Bexar County, Texas it is estimated that 23% of children on WIC are either overweight or obese. As in adults, individuals who are in these clinical categories are more likely to be at risk for Type 2 diabetes, asthma, high blood pressure.

Expanding primary care and prevention and establishing a usual source of care for this population can strengthen healthy behaviors and early adoption to adhere to regular clinical preventive care.

Our goal is by DY 4 and DY 5 to increase access to clinical preventive care over baseline by implementing screening practices that identify children and adolescents who are obese who are then referred into evidence-based health service interventions encouraging physical activity, healthy eating and adherence to good clinical preventive care. After establishing the baseline rates, outcome improvement targets will be determined.

To deliver these outcomes, process milestones were carefully selected. These milestones define the activities that will be undertaken to prepare UHS to report outcomes in DY4 and DY5.

The two process milestones selected are:

P-1: Project Planning – Engage stakeholders, identify current capacity and needed resources, determine timeliness and document implementation plans.

P-2: Establish Baseline Rates

To ensure that project performance milestones are met an evaluation plan will be developed and implemented to monitor project activities. The evaluation is based on elements of the Framework for Program Evaluation in Public Health as outlined by the Centers for Disease Control and Prevention (CDC, 1999). Framework elements include: engaging stakeholders, describing the program, focusing the evaluation design, appropriate and timely collection of data, justifying conclusions and ensuring use and sharing lessons learned. Use of this framework ensures barriers to effective implementation inherent in public health/health service interventions and translational research are reduced by placing focus on specific components of the intervention, clearly identifying the target population, setting obtainable targets, and effectively maintaining program fidelity through a focused and rigorous research design (Glasgow & Emmons, 2007).
**Outcome Measure Valuation:**

Adherence to clinical preventive services, such as routine disease screening and scheduled immunizations, are key to reducing death and disability and are in line with national health goals. There is clear evidence that clinical preventive services can both prevent and detect illnesses and disease that range from the flu to cancer and that if caught in their earlier, more treatable stages, can significantly reducing the risk of illness, disability, early death, and health care costs. For example, on average, 42,000 deaths per year are prevented among children who receive recommended childhood vaccines. Yet, despite this evidence and such services are now covered by Medicare, Medicaid, and many private insurance plans under the Affordable Care Act (ACA), large segments of the U.S. population which translate into millions of children, adolescents, and adults go without clinical preventive services that could protect them from developing a number of serious diseases or help them treat certain health conditions before they worsen.

Outcome Improvement Targets for each year:

This outcome improvement measure was chosen for its direct relation to the goals of the Waiver by a) improve the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further develop and maintain a coordinated care delivery system; c) contribute to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and d) serve as a powerful tool to help providers improve outcomes and reduce ED utilization (containing cost growth).

DY4:
IT-12.5: Percent improvement over baseline of number of adolescents screened for major depressive disorder (MDD)

DY5:
IT-12.5: Percent improvement over baseline of number of adolescents screened for major depressive disorder (MDD)
### Rationale:

Depression among youth is a relatively common, disabling condition that is associated with serious long-term morbidities and risk of suicide. The majority of depressed youth, however, are undiagnosed and untreated, despite opportunities for identification in settings such as primary care. A synthesis of the evidence suggest that primary care screening tools may be accurate in identifying depressed adolescents, and treatment can improve depression outcomes. Specific treatment should be based on the individual's needs and mental health treatment guidelines (USPSTF, Systematic Review, 2009).

Expanding primary/pediatric primary care and prevention and establishing a usual source of care for this population can strengthen healthy behaviors and early adoption to adhere to regular clinical preventive care that includes screening and immunizations.

The goal of this project is by DY 4 and DY 5 to increase access to clinical preventive care by TBD\% over baseline by implementing clinical practice guidelines that screen adolescents 12-18 years of age for major depressive disorders. After establishing the baseline rates, outcome improvement targets will be determined.

To deliver these outcomes, process milestones were carefully selected. These milestones define the activities that will be undertaken to prepare UHS to report outcomes in DY4 and DY5.

The two process milestones selected are:

**P-1: Project Planning** – Engage stakeholders, identify current capacity and needed resources, determine timeliness and document implementation plans.

**P-2: Establish Baseline Rates**

To ensure that project performance milestones are met an evaluation plan will be developed and implemented to monitor project activities. The evaluation is passed on elements of the Framework for Program Evaluation in Public Health as outlined by the Centers for Disease Control and Prevention (CDC, 1999). Framework elements include: engaging stakeholders, describing the program, focusing the evaluation design, appropriate and timely collection of data, justifying conclusions and ensuring use and sharing lessons learned. Use of this framework ensures barriers to effective implementation inherent in public health/health service interventions and translational research are reduced by placing focus on specific components of the intervention, clearly identifying the target population, setting obtainable targets, and effectively maintaining program fidelity through a focused and rigorous research design (Glasgow & Emmons, 2007).
Outcome Measure Valuation:

Adherence to clinical preventive services, such as routine disease screening and scheduled immunizations, are key to reducing death and disability is in line with national health goals. There is clear evidence that clinical preventive services can both prevent and detect illnesses and disease that range from screening for depression, flu to cancer that if diagnosed earlier, and in more treatable stages, can significantly reducing the risk of illness, disability, early death, and health care costs. Yet, despite this evidence and such services are now covered by Medicare, Medicaid, and many private insurance plans under the Affordable Care Act (ACA), large segments of the U.S. population which translate into millions of children, adolescents, and adults go without clinical preventive services that could protect them from developing a number of serious diseases or help them treat certain health conditions before they worsen.

**DY2:**
P-1: Project Planning – Engage stakeholders, identify current capacity and needed resources, determine timeliness and document implementation plans.

**DY3:**
P-2: Establish Baseline Rates for number of adolescents ages 13 to 18 years that receive the meningococcal conjugate vaccine (MCV-1).

**Outcome Improvement Targets for each year:**

This outcome improvement measure was chosen for its direct relationship to the goals of the Waiver by a) improve the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further develop and maintain a coordinated care delivery system; c) contribute to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and d) serve as a powerful tool to help providers improve outcomes and reduce ED utilization (containing cost growth).

**DY4:**
IT-12.5: TBD Percent improvement over baseline of number of adolescents 13-18 that receive the Meningococcal Conjugate Vaccine (MCV-1)

**DY5:**
IT-12.5: TBD Percent improvement over baseline of number of adolescents 13-18 that receive...
the Meningococcal Conjugate Vaccine (MCV-1)

**Rationale:**

Adherence to clinical preventive services, such as routine disease screening and scheduled immunizations, are key to reducing death and disability and are in line with national health goals. There is clear evidence that clinical preventive services can both prevent and detect illnesses and disease that range from the flu to cancer and that if caught in their earlier, more treatable stages, can significantly reduce the risk of illness, disability, early death, and health care costs. For example, on average, 42,000 deaths per year are prevented among children who receive recommended childhood vaccines.

Our goal is by **DY 4 and DY 5** to increase access to clinical preventive care over baseline by implementing screening and immunization practices that identify children and adolescents in need of the Meningococcal Conjugate Vaccine (MCV-1) ages 13 through 18 years if not previously vaccinated. After establishing the baseline rates, outcome improvement targets will be determined.

To deliver these outcomes, process milestones were carefully selected. These milestones define the activities that will be undertaken to prepare UHS to report outcomes in DY4 and DY5.

The two process milestones selected are:

**P-1:** Project Planning – Engage stakeholders, identify current capacity and needed resources, determine timeliness and document implementation plans.

**P-2:** Establish Baseline Rates

To ensure that project performance milestones are met an evaluation plan will be developed and implemented to monitor project activities. The evaluation is based on elements of the Framework for Program Evaluation in Public Health as outlined by the Centers for Disease Control and Prevention (CDC, 1999). Framework elements include: engaging stakeholders, describing the program, focusing the evaluation design, appropriate and timely collection of data, justifying conclusions and ensuring use and sharing lessons learned. Use of this framework ensures barriers to effective implementation inherent in public health/health service interventions and translational research are reduced by placing focus on specific components of the intervention, clearly identifying the target population, setting obtainable targets, and effectively maintaining program fidelity through a focused and rigorous research design (Glasgow & Emmons, 2007).

<td>136141205</td>
</tr>
</tbody>
</table>

**Outcome Measure Description:**

**OD-2 Potentially Preventable Admissions**

- **IT-2.13 Other Admission Rate (Stand-alone measure): Admission rate of patients managed by TOC project**
  - **Numerator:** Readmitted patients managed by TOC project
  - **Denominator:** All readmitted patients to University Health System within 30 days
  - **Data Source:** EMR/IDX/Crimson/Truven Health/Allscripts

**Process Milestone**

**DY2**

- **P-2: Establish baseline rates**
  - Early November 2012, a LEAN event has been scheduled to evaluate and assess the Transitions of Care Program by coordinating a priorities session. The intent of the week long event will be to establish where the efforts of the Transitions of Care Implementation Team need to focus their attention. The outcome will be a roadmap to the development of a Transitions of Care Program targeting the delivery of care post discharge and incorporating education, specialty visits, post discharge phone calls, medication reconciliation, and much more.

**DY3**

- **P-1: Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plan.**
  - Once the program is defined and the tasks are prioritized by level of significance as well as achievable goals, the next step will to identify the stakeholders and engage the individuals identified. The approach will be two fold:
    - **First,** an Executive Team will be established for reporting of efforts. An initial meeting will be held to identify the results of the LEAN event and identify the teams implemented as a result of the prioritization session.
    - **Second,** will be the identification of the implementation team members and the subcommittees needed to accomplish the goals and priorities established.

**Outcome Improvement Target**

**DY4/5**

- **IT-2.13 Other Admissions Rate (Stand-Alone Measure): Admission rate of patients managed by TOC project**
  - As the project continues to work towards reducing admissions, the Outcome Improvement Target will be reducing rates of readmission for patients identified
and managed by the Transitions of Care Project. The 5 year goal will be for 65% of patients identified as high risk and, thus, managed within the Transitions of Care program will not be readmitted.

**Rationale:**

It is vital for University Health System to target the discharge process and the first 48 hours and days post discharge because that is the most vulnerable time once a patient has returned home to struggle and return to the hospital and/or EC. The project will “significantly enhance” pre-existing efforts as stated per the baseline above. Although the work was thorough and fruitful, the following gaps remain:

- how to better identify patients at high risk before discharge and at home
- education at discharge and via post discharge calls
- referral processes
- improved internal and external handoffs and communication, and
- patient engagement.

**Outcome Measure Valuation:**

Project valuation for an efficient and comprehensive Patient Care Transition Program is prioritized as a Pass 1. As there are approximately 22,000 or more discharges a year, around 55,000 EC visits, and > 580,000 Ambulatory visits expected in 2013, better transitions of care impact is defined through cost avoidance, a reduction of admissions and readmissions as well as a decreased EC utilization.

TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $3,757,863
Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores
Unique RHP ID#: 136141205.3.12 – PASS 1
Performing Provider: University Hospital
Performing Provider TPI: 136141205

Outcome Measure Description:
OD-6 Patient Satisfaction/ IT 6.1

- IT-6.1 Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAPHS survey may be used to establish if patients: are getting timely care, appointments, and information; how well their doctors communicate; patient’s rating of doctor access to specialist; patient’s involvement in shared decision making, and patient’s overall health status/functional status.

Process Milestone
DY2

- P-1: Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plan.
  - DY2 will be used for reviewing and developing a strategic plan and training programs specific to Patient Centered Care
  - A patient/family experience strategic plan (to include plans for implementation of this plan) will be written by the Executive Director of Patient Centered Care and reviewed and approved by executive leadership of the health system to include both inpatient and outpatient services.
  - Working with Human Resources and Learning Resources Departments a training program specifically aimed at understanding Patient-Centered Care approach will be established.

DY3

- P-2 Establish baseline rates
  - Once the plans are written, disseminated and training is reviewed and agreed upon by the stake-holders we will be able to determine the amount of training necessary to ensure staff are in complete understanding of patient-centered care and focused on being a patient centered organization.

Rationale:

P-1 was selected as the process metric because is extremely important that stakeholders are engaged and on-board both with reviewing the material needed as well as training all University Health System staff members in the new philosophy of patient centered care. Timelines will be crucial in this endeavor as the focus on customer service and patient centered care tends to be moved down the list of priorities and it is crucial that it remains a top
**Outcome Measure Valuation:**

The outcome measure for this project is a 2% improvement in patient satisfaction scores for DY4 and 5 as illustrated in milestones 6 and 7. Improved patient satisfaction with health care services is a direct measure of how well we are accomplishing our triple aim goals of better health, better healthcare, and reduced cost. Satisfaction scores also support process improvement efforts to help identify areas that are in need of attention. University Health System is focused on reaching (NRC average) 25%. 2% improvement in DY 4 and DY 5 will ensure we are achieving the set goal.

</tr>
</thead>
<tbody>
<tr>
<td>a. Type of analysis to be determined by the provider: cost minimization</td>
</tr>
<tr>
<td>b. Data source: EPSI Budget System</td>
</tr>
</tbody>
</table>

**Rationale:**

**P – 1: Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans**

University Health System would need to coordinate this effort by pulling in leadership of the participating clinical departments and nursing units to raise awareness on the importance of driving down cost in the system. Stakeholders would design protocols and reporting tools to monitor performance against the project timeline based on the process improvement projects deadlines.

**P – 2: Establish baseline rates**

Part of the problem is identifying where the baseline is. EPSI (University Health System’s new budgeting system) will provide this data.

**P – 3: Develop and test data systems**

Configuration of EPSI will be required to pull correct, consistent cost data.

**IT – 5.1: Improved cost savings: demonstrate cost savings in care deliver**

Lean process improvement initiative will streamline processes. Part of reducing waste includes cost minimization because fewer resources are being devoted towards ‘non-value added’ activities. University Health System expects to see a decrease in the cost of care delivery as Lean management philosophies are developed throughout the system.

**Outcome Measure Valuation:**

The process milestones represent the build up to reaching the improvement target. Essentially, cost minimization adds value to the tax-paying citizens of Bexar county. As the county hospital, University Health System has a fiscal responsibility to use the resources given by the county as efficiently as possible. Lean process improvement focuses on reducing waste, one of which is unnecessary cost. P – 1 helps outline the departments or processes for cost minimization. The next step is measuring success which requires a baseline from which to gauge that success, P – 2. Ensuring consistency of our data systems will also go into this planning phase, P – 3.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $2,348,666**
Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT.6.1 Percent improvement over baseline of patient satisfaction scores (all questions within a survey need to be answered to be a standalone measure)
Unique RHP Identification Number: 136141205.3.14 – PASS 1
Performing Provider: University Hospital
TPI: 136141205

Outcome Measure Description:

IT-6.1 Percent improvement over baseline of patient satisfaction scores (all questions within a survey need to be answered to be a standalone measure)
Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAHPS survey may be used to establish if patients:
1. are getting timely care, appointments, and information; (Standalone measure)
2. how well their doctors communicate; (Standalone measure)
3. patient’s rating of doctor access to specialist; (Standalone measure)
4. patient’s involvement in shared decision making, and (Standalone measure)
5. patient’s overall health status/functional status. (Standalone measure)
a Numerator: Percent improvement in targeted patient satisfaction domain
b Data Source: Patient survey
c Denominator: Number of patients who were administered the survey

Process Milestones
- DY2
  - P-1 Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plan.
- DY3
  - P-5 Disseminate findings, including lessons learned and best practices, to stakeholders.

Improvement Targets
- DY4
  - IT-6.1 Percent improvement over baseline of patient satisfaction scores
- DY5
  - IT-6.1 Percent improvement over baseline of patient satisfaction scores

Rationale:
The rationale for selecting the following process milestones reflect the methodical approach that will be undertaken to engage stakeholder, identify needed resources, develop an implementation and project monitoring plan to ensure an appropriate alignment with improving and reporting on patient satisfaction.

In DY 2 and DY 3 process milestones will be addressed as follows:

P – 1: Project planning
University Health System would need to coordinate this effort by pulling in leadership of participating departments and clinical units to raise awareness on the importance of improving
patient satisfaction. Stakeholders would design protocols and reporting tools to monitor performance against the project timeline.

P – 5: Disseminate findings, including lessons learned and best practices, to stakeholders
After DY2, stakeholders would communicate successes and shortcomings or other insight learned from the project initiatives.

Improvement target for DY 4 and DY 5 were chosen to based on implementation timeline of the Lean process improvement initiative which will streamline processes around the patient’s experience. Reducing waste and focusing on the ‘value added’ activities will increase satisfaction. Workflows and throughput process will be designed to get the patient through the system as efficiently as possible. Clinicians can spend more time focused on patient care and patients will spend less time waiting for staff to work through inefficient processes. University Health System expects to see an increase in the patient satisfaction of care delivery as Lean management philosophies are developed throughout the system.

Outcome Measure Valuation:
The value and success of this category 3 outcome will based on improvement of HCAHPS patient satisfaction scores. Process improvements will focus on improving the overall experience for all patients within UH by driving out waste and focusing on the ‘value-added’ activities. This project is directly related to CN.1 as RHP 6 is challenged to increase patient satisfaction.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $2,358,666
Identifying Outcome Measure and Provider Information:

| Title of Outcome Measure (Improvement Target): IT-9.2 ED appropriate utilization |
| Unique RHP ID#: 136141205.3.15 – PASS 1 |
| Performing Provider: University Hospital |
| Performing Provider TPI: 136141205 |

Outcome Measure Description:

OD-9 Right Care, Right Setting

- IT-9.2 ED appropriate utilization (Stand-alone measure)
  - Reduce Emergency Department visits for targeted conditions
  - Data Source: EMR/IDX/Crimson/Truven Health/Allscripts

Process Milestone

DY2

- P-1: Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plan.
  - DY2 will be the year used to continuously identify the appropriate personnel assigned to a Navigation/Care coordination Program, to engage those identified individuals, to determine the resources needed for a successful implementation and expansion, as well as the development of an implementation plan.
  - Preliminary stakeholders include executive leadership from ambulatory and acute providers, other clinic personnel, and ED personnel.
  - Identified stakeholders will be actively engaged through regular meetings. The meetings will be an opportunity to show successes and discuss opportunities for improvement.

- P-2 Establish baseline rates
  - Once the implementation plan is established and vetted with appropriate members of the organization, the Navigation Program will begin to review all data associated with ED visits to determine the population of most needed support. The data will be used to identify the population with frequent EC visits and misuse.

Outcome Improvement Target

DY4/5

- IT-9.2 ED appropriate utilization (Stand-alone measure)
  - The selection of Outcome Improvement Target 9.2 was based on the long term goal of the Navigation Program of reducing EC utilization. The goal of the project is to reduce EC utilization for a defined population with chronic medical conditions and patients identified as high utilizers.
  - The Outcome Improvement Target allows University Health System to assess pre and post navigation services for identified patients. Target will be determined following baseline measure.
**Rationale:**

P-1 was selected as the process metric for University Health System because to date case managers, social workers and other personnel have only recently begun or introduced in the ED and in Ambulatory settings to assist with navigation and care coordination. Though ED visits were up 2.6% in 2012 from 2011, there is a population identified as high utilizers who frequent the ED for any number of health care and behavioral reasons and who would benefit from better access and coordination in the community. University Health System will develop a comprehensive implementation plan with plans to increase staffing in 2013 into additional Ambulatory settings. Metrics of success and stakeholder buy-in continues to evolve. ED utilization is a targeted metric for improvement. Baseline data will be gathered once staff and full implementation occurs per clinic setting for improved community access.

The Improvement target was chosen based on previous research that showed similar programs being able to impact ED utilization.

**Outcome Measure Valuation:**

Via the system created to weight all University Health System projects, this project was rated very high (18) due to the anticipated volume of patients touched who will receive case management and social services support. Cost avoidance is the anticipated end result secondary to a reduction of admissions and readmissions as well as a decrease in ED utilization. This project achieves the Waiver goals by a) improving the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further developing and maintaining a coordinated care delivery system; c) contributing to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and serving as a powerful tool to help providers improve outcomes and reduce ED utilization (containing cost growth).

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-13.1 Pain assessment (NQF-1637) (Non-standalone measure)
Unique RHP ID#: 136141205.3.16 – PASS 1
Performing Provider: University Hospital
TPI: 136141205

Outcome Measure Description:

Process milestones:
During **DY2**, the Lifelong Intensive Family Emotional (L.I.F.E.) Care/Palliative Medicine Service will specifically engage in Project Planning (P-1) for process improvement. This will include engaging multiple stakeholders, identification of current capacity and needed resources, determination of specific timelines and documentation and implementation of plans to address the outcome improvement measures for palliative care patients.

During **DY3**, the Lifelong Intensive Family Emotional (L.I.F.E.) Care/Palliative Medicine Service will use information gathered and systems developed during DY2 to establish baseline rates (P-2) for the outcome improvement measures for palliative care patients.

Outcome improvement measures:
Percentage of palliative care patients who screened positive for pain and who received a clinical assessment of pain within 24 hours of screening.

**Numerator**: Patients who received a comprehensive clinical assessment to determine the severity, etiology and impact of their pain within 24 hours of screening positive for pain.

**Denominator**: Patients receiving palliative care who report pain when pain screening is done on the admission evaluation/initial encounter.

**Exclusion**: patients with length of stay < 1 day in palliative care or <7 days in hospice, patients who were not screened for pain. Patients who screen negative for pain are excluded from the denominator.

**Data Source**: EHR, Palliative Care Database

**DY4**: Of patients receiving palliative care who report pain when pain screening is done on the admission evaluation/initial encounter, the palliative care team will successfully provide a comprehensive clinical assessment to determine the severity, etiology and impact of pain within 24 hours of screening positive for pain to at least 75% of patients(479).

**DY5**: Of patients receiving palliative care who report pain when pain screening is done on the admission evaluation/initial encounter, the palliative care team will successfully provide a comprehensive clinical assessment to determine the severity, etiology and impact of pain within 24 hours of screening positive for pain to at least 90% of patients(574).

Rationale:

The process metrics chosen are an essential to develop a systematic process for the quality improvement cycle related to fostering successful outcomes anticipated in DY4 and DY5. For Category 3 outcomes, the three non-standalone metrics (chart documentation of pain assessment, treatment preferences, and documentation of spiritual concerns) reflect some of the core quality measures needed to achieve excellence in patient care. These metrics also correlate with the selected Process and Improvement metrics. Patients report problems with hospital symptom management and continuity of care:

- 1 in 2 patients describe their hospital care as “suboptimal”⁹⁴

---

• 1 in 4 patients report inadequate treatment for pain and shortness of breath\textsuperscript{95}
• 1 in 3 families report inadequate emotional support\textsuperscript{96}
• 1 in 3 patients state they are poorly educated for pain and other symptom management after hospital discharge\textsuperscript{97}
• 1 in 3 patients are not provided plans for follow-care after hospital discharge.\textsuperscript{98}
• Over 50% of deaths in America occur in the hospital setting.\textsuperscript{99}
• Over 70% of patients who die in the hospital were admitted to the hospital in the previous 6 months.\textsuperscript{100}
• Only 40% of public hospitals have access to Palliative Care specialists.\textsuperscript{101}
• About 33% of patients enrolled in hospice die within one week.\textsuperscript{102}

Improving access to LIFE Care/Palliative Medicine services involves implementation of a comprehensive supportive service that inevitably relies on changing the culture in which the service is practiced. Referring physicians and physicians-in-training need to understand and appreciate the role that Palliative Care can play in improving patient and family satisfaction, pain and other symptom management, and in promoting patient and family-centered care. Education of referring physicians, especially primary care physicians and physicians-in-training, can deepen the appreciation for supportive care. Education in Palliative Care can also promote best practices and broad patient access to competent delivery of basics in Palliative Care, such as the safe use of opioids, emotional and spiritual aspects of care, and ethical issues related to surrogate decision-making and withdrawing or withholding life-sustaining interventions.

**Outcome Measure Valuation:**

For Category 3 outcomes, the three non-standalone metrics (chart documentation of pain assessment, life sustaining treatment preferences, and documentation of spiritual concerns) are valued based on their ability to demonstrate tangible achievement with various elements of a successful palliative care program and their impact on patient comfort, safety, and health care outcomes. One first step towards controlling pain and improving patient outcomes is to maximize and standardize the assessment and to anticipate the pain of our highest risk patients, especially those undergoing surgery or invasive procedures and those with advanced illness such as metastatic cancer. A consensus statement from an "International Expert Panel" out of Johns Hopkins in 2008 stated that opioids are an essential part of patient care for the elderly and patients with cancer.\textsuperscript{103} They recommended the use of evidenced-based medicine to establish local clinical practice guidelines for clinicians who prescribe opioids. They argue that increased awareness of medication profiles can promote effective and safe pain relief. Both the Agency for Health Care Research and the American Pain Society recommend balancing effective analgesia with effective monitoring, prevention, and management of adverse opioid events. The Category 3 metrics for this project will establish a systematic process to achieve higher standard for pain

\textsuperscript{96}Ibid.
\textsuperscript{98}Ibid.
assessment and management. Furthermore, in many cases, uncontrolled symptoms and incomplete communication regarding life sustaining preferences and religious/spiritual concerns are avoidable causes of prolonged hospitalization with the added risks, costs, and inconvenience to families. For any given patient, each day in which pain, nausea, shortness of breath, anxiety, spiritual distress, and life-and-death decisions are not maximally supported can seem like an eternity. Uncontrolled pain leads to physiologic disturbances and poor patient experiences. In many cases, uncontrolled pain is an avoidable cause of prolonged hospitalization with the added risks, costs, and inconveniences to families. The Agency for Healthcare Research and Quality suggests that patient safety and satisfaction cannot be optimized in hospital-based care without first raising the bar for pain assessment. The authors note that the scope of the problem is vast: 62% of the 35 million discharges from U.S. hospitals include surgery or interventional procedures, and over 80% of these patients experience post-operative or procedural pain.104 These patients are at risk for adverse cardiac events, swings in blood sugar, the development of chronic pain and addiction, and psychological distress such as anxiety and sleeplessness. The American Academy of Pain Medicine also notes that patients who experience uncontrolled pain experience higher absenteeism and lost productivity, with an annual estimated cost of about $300 billion.105 Even when pain is recognized and treated promptly, the safe and effective use of medications is a serious challenge for hospital care. A sentinel study from 1997 showed that 29% of adverse medication events in the hospital were opioid-related.106 For post-operative patients, the evidence of avoidable health system costs of uncontrolled pain and adverse opioid events is mounting. A study from 2013 showed that adverse opioid events in surgical patients are associated with significantly higher costs, length of stay, and readmission rates.107 A retrospective review of 320,000 patients showed that patients with documented adverse events – including constipation, altered mental status, respiratory depression, and poorly controlled pain – had on average 30% higher in-hospital costs. These patients also had a three-fold greater odds of being a cost and length of stay outlier that were more likely to be readmitted within 30 days. It is expected the benefits of reduced length of stay, decreased direct hospital costs, and readmission rates will be experienced directly by those patients who receive palliative care specialty services and will be multiplied as the standards for expert pain management are raised across other clinical services who deliver care to patients with advanced age, cancer, and surgical needs. Although peer reviewed studies in palliative care do not traditionally quantify the financial value of good pain control or addressing the treatment preferences and spiritual concerns of patients, these clearly have value to patients and families. Using the same approach to value category 2 metrics, these downstream outcomes are a smaller reflection of the larger value calculated through cost avoidance using data from patients previously seen at University Hospital. Early palliative care intervention is a specific goal for the LIFE Care/Palliative Medicine service, which offers the greatest ability to improve health outcomes, patient experience, and reduced

costs. University Hospital has valued the outcomes of the Lifelong Intensive Family Emotional (L.I.F.E.) Care/Palliative Medicine Service project through its ability to achieve the waiver goals, meet community needs, meet the level of required investment, and include the value of palliative care in the context of both the inpatient and outpatient setting. In 2011, University Health System cared for over 233,000 unique patients, including about 67,000 Emergency Center visits, 400,000 outpatient clinic visits, and 20,000 inpatient discharges. The primary inpatient facility in University Hospital, which operates 496 beds and will expand to about 750 beds when the new University Tower is completed in 2014. University Hospital is a Level One Trauma Center, a world-renowned solid organ transplant center, and a referral center for a broad array of life-threatening conditions including metastatic cancer, end-stage renal disease, cirrhosis, heart failure, AIDS, and vascular disease. South and Central Texas have some of the nation’s highest rates of diabetes and obesity. During the calendar year 2012, the LIFE Care/Palliative Medicine program provided 638 inpatient consultations and over 120 outpatient clinic visits. Preliminary analysis from an internal database reveals that 50% of these patients suffered from advanced cancer, 30% had brain injury or polytrauma, and 30% faced end-stage organ disease such renal failure and cirrhosis, with some overlap among these groups. Cost-savings or cost-avoidance is increasingly recognized as a secondary outcome associated with Palliative Care programs. When patients and families are provided early supportive care, the culture of automatic escalation of care is mitigated. This can result in cost-savings, improved quality of life, and even prolongation of life. One large multi-institutional study that matched patients by severity of illness (propensity scores) showed that inpatient Palliative Care consultation significantly reduced direct and variable costs. For patients who were discharged alive, Palliative Care consultation correlated with an adjusted net savings of $1,700 per admission. And for patients who died in the hospital, savings exceeded $4,900 per admission. When these savings are multiplied across hundreds of consultations per year, and increased ICU bed availability is added in, the savings to the healthcare system are substantial—those savings can be used to further improve and expand supportive care for all patients. At University Hospital, early analysis demonstrates similar cost-savings. One hundred and seventy patients seen by the LIFE Care/Palliative Medicine team during a six-month period were matched to about 9,000 patients with similar diagnoses and severity of illness. With conservative assumptions and excluding outliers, reduced direct and variable savings averaged $5,600 per admission. Consultations performed within 72 hours of admissions yielded cost-savings of $12,600 per admission, which further illustrates the need for early Palliative Care consultation. Opportunity costs not included in this analysis includes ICU bed days, which also decreased by an average of one day per admission and almost certainly resulted in reduced ICU mortality and Emergency Center throughput. Early palliative care involvement is the goal, which offers the greatest ability to improve health outcomes, patient experience, and cost avoidance.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $1,330,909
Identifying Outcome Measure and Provider Information:

| Title of Outcome Measure (Improvement Target): IT-13.2 Treatment Preferences (NQF 1641) (Non-standalone measure) |
| Unique RHP ID#: 136141205.3.17 – PASS 1 |
| Performing Provider: University Hospital |
| TPI: 136141205 |

Outcome Measure Description:

Process milestones:
During DY2, the Lifelong Intensive Family Emotional (L.I.F.E.) Care/Palliative Medicine Service will specifically engage in Project Planning (P-1) for process improvement. This will include engaging multiple stakeholders, identification of current capacity and needed resources, determination of specific timelines and documentation and implementation of plans to address the outcome improvement measures for palliative care patients.

During DY3, the Lifelong Intensive Family Emotional (L.I.F.E.) Care/Palliative Medicine Service will use information gathered and systems developed during DY2 to establish baseline rates (P-2) for the outcome improvement measures for palliative care patients.

Outcome improvement measures:
Percentage of patients with chart documentation of preferences for life sustaining treatments.

**Numerator:** Patients whose medical record includes documentation of life sustaining preferences

**Denominator:** Seriously ill patients receiving specialty palliative care in an acute hospital setting.

**Exclusions:** patients with length of stay < 1 day in palliative care or <7 days in hospice.

**Data Source:** EHR, Palliative Care Database

DY4: Of patients seriously ill patients receiving specialty palliative care in an acute hospital setting, the palliative care team will successfully documentation of life sustaining preferences in least 75% of patients (479).

DY5: Of patients seriously ill patients receiving specialty palliative care in an acute hospital setting, the palliative care team will successfully documentation of life sustaining preferences in least 90% of patients (574).

Rationale:
The process metrics chosen are an essential to develop a systematic process for the quality improvement cycle related to fostering successful outcomes anticipated in DY4 and DY5. For Category 3 outcomes, the three non-standalone metrics (chart documentation of pain assessment, life sustaining treatment preferences, and documentation of spiritual concerns) reflect some of the core quality measures needed to achieve excellence in patient care. These metrics also correlate with the selected Process and Improvement metrics. Patients report problems with hospital symptom management and continuity of care:

- 1 in 2 patients describe their hospital care as “suboptimal”\(^{110}\)
- 1 in 4 patients report inadequate treatment for pain and shortness of breath\(^{111}\)
- 1 in 3 families report inadequate emotional support\(^{112}\)
- 1 in 3 patients state they are poorly educated for pain and other symptom management after hospital discharge\(^{113}\)
- 1 in 3 patients are not provided plans for follow-care after hospital discharge\(^{114}\)

---

112Ibid.
Over 50% of deaths in America occur in the hospital setting.\textsuperscript{115} 
Over 70% of patients who die in the hospital were admitted to the hospital in the previous 6 months.\textsuperscript{116} 
Only 40% of public hospitals have access to Palliative Care specialists.\textsuperscript{117} 
About 33% of patients enrolled in hospice die within one week.\textsuperscript{118}

Improving access to LIFE Care/Palliative Medicine services involves implementation of a comprehensive supportive service that inevitably relies on changing the culture in which the service is practiced. Referring physicians and physicians-in-training need to understand and appreciate the role that Palliative Care can play in improving patient and family satisfaction, pain and other symptom management, and in promoting patient and family-centered care. Education of referring physicians, especially primary care physicians and physicians-in-training, can deepen the appreciation for supportive care. Education in Palliative Care can also promote best practices and broad patient access to competent delivery of basics in Palliative Care, such as the safe use of opioids, emotional and spiritual aspects of care, and ethical issues related to surrogate decision-making and withdrawing or withholding life-sustaining interventions.

**Outcome Measure Valuation:**

For Category 3 outcomes, the three non-standalone metrics (chart documentation of pain assessment, treatment preferences, and documentation of spiritual concerns) are valued based on their ability to demonstrate tangible achievement with various elements of a successful palliative care program and their impact on patient comfort, safety, and health care outcomes. One first step towards controlling pain and improving patient outcomes is to maximize and standardize the assessment and to anticipate the pain of our highest risk patients, especially those undergoing surgery or invasive procedures and those with advanced illness such as metastatic cancer. A consensus statement from an "International Expert Panel" out of Johns Hopkins in 2008 stated that opioids are an essential part of patient care for the elderly and patients with cancer.\textsuperscript{119} They recommended the use of evidenced-based medicine to establish local clinical practice guidelines for clinicians who prescribe opioids. They argue that increased awareness of medication profiles can promote effective and safe pain relief. Both the Agency for Health Care Research and the American Pain Society recommend balancing effective analgesia with effective monitoring, prevention, and management of adverse opioid events. The Category 3 metrics for this project will establish a systematic process to achieve a higher standard for pain assessment and management. Furthermore, in many cases, uncontrolled symptoms and incomplete communication regarding life sustaining preferences and religious/spiritual concerns are avoidable causes of prolonged hospitalization with the added risks, costs, and inconvenience to families. For any given patient, each day in which pain, nausea, shortness of breath, anxiety, spiritual distress, and life-and-death decisions are not maximally supported can seem like an eternity. Uncontrolled pain leads to physiologic disturbances and poor patient experiences. In many cases, uncontrolled pain is an avoidable cause of prolonged hospitalization with the added risks, costs, and inconveniences to families. The Agency for Healthcare Research and Quality

\textsuperscript{114}Ibid.  
suggests that patient safety and satisfaction cannot be optimized in hospital-based care without first raising the bar for pain assessment. The authors note that the scope of the problem is vast: 62% of the 35 million discharges from U.S. hospitals include surgery or interventional procedures, and over 80% of these patients experience post-operative or procedural pain. These patients are at risk for adverse cardiac events, swings in blood sugar, the development of chronic pain and addiction, and psychological distress such as anxiety and sleeplessness. The American Academy of Pain Medicine also notes that patients who experience uncontrolled pain experience higher absenteeism and lost productivity, with an annual estimated cost of about $300 billion. Even when pain is recognized and treated promptly, the safe and effective use of medications is a serious challenge for hospital care. A sentinel study from 1997 showed that 29% of adverse medication events in the hospital were opioid-related. For post-operative patients, the evidence of avoidable health system costs of uncontrolled pain and adverse opioid events is mounting. A study from 2013 showed that adverse opioid events in surgical patients are associated with significantly higher costs, length of stay, and readmission rates. A retrospective review of 320,000 patients showed that patients with documented adverse events – including constipation, altered mental status, respiratory depression, and poorly controlled pain – had on average 30% higher in-hospital costs. These patients also had a three-fold greater odds of being a cost and length of stay outlier that were more likely to be readmitted within 30 days. It is expected the benefits of reduced length of stay, decreased direct hospital costs, and readmission rates will be experienced directly by those patients who receive palliative care specialty services and will be multiplied as the standards for expert pain management are raised across other clinical services who deliver care to patients with advanced age, cancer, and surgical needs. Although peer reviewed studies in palliative care do not traditionally quantify the financial value of good pain control or addressing the treatment preferences and spiritual concerns of patients, these clearly have value to patients and families. Using the same approach to value category 2 metrics, these downstream outcomes are a smaller reflection of the larger value calculated through cost avoidance using data from patients previously seen at University Hospital. Early palliative care intervention is a specific goal for the LIFE Care/Palliative Medicine service, which offers the greatest ability to improve health outcomes, patient experience, and reduced costs. University Hospital has valued the outcomes of the Lifelong Intensive Family Emotional (L.I.F.E.) Care/Palliative Medicine Service project through its ability to achieve the waiver goals, meet community needs, meet the level of required investment, and include the value of palliative care in the context of both the inpatient and outpatient setting. In 2011, University Health System cared for over 233,000 unique patients, including about 67,000 Emergency Center visits, 400,000 outpatient clinic visits, and 20,000 inpatient discharges. The primary inpatient facility in University Hospital, which operates 496 beds and will expand to about 750 beds when the new University Tower is completed in 2014. University Hospital is a Level One Trauma Center, a

---

world-renowned solid organ transplant center, and a referral center for a broad array of life-threatening conditions including metastatic cancer, end-stage renal disease, cirrhosis, heart failure, AIDS, and vascular disease. South and Central Texas have some of the nation’s highest rates of diabetes and obesity. During the calendar year 2012, the LIFE Care/Palliative Medicine program provided 638 inpatient consultations and over 120 outpatient clinic visits. Preliminary analysis from an internal database reveals that 50% of these patients suffered from advanced cancer, 30% had brain injury or polytrauma, and 30% faced end-stage organ disease such renal failure and cirrhosis, with some overlap among these groups. Cost-savings or cost-avoidance is increasingly recognized as a secondary outcome associated with Palliative Care programs. When patients and families are provided early supportive care, the culture of automatic escalation of care is mitigated. This can result in cost-savings, improved quality of life, and even prolongation of life. One large multi-institutional study that matched patients by severity of illness (propensity scores) showed that inpatient Palliative Care consultation significantly reduced direct and variable costs. For patients who were discharged alive, Palliative Care consultation correlated with an adjusted net savings of $1,700 per admission. And for patients who died in the hospital, savings exceeded $4,900 per admission. When these savings are multiplied across hundreds of consultations per year, and increased ICU bed availability is added in, the savings to the healthcare system are substantial—those savings can be used to further improve and expand supportive care for all patients. At University Hospital, early analysis demonstrates similar cost-savings. One hundred and seventy patients seen by the LIFE Care/Palliative Medicine team during a six-month period were matched to about 9,000 patients with similar diagnoses and severity of illness. With conservative assumptions and excluding outliers, reduced direct and variable savings averaged $5,600 per admission. Consultations performed within 72 hours of admissions yielded cost-savings of $12,600 per admission, which further illustrates the need for early Palliative Care consultation. Opportunity costs not included in this analysis includes ICU bed days, which also decreased by an average of one day per admission and almost certainly resulted in reduced ICU mortality and Emergency Center throughput. Early palliative care involvement is the goal, which offers the greatest ability to improve health outcomes, patient experience, and cost avoidance.

Outcome Measure Description:

**IT-6.1 Percent improvement over baseline of patient satisfaction scores (all questions within a survey need to be answered to be a standalone measure)**

Percent improvement over baseline of patient satisfaction scores, among non-English speaking patients, for one or more of the patient satisfaction domains that the provider targets for improvement, utilizing the HCAHPS survey.

| a Numerator: Percent improvement in targeted patient satisfaction domain |
| b Data Source: Patient survey |
| c Denominator: Number of patients who were administered the survey |

Process Milestones

- **DY2**
  - P-1 Project planning-engage stakeholders
  - P-2 Establish baseline rates

- **DY3**
  - P-3 Establish and test data systems

- **DY4**
  - P-4 Conduct Plan, Do, Study and Act

- **DY5**
  - P-4 Conduct Plan, Do, Study and Act
  - P-4 Disseminate Findings

Improvement Milestones

- **DY4**
  - **IT-6.1 patient satisfaction:** Exceed Teaching Hospital benchmarks by 5% by end of DY 4, show improvement over baseline of patient satisfaction scores at a level to be determined.

- **DY5**
  - **IT-6.1 patient satisfaction:** Exceed Teaching Hospital benchmarks by 5% by end of DY 5, show improvement over baseline of patient satisfaction scores at a level to be determined.

**DY 2: P-1 & P-2:** Project planning/establish baseline rates: develop appropriate metric for measuring HCAHPS patient experience data for patients who have selected a language other than English as their preference. [P-1] Conduct an analysis to determine gaps in language access and culturally competent care. [P-5] Train additional volunteer health care interpreters and assess their competency.

Develop job descriptions and functions for In-house Healthcare Interpreter Service personnel. Hire manager. Begin process of identifying and evaluating vendors that offer web-based video interpretation tools.

Develop goals and processes for Healthcare Interpreter Services. [P-5]: Hire and train certified Spanish translation staff to translate written documents and provide web-based video interpretation services 24/7.

Begin monitoring HCAHPS metrics to identify key drivers for the patient experience for non-English speaking patients. Develop communication materials to increase staff/MD awareness of new program and processes.

DY 4 & DY5: P-4: Conduct Plan Do Study Act cycles to improve data collection and intervention activities: Target: IT-6.1 Meet Teaching Hospital cohort CAHPS benchmarks in all Dimensions of Service by DY 4. Show improvement over baseline of patient satisfaction scores at a level to be determined.

DY 5: P-5: Disseminate Findings, including lessons learned and best practices, to stakeholders across Bexar County community as well as through articles, webinars, and presentations through the Teaching Hospitals of Texas, Texas Hospital Association and NRC Picker.

Improvement Target: IT-6.1 Exceed Teaching Hospital benchmarks by 5% by end of DY 5, show improvement over baseline of patient satisfaction scores at a level to be determined.

**Rationale:**

The rationale for selecting the following process milestones reflect the methodical approach that will be undertaken to engage stakeholders, identify required resources, develop an implementation and project monitoring plan to ensure appropriate alignment with improving and reporting of data and systems provide the necessary infrastructure to ensure timely and accurate reporting of patient satisfaction scores.

**Process Milestones**

Process milestones (P-1, P-2 and P-3) were chosen as part of ensure the accurate and appropriate collection of patient experience in DY2 and DY3. With the implementation of value-based purchasing, as well as research demonstrating the link between the patient experience and other hospital quality metrics, it is critically important for University Health System to ensure that a focus is on placed on HCAHPS improvement from the onset. The project to improve effective communication between healthcare professionals with patients and families through interpreter/document translation enhancements will enable University Health System improve the patient experience as measured by achieving new levels of performance on HCAHPS, and ultimately deliver higher quality care. The culmination of this efforts will be further calibrated with process milestones P-4 conduct a plan, do study and act as well as share finding (P-5) and lessons learned with regional hospital partners and related organizations regarding best practices and opportunities to improve patient experience.

**Improvement Targets**

This outcome improvement measure was chosen for its direct relation to the goals of the triple aim: assuring patients receive high-quality and patient-centered care, in the most effective way
as well as developing and maintaining a coordinated care delivery system that address patient preferences including cultural and linguistic orientation and thereby contributes to patients receiving high-quality, patient-centered care in the most cost-effective way. In addition, intent of measuring patient experience is that it enhances public accountability in health care by increasing the transparency of the quality of institutional care provided in return for the public investment.

**Outcome Measure Valuation:**

University Health System’s efforts to successfully strengthen access to culturally competent patient-centered care through strategies that promote timely oral interpretation/translation services, improve the fluid exchange of health information between patients and healthcare professionals and promote opportunities for patient to adhere to prescribed clinical care and treatment regimens will in large be self-evident and in particular demonstrated by an increase in patient satisfaction scores regarding quality of care received. Such efforts will also strengthen waiver goals: a) improving the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further developing and maintaining a coordinated care delivery system; c) contributing to patients receiving high-quality, patient-centered care in the most cost-effective way; and serving as a powerful tool to help providers improve outcomes and reduce ED utilization (containing cost growth).

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT – 12.1 Breast Cancer Screening
Unique RHP Outcome ID #: 136141205.3.21 – PASS 2
Performing Provider: University Hospital
TPI: 136141205

Outcome Measure Description:

Outcome Measure Description:

IT – 12.1 - Breast Cancer Screening

Numerator: Number of women aged 40 to 69 that have received an annual mammogram during the reporting period.

Denominator: Number of women aged 40 to 69 in the patient or target population. Exclusion: women who have had a bilateral mastectomy are excluded.

Data Source: EHR, Claims, Visit management system

Process Milestones:

DY2:
   - P-1: Project Planning – Engage stakeholders, identify current capacity and needed resources, determine timeliness and document implementation plans.

DY3:
   - P-2: Establish Baseline Rates

Outcome Improvement Targets for each year:

DY4:

- **DY4**- Increase IT – 12.1 - Breast Cancer Screening by TBD percent (%) over baseline year for number of women aged 40 to 69 that have received an annual mammogram during the reporting period.

DY 5:

- **DY5**- Increase IT – 12.1 - Breast Cancer Screening by TBD over baseline year those number of women aged 40 to 69 that have received an annual mammogram during the reporting period.

The process milestones will be reported on in DY 2-3 and specifically outlined as P-1 Project Planning and P-2 Establish Baseline Rates. Improvement targets in DY 4-5 and their methodology including corresponding metrics, data, and sources for data extraction, goals and rationale will also be specified to report on project specific outcome. Specifically, baseline
measures will be established, goals will be set for outcomes measure in DY 4 and DY5.

**Rationale:**

Less than half of all Americans receive the recommended levels of screening associated with clinical preventive care. Studies confirm the clinical and economic benefits of providing timely access to preventive services by significantly reducing the onset of chronic health conditions that include cancer.

Screening for breast cancer implies testing for early stages of disease before symptoms occur. It involves application of an early detection test to a large number of apparently healthy people to identify those having unrecognized cancer. People with positive screening tests are subsequently investigated with diagnostic tests and those with confirmed disease are offered appropriate treatment and follow-up. The objective of screening is to reduce incidence of and/or death from cancer by detecting early preclinical disease when treatment may be easier and more effective than for advanced cancer diagnosed after the symptoms occur. It is important to evaluate the efficacy of a given screening approach to reduce disease burden, harm and cost, as well as its overall cost-effectiveness, before it is considered for widespread implementation in large population settings.

Expanding primary care and prevention and establishing a usual source of enhance screening behaviors including adherence to clinical preventive care such as breast cancer screening.

Project goal in DY 4 and in DY 5 is to increase access and coverage to clinical preventive care; specifically ensuring that women receive a mammogram based on clinical preventive guidelines. After establishing the baseline rates, outcome improvement targets will be determined.

To deliver these outcomes, process milestones were carefully selected. These milestones define the activities that will be undertaken to prepare University Health System to report outcomes in DY4 and DY5. The two process milestones selected are:

**P-1:** Project Planning – Engage stakeholders, identify current capacity and needed resources, determine timeliness and document implementation plans.

**P-2:** Establish Baseline Rates

**Quality Improvement Process:** To ensure that project performance milestone are met an evaluation plan will be embedded within project activities and will guided by elements of the Framework for Program Evaluation in Public Health as outlined by the Centers for Disease Control and Prevention (CDC, 1999). Framework elements will include: engaging stakeholders, describing the program, focusing the evaluation design, appropriate and timely collection of data, justifying conclusions and ensuring use and sharing lessons learned. The strength of utilizing this framework will also ensure that barriers to effective implementation inherent in public health/health service interventions and translational research are reduced by placing focus specific components of the intervention, clearly identifying the target population and target setting and effectively capturing fidelity of the project activities through a focused research design (Glasgow & Emmons, 2007). Evaluation of project success will in large part be self-evident. That is, accomplishment of previously specified program activities will be specific, measurable, attainable, relevant and timely in helping to strengthen the health status of women.
residing in Bexar County/San Antonio, Texas.

The improvement targets were chosen as they reflect the importance of promoting evidence-based screening for cervical, colorectal, and breast cancer by measuring the use of screening tests identified in the U.S. Preventive Services Task Force (USPSTF) recommendations. The objectives for Healthy People 2020 also highlight the importance of monitoring the incidence of invasive cancer (cervical and colorectal) and late-stage breast cancer, which are considered intermediate markers of cancer screening success.

**Outcome Measure Valuation:**

The USPSTF make evident the clinical and economic benefits of preventive screening. That is providing timely access to preventive services has been shown to significantly reduce the onset of chronic health conditions such as diabetes, infectious disease such as flu and pneumonia and reducing mortality by detecting cancer and other diseases at much earlier stage.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $979,433**
**Identifying Outcome Measure and Provider Information:**

| Title of Outcome Measure (Improvement Target): IT – 12.3 - Colorectal Cancer Screening |
| Unique RHP Outcome ID #: 136141205.3.23 – PASS 2 |
| Provider name: University Hospital |
| TPI: 136141205 |

**Outcome Measure Description:**

IT – 12.3 – Colorectal Cancer Screening

**Numerator:** Number of adults aged 50 to 75 that have received one of the following screenings: Fecal occult blood test yearly, flexible sigmoidoscopy every five years, colonoscopy every 10 years

**Denominator:** Number of adults aged 50 to 75 in the patient or target population. Adults with colorectal cancer or total colectomy are excluded.

**Data Source:** EHR, Claims

**Process Milestones:**

**DY2:**
- **P-1:** Project Planning – Engage stakeholders, identify current capacity and needed resources, determine timeliness and document implementation plans.

**DY3:**
- **P-2:** Establish Baseline Rates

**Outcome Improvement Targets for each year:**

**DY4:**

- **DY4**- Increase 12.3 – Colorectal Cancer Screening by TBD percent (%) over baseline year for those number of adults aged 50 to 75 that have received one of the following screenings: Fecal occult blood test yearly, flexible sigmoidoscopy every five years, colonoscopy every 10 years

**DY 5:**

- **DY5**- Increase 12.3 – Colorectal Cancer Screening by TBD percent (%) over baseline year for those number of adults aged 50 to 75 that have received one of the following screenings: Fecal occult blood test yearly, flexible sigmoidoscopy every five years, colonoscopy every 10 years

The process milestones will be reported on in DY 2-3 and specifically outlined as IP-1 Project Planning and P-2 Establish Baseline Rates. Improvement targets in DY 4-5 and their methodology including corresponding metrics, data, and sources for data extraction, goals and rationale will also be specified to report on project specific outcome. Specifically, baseline measures will be established, goals will be set for outcomes measure in DY 4 and DY5.
**Rationale:**

Less than half of all Americans receive the recommended levels of screening associated with clinical preventive care. Studies confirm the clinical and economic benefits of providing timely access to preventive services by significantly reducing the onset of chronic health conditions that include cancer.

Screening for colorectal cancer implies testing for early stages of disease before symptoms occur. It involves application of an early detection test to a large number of apparently healthy people to identify those having unrecognized cancer. People with positive screening tests are subsequently investigated with diagnostic tests and those with confirmed disease are offered appropriate treatment and follow-up. The objective of screening is to reduce incidence of and/or death from cancer by detecting early preclinical disease when treatment may be easier and more effective than for advanced cancer diagnosed after the symptoms occur. It is important to evaluate the efficacy of a given screening approach to reduce disease burden, harm and cost, as well as its overall cost-effectiveness, before it is considered for widespread implementation in large population settings.

Expanding primary care and prevention and establishing a usual source of enhance screening behaviors including adherence to clinical preventive care such as cervical cancer screening.

Project goal **in DY 4 and in DY 5 is to increase** access and coverage to clinical preventive care; specifically ensuring that women receive a colorectal screening based on clinical preventive guidelines. After establishing the baseline rates, outcome improvement targets will be determined.

To deliver these outcomes, process milestones were carefully selected. These milestones define the activities that will be undertaken to prepare University Health System to report outcomes in DY4 and DY5. The two process milestones selected are:

P-1: Project Planning – Engage stakeholders, identify current capacity and needed resources, determine timeliness and document implementation plans.

P-2: Establish Baseline Rates

**Quality Improvement Process:** To ensure that project performance milestone are met an evaluation plan will be embedded within project activities and will guided by elements of the Framework for Program Evaluation in Public Health as outlined by the Centers for Disease Control and Prevention (CDC, 1999). Framework elements will include: engaging stakeholders, describing the program, focusing the evaluation design, appropriate and timely collection of data, justifying conclusions and ensuring use and sharing lessons learned. The strength of utilizing this framework will also ensure that barriers to effective implementation inherent in public health/health service interventions and translational research are reduced by placing focus specific components of the intervention, clearly identifying the target population and target setting and effectively capturing fidelity of the project activities through a focused research design (Glasgow & Emmons, 2007). Evaluation of project success will in large part be self-evident. That is, accomplishment of previously specified program activities will be specific, measurable, attainable, relevant and timely in helping to strengthen the health status of individuals residing in Bexar County/San Antonio, Texas.
The improvement targets were chosen as they reflect the importance of promoting evidence-based screening for cervical, colorectal, and breast cancer by measuring the use of screening tests identified in the U.S. Preventive Services Task Force (USPSTF) recommendations. The objectives for Healthy People 2020 also highlight the importance of monitoring the incidence of invasive cancer (cervical and colorectal) and late-stage breast cancer, which are considered intermediate markers of cancer screening success.

**Outcome Measure Valuation:**

USPSTF make evident the clinical and economic benefits of preventive screening. That is providing timely access to preventive services has been shown to significantly reduce the onset of chronic health conditions such as diabetes, infectious disease such as flu and pneumonia and reducing mortality by detecting cancer and other diseases at much earlier stage.

TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $979,434
Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): 3-IT-2.11 Ambulatory Care Sensitive Conditions Admission Rate
Unique RHP outcome identification number: 136141205.3.24 – PASS 2
Performing Provider: University Hospital
TPI: 136141205

Outcome Measure Description:

IT-2.11- Ambulatory Care Sensitive Conditions Admissions Rate

a). Numerator: Total number of acute care hospitalizations for ambulatory care sensitive conditions under age 75 years

Inclusions: Total number of acute care hospitalizations for ambulatory care sensitive conditions* under age 75. This is based on a list of conditions developed by Billings et al., any one most responsible diagnosis code of: Grand mal status and other epileptic convulsions; Chronic obstructive pulmonary diseases; Asthma; Heart Failure and pulmonary edema; Hypertension; Angina; Diabetes

Exclusions: Individuals 75 years of age and older; Death before discharge

b) Denominator: Total mid-year population under age 75.

c) Data source: EMR/IDX

d). Reasons/Rationale for selecting the outcome measures: Lack of access to medication or non-compliance with medication instructions are 2 key contributors to increased hospital admissions. Reducing unnecessary admissions benefits the patient and lowers costs for the hospital and the state. A potentially avoidable hospitalization a chronic health condition is commonly associated with a lack of access to appropriate ambulatory care. While not all admissions for chronic conditions are avoidable, it is assumed that appropriate ambulatory care can prevent avoidable admissions through more effective disease management, and control of acute episodes. A high rate of avoidable admissions reflects problems in obtaining access to appropriate primary care.

This pharmacist-led, chronic disease medication management program will have a direct impact on reducing avoidable admissions by reducing medication errors and adverse effects from medication use. Culturally competent pharmacists can effectively remove barriers and communicate with patients to educate them about medications, assure proper usage, answer questions, and provide social and emotional support to patients and their families.

Process Milestones:

- **DY2:** P-1 – Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
- **DY3:** P-2 – Establish baseline rates
### Outcome Improvement Targets for each year:

- **DY4:** IT-2.11: Reduce total acute care hospitalizations for ambulatory care sensitive conditions under age 75 years. Target Outcome TBD
- **DY5:** IT-2.11: Reduce total acute care hospitalizations for ambulatory care sensitive conditions under age 75 years. Target Outcome TBD

### Rationale:

The rationale for this measure is as follows: “Hospitalization for an ambulatory care sensitive condition (ACSC) is considered to be a measure of access to appropriate primary health care. While not all admissions for these conditions are avoidable, it is assumed that appropriate ambulatory care could prevent the onset of this type of illness or condition, control an acute episodic illness or condition, or manage a chronic disease or condition. A disproportionately high rate is presumed to reflect problems in obtaining access to appropriate primary care.” Proper medication management for patients with chronic illnesses by a dedicated, specially trained pharmacist will be a significant contributing variable to lowering the rate of these admissions among the selected hub clinic population.

The Health System does not have such a program in place and this template will generate the data necessary to make a significant contribution to the medication management program and to the other care coordination efforts currently under way in the Health System – and those proposed by other Performing Providers under this 1115 Waiver. Improvement targets have not been identified, but will be during DYs 2 and 3.

### Outcome Measure Valuation:

Valuation is based on Achievement of Waiver Goals, Community Needs, Scope of Project, and Project Investment. The addition of a pharmacist to the ambulatory team in a specified Health System “hub clinic” will benefit the community patient, while reducing costs for unnecessary admissions. Value is estimated to be $3,567,935 over the remaining four-years of the waiver.

Identifying Outcome Measure and Provider Information:
Title of Outcome Measure (Improvement Target): IT-9.3- Pediatric/Young Adult Asthma Emergency Department Visits – NQF 1381 (Standalone measure)
Unique RHP outcome identification number: 136141205.3.25 – PASS 3
Performing Provider: University Hospital
TPI:136141205

Outcome Measure Description:

IT-9.3 – Pediatric/Young Adult Asthma Emergency Department Visits – NQF 1381
a. Numerator: Percentage of patients with asthma who have greater than or equal to one visit to the emergency room for asthma during the measurement period.
b. Denominator: Denominator is all patients age two through age 20, diagnosed with asthma during the measurement period. The denominator will include recipients with claims with asthma as primary and secondary diagnoses with the dates of service “Begin Date through End Date" equal any consecutive 12 month period with paid dates from "Begin Date through End Date which includes 3 month tail
c. Data Source: EHR, Claims

Process Milestones:

DY2: Process Milestone 1: Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans, relates directly to the milestones outlined in the Health System’s Category 1 Table for 136141205.1.8. This will be an expansion and enhancement initiative that targets delivery of patient-centered primary pediatric care in Bexar County, Texas. This undertaking will be made possible by leveraging the University Health System ambulatory network of clinical and preventive health clinics that are located in both high-growth and high-need areas delineated primarily by economically vulnerable populations that include minority individuals with multiple chronic conditions with limited and non-existed health insurance coverage.

For example project efforts will coincide with University Health System initiatives to partner with FQHCs to expand primary care capacity and access, oral health services, establish school-based clinics in major urban sectors of the city and health promotion efforts that enhance awareness of preventive care at all life stages to further help establish linkages between communities and preventive care. The experience of enhancing delivery of services to vulnerable populations gives us confidence that enhancing and expanding primary pediatric care and urgent pediatric care to our current clinic patient population and in partnership with the other performing providers in RHP6 will vastly improve management of pediatric asthma and related conditions.

DY3: Process Milestone 2: Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities.

Process Milestone 2 affords the opportunity to engage in quality improvements, share lessons learned, and effect rapid cycle improvements as appropriate.
Outcome Improvement Targets:
Category 3 Outcome: Reduce Pediatric/Young Adult Asthma Emergency Department Visits per NQF 1381, which populates both DYs 4 and 5 in anticipation of continuous improvement. The outcome improvement targets are yet to be determined (TBD) for DYs 4 and 5.

Rationale:

Process Milestone 1: Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans. As noted above, the Health System currently employs telemedicine on a pilot basis for the Bexar County Adult Detention Center inmates. Expanding the technology to patient clinic sites, as well as to regional partners in the future, however, requires a completely new planning process.

Process Milestone 2: Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities. As mentioned, Process Milestone 2 affords the opportunity to engage in quality improvements, share lessons learned, and effect rapid cycle improvements as appropriate. This milestone is the natural extension to creation of the project plan as the steps to implementation are completed.

The outcome improvement targets for the selected Category 3 Outcome, “Reduce pediatric/young adult asthma emergency department visits per NQF 1381,” in both DY 4 and 5, will be determined in DY 2 for implementation in DY 3. This outcome improvement measure directly responds to the Waiver’s goals of a) improving the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further developing and maintaining a coordinated/integrated care delivery system; c) contribute to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and d) serve as a powerful tool to help providers improve outcomes and reduce ED utilization (containing cost growth).

Outcome Measure Valuation:
Successful expansion in capacity/delivery of primary pediatric care and as a countermeasure to reduce inappropriate ED utilization for pediatric and young adult asthma patients will be an indicator for achievement of Waiver goals: a) improving the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further developing and maintaining a coordinated care delivery system; c) contributing to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and serving as a powerful tool to help providers improve health outcomes and reduce emergency room utilization (containing cost growth).

When fully implemented – beyond DY5 – which includes expansion of primary pediatric care health service delivery for other highly prevalent conditions, the larger scope of the project should impact proper utilization in the form of increased routine and follow-up patient visits and encounters and reduced ED utilization.

This project requires investment as it complements HITECH funding goals. The hardware, software applications, human resources, and time to implement are of the highest organizational priority for the Health System. This particular project targets asthma, but the scope of utilization
for other chronic diseases and in other health care settings is potentially huge.

</tr>
</tbody>
</table>

### Outcome Measure Description:

#### Process Milestone 3
Develop and test data systems related to the identification of multiple hospitalization
   Data Source: Hospital admissions supplied by collaborating hospitals

#### Process Milestone 2
Establish baseline rates

Outcome measure: **IT-9.2 ED appropriate utilization: behavioral health/substance abuse**

### Rationale:

The process milestones (P-3 and P-2) were selected to prepare University Hospital for reporting of ED appropriate utilization rates for behavioral health. Since we have not determined at this time what the improvement targets for emergency utilization will be, we plan to determine them in our assessment work during the balance of DY2 for implementation in DY3.

### Outcome Measure Valuation:

By redirecting non emergent healthcare needs to community resources a reduction in denials will be supported while addressing a priority community need. Valuation methodology for outcome measures and their associated process milestones included, for this project, assessment of relative value for breadth of impact on the project (in terms of the three criterion of numbers of patients affected, the large scope of the project, and the positive impact on the community).

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-3.8 Behavioral Health/Substance Abuse 30 day readmission rate
Unique RHP ID: 136141205.3.27 - PASS 3
Provider Name: University Hospital
TPI: 136141205

Outcome Measure Description:

Process Milestone 3
Develop and test data systems related to the identification of multiple hospitalization
Data Source:

Process Milestone 2
Establish baseline rates

Outcome measure:
3.IT-3.8
Reduction of readmission rate by TBD% by the end of DY5 for the target population

Rationale:

According to a 2009 American Hospital Association report approximately 18% of Medicare patients are readmitted within 30 days which costs the Medicare program approximately $15 billion a year. Legislators and regulators at all levels of government are exploring options for increasing quality and reducing health care costs related to avoidable readmissions. While not all readmissions are preventable understanding what is causing them and developing strategies to reduce readmissions can be implemented.

Case management services provided in the psychiatric emergency service can transition patients with multiple admissions over to community resources that can reduces reimbursement denials and preserves acute care beds for more appropriate admissions.

Outcome Measure Valuation:

By redirecting non emergent healthcare needs to community resources a reduction in readmissions to an inpatient stay will be supported while addressing a priority community need.

Valuation methodology for outcome measures and their associated process milestones included, for this project, assessment of relative value for breadth of impact on the project (in terms of the three criterion of numbers of patients affected, the large scope of the project, and the positive impact on the community).

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $4,028,021**
Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-7.8 Chronic Disease Patients Accessing Dental Services *(Standalone measure)*
Unique RHP ID#: 136141205.3.28 – PASS 3
Performing Provider: University Hospital
TPI: 136141205

Outcome Measure Description:

IT-7.8 Chronic Disease Patients Accessing Dental Services: Percentage of patients with chronic disease conditions accessing dental services following referral by their medical provider *(Standalone measure)*

Process Milestones:
Determining a process for gathering the data and developing baseline will be conducted in DY2 and DY3.

DY 2: P-1 Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

DY 3: P-2 Establish baseline rates for percentage of patients with a chronic disease conditions accessing dental health services following a referral by a medical provider.

Outcome Improvement Target for each year:

DY4: Improvement Target: Increase in chronic disease patients who access dental health services X% from baseline Y3

DY5: Improvement Target: Increase in chronic disease patients who access dental health services X% from baseline Y3

Rationale:
The rationale for selecting the following process milestones reflect the methodical approach that will be undertaken to engage stakeholders, identify required resources, develop an implementation, establish baseline performance measures and a project monitoring plan to ensure appropriate alignment with improving and reporting of data and systems that will provide the necessary infrastructure to ensure timely and accurate reporting of patient outcome measures (IT 7.8 Chronic Disease Patient Accessing Dental Services).

National studies on disparities in receipt of oral health services find that almost half of all Americans do not a visit a dentist each year and nearly one-third lack access to basic preventive and primary oral health care services. In addition, these studies further detail that Individuals who are least likely to access preventative oral health care are more likely to have higher rates of oral disease. In particular, economically vulnerable populations that include minority adults, persons with a chronic disease and children are significantly less likely to have access to oral health care compared to their non-poor and non-minority peers. Studies on adherence to
preventive oral health services find that patients are more likely to seek dental services when the importance of need is documented by a formal referral being made.

The target population will be economically vulnerable populations that seek services at UHS including Carelink members assigned to UHS patient centered medical homes. CareLink is a financial assistance program for uninsured residents of Bexar County. The program was created in 1997 to help address the needs of Bexar County residents without health care coverage who were not eligible for Medicaid or other public or private funding. While CareLink is not an insurance product per se, it has many similar advantages in terms of promoting access to preventive health services, encouraging a long lasting relationship with a primary care provider, and instilling a sense of shared responsibility between member and staff for the member’s health. As of December 31, 2011, there were 54,256 members enrolled in CareLink.

**Outcome Measure Valuation:**

This outcome will be valued based on the number of chronic disease patients that are able to access dental health services within the project timeframe. The rationale is implementing patient-centered care and leveraging resources with partners safety net providers allows for expanded comprehensive clinical preventive care, better care coordination, and improved health promotion and disease prevention.

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-3.2 Congestive Heart Failure 30 day readmission rate (Stand-Alone Measure)
Unique RHP ID#: 136141205.3.29– PASS 3
Performing Provider: University Hospital
TPI: 136141205

Outcome Measure Description:

Process Milestone

DY2
- P-1: Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plan.
  - Next steps will be to establish an Executive team for reporting efforts.
  - Prioritization of future process steps will be identified
  - Identification of the implementation team members and the subcommittees needed to accomplish the goals and priorities will be established.

DY3
- P-5: Disseminate findings, including lessons learned and best practices, to stakeholders
  - Regularly scheduled meetings will be held to discuss successes and failures and determine future courses of action.

OD-3 Potentially Preventable Re-Admissions – 30 Day Readmission Rates (PPRs)
- IT-3.2 Congestive Heart Failure 30 day readmission rate (Stand-Alone Measure)
  - Numerator: The number of readmissions (for patients 18 years and older), for any cause, within 30 days of discharge from the index HF admission. If an index admission has more than 1 readmission, only first is counted as a readmission.
  - Denominator: The number of admissions (for patients 18 years and older), for patients discharged from the hospital with a principal or secondary diagnosis of HF and with a complete claims history for the 12 months prior to admission.

Rationale:
The Potentially Preventable Admissions Outcome Measure enables the Transitions of Care Program to identify, monitor, and assess the patients placed on the CHF initiative. Data presented by TMF for 2010, reported a 30.1 readmission rate for Medicare Beneficiaries at University Hospital diagnosed with congestive heart failure. The RHP 6 average was 20.5 for the same population.
<table>
<thead>
<tr>
<th>Outcome Measure Valuation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>The project will value the outcome and measure success by the readmission rate for patients admitted with a diagnosis of heart failure (IT-3.2). With a more coordinated discharge process, patients will have a clearer follow-up timeline to manage their chronic condition. The investment in redesigning this process with more of a focus on post discharge planning and care coordination will avoid higher cost hospital stays for readmitted patients. This drives value to RHP 6 by directly addressing CN.2 which cites a need for better chronic disease management.</td>

### Identifying Outcome Measure and Provider Information:

| Title of Outcome Measure (Improvement Target): IT-1.10 Diabetes care: HbA1c poor control (>9.0%) | 233- NQF 0059 (Standalone measure) |
| Unique Category 3 Outcome RHP ID: 136141205.3.30 (Replaces 136141205.3.20) |
| Performing Provider: University Hospital |
| TPI: 136141205 |

### Outcome Measure Description:

| IT-1.10 Diabetes care: HbA1c poor control (>9.0%) 233- NQF 0059 (Standalone measure) |

This measure will demonstrate whether patients are in control of the management of their diabetes during the implementation of the project.

- **Numerator:** Percentage of patients 18-75 years of age with diabetes (type 1 or type 2) who had hemoglobin A1c (HbA1c) control > 9.0%.
- **Denominator:** Members 18 to 75 years of age as of December 31 of the measurement year with diabetes (type 1 and type 2).
- **Data Source:** EHR
- **Rationale/Evidence:** Diabetes is one of the most costly and highly prevalent chronic diseases in the United States. Approximately 20.8 million Americans have diabetes, and half these cases are undiagnosed. Complications from the disease cost the country nearly $100 billion annually. In addition, diabetes accounts for nearly 20 percent of all deaths in people over 25 years of age. Many complications, such as amputation, blindness, and kidney failure, can be prevented if detected and addressed in the early stages. Although many people live with diabetes years after diagnosis, it is a costly condition that leads to serious and potentially fatal health complications. Diabetes control can improve the quality of life for millions of Americans and save billions of health care dollars.

### Process Milestones:

**DY2:**
- P-1 Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans for clinic 1
- P-2 Establish baseline rates for number of diabetic patients at clinic site 1 and at UHS.

**DY3:**
- P-1 Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans for clinics 2 & 3
- P-2 Establish baseline rates for number of diabetic patients at clinic site 2 & 3 and at UHS.

### Outcome Improvement Targets for each year

**DY 4:** IT-10.1 Diabetes care: HbA1c poor control (>9.0%), Improvement Target: TBD Percent increase over baseline of the number of people with HbA1c <9% from the first year of implementation in site 1.

**DY 5:** IT-10.1 Diabetes care: HbA1c poor control (>9.0%), Improvement Target: TBD Percent increase over baseline of the number of people with HbA1c <9% from the first year of implementation in site 2 & 3.
### Rationale:
There is an abundance of evidence that the Chronic Care Model can be effectively implemented to help patients manage their diabetes and improve their overall outcomes through the partnership between the primary care teams and the patient. In DY2 and DY3 the primary care teams from all 3 sites require training by an endocrinologist in all aspects of specialty care for patients with low to moderate risk of complications. One site will complete training and full implementation of the program components by the end of DY2, and other sites will be fully trained and implemented by the end of DY3. Adherence to the medical recommendations will demonstrate the level of empowerment the patient experienced through the strength of the relationship with the primary care team. Further evidence of adherence to medical recommendations will be through monitoring of HbA1c test results.

### Outcome Measure Valuation:
In Bexar County 11.8% (137,009) have been diagnosed with diabetes, which is in vast contrast to 9.3% (1.7 million) diabetes in the state. Diabetes is also the 4th leading cause of death in Bexar County. In face of such high prevalence of diabetes in Bexar County, effective management is necessary to reduce the burden of the disease and the cost of treatment of complications. Texas has failed to meet the national standards for health care quality measures regarding diabetes. This innovative, evidence-based approach will increase help meet the three part CMS aim of assuring patients receive high-quality, patient-centered care, in the most cost-effective ways, which translates to reducing the costs due to unnecessary hospitalizations and the treatment of complications related to poor control of diabetes. Each project site has been chosen because of the proximity to areas where the majority of UHS’ diabetic population reside. The efficacy of the program will be demonstrated through monitoring HbA1c test results.

**Outcome Measure Description:**

This measure will demonstrate whether patients are in control of the management of their diabetes during the implementation of the project.

**IT-1.11 Diabetes care: BP control (<140/80mm Hg) – NQF 0061 (Standalone measure)**

| a Numerator: Use automated data to identify the most recent blood pressure (BP) reading during the measurement year. The member is numerator compliant if the BP is less than 140/90 mm Hg. |
| b Denominator: Members 18 to 75 years of age as of December 31 of the measurement year with diabetes (type 1 and type 2) |
| c Data Source: EHR, Registry, Claims, Administrative clinical data |
| d Rationale/Evidence: Diabetes is one of the most costly and highly prevalent chronic diseases in the United States. Approximately 20.8 million Americans have diabetes, and half these cases are undiagnosed. Complications from the disease cost the country nearly $100 billion annually. In addition, diabetes accounts for nearly 20 percent of all deaths in people over 25 years of age. Many complications, such as amputation, blindness, and kidney failure, can be prevented or delayed through appropriate management. |

**Process Milestones:**

**DY2:**
- P- 1 Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans for clinic 1
- P- 2 Establish baseline rates for number of diabetic patients at clinic site 1 and at UHS.

**DY3:**
- P- 1 Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans for clinics 2 & 3.
- P-2 Establish baseline rates for number of diabetic patients at clinic site 2 & 3 and at UHS.

**Outcome Improvement Targets for each year**

**DY 4:**
- IT-11.1 Diabetes care: BP control (<140/80mm Hg), Improvement Target: TBD Percent increase over baseline of the number of people with BP measures <140/80mm Hg during the first year of implementation in site 1.

**DY 5:**
- IT-11.1 Diabetes care: BP control (<140/80mm Hg), Improvement Target: TBD Percent increase over baseline of the number of people with BP measures <140/80mm Hg during the first year of implementation in sites 2 & 3.

**Rationale:**

There is an abundance of evidence that the Chronic Care Model can be effectively implemented to help patients manage their diabetes and improve their overall outcomes through the
partnership between the primary care teams and the patient. In DY2 and DY3 the primary care teams from all 3 sites require training by an endocrinologist in all aspects of specialty care for patients with low to moderate risk of complications. One site will complete training and full implementation of the program components by the end of DY2, and other sites will be fully trained and implemented by the end of DY3. Adherence to the medical recommendations will demonstrate the level of empowerment the patient experienced through the strength of the relationship with the primary care team. Further evidence of adherence to medical recommendations will be through monitoring of blood pressures which are within the established guidelines for diabetic patients.

**Outcome Measure Valuation:**

In Bexar County 11.8% (137,009) have been diagnosed with diabetes, which is in vast contrast to 9.3% (1.7 million) diabetes in the state. Diabetes is also the 4th leading cause of death in Bexar County. In face of such high prevalence of diabetes in Bexar County, effective management is necessary to reduce the burden of the disease and the cost of treatment of complications. Texas has failed to meet the national standards for health care quality measures regarding diabetes. This innovative, evidence-based approach will increase help meet the three part CMS aim of assuring patients receive high-quality, patient-centered care, in the most cost-effective ways, which translates to reducing the costs due to unnecessary hospitalizations and the treatment of complications related to poor control of diabetes.

Each project site has been chosen because of the proximity to areas where the majority of UHS’ diabetic population reside. The efficacy of the program will be demonstrated through monitoring of blood pressures which are within the established guidelines for diabetic patients.

## Outcome Measure Description:

### 3.IT-1.6 Cholesterol management for patients with cardiovascular conditions (NCQA-HEDIS 2012) (Standalone measure)

**a** Numerator: Number of patients who had each of the following during the reporting period:
- Low-density Lipoprotein Cholesterol (LDL-C) Screening: An LDL-C test performed during the measurement year.
- LDL-C Level Less Than 100 mg/dL: The most recent LDL-C level during the measurement year is less than 100 mg/dL.

**b** Denominator: Patients aged 18 to 75 years as of December 31 of the measurement year who were discharged alive for acute myocardial infarction (AMI), coronary artery bypass graft (CABG), or percutaneous coronary interventions (PCI) from January 1 through November 1 of the year prior to the measurement year, or who had a diagnosis of ischemic vascular disease (IVD) during measurement year and the year prior to the measurement year.

**c** Data Source: EHR, Registry

**d** Rationale/Evidence: Total blood cholesterol is directly related to the development of coronary artery disease (CAD) and coronary heart disease (CHD), with most of the risk being associated with low-density lipoprotein cholesterol (LDL-C). When LDL-C levels are high, cholesterol can build up within the walls of the arteries, causing atherosclerosis, the build-up of plaque.

Hemorrhaging or clot formation can occur at the site of plaque build-up, blocking arteries and causing heart attack and stroke. Reducing cholesterol in patients with known heart disease is critically important, as treatment can reduce morbidity (heart attack and stroke) and mortality by as much as 40%.

The National Cholesterol Education Program (NCEP) has established guidelines for managing cholesterol levels in patients with heart disease. The guidelines mg/dL for such patients. Cholesterol screening and control depends on the combined efforts of patient, physician and organization. Lifestyle factors and new medications offer tangible means for reducing cholesterol and the risk of heart disease.

established the need for close monitoring of LDL cholesterol in patients with coronary heart disease and set a target for LDL-C of less than or equal to 100

### Process Milestones:

**DY2:** P- 1 Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans for clinic 1
P- 2 Establish baseline rates for number of diabetic patients at clinic site 1 and at UHS.
**DY3:** P-1 Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans for clinics 2 & 3

P-2 Establish baseline rates for number of diabetic patients at clinic site 2 & 3 and at UHS

**Outcome Improvement Targets for each year**

**DY 4:** IT-1.6 Cholesterol management for patients with cardiovascular conditions (NCQA-HEDIS2012) *(Standalone measure)*, Improvement Target: TBD Percent increase over baseline of the number of people with LDL-C Level Less Than 100 mg/dL from the first year of implementation in site 1.

**DY 5:** IT-1.6 Cholesterol management for patients with cardiovascular conditions (NCQA-HEDIS2012) *(Standalone measure)*, Improvement Target: TBD Percent increase over baseline of the number of people with LDL-C Level Less Than 100 mg/dL from the first year of implementation in sites 2 & 3.

**Rationale:**

There is an abundance of evidence that the Chronic Care Model can be effectively implemented to help patients manage their diabetes and improve their overall outcomes through the partnership between the primary care teams and the patient. In DY2 and DY3 the primary care teams from all 3 sites require training by an endocrinologist in all aspects of specialty care for patients with low to moderate risk of complications. One site will complete training and full implementation of the program components by the end of DY2, and other sites will be fully trained and implemented by the end of DY3. Adherence to the medical recommendations will demonstrate the level of empowerment the patient experienced through the strength of the relationship with the primary care team. Further evidence of adherence to medical recommendations will be through monitoring of LDL test results as established by the recommended guidelines.

**Outcome Measure Valuation:**

In Bexar County 11.8% (137,009) have been diagnosed with diabetes, which is in vast contrast to 9.3% (1.7 million) diabetes in the state. Diabetes is also the 4th leading cause of death in Bexar County. In face of such high prevalence of diabetes in Bexar County, effective management is necessary to reduce the burden of the disease and the cost of treatment of complications. Texas has failed to meet the national standards for health care quality measures regarding diabetes. This innovative, evidence-based approach will increase help meet the three part CMS aim of assuring patients receive high-quality, patient-centered care, in the most cost-effective ways, which translates to reducing the costs due to unnecessary hospitalizations and the treatment of complications related to poor control of diabetes.

Each project site has been chosen because of the proximity to areas where the majority of UHS’ diabetic population reside. The efficacy of the program will be demonstrated through monitoring of LDL test results as established by the recommended guidelines.

**Identifying Outcome Measure and Provider Information:**

<table>
<thead>
<tr>
<th>Title of Outcome Measure (Improvement Target):</th>
<th>IT-3.1: All Cause 30 Day Readmission Rate- NQF 1789 (stand-alone)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique RHP outcome identification number(s):</td>
<td>121782003.3.1 - PASS 1</td>
</tr>
<tr>
<td>Performing Provider:</td>
<td>Uvalde Memorial Hospital</td>
</tr>
<tr>
<td>TPI:</td>
<td>121782003</td>
</tr>
</tbody>
</table>

**Outcome Measure Description:**

IT-3.1: All Cause 30 Day Readmission Rate- NQF 1789 (stand-alone)

A readmission will be defined as an inpatient admission to any acute care facility which occurs within 30 days of discharge date of an eligible index admission. All readmissions are counted as outcomes except those that are considered planned. The readmission rate will be calculated out of the number of admissions to acute care facilities for patients aged 65 years or older.

**Process Milestones:**

- **DY 2:**
  - P-1 – Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

- **DY 3:**
  - P-3 – Develop and test data systems
  - P-2 – Establish baseline rates

**Outcome Improvement Target(s):**

- **DY 4:**
  - IT-3.1 All Cause 30 Day Readmission Rate- NQF 1789 (stand-alone)
    - Percent reduction in the all cause 30 day readmission rate will be determined after P-3.2 is achieved in DY 3.

- **DY 5:**
  - IT-3.1 All Cause 30 Day Readmission Rate- NQF 1789 (stand-alone)
    - Percent reduction in the all cause 30 day readmission rate will be determined after P-3.2 is achieved in DY 3.

**Rationale:**

Process milestones (P-1 through P-3) were chosen due to the current lack of accurate reports, resources and systems necessary for monitoring, measuring and reporting all cause 30 day readmission rates. In DY 2 P-1 was chosen to develop plans and garner staff support while P-2 and P-3 will allow accurate systems and a valid baseline. The accomplishment of these milestones will allow for percentage improvements to be determined for DY 4 and DY 5 in the outcome improvement target: IT-3.1 All Cause 30 Day Readmission Rate- NQF 1789 (stand-alone).
Outcome Measure Valuation:
The outcome measure chosen with its associated process milestones and outcome improvement targets, are those with the highest potential for impact on the physical and financial health of the population.

Methods used to value and select the outcome measure hinged on a valuation methodology including the following four categories: Achieves Waiver Goals, Addresses Community Need(s), Project Scope and Project Investment.

Reducing the all-cause 30 day readmissions rate is achieved through case management and increased follow-up. When patients are regularly followed up with, they are more likely to follow their discharge instructions, take their medications, and make it to appointments with their physicians. This increases the health of patients, especially those who are elderly and prone to readmission.

From a cost avoidance perspective, reducing potentially preventable re-admissions will reduce cost with each decrease in re-admission in DY 4 and DY 5. From the patient perspective, costs are avoided and health increases, especially when one considers the rate of hospital acquired infections increases with each re-admission.

Year 5 Estimated Outcome Amount: $532,378

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $1,013,445**
**Identifying Outcome Measure and Provider Information:**

Title of Outcome Measure (Improvement Target): IT-9.2 ED appropriate utilization (stand-alone)
Unique RHP outcome identification number: 121782003.3.2 – PASS 1
Performing Provider: Uvalde Memorial Hospital
TPI: 121782003

**Outcome Measure Description:**

IT-9.2 ED appropriate utilization (stand-alone): Reduce ED visits for target conditions

Target conditions include: Congestive Heart Failure, Diabetes, Cardiovascular Disease/Hypertension, and Chronic Obstructive Pulmonary Disease.

**Process Milestones:**

- **DY 2:**
  - P-1 – Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

- **DY 3:**
  - P-3 – Develop and test data systems
  - P-2 – Establish baseline rates

**Outcome Improvement Target(s):**

- **DY 4:**
  - ED appropriate utilization (stand-alone): Reduce ED visits for target conditions
    - Percent reduction in the number of ED visits for target conditions will be determined after P-3.2 is achieved in DY 3.

- **DY 5:**
  - ED appropriate utilization (stand-alone): Reduce ED visits for target conditions
    - Percent reduction in the number of ED visits for target conditions will be determined after P-3.2 is achieved in DY 3.

**Rationale:**

Process milestones (P-1 through P-3) were chosen due to the current lack of accurate reports, resources and systems necessary for monitoring, measuring and reporting ED admissions for target conditions. In DY 2 P-1 was chosen to develop plans and garner staff support while P-2 and P-3 will allow accurate systems and a valid baseline.

Accomplishing these milestones will allow for percentage improvements to be determined for DY 4 and DY 5 in the outcome improvement target: IT-9.2 ED appropriate utilization (stand-alone): Reduce ED visits for target conditions.

Specific improvement targets for each target condition will be determined in DY 3 after the accomplishment of [P-3.2]. These target conditions were selected as they are the most likely to be impacted by the linked Category 1 project, 121782003.1.1 in areas of: cost, patient education, and quality of care. Specifically, case management and community health worker programs have been linked to reductions in admissions for these target conditions in many hospitals throughout the country.
**Outcome Measure Valuation:**

The outcome measure chosen with its associated process milestones and outcome improvement targets, are those with the highest potential for impact on the physical and financial health of the population.

Methods used to value and select the outcome measure hinged on a valuation methodology including the following four categories: Achieves Waiver Goals, Addresses Community Need(s), Project Scope and Project Investment.

Reducing ED admissions for target conditions is achieved through case management and increased follow-up. When patients are regularly followed up with, they are more likely to follow their discharge instructions, take their medications, and make it to appointments with their physicians. This increases the health of patients, especially those who are elderly and prone to readmission.

From a cost avoidance perspective, reducing ED visits will reduce hospital and payer cost as the ED is the highest source of uninsured and Medicaid admissions. From the patient perspective, costs are avoided and health increases, as care is shifted from the ED to primary care.

</tbody>
</table>
**Outcome Measure Valuation:**

The outcome measure chosen with its associated process milestones and outcome improvement targets, are those with the highest potential for impact on the physical and financial health of the population. Methods used to value and select the outcome measure hinged on a valuation methodology including the following four categories: Achieves Waiver Goals, Addresses Community Need(s), Project Scope and Project Investment. Uvalde Memorial Hospital also values each outcome based on the following factors: the potential impact on health of our population, the resources necessary to achieve the outcome, and level of improvement anticipated in overall patient satisfaction.

From a cost avoidance perspective, reducing ICU admissions during the last 30 days of life will reduce hospital and payer cost as the ICU is a very high cost source for care. Not only are ICU stays for these patients expensive for their families, they are also not comfortable or accommodating to the needs of the patient and his or her family. Costs are avoided, and pain managed more effectively during the last days of life through an effective palliative care program that puts the needs of the patient and family first.

TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $541,597
Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): 6.1 Percent improvement over baseline of patient satisfaction scores
Unique RHP ID: 119877204.3.1 – PASS 1
Performing Provider: Val Verde Regional Medical Center (VVRMC)
TPI: 119877204

Outcome Measure Description:

In DY2 & 3, VVRMC will accomplish Process Milestones as listed below in regards to developing the processes and foundation for its clinic patient experience program.

Process Milestones
P-1 Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans – DY 2
P-2 Establish baseline rates – DY 3

Improvement Target
In DY 4 & 5, VVRMC has selected the following Improvement Target and given success in DY 2 & 3 for accomplishing its Process Milestones will be in good position to achieve improvements in patient experience:

OD-6 Patient Satisfaction
IT-6.1 Percent improvement over baseline of patient satisfaction scores (all questions within a survey need to be answered to be a standalone measure)
Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. VVRMC will capture data on each of the following elements:
(1) are getting timely care, appointments, and information; (Standalone measure)

a Numerator: Percent improvement in targeted patient satisfaction domain
b Data Source: Patient survey
c Denominator: Number of patients who were administered the survey

Rationale:
The bell-weather metric for measuring patient experience is patient satisfaction. As VVRMC works to expand access to care in its rural community, it becomes important to measure and assure success in regards to the ease of access and interaction with the providers in the clinics. The community needs assessment clearly identified bringing additional healthcare resources to Val Verde County as a high priority. In addition, the expectation is that the providers will be set-up and organized well to be able to meet everyone’s expectations around how they receive care. It is our intent in the first two DY’s to establish a process, similar to how we measure on the inpatient side of services, that will afford all of the clinics baseline data. In DY 4 & 5 patient satisfaction will be formally measured and compared back to baseline years to demonstrate improvements in how care is perceived at the clinics.

The intent of this initiative is to provide a standardized survey instrument and data collection methodology for measuring patients' perspectives on clinic care. The surveys are designed to
produce comparable data on the patient's perspective on care that allows objective and meaningful comparisons between institutions on domains that are important to consumers. Public reporting of the survey results is designed to create incentives for institutions to improve their quality of care. Public reporting will serve to enhance public accountability in health care by increasing the transparency of the quality of institutional care provided in return for the public investment.

**Outcome Measure Valuation:**

The outcome measure selected, with its associated improvement target, was chosen based on how accurately it demonstrates patient impact and benefit. The following valuation methodology suggested by the Anchor was also taken into consideration. How does the project achieve waiver goals? Does it address community needs sufficiently? What is the scope of the project/outcome? What is the total project/outcome investment? Based on this criteria and potential patient impact/benefit, improving patient satisfaction was selected as our Category 3 outcome measure and improvement target.

Continually working to improve patient satisfaction at primary care and specialty care clinics, as well as through our telemedicine program, will improve the quality of healthcare provided in our region. It is the only measure within the RHP planning protocol that ensures care is truly “patient-centered” and meets the waiver goals.

If we are able to demonstrate very high patient satisfaction with the new services provided through the clinics, we will have met Val Verde County and Del Rio’s expectations in regards to what was important to them through community needs assessments.

This will be a significant undertaking as there currently is no formal process for measuring satisfaction in the clinic locations.

This outcome measure will impact thousands of citizens in the community, as all that interact in the primary care and specialty clinics will be asked for their feedback.

### Outcome Measure Description:

In DY2 & 3, VVRMC will accomplish Process Milestones as listed below in regards to developing the processes and foundation for its telemedicine patient experience program.

#### Process Milestones

- P-1 Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans – DY 2
- P-2 Establish baseline rates – DY 3

#### Improvement Milestones

In DY 4 & 5, VVRMC has selected the following Improvement Target and given success in DY 2 & 3 for accomplishing its Process Milestones will be in good position to achieve improvements in patient experience:

**OD-6 Patient Satisfaction**

**IT-6.1 Percent improvement over baseline of patient satisfaction scores (all questions within a survey need to be answered to be a standalone measure)**

Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. VVRMC will capture data on each of the following elements:

1. Numerator: Percent improvement in targeted patient satisfaction domain
2. Data Source: Patient survey
3. Denominator: Number of patients who were administered the survey

#### Rationale:

The bell-weather metric for measuring patient experience is patient satisfaction. As VVRMC works to expand access to care in its rural community, it becomes important to measure and assure success in regards to the ease of access and interaction with the providers in through new technology of telemedicine. The community needs assessment clearly identified bringing additional healthcare resources to Val Verde County as a high priority. In addition, the expectation is that the providers will be set-up and organized well to be able to meet everyone’s expectations around how they receive care. It is our intent in the first two DYs to establish a process, similar to how we measure on the inpatient side of services, that will afford all the unique practice of telemedicine baseline data. In DY 4 & 5 patient satisfaction will be formally measured and compared back to baseline years to demonstrate improvements in how care is perceived through telemedicine.

The intent of this initiative is to provide a standardized survey instrument and data collection.
methodology for measuring patients' perspectives on telemedicine care. The surveys are designed to produce comparable data on the patient's perspective on care that allows objective and meaningful comparisons between institutions on domains that are important to consumers. Public reporting of the survey results is designed to create incentives for institutions to improve their quality of care. Public reporting will serve to enhance public accountability in health care by increasing the transparency of the quality of institutional care provided in return for the public investment.

### Identifying Outcome Measure and Provider Information:

<table>
<thead>
<tr>
<th>Title of Outcome Measure (Improvement Target): IT-9.2 ED appropriate utilization</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique RHP ID#: 092414401.3.1 – PASS 2</td>
</tr>
<tr>
<td>Performing Provider: Community Medicine Associates</td>
</tr>
<tr>
<td>TPI: 092414401</td>
</tr>
</tbody>
</table>

### Outcome Measure Description:

**IT-9.2 ED appropriate utilization (Standalone measure)**

- Reduce all ED visits (including ACSC)
- Reduce pediatric Emergency Department visits (CHIPRA Core Measure)
- Reduce Emergency Department visits for target conditions:
  - Chronic Obstructive Pulmonary Disease
  - Behavioral Health
  - Diabetes
  - Asthma

Determining a process for gathering the data and developing baseline will be conducted in DY2 and DY3. After baseline established, goals will be set for outcomes measure in DY 4 and DY5.

Process Milestones:

**DY2:**
- P-1 – Project Planning – engage stakeholders, identify current capacity and needed resources, determine timeliness and document implementation plans.

**DY3:**
- P-2- Establish baseline rates for reduction in ED visits for targeted conditions

**Outcome Improvement Targets for each year:**

**DY4:**
- Reduce ED visits for targeted conditions by a TBD percentage from baseline Y3.

**DY5:**
- Reduce ED visits for targeted conditions by a TBD percentage from baseline Y3.

### Rationale:

High emergency room (ER) utilization is a considerable concern for the increasing cost of health care. Frequent and inappropriate use of hospital ERs is extremely costly and care could be provided in a less expensive setting. Patients, when possible, should be treated by their primary care provider for non-emergency conditions in order to promote consistent, quality care. The targeted population will be the Carelink members assigned to University Health System patient centered medical homes. CareLink is a financial assistance program for uninsured residents of Bexar County. The program was created in 1997 to help address the needs of Bexar County residents without health care coverage who were not eligible for Medicaid or other public or private funding. While CareLink is not an insurance product per se, it has many similar advantages in terms of promoting access to preventive health services, encouraging a long lasting relationship with a primary care provider, and instilling a sense of shared responsibility between member and staff for the member’s health. As of December 31, 2011, there were 54,256 members enrolled in CareLink.

Process Milestones P1 and P2 were chosen to allow time for necessary project planning and data
collection activities to understand our patients who will benefit the most from expanded primary care into their neighborhoods. It will also allow us to set up the necessary processes to effectively reach out and work with chronic disease patient as we expand our primary care capacity.

The improvement targets of reducing avoidable ED visits for specific medical conditions selected because of the evidence base associated with access to primary care and the reduction of unnecessary ED visits. Having a regular source of primary care increases the probability that patients with chronic medical conditions will have less exacerbations, better control of their disease, and therefore fewer ED visits caused by uncontrolled symptoms. Since this is an expansion of primary care in an existing patient population we know which patients to target for more outreach, and care management to reach our goals.

**Outcome Measure Valuation:**

This outcome will be valued based on the number of emergency visits avoided by patients with COPD, behavioral health diagnoses, diabetes exacerbations, and asthma. The rational is expanded primary care and acute care through University Health System’s ExpressMed clinics will support patients in controlling these chronic conditions and reduce avoidable emergency center visits. It will also support the achievement of Waiver goals: a) improving the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further developing and maintaining a coordinated care delivery system; c) contributing to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and serving as a powerful tool to help providers improve outcomes and reduce ED utilization (containing cost growth).

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $1,042,096**
Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-2.13 Other Admissions Rate
Unique RHP ID#: 092414401.3.2 – PASS 2
Performing Provider: Community Medicine Associates
TPI: 092414401

Outcome Measure Description:

OD – 2 Potentially Preventable Admissions

- IT 2.13 Other Admissions Rate (Stand-Alone Measure)
  - Numerator: Admissions to hospital of patients for Care Team
  - Denominator: Active panel of patients for Care Team
  - Data Source: EMR/IDX/Crimson/Truven Health/Allscripts

Process Milestone
DY2

- P-1: Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plan.
  - DY2 will be the year used to identify the appropriate personnel to discuss the Care management Model, to engage those identified individuals, determine the resources needed for a successful implementation, as well as the development of an implementation plan.
  - Preliminary stakeholders include executive leadership from ambulatory and acute, clinic providers and other clinic personnel, along with members of the care management team.
  - Once identified, the stakeholders will be actively engaged through regular meetings. The meetings will be an opportunity to show successes and discuss opportunities for improvement.

DY3

- P-2 Establish baseline rates
  - Care Coordination and clinic leadership will review all data associated with admissions, readmissions, and EC visits per clinic and identify the population(s) having high risk health care needs for management.

Outcome Improvement Target

DY4/5

- IT-2.13 Other Admissions Rate (Stand-Alone Measure)
  - The selection of Outcome Improvement Target 2.13 was based on the inability to identify a single diagnosis within a clinic panel in need of additional resources
and support. As high risk stratification criteria are developed, the intent of the Care Management Model is to improve clinical outcomes, decrease admissions, minimize readmissions, and address EC utilization for risk stratified patients in need of additional support. Therefore, we expect to achieve a TBD decrease in hospital admissions, a TBD decrease in readmissions, and a TBD decrease in EC utilization for the patients enrolled in the care management program.

**Rationale:**

We have only just begun to pilot the role of case manager in our Ambulatory Clinics. Many new providers and mid-levels are being hired into Ambulatory clinics in order to improve access. In order to address the barriers identified in the project description, and in order to be successful, stakeholder engagement including leaders and providers and other clinic personnel must be engaged for this model to be successful. A documented plan with timelines and accountability will assist to keep us on course due to day in day out distractions. We will know we are successful when clinic no show rates improve and when patients, assigned to a care team, visit the hospital less frequently for their primary care for conditions better managed in the community. Therefore, it was necessary to select process milestones P-1 and P-2. The improvement targets were chosen based on the need for alignment among all stakeholders and that documentation to validate and hardwire agreed upon process steps.

**Outcome Measure Valuation:**

Project valuation for an efficient and comprehensive Care Model was rated at the highest valuation level and is defined predominantly through cost avoidance. Assuming the patients are receiving, case management support, social services support, and medically appropriate patient education, the result should be a reduction of admissions and readmissions as well as a decrease in EC utilization. Patient and provider satisfaction will be improved with projected valuation, as well. This project achieves the Waiver goals by a) improving the health care infrastructure to better serve the Medicaid and uninsured residents of the county; b) further developing and maintaining a coordinated care delivery system; c) contributing to patients’ receiving high-quality, patient-centered care in the most cost-effective way; and serving as a powerful tool to help providers improve outcomes and reduce ED utilization (containing cost growth).

<td>Provider name: Community Medicine Associates – PASS 2</td>
</tr>
<tr>
<td>TPI: 92414401</td>
</tr>
</tbody>
</table>

### Outcome Measure Description:

**IT-9.2 ED appropriate utilization (Standalone measure)**

- Reduce all ED visits (including ACSC)
- Reduce pediatric Emergency Department visits (CHIPRA Core Measure)
- Reduce Emergency Department visits for target conditions:
  - Chronic Obstructive Pulmonary Disease
  - Behavioral Health
  - Diabetes
  - Asthma

### Process Milestones:

Determining a process for gathering the data and developing baseline will be conducted in DY2 and DY3.

- P-1 Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
- P-2 Establish baseline rates for reduction in ED visits for targeted conditions

### Outcome Improvement Target for each year:

- **DY4**: Improvement Target: Reduce ED visits for targeted conditions by X% from baseline Y3
- **DY5**: Improvement Target: Reduce ED visits for targeted conditions by X% from baseline Y3

### Rationale:

High emergency room (ER) utilization is a considerable concern for the increasing cost of health care. Frequent and inappropriate use of hospital ERs is extremely costly and care could be provided in a less expensive setting. Patients, when possible, should be treated by their primary care provider for non-emergency conditions in order to promote consistent, quality care. The targeted population will be the Carelink members assigned to University Health System patient centered medical homes. CareLink is a financial assistance program for uninsured residents of Bexar County. The program was created in 1997 to help address the needs of Bexar County residents without health care coverage who were not eligible for Medicaid or other public or private funding. While CareLink is not an insurance product per se, it has many similar advantages in terms of promoting access to preventive health services, encouraging a long lasting relationship with a primary care provider, and instilling a sense of shared responsibility between member and staff for the member’s health. As of December 31, 2011, there were 54,256 members enrolled in CareLink.
### Outcome Measure Valuation:

This outcome will be valued based on the number of emergency visits avoided by patients with COPD, behavioral health diagnoses, diabetes exacerbations, and asthma. The rationale is implementing the PCMH allows for expanded primary care, better care coordination, and improved chronic disease management. This supports a reduction in avoidable emergency center visit for patients with these specific conditions.

Identifying Outcome Measure and Provider Information:
Title of Outcome Measure (Improvement Target): IT-4.10 Other Outcome Improvement Target: Enhance Improvement Capacity within People (Improving Inter-professional Team-Based Care for Patient Safety)
Unique RHP ID#: 085144601.3.1 – PASS 1
PERFORMING PROVIDER: University of Texas Health Science Center at San Antonio; Kathleen R. Stevens, RN, EdD, FAAN
TPI: 085144601

Outcome Measure Description:
DYs 2 and 3 Process Milestones

Process Milestone 1
P-1. Project Planning-Engage stakeholders, identify current capacity and document implementation plan.

Process Milestone 2
P-2. Establish baseline for team attitudes toward team-based performance.

Outcome Improvement Targets

YEAR 4:
OUTCOME MEASURE: AHRQ Teamwork Attitudes Questionnaire
1-X-1 METRIC Average of 5% gain of cohort on team performance (difference on Pre and Post scores on trainee-reported AHRQ Teamwork Attitudes Questionnaire)

OUTCOME MEASURE: AHRQ Medical Office or Hospital Survey on Patient Safety Culture
1-X-2 METRIC Average of 5% gain of cohort on culture of patient safety (difference on Pre and Post scores on trainee-reported AHRQ culture of patient safety survey)

YEAR 5:
OUTCOME MEASURE: AHRQ Teamwork Attitudes Questionnaire
1-X-1 METRIC Average of 5% gain of cohort on team performance (difference on Pre and Post scores on trainee-reported AHRQ Teamwork Attitudes Questionnaire)

OUTCOME MEASURE: AHRQ Medical Office or Hospital Survey on Patient Safety Culture
1-X-2 METRIC Average of 5% gain of cohort on culture of patient safety (difference on Pre and Post scores on trainee-reported AHRQ culture of patient safety survey)

Rationale:
Nationally referenced measures will be used to gather data on staff opinions about patient safety issues, medical error, and event reporting. Specifically, The AHRQ Survey on Patient Safety Culture (SOPS) (Sorra & Nieva, 2004; Sorra & Dyer, 2011) will be used to gather data on staff opinions about patient safety issues, medical error, and event reporting during Year 4 and 5. One of two versions of SOPS will be used, depending on the setting. Both measure 12 areas of composites of patient safety culture. The scales demonstrate high reliability (Sorra & Dyer, 2010). An advantage of the SOPS is the opportunity it provides for referencing local data to national benchmarks. AHRQ produces a national comparative database report that provides survey results on over 1,000 healthcare settings, classified by setting characteristics and respondent characteristics (e.g., work area and staff position). These national data will be used
as benchmarks to better evaluate the local results.

**Outcome Measure Valuation:**

<table>
<thead>
<tr>
<th>Outcome Measure Valuation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Because a healthcare setting’s culture of patient safety is demonstrated to be directly related to prevention of healthcare associated harm and reflects higher organizational just cultures, teams that hold strong allegiance to high team performance are crucial within the context of the high reliability organization. The project valuation is based on creating a care climate that potentially prevents adverse medical events. The project is valued based upon achieving waiver goals, meeting community needs, scope, and investment.</td>

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-11.1 Improvement in Clinical Indicator in Identified disparity group
Unique RHP ID number: 085144601.3.2 – PASS 1
Performing Provider: University of Texas Health Science Center at San Antonio
TPI: 085144601

Outcome Measure Description:
Outcome Measure: Improvement in Clinical Indicator in Identified disparity group
We will focus our project on improving outcomes of low income Latino patients with Medicaid, CareLink (county-funded financial assistance), and no insurance who are not meeting quality of care, health maintenance goals or requiring treatment with narcotics for pain. We will first target individuals with diabetes mellitus who have a mean hemoglobin (Hb) A1C level of \( \geq 7.5\% \) which increases the patients’ risk of diabetes complications. Second, we will identify a similar cohort of persons who have sustained uncontrolled systolic hypertension, which is the dominant form of uncontrolled hypertension. Third, we will identify persons who have chronic non-cancer pain and are treated with narcotics long-term since these individuals are known to be heavy users of emergency and hospital services as well as at risk for overdose events. Finally, we will identify HIV-infected persons in our local HIV clinic who have Ryan White or CareLink insurance because we have found that over 60% are overweight or obese and are still having significant weight gain.

Milestones

Year 2:
- P-1 Project Planning-engage stakeholders from study practices, administrators from involved health care systems and patients in those practices identify current capacity and needed resources.
- P-2 Establish baseline rates of uncontrolled hypertension, elevated hemoglobin A1c, and weight of HIV-infected persons who have Ryan White or CareLink insurance in our clinics as well as quality of care measures for patients on long-term opioids (>90 days in 180)

Year 3:
- P-3 Develop and test data derived from the registries
- P-4 Conduct plan do Study Acts (PDSA) cycles to improve data collection and intervention activities.

Year 4:
- P-5 Implement patient support programs, disseminate findings, including lessons learned and best practices, to stakeholders throughout the community

Year 5:
- Improvement in clinical indicators in identified disparity group vs. other patients

Outcome improvement targets:
Year 4:
(IT-11.1]: Improvement in clinical indicators in both Hispanic and non-Hispanic populations related to hypertension control, reduction in rapid risk in BMI of HIV infected patients who are overweight or obese, hemoglobin A1C. But reductions are expected to be greater in Hispanics group because of poorer status at baseline.

Year 5:
Rationale:

Related to Category 3 Outcome Measures, this project will address Outcome Dimension 11: Addressing Health Disparities in Minority Populations, specifically Improvement in Clinical Indicators in Latino Populations. The clinical indicators chosen for this project include hypertension control, HbA1c reduction, and HIV care goals of reducing excessive weight gain in persons who are overweight or obese. These measures are a priority for the RHP because research and national surveys conducted by the CDC have shown that low-income, Latino populations are disproportionately affected by poor clinical and functional status reflecting poor achievement of chronic disease management goals and a high prevalence of overweight and obesity. Thus, morbidity and chronic disease management are areas of great concern for providers caring for Latinos. Our population is over 60% Latino in our primary care clinics and, in our HIV clinic, Latinos and African-Americans represent 77% of our patient population. In terms of hypertension, the goal of this project is to improve the comprehensiveness of our data entry and its accuracy so that valid blood pressure data are recorded for at least 90% of our Latino population. For Latinos with a mean HbA1c over 7.5, efforts to reduce this level to under 7.5 is not only cost-effective but and reduces the risk of diabetes complications when <7% according to the ADA. We propose to reduce the mean HbA1c from the current 7.7% in our study practices to 7.3 (5% absolute reduction) by targeting the persons who fail to keep their appointments and who have elevated HbA1c. We will also use our visit arrival status variable to target persons who need additional support. We have found that the average relative reduction in HbA1c for persons with an HbA1c over 8% at baseline is -15.9% for persons who keep >75% of visits vs. only -9.5% for persons who keep <60% of visits. We will also target minority patients in our HIV clinic to raise consciousness about the risks of obesity and offer specific, culturally appropriate support programs to help control weight gain – both in the practice and in the community (e.g. Weight Watchers). Similarly, we will reduce the proportion of Latinos who have uncontrolled hypertension despite therapy by 10% and achieve at least a 3-5 mmHg reduction in systolic blood pressure. We will be able to achieve these goals by using the registry to define patients who need additional support to achieve goals and to implement evidence-based community health worker (promotora) interventions to address these health risks through promotoras and peer support. In collaboration with the patient practices, promotoras and trained peers will provide culturally appropriate outreach aimed at reducing disparities for low-income and Latinos. The use of promotora and peers support is particularly effective in minority populations and has been shown to significantly reduce HbA1c, systolic blood pressure, and improve receipt of needed cancer prevention services. For example, to reduce significant disparities in cardiovascular risk, Dr. Turner led a successful randomized controlled trial of peer support for uncontrolled hypertension in an African-American population that resulted in a reduction in systolic blood pressure that was equal to adding a new drug (Turner BJ et al. JGIM 2012). As in prior research conducted by Dr. Turner, we will train a community based providers, promotoras, and peers to support patients to achieve their disease goals. These are evidence-based interventions that offer culturally appropriate outreach aimed at reducing disparities for low-income. Latino patients.

The process milestones were chosen as stated above in order to develop a strong collaborative
team approach between the clinical staff, administrators, stakeholders, and participating practices. The first steps in DY 2 will be project planning (P-1) through stakeholders who include community advisory board members, providers from study practices, and Latino patients to review barriers to achieving reductions in baseline poor control of (P-2) of HbA1C, systolic blood pressure and excessive increase in BMI in HIV-infected persons. The procedures for testing data collection will be evaluated using the Plan Do Study Act (PDSA) cycles (P-4). In DY 3 a similar process will provide for accurate measurement of baseline status on key clinical variables from which to measure the success of the promotora and peer coach support intervention. In particular, we chose to add Process milestone P-3 --Develop and test data systems -- in order to determine any new systemic changes necessary to obtain needed data that were not available in DY2 especially targeting factors that are important to Latinos. We chose to add (P-5) to disseminate findings, including lessons learned and best practices, to stakeholders in DY 4 and DY 5 to improve the understanding and use of the registry. To accomplish this we will partner with the federally funded Area Health Education Center (AHEC) that has a strong relationship with healthcare providers throughout our region as well as key community stakeholders from major organizations and businesses.

Outcome Measure Valuation:

Achieves Waiver Goals: This project will work to reduce well observed disparities that patients from under-represented minorities -- especially those on Medicaid, receiving financial assistance for care, or uninsured -- have in receiving high quality, patient-centered care that will improve chronic disease care status as well as ultimately reduce unnecessary complications that increase hospital and emergency room utilization. Previous research on the effectiveness of patient registries shows that they facilitate identification of at-risk patients and, for diabetics, can direct programs to help patients meet Hgb A1c control goals and reduce complications as well as costs of care. Dr Turner’s previous research has used registries to examine racial disparities in hypertension control and management of hyperlipidemia (Umscheid, Gross, Weiner, Hollenbeak, Tang, Turner, 2010; Turner, Hollenbeak, Weiner, Ten & Roberts, 2009; Turner, Hollenbeak, Weiner & Tang, 2011)

Address Community Need(s): This project addresses community priority needs described in the Community Health Improvement Plan for Bexar County for: Healthy Eating and Active Living and Behavioral and Mental Well-Being. Priority health issues addressed by this project include diabetes, obesity, and hypertension. Registries are increasingly adopted nationally to effectively characterize patient health care needs and respond with appropriate interventions. Through the diabetes and other registries, we will make this unique resource available to providers and patients in order to guide efforts to achieve the goals of the Community Health Improvement Plan for Bexar County.

Project Scope: All the proposed database registries will include approximately 10,000 patients and 30 providers. Providers who are recruited and trained in using these data will be more empowered to improve patient outcomes by targeting interventions and support to those who need it most. The cost of diabetes is high (as of 2007, $91.8 billion in direct costs and $39.8 billion spent on indirect expenses) and rising. Previous research estimates costs will be decreased if we are able to decrease hemoglobin A1c (a $2,536 cost differential accrued over 3 years between patients with an A1c of 6% to 7% versus those 9% to 10% who had diabetes along with comorbid heart disease and hypertension) (Gilmer TP, O'Connor PJ, Rush WA, et al. Predictors of health care costs in adults with diabetes. Diabetes Care.2005;28:59–64). Similar to diabetes, obesity and hypertension also incur increased costs of care relative to persons without these
conditions. However one of the critical aspects of both diabetes and obesity are of the fact that it disproportionately affects minorities. In our Texas region obesity is a major health risk for Latinos and it even affects HIV-infected Latinos. Our goal in this project is to start to address some of these health disparities that put Latinos increased risk of diabetes complications as well as other ravages of obesity in regard to the degenerative joint disease and chronic pain. The proposed registry will allow us to see a decrease in the clinical indicators of hypertension control, stabilization of BMI of HIV infected patients who are overweight or obese, hemoglobin A1C among Hispanics in the registry.

**Project Investment:** The expected investment in this program for Human Resources will include the cost of promotoras, project coordinator, peer coaches and the data mining team. Equipment purchase and maintenance will be covered by our accompanying project to develop a Health Information Exchange and improved data linkages between the data derived from the Sunrise electronic medical record and UT medicine billing data – making this a relatively cost-effective project. The time to implementation of updated diabetes and HIV registries will be one year which will be used to complete the registry and hire and train staff in use of the registry. Subsequent hypertension registry will be completed in year 2-3 and staff trained by year 4. We will also develop the database of patients on long-term opioids by the end of year 3. Several organizational priorities will be met by the development of these longitudinal chronic disease registries but the most important is to insure that we provide comprehensive, value-based care that improves the health of the vulnerable populations that we serve.

Title of Outcome Measure (Improvement Target): IT-11.2 Improvement in disparate health outcomes for target population, including identification of the disparity gap
Unique RHP ID number: 085144601.3.3 – PASS 1
Performing Provider: University of Texas Health Science Center at San Antonio
TPI: 085144601

Outcome Measure Description:

Outcome Measure: Improvement in disparate health outcomes for target population, including identification of the disparity gap

We will focus our project on improving outcomes of low income Latino patients with Medicaid, CareLink (county-funded financial assistance), and no insurance relative to non-Hispanic whites who have a similar insurance groups. We will first target individuals with diabetes mellitus who have a mean hemoglobin (Hb) A1C level of \( \geq 7.5\% \) which increases the patients’ risk of diabetes complications. Second, we will identify a similar cohort of persons who have sustained uncontrolled systolic hypertension, which is the dominant form of uncontrolled hypertension. Third, we will identify persons who have chronic non-cancer pain and are treated with narcotics long-term since these individuals are known to be heavy users of emergency and hospital services as well as at risk for overdose events. Finally, we will identify HIV-infected persons in our local HIV clinic who have Ryan White or CareLink insurance because we have found that over 60% are overweight or obese and are still having significant weight gain.

Milestones

Year 2:
- P-1 Project Planning-engage stakeholders identify current capacity and needed resources.
- P-2 Establish baseline rates of uncontrolled hypertension, elevated hemoglobin A1c, and BMI in HIV-infected persons who have Ryan White or CareLink insurance in our clinics

Year 3:
- P-3 Develop and test data
- P-4 Conduct plan do Study Acts (PDSA) cycles to improve data collection and intervention activities.

Year 4:
- P-5 Implement patient support programs Disseminate findings, including lessons learned and best practices, to stakeholders

Year 5:
- Improvement in clinical indicators in identified disparity group vs. other patients

Outcome improvement targets:

Year 4:
[IT-11.2]: Improvement in disparate health outcomes for target population, including identification of disparity gap

Year 5:
[IT-11.2]: Improvement in disparate health outcomes for target population, including identification of disparity gap
Rationale:
Related to Category 3 Outcome Measures, this project will address Outcome Dimension 11: Addressing Health Disparities in Minority Populations, specifically Improvement in Clinical Indicators in Latino Populations. The clinical indicators chosen for this project include hypertension control, Hb A1C reduction to goal, and HIV care goals of reducing excessive weight gain in persons who are overweight or obese. These measures are a priority for the RHP because research and national surveys conducted by the CDC have shown that low-income, Latino populations are disproportionately affected by poor clinical and functional status reflecting poor achievement of chronic disease management goals and a high prevalence of overweight and obesity. This project will focus on reducing gaps between Latinos and non-Hispanic whites. For persons with a mean HbA1c over 7.5, efforts to reduce this level to under 7.5 is not only cost-effective but and reduces the risk of diabetes complications when <7% according to the ADA. For example we know that in our two primary care clinics, 55.7% of Latinos (81.7% of all diabetic patients in these practices) have a HbA1c under 7.5 versus 61.2% of whites (11% of diabetics in practices). Although our African-American diabetic population is much smaller (7.1%), they will also benefit from this intervention because in that group the proportion with an HbA1c under 7.5 is only 50.4%. We propose to reduce the mean HbA1c from the current 7.7% in our study practices to 7.3 (5% absolute reduction) by targeting especially the Latinos persons who fail to keep their appointments and who have elevated HbA1c. Currently, we have found that the average relative reduction in HbA1c for persons with an HbA1c over 8% at baseline is -15.9% for persons who keep >75% of visits vs. only -9.5% for persons who keep <60% of visits. Thus, these patients are less likely to benefit from longitudinal diabetes care.

Similarly, we will reduce the proportion of patients who have uncontrolled hypertension despite therapy by 10% and achieve at least a 3-5 mmHg reduction in systolic blood pressure. In regard to obesity in the HIV clinic, the most rapid weight gain among the persons who are overweight or obese is observed in the minority patients who have either CareLink or Ryan White insurance. We will be able to achieve these goals by using the registry to define patients who need additional support to achieve goals and to implement evidence-based community health worker (promotora) interventions to address these health risks through promotoras and peer support. In collaboration with the patient practices, promotoras and trained peers will provide culturally appropriate outreach aimed at reducing disparities for low-income, Latino patients. To address health disparities, Dr. Turner led a successful randomized controlled trial of peer support for uncontrolled hypertension in a minority population that resulted in a reduction in systolic blood pressure similar to adding a new drug (Turner BJ et al. JGIM 2012). As in prior research conducted by Dr. Turner, we will train non physician, community based providers and peers to support patients to achieve their disease goals. These are evidence-based interventions that offer culturally appropriate outreach aimed at reducing disparities for low-income and Hispanic patients.

In the past decade, diagnosis, management, and control of hypertension (HTN) has improved significantly but several groups continue to lag behind including: persons with diabetes mellitus (DM), non-Hispanic blacks, and Mexican-Americans (Gu, Burt, Dillon & Yoon, 2012). Similarly to hypertension, Hispanics are more likely than the general population to develop diabetes. It is estimated that 2.5 million, or 10.4 percent of Hispanic and Latino Americans aged 20 and older have diabetes. Hispanics also are more likely to have undiagnosed diabetes than non-Hispanic whites and non-Hispanic blacks (National Alliance of Hispanic Health, 2010). Unfortunately, minority groups disproportionately bear this dual disease burden. We will also be measuring and addressing the BMI of HIV-infected persons who are primarily comprised of
Hispanics and blacks locally and nationally (Hall HI, Song R, Rhodes P, et al., 2008). Weight gain has been identified as a problem for HIV-infected patients (Torriani, Fitch, Stavrou, et al., 2012) and this registry will allow us to target patients who require additional support to reduce rapid weight gain.

The process milestones were chosen as stated above in order to develop a strong collaborative team approach between the clinical staff, administrators, stakeholders, and participating practices. The first steps in DY 2 will be project planning (P-1) through the use of a community advisory board members who will be referred to as stakeholders, then establishment of baseline rates (P-2) of HbA1C, diastolic blood pressure and BMI of HIV-infected persons. The procedures for testing data collection will be evaluated using the Plan Do Study Act (PDSA) cycles (P-4). In DY 3 a similar process will provide for accurate measurement of baselines from which to measure the success of the promotora intervention. In particular, we chose to add Process milestone P-3 Develop and test data systems in order to determine any new systemic changes in data collection that the collaborations may have allowed for that may not have been available in DY2. We chose to add (P-5) Disseminate findings, including lessons learned and best practices, to stakeholders in DY 4 and DY 5 to improve on the understanding and use of the registry.

**Outcome Measure Valuation:**

**Achieves Waiver Goals:** This project assures that patients -- especially those on Medicaid or uninsured --will receive high quality, patient-centered care with high value services that will reduce use of costly urgent care services and reduce unnecessary or duplicative tests/services. Previous research on the effectiveness of patient registries show that they facilitate identification of at-risk patients and, for diabetics, can direct programs to help patients met Hgb A1c control goals and reduce complications as well as costs of care.

**Address Community Need(s):** This project addresses community priority needs described in the Community Health Improvement Plan for Bexar County for: Healthy Eating and Active Living and Behavioral and Mental Well-Being. Priority health issues addressed by this project include diabetes, obesity and hypertension. Registries are increasingly adopted nationally to effectively characterize patient health care needs and respond with appropriate interventions. Through the diabetes and other registries, we will make this unique resource available to providers and patients in order to guide efforts to achieve the goals of the Community Health Improvement Plan for Bexar County.

**Project Scope:** The proposed database registries will include approximately 10,000 patients with 30 providers (faculty, residents, and medical students). Providers who are recruited and trained in using these data will be more empowered to improve patient outcomes by targeting interventions and support to those who need it most – especially Latinos. The cost of diabetes is high (as of 2007, $91.8 billion in direct costs and $39.8 billion spent on indirect expenses) and rising. Previous research estimates costs will be decreased if we are able to decrease hemoglobin A1c (a $2,536 cost differential accrued over 3 years between patients with an A1c of 6% to 7% versus those 9% to 10% who had diabetes along with comorbid heart disease and hypertension) (Gilmer TP, O'Connor PJ, Rush WA, et al., 2005). Similarly to diabetes, obesity and hypertension also have high costs. This proposed registry will allow us to identify the gap that exists between Hispanics and non-Hispanics in regard to specified clinical indicators. We will conduct multivariable analyses examining the association of race-ethnicity with improvement in clinical
indicators – systolic blood pressure, HbA1c, and BMI (in HIV-infected persons).

**Project Investment:** The expected investment in this program for Human Resources will include the cost of trainers, promotoras, project coordinator and the data mining team. Equipment purchase and maintenance will be covered by our accompanying project to develop a Health Information Exchange – making this a relatively cost-effective project. The time to implementation of updated diabetes and HIV registries will be one year which will be used to complete the registry and hire and train staff in use of the registry. Subsequent hypertension registry will be completed in year 2-3 and staff trained by year 4. Several organizational priorities will be met by the development of these longitudinal chronic disease registries but the most important is to insure that we provide comprehensive, value-based care that improves the health of the vulnerable populations that we serve.
### Improvement in disparate health outcomes for target population, including identification of the disparity gap. (Addressing Health Disparities in Minority Populations)

<table>
<thead>
<tr>
<th><strong>Rationale:</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>We need work to develop strategies that encourage graduates of all of these programs to remain and practice in South Texas. This will each program to learn from each challenges and successes of other programs and disciplines. Texas has a serious shortage of primary care providers. Working together should allow us to develop ideas to select trainees that are likely to stay in Texas and to encourage them to stay after training.</td>
</tr>
<tr>
<td>Other projects within the overall proposal are designed to increase the primary care workforce. There is a natural collaboration with all venues for increasing primary care training, but most specifically with those that increase Family Physician training. This will fit very well with the project to start a new Family Medicine residency in the McAllen area. We will also be in a position two develop some interdisciplinary training with programs in the area that training Physician assistants and Family Nurse Practitioners.</td>
</tr>
<tr>
<td>Additionally, we work to develop strategies that encourage graduates of all of these programs to remain and practice in South Texas. This will each program to learn from each challenges and successes of other programs and disciplines. Texas has a serious shortage of primary care providers. Working together should allow us to develop ideas to select trainees that are likely to stay in Texas and to encourage them to stay after training.</td>
</tr>
<tr>
<td>There are also organizations and training programs training primary care providers that are not part of the DSRIP process (ex. other Family Medicine residency programs in Texas). We will plan to work with them closely on common issues. The Texas Academy of Family Physicians should be able to assist in developing forums to work on common problems with these</td>
</tr>
</tbody>
</table>
Measurement and tracking of changes will be done through the Annual Review of program effectiveness process. These results are reported to the department chair. The Associate Dean for Graduate Medical Education also receives the results of this process and has additional oversight for the educational processes.

There are multiple academic meetings at which the results can be disseminated. The most important would probably be the Texas Family Medicine Leadership Conference, which is sponsored by the Texas Academy of Family Physicians on a yearly basis. Most family medicine residencies in Texas have representatives at the meeting.

**Outcome Measure Valuation:**

Implementation of the Patient Centered Medical Home will require more primary care providers. Family Medicine is that specialty that trains the most physicians who remain in primary care for an extended part of their career. The number of physicians in practice is driven almost solely by the number of residency slots and is relatively unrelated to medical school training positions.

Size of expansion is based on a realistic assessment of the potential for additional quality training in this medical center. A much greater expansion is needed based on the future needs of the growing population of South Texas, but any expanded training must be high quality training.

Additional, patient care will occur in the Family Health Center as part of the residency expansion, but the greater impact will be in the additional primary care physicians practicing in South Texas.

</tr>
</tbody>
</table>

### Outcome Measure Description:

| In DY 2 the focus will be on project planning, establishing baseline patient satisfaction scores and developing and testing the EpicCareLink referral system. Once baseline satisfaction scores are available the outcome improvement target for DY 3-5 will be determined. DY 3 will be devoted to conducting Plan Do Study Act (PDSA) cycles, disseminating findings through learning collaboratives and beginning to demonstrate improvement in patient satisfaction scores. The focus in DY 4-5 will be continued improvement in patient satisfaction scores. |

### Rationale:

The RHP 6 needs assessment identified access to specialty care as a key health challenge for the region, and continued population growth is expected to exacerbate this problem in the future. A large academic medical center in the Midwestern US addressed a problem with specialty care access by implementing a web-based referral system, showing that referrals generated through that system were more than twice as likely to lead to a scheduled visit with a specialty physician (Weiner, M, El Hoyek, G. A web-based generalist-specialist system to improve scheduling of outpatient specialty consultations in an academic center. J Gen Intern Med. 2009 Jun;24(6):710-5). We expect that implementation of a similar web-based referral system (EpicCareLink) at UT Medicine will result in similar outcomes along with an improvement in patient satisfaction related to specialty referrals.

The process milestones of project planning, developing and testing the EpicCareLink referral portal, and establishing baseline patient satisfaction scores in DY 2 set the foundation for technical and operational success of the project. In DY 3 PDSA cycles and dissemination of findings to others and gaining knowledge from other groups through learning collaboratives will lead to further refinements in the technical configuration of the EpicCareLink referral portal and inform decisions on how to most effectively operationalize this technology to improve access to specialty care. We expect to see improvements in the outcome improvement target beginning in DY 3 through DY 5 and beyond.

### Outcome Measure Valuation:

The project valuation section state the project is valued based upon achieving waiver goals, meeting community needs, scope, and investment.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $479,148**
**Identifying Outcome Measure and Provider Information:**

| Title of Outcome Measure (Improvement Target): IT-1.10 Diabetes care: HbA1c poor control (>9.0%) NQF 0059 |
| Unique RHP Outcome Identification Number: 085144601.3.6 – PASS 1 |
| Performing Provider Name: University of Texas Health Science Center at San Antonio |
| Performing Provider TPI: 085144601 |

**Outcome Measure Description:**

| DY 2 will be devoted to project planning, developing and testing the chronic disease database/registry and establishing baseline rates of diabetic patients in the registry with HbA1C > 9.0%. In DY 3 we will begin to conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities, disseminate our findings to other groups and reduce the percentage of diabetic patients with HbA1C > 9.0% by 1% compared to the baseline that will be determined in DY 2. In DY 4 we will reduce the percentage of diabetic patients with HbA1C > 9.0% by another 1%. In DY 5 we will reduce the percentage of diabetic patients with HbA1C > 9.0% by another 1%, resulting in a reduction of 3% by the end of the waiver. |

**Rationale:**

| We have chosen IT 1.10 Diabetes care: HbA1c poor control (>9.0%) NQF 0059 (Standalone measure) as the Category 3 outcome measure for this project. Diabetes registries have been shown to be an effective tool to help manage underserved populations with diabetes as evidenced by improvements in A1C values (Seto W, Turner BS, Champagne MT, Liu L. Utilizing a diabetic registry to manage diabetes in a low-income Asian American population. Population Health Management 2012;15:220-229). Sixty percent of the 16,000 deaths in RHP 6 in 2008 were the result of preventable causes including diabetes. According to the RHP 6 Needs Assessment, “Disease management …programs are critical to reducing morbidity and mortality of these diseases.” |

| The process milestones of project planning, developing and testing the HIE and chronic disease registry, and establishing baseline rates of diabetic patients in the registry with HbA1C > 9% in DY 2 set the foundation for technical and operational success of the project. In DY 3 PDSA cycles and dissemination of findings to others and gaining knowledge from other groups through learning collaboratives will lead to further refinements in the HIE and chronic disease registry and inform decisions on how to most effectively operationalize this technology to improve the health of our underserved population. We expect to see improvements in the outcome improvement target beginning in DY 3 through DY 5 and beyond. |

**Outcome Measure Valuation:**

| In 2010 alone Bexar county had 14,769 potentially preventable hospitalizations costing approximately $372,000,000 at $25,212 per hospitalization (www.dshs.state.tx.us/ph). Improved chronic disease management will reduce the number of potentially preventable hospitalizations as well as preventable emergency department visits. We conservatively anticipate that this project will prevent at least 500 hospitalizations over the four year project period resulting in a total savings of $12,606,000. The project valuation section state the project is valued based upon achieving waiver goals, meeting community needs, scope, and investment. |

**Outcome Measure Description:**

Outcome Measure 3.IT-3.8 seeks to reduce 30 day readmission rates. This can be done by assuring that accessible and effective outpatient programs exist to refer patients to upon discharge from the initial hospital visit and by integrating our program for seamless continuity of care follow-up for discharged patients. In DY2, three process milestones will begin to establish the STOP program envisioned as the accessible and effective outpatient treatment program. The goal of Project Planning (P-1) is to engage University Health System stakeholders and hire the program faculty and staff necessary to develop and establish the STOP program. Metrics include the recruitment of faculty and hiring of staff, and the development of program procedures and training plan, and integration of the STOP Program within University Health System Outpatient clinical programs. Success will be demonstrated through the documented achievement of these goals. We also will work with University Health System to Establish Baseline Rates (P-2) through data pulled from the EMR to track current rates of 30 day readmissions to the hospital or to the ER. Finally, we will Develop and Test Data Systems (P-3) capable of providing the outcome tracking necessary for the evaluation of program success. With these processes begun in DY2, two processes of DY3 will be devoted to evaluating and refining our program processes. First, we will conduct Plan-Do-Study-Act (PDSA) cycles (P-4) to evaluate our data collection processes for both the performance metrics within the STOP Program and from the hospitalization records of STOP Program patients. Our goal is to establish and improve the level of STOP Program operational success in treatment and hospital/ER visit prevention. Finally, it is critical to Disseminate Findings (P-5) to stakeholders and to identify lessons-learned and best practices to assure success. With STOP Program operations and performance metrics in place, DY3-DY4 will see further expansion of our patient care capacity through the addition of community provider trainees and continued program evaluation through PDSA cycle monitoring. Also in DY 4 and continuing through DY5, we can determine and improve upon the achievement of our Outcome Improvement Target to reduce readmission rates by at least 10% through effective STOP Program involvement.

**Rationale:**

Outcome Measure OD-3-IT-3.8 seeks to reduce 30 day readmission rates which for the STOP Program includes both inpatient admissions and ER visits. Readmission is understood to occur when ineffective initial treatment is given or when there is lack of efficacy for the follow-up treatment, or when there is lack of adherence to prescribed effective treatments. In the case of substance use disorder (SUD), neither hospitalization nor ER visits alone are considered effective treatment and therefore the critical feature is to have accessible and effective programs for post-discharge aftercare. Inadequate outpatient care infrastructure for adults with moderate behavioral health needs including substance abuse/dependence is well known and was identified in the Section III Needs Assessment Report. Also identified is the known reality that inadequate outpatient care programs result in unnecessary hospitalizations and Emergency Room visits. The STOP Program is designed to provide the outpatient continuum of care necessary for University
Health System to provide effective treatments and long-term relapse prevention using the evidence-based medication and non-medication treatments required to prevent ER visits and hospitalization. Successful rehabilitation and maintenance of relapse prevention through the STOP Program also will reduce unnecessary University Health System service utilization associated with comorbid disease deterioration.

**Outcome Measure Valuation:**

SUD is a chronically recurring disorder with a high risk of relapse that if left untreated, results in progressively more destructive patterns of disability, socioeconomic cost, and medical comorbidity. The STOP Program seeks to reduce hospital readmission by increasing the access to the continuum and continuity of care required to maximize treatment outcome and minimize the chances of full-blown relapse. Prevention of hospital visits for patients with SUD could save $1,000-2,000 per ER visit, $1,000-$3,000 per day of Hospital Admission. Of course the costs of trauma care and transplant services and the treatment of infectious diseases are much higher and effective outpatient treatment will also reduce these adverse outcomes. 3. Cost associated with preventing a single fatality related to DWI is estimated to be $3,300,000. There also are substantial cost savings in law enforcement and incarceration costs that could be considered in terms of community savings.

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores
Unique RHP ID#: 085144601.3.8 – PASS 1
Performing Provider: University of Texas Health Science Center at San Antonio
Performing Provider TPI: 085144601

Outcome Measure Description:
Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider target for improvement

1. Timely care, appointments, and information
2. Patient’s rating of doctor access to specialist

Process Milestones
DY2: P-1: Project Planning – engage stakeholders, identify current capacity and needed resources, determine timeline and document implementation plan
DY3: P-2: Establish baseline rates for patient satisfaction

Improvement Targets
I-23 Increase specialty care clinic volume of visits and evidence of improved access for patients seeking service

DY4: 5 percent over baseline
DY5: 10 percent over baseline

Rationale:
Providing patients with increased access to neurologic services leading to earlier intervention in patients with neurologic illnesses may prevent or slow deterioration or improve quality of life, and decrease the need for emergency department visits. Currently, the clinic is not adequately staffed to meet the ongoing needs of patients with neurologic diseases. Lack of timely access to a neurologist results in unnecessary visits to the emergency department often resulting in unnecessary admissions and/or increased length of stay for services that are not available in a timely fashion.

Outcome Measure Valuation:
Lack of timely access to a neurologist results in unnecessary visits to the emergency department often resulting in unnecessary admissions and/or increased length of stay for services that are not available in a timely fashion. Increased availability of outpatient neurologic services will result in reduced appointment waiting times, decreased ED utilization, and reduced lengths of stay.

The project is valued based upon achieving waiver goals, meeting community needs, scope, and investment.

### Outcome Measure Description:

- Patient Satisfaction Scores for the following domains:
  1. Timely care, appointments, and information
  2. Patient rating of doctor access to specialist

### Process Milestones

- **DY2: P-1** Project planning – identify current capacity and needed resources, determine timeframes, and document implementation plans
- **DY3: P-2** Establish baseline rates for patient satisfaction

### Improvement Targets for DY3, DY4, and DY5:

- **DY4:** 5 percent over baseline
- **DY5:** 10 percent over baseline

### Rationale:

This outcome improvement target was selected to measure patient satisfaction with access to services.

### Outcome Measure Valuation:

Individuals with medical conditions affecting brain functioning often result in neuropsychiatric symptoms impaired cognitive abilities. Both of which are risk factor for decline in functional abilities. A decline in functional abilities affects patients’ ability to obtain/maintain employment resulting in lost productivity and work-related earnings.

The project is valued based upon achieving waiver goals, meeting community needs, scope, and investment. The project is valued based upon achieving waiver goals, meeting community needs, scope, and investment.

Outcome Measure Description:

**DY 2** Develop Asthma outreach plan in order to effect appropriate utilization across Medicaid and indigent populations visiting the UTNCs

**DY 3** Define Asthma ED utilization baseline rate for those Medicaid and indigent patients visiting the UTNCs

**DY 4** IT-9.2 Improvement Target: ED appropriate utilization; Reduce Asthma ED visits by 10% over year DY 2 for established patients at the UTNCs who are Medicaid and or indigent.

**DY 5** IT-9.2 Improvement Target: ED appropriate utilization; Reduce Asthma ED visits by 20% over year 2 for established patients at the UTNCs who are Medicaid and or indigent.

Rationale:

In 2012, a survey from The Weather Channel and the Asthma and Allergy Foundation reported that San Antonio's spring allergy was the ninth worst in the nation, up from number 42 in 2011. Allergies, along with pollution, are triggers for asthma. The Medicaid and indigent populations are most susceptible to these triggers. One contributing factor is that the homes they occupy are not up to code for mold prevention; therefore, many of them live with the allergen triggers not only in the outside air, but in the places they reside.

According to the American Academy of Allergy, Asthma & Immunology (AAAAI), for the period 2007–2009 compared with adults, children had higher rates for asthma primary care and emergency department visits, similar hospitalization rates, and lower death rates from 2001 to 2009, health care visits for asthma per 100 persons with asthma declined in primary care settings, while asthma emergency department visit and hospitalization rates were stable. For the period 2008–2010, asthma prevalence was higher among children than adults. The number of people with asthma continues to grow. One in 12 people (about 25 million, or 8% of the U.S. population) had asthma in 2009, compared with 1 in 14 (about 20 million, or 7%) in 2001. More than half (53%) of people with asthma had an asthma attack in 2008. More children (57%) than adults (51%) had an attack. 185 children and 3,262 adults died from asthma in 2007.

As indicated, we will focus on keeping the asthma patients healthy and well-controlled in the primary care setting, thus reducing the ED visits and hospitalizations. In the baseline year, we will establish the status of our UTNC patients with asthma.

Outcome Measure Valuation:

Per the AAAAI, asthma cost the US about $3,300 per person with asthma each year from 2002 to 2007 in medical expenses, missed school and work days, and early deaths. Asthma costs in the US grew from about $53 billion in 2002 to about $56 billion in 2007. More than half (59%) of children and one-third (33%) of adults who had an asthma attack missed school or work because of asthma in
2008. On average, in 2008 children missed 4 days of school and adults missed 5 days of work because of asthma.

Untreated asthma will lead to more costly respiratory infections/illnesses, an increase in ED visits and hospitalizations, permanent narrowing of the airways, increased use of rescue medications, missed school days and getting behind in school, poor sleep and fatigue symptoms that interfere with play, sports and other activities that promote health and development.

Accessible, cost-effective primary care, patient/parent coaching and education will allow maintenance of asthma care patients. This project will enable the UTNC to reduce ED visits by 10% over the baseline in DY4 and by 20% in DY5.

### Identifying Outcome Measure and Provider Information:

- **Title of Outcome Measure (Improvement Target):** IT 1.11 Diabetes care: BP control (<140/80mm Hg) NQF 0061 (Standalone measure)
- **Unique RHP ID:** 085144601.3.13 – PASS 1
- **Performing Provider Name:** University of Texas Health Science Center at San Antonio
- **TPI:** 085144601

### Outcome Measure Description:

Diabetes care: BP control (<140/90mm Hg)

- **Numerator:** Use automated Epic EHR to identify the most recent blood pressure (BP) reading during the measurement year. The member is numerator compliant if the BP is less than 140/90 mm Hg.
- **Denominator:** Patients 18 to 75 years of age as of December 31 of the measurement year with diabetes (type 1 and type 2)
- **Data Source:** EHR, Registry

This outcome will be improved by 5% at the end of the waiver.

### Rationale:

Diabetes is one of the most costly and highly prevalent chronic diseases in the United States. Approximately 20.8 million Americans have diabetes, and half these cases are undiagnosed. Complications from the disease cost the country nearly $100 billion annually. In addition, diabetes accounts for nearly 20 percent of all deaths in people over 25 years of age. Many complications, such as amputation, blindness, and kidney failure, can be prevented if detected and addressed in the early stages. Although many people live with diabetes years after diagnosis, it is a costly condition that leads to serious and potentially fatal health complications. Diabetes control can improve the quality of life for millions of Americans and save billions of health care dollars. The known prevalence of diabetes in Bexar County is 10% and more than double for African Americans (14%) and Hispanics (13%) compared to 6% among Non-Hispanic Whites. Hispanics represent 54% of residents of RHP 6. These estimates do not account for undiagnosed diabetics and pre-diabetics. A highly functional primary care office in addition to increasing access will improve the quality of care for diabetics and hypertensives. The system changes needed to achieve this outcome will benefit both diabetic and hypertensive patients treated at these clinics with substantial savings preventing major complications from both diseases.

The process milestones selected are sequential and designed to address what we expect will be the major potential roadblocks to delivering this outcome goal and the practice engagement processes that will allow us to achieve this outcome. The initial project planning (P-1) will include an assessment of tools available for developing a registry of diabetics in Epic EHR, hiring a case management registered nurse for care management, and implementation of capture of data to populate diabetes registry. The second process milestone (P-2) establishing baseline rates will occur during DY2. The third process milestone (P-3) developing and testing data systems will occur during DY3, at the same time PDSA cycles will be implemented in each of the clinics (P-4) to implemented and test different interventions that will improve data collection and improve expected outcome measure.
### Outcome Measure Valuation:

The project is valued based upon achieving waiver goals, meeting community needs, scope, and investment.

Achieves waiver goals (score 5): The project directly addresses waiver goals, with its objectives to assure that patients receive high-quality and patient-centered care in the most cost effective ways; improves health care infrastructure by expanding primary care and behavioral health access care access; further develops and maintains a coordinated care delivery system; and improves outcomes while containing cost growth by avoiding expensive emergency department visits and improving preventive and chronic disease care.

Addresses community needs (score 5): The project directly addresses multiple community needs including the recruitment and retention of a primary care workforce and thus addressing the shortage and access to primary care; addresses the need to have integrated behavioral health and primary care services; and directly addresses cardiovascular disease, cancer and diabetes, three of the top causes of death in the region.

Project Scope – (score 5) – By the end of this project, the region will have 10 additional primary care and behavioral health clinicians practicing in the community. The primary care capacity of UT Medicine will be increased by 25% to almost 50,000 unduplicated patients in all primary care clinics from a baseline of 39,818. A recently published article in Health Affairs provides us with an estimate of savings (Z. Song, D. G. Safran, B. E. Landon et al., “The ‘Alternative Quality Contract,’ Based on a Global Budget, Lowered Medical Spending and Improved Quality,” Health Affairs Web First, published online July 11, 2012.) Properly implemented changes similar to those proposed here provide savings as high as $22.58 per member per quarter. At the end of the project we expect to be caring for a panel of 9600 patients. At this rate the value in savings to the system could be as high as $867,072 at the final year in savings to the region.

Project Investment – (score 5) – The expected capital investment in human resources, lease, equipment, medical supplies, IT infrastructure and support, and time to implement is relatively large. The sustainability of the project is risky in that it requires a significant change in the payment structure for primary care from a fee-for-service only to a medical home blended payment similar to those implemented in other states.

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-7.10  Proportion of children and adults with urgent dental care needs *(Stand alone measure)*
Unique RHP ID: 085144601.3.14 – PASS 1
Performing Provider: University of Texas Health Science Center at San Antonio
TPI: 085144601

Outcome Measure Description:

Other Outcome Improvement Target
The evidence-based outcome is the increased % of dental emergency pain patients being treated by the dental provider.

Rationale:

We have selected IT-7.10. Other Outcome Improvement Target: Proportion of children and adults with urgent dental care needs *(Stand alone measure)*

a Numerator: Total number of patients seen by a new dental emergency clinic
b Denominator: Total Number of children and adults with urgent dental pain care needs
c Data Source: EHR, Claims
d Rationale/Evidence: patients are less likely to suffer from more severe, urgent oral health problems with adequate and regular access to dental care

- This outcome should be a priority for the RHP since it directly addresses a community need for emergency/urgent dental care. Data are described in the “Starting Point/Baseline” section, above.
- The proposed Category 1 project will help achieve this Category 3 outcome measure by providing emergency/urgent dental care to children and adult (including geriatric) patients. Thus, each patient treated contributes directly to the numerator for this Outcome Measure.

As described in the Category 1 template, our web-based survey indicates that low-income populations with moderate/severe health disparities comprise the majority of subjects contacting the UTHSCSA Dental Clinic with requests for access to emergency/urgent dental care. As of July 12, 2012, a total of 32,824 records have been entered by prospective patients. An analysis of this database indicates that there is a large unmet need for treating oral emergencies. Nearly 55% of the 32,824 records included patients who entered at least one of the following keywords indicative of a need for emergency/urgent care: “pain”, “ache”, “hurt”, “broken”, “toothache”, “emergency”, “swollen” or “swelling”. The process milestones and metrics as well as outcome improvement targets selected for this project are specifically designed to achieve designated outcomes to enhance dental care access for patients needing urgent care.

Two major conclusions emerge from this analysis. First, the UTHSCSA Dental School has a large catchment zone that includes broad representation across our community. However, the second finding is even more significant. The zip codes most frequently used by prospective emergency dental patients are highly linked to elevated scores on the Community Needs Index (CNI; see Fig 1 – Category I template). The CNI identifies the severity of health disparity for every zip code in the United States (5,6). It is a composite measure of income barriers, culture/language barriers, education barriers, insurance barriers and housing barriers. The CNI ranges from 1 (lowest socioeconomic barriers) to 5 (highest socio-economic barriers). There is >95% correlation between CNI scores and hospitalization rates, with admission rates for communities with CNI scores of 5 being ~60% greater than rates observed in communities with CNI scores of 1 (5). Importantly, the
mean CNI score for the top 20 zip codes in our database is 3.7. This analysis clearly demonstrates that there is strong need for an emergency dental clinic at UTHSCSA and that such a clinic will directly address populations with substantial health disparities.

References

Outcome Measure Valuation:

Achieves Waiver Goals (Self-Score =5): This project will develop a new dental care clinic for treating emergency/urgent care patients (process milestone) and provides new training and rotations for dental students and residents (process milestone). A recent study indicates that the cost of treating dental emergency patients in a dental clinic is about 10% of the cost of treatment provided in the ER (Graham et al., Ped Dent 22:134-140, 2000). Thus, this project addresses the Triple Aim by providing high quality and patient centered care in a cost effective manner (improvement outcome). Addresses Community Needs (Self-Score =5): An analysis of web-based contacts to the UTHSCSA Dental School by potential patients indicates that nearly 55% of the 32,824 patient contacts to the UTHSCSA Dental School requested emergency/ urgent care treatment. Project Scope (Self-Score = 4): This project scope is large in impact from four perspectives. First, it provides a new dental care clinic that does not currently exist (improvement outcome). Second, it will employ expanded hours to increase patient visits/encounters (improvement outcome). Third, it will involve training of both dental students and residents to treat these populations increasing the number of recruited/trained practitioners for the population living in the borders of RHP 6. (process milestone/improvement outcome) Fourth, it will provide savings from avoiding unnecessary ER visits. (improvement outcome). Project Investment (Self-Score = 5): This project involves human resources (faculty, staff, dental students, residents), new clinic space, new equipment and time to implement with an overall plan that integrates improvement and process to achieve the milestones.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $898,405
Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-7.10 Other Outcome Improvement Target: Enhance quality assessment of dental care via use of information technology. *(Proposed Standalone measure)*

Unique RHP ID: 085144601.3.15 – PASS 1
Performing Provider: University of Texas health Science Center at San Antonio;
TPI: 085144601

Outcome Measure Description:
The Dental EHR will serve as a data source to measure milestones for the project. The system contains patient record information, clinic schedules, transactional history for both patients and providers, billing information, consent forms and clinical notes. Dental School faculty and staff in the office of Patient Care/Information technology will be responsible for the implementation of the project and for the training of all the Dental School workforce providers involved in the delivery of patient care in the various general and specialty clinics. At the end of the project, we expect to achieve a 10% increase in the number of specialized data elements, queries, and reports that will be used in the Quality Improvement processes for patients treated in the DS and off-site clinics.

PROCESS MILESTONES DY 2 AND DY 3:

- P-1 Project Planning-engage stakeholders identify current capacity and needed resources.
- P-2 Establish baseline rates
- P-3 Develop and test data
- P-4 Conduct plan, do Study Acts (PDSA) cycles to improve data collection & intervention activities
- P-5 Disseminate findings, including lessons learned and best practices, to stakeholders
- P-7 Other activities described below:

Process milestones are essential to the planning process and to enable us to establish parameters and protocols essential to assessing clinical quality outcomes, patient safety and treatment effectiveness. Patient satisfaction surveys will assist in measuring timeliness, appropriateness and satisfaction with care and care experience. Reference to P-1: a clinical informatics curriculum will be established in order to train and calibrate all providers and staff on the use of Certified Electronic Record. Treatment outcomes assessments that are based on standards of care will be performed on patients of the dental school and the aggregate data analysis will identify needs for improvement based on established targets.

The category 3 Outcome target relates to the implementation of the certified electronic record training of all faculty, students and staff involved in patient care throughout all of the Dental School general and specialty clinics, including outreach facilities using the same clinic information system and analysis of patient data to support clinical quality measures. Each year, we will have a new cohort of students, including general and specialty residents as well as new faculty or staff who will require training. This information will enable us to make necessary changes to improve oral health quality and achieve efficiency in the system. Our benchmark for compliance will be 85% after year 3 implementation with goal of 95-100% compliance in year 4. This will enable us to share standardized data with other US dental schools using certified systems.
Rationale:
We have selected IT-7.10. Other Outcome Improvement Target: In order to evaluate treatment outcomes, a comprehensive EHR with specialized designated data elements need to be implemented. Software (acquired via EHR Incentive Program) that has Core CMS quality measures that support meaningful use of HIT, hardware, network systems and workforce IT training along with the ability to add customized data elements, helps to provide the infrastructure (human and technological resources) necessary for patient care quality improvement. This can be used to compare against benchmarks and to indicate that standards have been met to attain quality improvement.
a Numerator: Number of DS faculty, students, residents and staff trained in use of Certified EHR
b Denominator: Total number of faculty, students, residents and staff involved in patient care delivery at the Dental School and Off-campus sites
c Data Source: Training logs/schedules; training materials
Rationale/Evidence: The ability to impact the effectiveness, timeliness and appropriateness of care within the UTHSCSA dental school and its’ off-campus sites which serve the general population of the Region, including low-income populations and have the capacity to share this information with other providers of health care services and dental educators is critical to maintaining the quality of dental educational institutions. (Fontaine et al).

Outcome Measure Valuation:
Outcome Measure (proposed): Enhance quality assessment of dental care via use of information technology. This project is intended to provide the information infrastructure needed to assess patient care and ensure that patients treated at the Dental School and off-site clinics receive high quality, patient-centered dental care in a cost effective and efficient manner; and that the dental care is coordinated and that better dental care outcomes are attained for all dental school patients, including the uninsured, Medicaid and CHIP as well as Title V and special needs patients. The DS will implement and train the dental school faculty, staff, dental/dental hygiene students and residents in the use of the certified electronic record with the CMS quality core measures added. Through this project, we will track dental treatment outcomes, cost savings, efficiency of dental care delivery and referral systems within dental school to specialty departments, reduction in dental errors/prosthetic replacements, measure student performance, provide broad array of clinical experiences required to train dentists, dental hygienists, and dental specialists to be competent practitioners, and identify gaps in training needs.

Achieves Waiver goals: this project focuses on assuring that patients receive high-quality care through monitoring treatment via use of the certified electronic health record. It improves the oral health care infrastructure to better serve all patients, including Medicaid patients and will enable the DS to further develop and maintain an internal coordinated care delivery system. The implementation of this project is expected to improve oral health outcomes while containing cost and minimizing unneeded treatment. This project will also impact the DS urgent care clinic, facilitating reporting and standardization and impacts all patients treated by the DS. The evidence supports implementation of the Certified EHR addresses Community Needs: this project supports all of the DS treatment programs and is expected to provide real-time evidence regarding treatment outcomes for patients, including the underserved and uninsured, many of whom seek treatment in the DS. Project Scope: Patient visits/encounters will be tracked for all patients along with clinical core measures, providers will be trained and savings are anticipated due to better coordination of comprehensive dental care. Project Investment: this project involves
human resources (faculty, staff, dental students, residents), new clinic facility, new equipment and time to implement with an overall plan that integrates improvement and process to achieve the milestones.

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-9.3 Pediatric/young adult asthma emergency department visits-NQF 1381
Unique RHP ID: 085144601.3.18 – PASS 1
Provider Name: University of Texas Health Science Center at San Antonio
TPI: 085144601

Outcome Measure Description:

Outcome Measures: Improved primary health care for asthma and lead exposed children by: (a) Reducing emergency department visits by 65%, reducing hospitalizations by 81%; reducing school days missed by 39%; reducing parents’ work days missed by 49%; increasing the use of written care providers Asthma Action Plans by 71%; increasing parent lead/asthma health care literacy survey score by 50% and improving health quality of life survey scores for lead asthma patients and providers by 50%. (B) Assessing environmental triggers for asthma and lead; (C) educating the parent provider on home remediation techniques; (c) facilitating Medicaid health care enrollment through assistance from assigned health navigator; (d) assessing neuropsychological growth and development pathology secondary to asthma & lead exposures; (e) Performing environmental health inspections for mold, CO2, lead, dust mites and pet dander.

Rationale:

Reason for Selecting Process Milestone: The selected milestones are research-based milestones documented in the U.S. Housing and Urban Development and in Centers for Diseases Control and Prevention policy and public documents. The units of analysis are reduced identified patients hospital visits and reduced school absents to improve cognitive, behavioral, psychosocial & mental health of the identified child. Improved health knowledge and parental compliance in child health management, continued enrollment in Medicaid, and enhanced knowledge via health education to make environmental hygienic changes in the home to reduce asthma triggers.

Outcome Measure Valuation:

Approach for Valuing Outcome measure: (a) Medical chart review will be conducted to assess number of sick day visits pre-program intervention, at 3, 6 and 12 intervention time periods; (b) School attendance records (sick days) will be reviewed at baseline entry, 3, 6 and 12 months; (c) Quality of life, Asthma and other health indicators of lead exposure (to include biomarker data) will be collected at baseline, 6 months and 12 months; (d) Parent completed child behavior checklist (psychosocial measure) will be conducted at baseline, 6 months and 12 months. A total of 372 family units, approximately 1,488 subjects, will be served at clinic and home visitation sessions. Home inspections, education, home remediation suggestions and environmental measures will be collected at baseline, 6 and 12 months.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $778,618**
### Identifying Outcome Measure and Provider Information:

| Title of Outcome Measure (Improvement Target): | IT-2.4 Behavioral Health / substance abuse admission rate |
| Unique RHP Outcome Identifier: | 085144601.3.19 – PASS 1 |
| Performing Provider: | The University of Texas Health Science Center at San Antonio |
| TPI: | 085144601 |

### Outcome Measure Description:

The major outcome will be Potentially Preventable Admissions (PPA) to psychiatric hospitals for the target population (Children with ADHD with severe comorbidities). We estimate that our target populations will have 80-120 such preventable admissions a year; we seek to reduce this by 20%. Decrease in hospitalization will be the outcome measure in years 4 and 5. This estimate is based on our clinical experience that half of these hospitalizations are related to acute crisis/lack of access to outpatient care and could be avoided with through PROXIMA. The other half of hospitalizations are due to severe mental illness and require inpatient stabilization.

### Rationale:

- Psychiatric hospitalizations of children with ADHD and complex comorbidities (aggression, mood disorder) have risen dramatically in Texas. These admissions occur in crisis and rarely result in long term outpatient care to consolidate any gains. Thus, there is often little long term benefit despite high costs. (We seek to reduce psychiatric hospital admission by 50% over baseline rates).
- PROXIMA will seek to reduce potentially preventable admissions (PPA, OD-2) through provision of integrated mental/physical health services. Improved outcome for children with ADHD with integrated care has been shown by numerous studies (http://www.skipproject.org/)
- Process Milestones for Outcome: **Milestone 1** will be to engage stakeholders (pediatricians, community) to ensure PROXIMA program meets the challenges these families present. **Milestone 2** will establish the baseline rate of psychiatric hospitalization. This is a customized milestone critical to accurate assessment of our Improvement Target. **Milestone 3** will be to test data collection procedures, while **Milestone 4** will be to conduct Plan Do Study Act (PDSA). We choose reduced hospitalization as our Improvement Target due to the high cost of hospitalization and the lack of evidence that acute hospitalization improves long term functioning.

### Outcome Measure Valuation:

The project valuation section state the project is valued based upon achieving waiver goals, meeting community needs, scope, and investment.

### Identifying Outcome Measure and Provider Information:

| Title of Outcome Measure (Improvement Target): IT-3.8 Behavioral Health/Substance abuse 30 day readmission rate  
Unique RHP ID: 085144601.3.20 – PASS 1  
Provider Name: The University of Texas Health Science Center at San Antonio  
TPI: 085144601 |

### Outcome Measure Description:

Process Milestones include project planning to determine current capacity and needed resources, establishing baseline rates based on hospital discharge and readmission data, developing and testing data systems, and conducting Plan, Do, Study, Act (PDSA) cycles to improve data collection and intervention activities. Process milestones and PDSA cycles monthly will focus on steps needed in preventing readmissions to hospital for behavioral health reasons. Improvement Goal is Behavioral Health readmission rate. Our goal is to reduce the readmission rate by 20% by year 3 and 30% in year 4.

### Rationale:

With respect to our process milestones, we have selected a planning phase to identify the current capacity of the TCC and determine the needs for training and clinical care based upon input from the community. We are in constant contact with hospitals to improve communication and services. We will also work to establish baseline rates based upon data from participating hospitals regarding readmission rates within 30 days. This will require collecting and merging data from a variety of sources to ensure that appropriate cases are counted. We will develop and test data systems to support our analysis of outcomes. We work closely with our data management staff to ensure that HIPPA compliant data systems can generate needed reports. Finally, we have extensive experience using PDSA to improve treatment delivery and patient outcomes in community mental health for SMI. We have been able to use this approach in numerous ways to improve outcomes (e.g. ensuring providers follow guidelines for monitoring metabolic syndrome in community mental health). With respect to outcome improvement targets, re-hospitalization was selected because hospitalization is the single most costly intervention for individuals with behavioral health diagnoses and preventing readmission and ED diversions is a primary goal of the community. The TCC will achieve this goal by providing rapid access to care and multiple ebps including medication management, Cognitive Adaptation Training, Cognitive Behavior Therapy, and Case coordination. Our own published research demonstrates a reduction of up to 45% in 9 month readmission rates for individuals in wrap-around care versus standard care. While the TCC focuses on only the 3 months post-hospital period, this is the most critical period with continuing care provided by connecting individuals to existing community services. Reductions of 20% and 30% in DY4 and DY5 are based on the shorter length of time we will have working with these individuals versus our published reports. Focusing on preventing readmission will allow rapid and evidence-based treatment in the community where individuals have maximal independence and costs of care are lower.

### Outcome Measure Valuation:

Rehospitalization and emergency room revisit rates from Major Hinchman 2010 study yield the cost lack of care coordination between inpatient/ED and outpatient settings as well as of the delay in accessing care. We also used demonstrated savings from our pilot program for Superior Medicaid of $20,000/patient in hospital costs per year. The PDSA, includes collection of data from various hospitals and emergency departments as well as maintaining a data base and documenting the quality improvement process.

TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $1,197,874
Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-1.10 Diabetes care: HbA1c poor control (>9.0%)
Unique RHP ID#: 085144601.3.21 – PASS 1
Performing Provider: University of Texas Health Science Center at San Antonio
Performing Provider TPI: 085144601

Outcome Measure Description:

DY2
The process milestones for this year are designed to lay the groundwork for our chronic disease management program. Milestone P-3 will reflect our development of a comprehensive care management program for diabetes and hypertension based on principles of the CCM. The milestone will be implemented by a practice improvement team meeting weekly. The team will include physicians, nurses, medical assistants, pharmacists, social work, and a practice facilitator with experience in practice change towards CCM. The team will assemble and adapt evidence-based protocols from the literature on CCM implementations in primary care. As the evidence-based protocols are assembled, we will train the relevant staff (Milestone P-2) in the CCM. We will also be working with our health system to create EHR reports tracking HbA1c levels and blood pressure readings for patients with diabetes mellitus and hypertension. Milestones P-2 and P-3 will establish baseline rates for the diabetes improvement milestone and develop and test data systems for creating a valid patient cohort based on the outcome measures and for reporting diabetes outcomes for these patients.

DY3
The process milestones for this year will add CCM components to increase the comprehensiveness of our approach. These include P-1 Document Implementation Plans: Develop and implement a plan to help patients self-manage their chronic conditions. DY3 also includes our improvement Milestone I-17 in which we identify our first cohort of 200 patients with poorly controlled diabetes for inclusion in our disease registry and CCM interventions as determined by the planning process. As program implementation begins, we will also implement PDSA cycles testing iterative small improvements in our intervention.

DY4
Milestones for this year include scaling up process and improvement milestones from DY3, so that more patients are included in the CCM registry and intervention, more participate in self-management and more participate in group visits. In addition, in DY4 we will introduce our Category 3 milestones:
IT 1.10 Diabetes care: HbA1c poor control. We have determined the baseline rate for HbA1c>9% to be 25% in our population. Our goal for this milestone is to reduce it to 22.55 in DY4.
We will continue to increase the numbers of patients participating in the intervention and to further decrease the prevalence of HbA1c >9%.
The goal for HbA1c >9% is less than 17.5% absolute prevalence among patients with diabetes in the CCM program.

Rationale:
The process milestones were selected to create a logical flow from planning, to developing an overall CCM approach, to developing specific elements supporting the CCM (Hroscikoski et al, Ann Fam Med 2006;4:317). The selected Category 3 outcome measure is IT 1.10 HbA1c poor control (>9%). We chose this measure because our system-wide assessments reveal that the
prevalence of poor control is high in our population. Although not all interventions based on the chronic care model are successful (e.g. Landon et al, NEJM 2007:356) a recent review concludes that the CCM has, overall, helped guide successful interventions and improved outcomes (Coleman et al, Health Affairs 2009:75.) In our low-income population with poor health care access, we anticipate that improved connections to effective care and self-management support will decrease the proportion of patients with poorly controlled diabetes (Liebman et al, Diab Educ 2007;33:132S).

Although HbA1c is an intermediate outcome rather than a direct measure of morbidity/mortality, it is very strongly associated with the latter (Wei et al, Diab Care 119;21:1167) and reductions in HbA1c reduce macrovascular and microvascular complications although data demonstrate that overly intensive treatment of glycemic levels is associated with increased risk (Kelly et al, Ann Intern Med. 2009;151:394-403).

**Outcome Measure Valuation:**
The outcome selected (glycemic control for patients at highest levels of HbA1c) has strong evidence tying it to reduced complications, improved quality of life, and lower health care costs. The intervention framework and interventions have also been extensively studied and applied in the target population, with evidence of benefit for the Category 3 outcomes. For example, the short-term health care savings from lowering HbA1c values higher than 9-10% is approximately $1500 per patient, based on the literature cited above. This does not account for reducing the longer-term prevention of complications.
### Diabetes care: HbA1c poor control (>9.0%)

**Process Milestone 1**

P-1 – Project Planning:
- Document implementation plans: Develop a comprehensive care management program
- Metric 1: Documentation of a care management program based on Wagner's Chronic Care Model
- Baseline/Goal: Baseline of no plan documented to goal of approved care management plan
- Data Source: Program Materials including approved care management plan

**Process Milestone 2**

P-2: Establish baseline values for improvement outcome indicator: Poor control of diabetes with HbA1c values >9%.

**Process Milestone 3**

P-3 Develop and test data systems: Test reporting systems for HbA1c.
- Metric 1 P-3: Create valid reports for glycemic control.
  - Goal: Monthly reports that are sensitive and specific with respect to eligible patients and associated readings.
  - Data source: Electronic program files.
  - Rationale: Eligible patients and relevant readings must be identified with excellent sensitivity and specificity from EHR queries.

**Process Milestone 4**

P-3 Develop and test data systems: Create registries for patients with diabetes to be enrolled in the CCM project.
- Goal: Create data fields for a working registry to be populated.
- Data source: documentation of eligible patients and relevant readings.

**Outcome Improvement Target 1**

IT-1.10: Decrease the % of adult patients with poor control of HbA1c.
- Metric 1: % of practice patients age 18-75 with diabetes mellitus with HbA1c>9%.
  - Baseline: 25%
  - Goal: 22.5%
  - Data Source: EHR data.
  - Rationale: Poorly controlled glycemia is associated with a high burden of diabetes complications, hospitalizations, and costs.

**Outcome Improvement Target 2**

IT-1.10: Decrease the % of adult patients with poor control of HbA1c.
- Metric 1: % of practice patients age 18-75 with diabetes mellitus with HbA1c>9%.
  - Baseline: 22.5%
  - Goal: 17.5%
  - Data Source: EHR data.
  - Rationale: Poorly controlled glycemia is associated with a high burden of diabetes complications, hospitalizations, and costs.

**Outcome Measure Description:**

Here we describe Category 3 Process and Improvement Milestones.

**DY2**

P-1: Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans. Here we begin by establishing criteria for selecting patients for CHW services. We also develop work routines for collaboration of CHWs and members of the health care team: meeting frequency, attendance, appropriate modes of communication through voice, email, text, and EHR, and record keeping. The metric for P-1 is written documentation for the planning and protocols described.

**DY3**

P-4 Conduct PDSA cycles. In this year, as CHW begin work with our patient panel we will hold weekly meetings of CHWs and clinical staff to review successes, stumbling blocks, and needed additional supports. Using PDSA methodology, we will iteratively frame small tests of improvement and evaluate the results. The metric for P-4 is meeting records and summaries of improvement projects.

P-3 Develop and test data systems. We will work with our health system IT personnel to develop routine monthly reports on patients with diabetes from our panel that will capture HbA1c levels, ambulatory visits (to identify patients not having regular visits), ED visits (to identify patients with critical disconnects from care), and hospital admissions (to identify patients with complications). The metric for P-3 will be monthly data reports from the patient panel of glycosylated hemoglobin levels, patients exceeding the threshold of 9%, and patients in the cohort working with CHWs who have ED visits or admissions.

**DY4**

P-4 Conduct PDSA cycles. In this year, as CHW begin work with our patient panel we will hold weekly meetings of CHWs and clinical staff to review successes, stumbling blocks, and needed additional supports. Using PDSA methodology, we will iteratively frame small tests of improvement and evaluate the results.

IT-1.10, % of patients with poor control of HbA1c.

**Metric 1** % of practice patients age 18-75 with diabetes mellitus with HbA1c>9%.

- Baseline: 25.5%
- Goal: 22.5%

Data Source: EHR data.

**DY5**

IT-1.10, % of patients with poor control of HbA1c.
Metric 1  % of practice patients age 18-75 with diabetes mellitus with HbA1c>9%.
Baseline: 22.5%
Goal: 17.5%
Data Source: EHR data.

Rationale:
Our Category 3 improvement target and valuation is based on the following considerations: there is strong evidence that moving patients from poor to fair or good glycemic control (a) reduces diabetes complications such as coronary disease, stroke, and renal failure; (b) decreases hospitalizations, and health care costs, and (c) improves patients’ quality of life. This evidence is briefly summarized and quantified below.

In recent years, data from UKPDS and other studies have led to a reconsideration of the utility and safety of aggressive glucose targets in type 2 diabetes. Our goal in this project is therefore to reduce the prevalence of markedly abnormal glycemic control, which we define as HBA1c >9%. Ample evidence documents the micro- and macro-vascular morbidity associated with uncontrolled diabetes. For example, persons with diabetes in a community-based cohort study (Atherosclerotic Risk in Communities) in the highest Hba1c quintile (A1c>8.2%) had a 2.8 fold increased risk of coronary heart disease events (on a baseline of 14.4%) compared with those in the lowest quintile (Selvin et al, Arch Int Med 2005). In a secondary analysis of data from the HOPE study, a randomized drug trial, a 1% rise in the Hba1c level was associated with a 7% increase in the risk of cardiovascular events, a 20% increase in the risk of hospitalization for heart failure, a 12% increase in total mortality risk, and a 26% increase in risk of overt nephropathy. Risks increased nonlinearly, with steeper increases in patients in the top 2 deciles of A1c (A1c >8.9%)(Gerstein, Diabetologia 2005). An observational study from the Fallon Clinic showed poor glycemic control (A1c >10%) was associated with a high risk of hospitalization -- 31 per 100 per year, twice that of patients with fair control (A1c 8-10%). Mean adjusted hospital charges were also twice as high ($3040 vs. $1380/year; in 1998 dollars) (Menzin et al, Diabetes Care 2001). A larger follow-up study from 2010 in the same system confirmed the findings: annual costs for diabetes-related hospitalizations were $3278 with Hba1c of 7-8%, $4029 at 8-9%, $4963 at 9-10%, and $6759 when the A1c exceeded 10% (Menzin et al, J Managed Care Pharm 2010). And the Group Health Cooperative of Puget Sound, found that reductions in Hba1c from a mean of 10% were associated with annual savings of $680-950 (in 1997 dollars). (Wagner et al, JAMA 2001).
Improved glycemic control also improves quality of life. A randomized trial of intensified glycemic control (from mean Hba1c of 9.3% to 7.5%) examining patients’ functional outcomes, such as quality of life, work participation, bed-days, and restricted activity days, demonstrated substantial improvements in a wide range of QOL and activity measures (Testa, JAMA 2008).

The evidence base supporting this CHW intervention derives from a variety of CCM interventions that are being adapted for low-income populations (e.g. Epping-Jordan et al, Qual Saf Health Care 2004;13:299–305; Lorig et al, Nurs Res 2003;52:361). In many of these models, CHWs collaborate closely with nurse care managers to deliver assessment and education in the home setting when patients have barriers limiting travel to the health center.

In this project the CHW role encompasses 3 models of care defined in the Community Health
Worker National Workforce Study (HRSA 2007): member of care delivery team, navigator, and organizer. These models, which the report noted were not mutually exclusive, consist of working under the direction of clinicians (physicians or nurses), helping patients navigate complex health systems, and working in communities to promote self-directed change and community development (HRSA 2007).

The process milestones for CHW’s unique patients served were estimated at follows. Our CHW model calls for assessments and teaching in the patients’ homes so as to provide data on contextual influences such as neighborhood setting for diet and physical activity, or family situations that interfere with self-management. We therefore estimate CHW’s will make 8 visits per week x 50 wks or 400 visits per year per FTE. Conservatively estimating 5 visits per year per unique patient to allow for both assessment and self-management training, each CHW FTE will manage 80 unique patients per year. We allow for 50% capacity in the first year after hire. With 3 CHW hired in year 1 and 3 additional CHW hired in year 2, the target numbers for unique patients served in DY3/4/5 are thus 180/540/720.

Outcome Measure Valuation:
The outcome selected (glycemic control for patients at highest levels of HbA1c) has strong evidence tying it to reduced complications, improved quality of life, and lower health care costs. Please see “Rationale” immediately above for details. The intervention mechanism has also been extensively studied and applied in the target population, with evidence of benefit for the Category 3 outcome. For example, the short-term health care savings from lowering HbA1c values higher than 9-10% is approximately $1500 per patient, based on the literature cited above. This does not account for reducing the longer-term prevention of complications.

### Identifying Outcome Measure and Provider Information:

| Title of Outcome Measure (Improvement Target): | IT-10.1 (Quality of Life) |
| Unique RHP Identification Number: | 085144601.3.23 – PASS 2 |
| Provider Name: | University Health Science Center at San Antonio |
| TPI: | 085144601 |

### Outcome Measure Description:

In general our goal for individuals with hearing loss that is significantly interfering with their ability to communicate and generally enjoy life, is to enable them through appropriate assessment and intervention including use of appropriate hearing aids and supportive counseling, to hear more of the sounds around them and better understand speech in a range of situations. In short, our goal is to help them increase all communication-related activities (World Health Organization). To assess the benefit derived from amplification and the resultant reduction in hearing handicap and improved life quality, we will administer three brief questionnaires, prior to intervention (at the time of initial assessment) and following intervention (30 -45 days after the initial fitting of amplification and initial communication counseling). Three standardized self-assessment measures will be used: The Client Oriented Scale of Improvement (COSI); The 10 item Hearing Handicap Inventory for the Elderly Screening Version (HHIE),( Ventry & Weinstein, 1982) which assess both the social and emotional impact of hearing loss on the individual, and the 15 item Satisfaction with Amplification in Daily Life scale (SADL) (Cox and Alexander, 1999), which assess positive effect comprised of decreased communication disability, improved self-confidence, improved sound quality, and overall assessment of worth; service and cost, comprising reliability, clinician competence, and cost; negative features comprised of reaction to background sounds, feedback, and the hearing aid’s usefulness on the telephone; and personal image, comprised of appearance and the apparent reaction of others. Pre and post measures will be taken to assess reduction in hearing handicap and increase in communication ability and overall satisfaction and improvement in life quality. 80-85 % of patients served with hearing aids and support services through the Drop In Hearing Clinic will report improvement in quality of life/hearing handicap reduction scores as measured via the standardized HHIE and the SADL self-assessment inventories.

### Rationale:

At the current time a significant barrier to access to hearing health care is lack of proximity of care, inappropriate level of care (entering the hearing health care system at a more costly level of triage/care, and cost), and high cost of care. This project addresses these current barriers. Appropriate intervention for hearing loss and medical ear problems will both improve health status through primary prevention, appropriate identification of and referral for intervention for ear disease, as well as reduction of the impact of hearing loss, on the ability of individuals in this group to achieve communication independence and more fully function in society. In short; to more effectively claim their unalienable rights to life, liberty and the pursuit of happiness.
Outcome Measure Valuation:

The value of this project is in its creation of a new model for hearing health care delivery that incorporates both new and existing personnel and new and existing health care facilities in multi-level hearing health care assessment/treatment model designed to address the gross disparity in percentage of adults with hearing loss receiving hearing health care services versus all who need those services. Consistent with the definition of health care “value” as health outcomes per dollar spent, it is designed to provide more convenient patient access to lower cost effective hearing health care resulting in improved hearing/communication ability for an increased percentage of those who need effective hearing health care. The model acknowledges that a significant percentage of this population has sensorineural hearing loss that is essentially bilaterally symmetrical, often noise-induced, with no other medically-related hearing/balance complications and who primarily need assessment of their hearing and appropriate fitting/adjustment of digital signal processing hearing aid technology delivered and supported as close to their neighborhood as possible. A smaller percentage of the adult hard of hearing population needs more extensive audiology and medical services. They are in need of triage from the Drop-In Hearing Clinic with referral to the next level of audiology/medical care. A goal of this project is to demonstrate an approach to the “right care, each time for each patient” for individuals entering the hearing health care system with the ultimate goal of improving the quality of life for each patient served through appropriate intervention and ultimately hearing handicap reduction. This triage and referral process would be accomplished through the Drop-In Hearing Clinic access point staffed by remote community audiologists participating in the Drop-In Hearing Clinic Network, working in conjunction with onsite Teleaudiology Clinical Technician students whom they supervise. Next-level referrals would be facilitated to network audiology/ENT providers who the patients identify as located conveniently to them and/or who has the most immediate ability to schedule a next-level hearing health care appointment for the patient. This would enable the patient to begin the referral relationship facilitated at the Drop-In Hearing Clinic site.

The scope of this pilot project is limited to 1 site: UTHSCSA Student/Employee Health Clinic with audiology faculty and their Au.D. students providing the remote audiology services from the UTHSCSA MARC, University Health Systems Audiology Department; or UT-Austin Department of Communication Sciences and Disorders Audiology Clinic in conjunction with TCT course students from the UTHSCSA School of Nursing or other professional degree programs. This scope is designed to bring hearing health care services to UTHSCSA students and employees and their families at a central campus location. Project outcomes for providers include: Up to 15 joint UT-Austin/UTHSCSA Doctor of Audiology students will complete clinical rotations among the CECSD hearing/balance consortium partners in the San Antonio region including delivery of audiology services under faculty supervision in the Drop-In Teleaudiology Clinic; 15 to30 UTHSCSA nursing or other professional degree (e.g. PA) students will complete the Teleaudiology Clinical Course and engage in teleaudiology clinical service delivery under supervision in the Drop-In Hearing Clinic. Project outcomes for patients: 700 adult patients will be served at the Drop In Hearing Clinic locations and either provided with high performance mini-BTE hearing aids or appropriately referred to the next level of hearing health care.

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-9.4 Other outcome improvement target
Unique RHP Outcome ID: 085144601.3.24 – PASS 2
University of Texas Health Science Center at San Antonio
TPI: 085144601

Outcome Measure Description:

Outcome Measure: “Other outcome improvement target.” This project’s intent is to implement cancer telemedicine conferences to underserved communities.

Process milestones and improvement targets: We are projecting an increase in the number of cancer telemedicine conferences by 30% over baseline, to serve this region.

Quality: Process Milestones. P-1: Project Planning: Engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans. Metric: Establish Multidisciplinary cancer specialty telemedicine conferences serving a broad section of underserved areas in South Texas. Goals/Rationale: Implement multidisciplinary cancer specialty telemedicine conferences serving underserved population areas in South Texas. Goals/Rationale: Project Planning: Engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans. Metric: Establish Multidisciplinary cancer specialty telemedicine conferences serving underserved areas in South Texas. Goals/Rationale: Implement and test telemedicine videoconferencing equipment at specific sites, establish standard operating procedures for the videoconference; complete signed agreements for process and privacy; conduct tutorials for staff accessing this program. P-4: Conduct Plan-Do-Study-Act (PDSA) Cycles to improve data collection and intervention activities. Metric: Implement high quality multidisciplinary specialty cancer-care videoconferences to serve the needs of the population in underserved areas of South Texas. Goals/Rationale: PDSA cycles are widely accepted methods of continuous quality improvement. PDSA cycles quarterly will be used to demonstrate improvement in quality of specialty cancer care videoconferences in underserved areas. PLAN: Implement ideal multidisciplinary videoconferencing for specialty cancer care in underserved areas. DO: Equip all target underserved sites with videoconferencing tools and outline SOPs. STUDY: Quality of Conferences and Provider Satisfaction Surveys. ACT: Update format of conferences and equipment needs to suit ideal needs of the target population in underserved areas.

To achieve continuous quality improvement we shall assess the project’s impact and make adjustments as necessary, share best practice and lessons learned, seize scaling opportunities to expand successful outcomes to broader populations, and rapidly disseminate successful outcomes to other providers across Texas.

Rationale:

Cancer is a leading public health issue in Texas (It is the number one cause of death for children in Texas age 1-14, and the leading cause of death for people in Texas age 85 or younger). In the absence of effective communication, providers of cancer-care are forced to refer patients to tertiary care centers, and the patients and public are forced to travel enormous distances to tertiary-care cancer centers at significant cost to their quality of life and financial health. Communication methods like telemedicine can improve cancer healthcare by enhancing cancer-related decision-making and motivate action to improve the quality of cancer care in underserved areas. The CTRC is committed to enhancing Cancer-Telemedicine to communities in underserved areas of South Texas by expanding use of telehealth to provide expert multidisciplinary cancer conferences and Tumor Boards to improve access to evidence-based cancer decision-making across the disease spectrum from prevention to survivorship and end of life care. Increase the percent of providers in underserved areas of South Texas accessing specialty cancer-care consultations by cancer
telemedicine by 25% over baseline; and of patients in those areas receiving tertiary cancer-care by telehealth in their own communities by 30% over baseline by Year-3 of implementation.

**Outcome Measure Valuation:**

Cancer is a huge burden in Texas and it is important to point out that Cancer is the leading cause of death among Hispanics in the US—the largest and fastest growing minority group in the US. With 20% of all Hispanics in the US residing in Texas, we will need to prepare for 1 in 2 Hispanic men, and 1 in 3 Hispanic women being diagnosed with cancer, and the lifetime probability of dying from cancer is 1 in 5 for Hispanic men and 1 in 6 for Hispanic women (American Cancer Society, Cancer Facts and Figures for Hispanics and Latinos 2012-2014), we will need to enhance the access to specialty cancer-care using telemedicine and for this population. In addition, there are projected to be nearly 12 million cancer survivors by 2020, >60% of whom are age >65—it is critical, therefore, to use the best technology to provide immediate access to specialty cancer-care across all areas of Texas urban and rural using telemedicine to deal with this magnitude of elderly cancer survivors who will need care, surveillance, and efforts to promote healthy aging (Parry C et al., Cancer Epidemiol Biomarkers Prev 2011;20:1996-2005).

<tr>
<td><strong>Outcome Measure:</strong> “Other outcome improvement target.” This project’s intent is to increase trained oncology providers to serve the underserved population with or at-risk for cancer in South Texas who have been identified as being at significant cancer health disparity in that region.</td>
</tr>
</tbody>
</table>

Process milestones and improvement targets: We are projecting an increase in the number of new oncology trainees by 25% over baseline, to serve this region.

Process Milestones: The following will be applied: P-1: Project Planning: Engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans. Metric: Percentage of current trainees providing cancer-care in underserved and rural areas. Goals/Rationale: Implementing training for hematology-oncology fellows to serve in underserved areas with cultural competency curricula and skills will enhance specialty care in underserved areas as nearly 80% of trainees stay in Texas after training. Accreditation bodies such as the ACGME, and UTHSCSA GME will need to be engaged to approve innovative curricula, approve increase in training slots. Finally, Memoranda of Understanding will need to be in place between the training program and the individual underserved institutions and clinical training sites. P-4: Conduct Plan-Do-Study-Act (PDSA) Cycles to improve data collection and intervention activities. Metric: Improve the curriculum of cancer-care for underserved population in combination with cultural competency education. PDSA cycles are widely accepted methods of continuous quality improvement. PDSA cycles q 6 months will be used to demonstrate improvement in training quality in underserved areas. The following PDSA format will be used PLAN: Design and Implement Curricula and Cultural Competency Skills Education and Evaluation. DO: 6-month blocks of rotations in underserved areas. STUDY: Pre- and Post-Test scores. ACT: Revise curriculum based on target scores

<table>
<thead>
<tr>
<th><strong>Rationale:</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>The main reason for selecting this project is the overwhelming burden of cancer affecting our population in Texas—cancer is the leading cause of death in this state, coupled with serious shortage of trained oncology providers—Texas ranks 45th in the nation in the number of physicians per population: Therefore, we would like to educate the next generation of cancer care providers especially medical oncologists who can provide ideal cancer care from cancer prevention to survivorship care in rural and underserved areas of South Texas. This is one of the highest priorities for the NCI-designated Cancer Center, the CTRC. We would like to increase the capacity to provide cancer care and oncology specialty care services and the availability of highly trained specialty providers to better accommodate the high demand for cancer care and oncology specialty care so that patients have efficient and effective access to such services in their own community</td>
</tr>
</tbody>
</table>

<table>
<thead>

| Cancer is a huge burden in Texas and it is important to point out that Cancer is the leading cause of death among Hispanics in the US—the largest and fastest growing minority group in the US. With 20% of all Hispanics in the US residing in Texas, we will need to prepare for 1 in 2 Hispanic men, and 1 in 3 Hispanic women being diagnosed with cancer, and the lifetime probability of dying from
cancer is 1 in 5 for Hispanic men and 1 in 6 for Hispanic women (American Cancer Society, Cancer Facts and Figures for Hispanics and Latinos 2012-2014), we will need to enhance the number and quality of trained oncologists to serve this population. In addition, there are projected to be nearly 12 million cancer survivors by 2020, >60% of whom are age >65—it is critical, therefore, to prepare a workforce to deal with this magnitude of elderly cancer survivors who will need care, surveillance, and efforts to promote healthy aging (Parry C et al., Cancer Epidemiol Biomarkers Prev 2011;20:1996-2005)
Starting Point/Baseline: Texas Medical Association (TMA) data show that physicians who complete both medical school and GME in the state are almost three times more likely to practice in Texas. Our own data on training oncologists from 2004-2012 in our ACGME accredited training program at the UT Health Science Center demonstrates the following: 19 of the total of 26 (73%) oncologists who graduated from our program in this period stayed in Texas upon graduating, and of those, 17 (89%) are still practicing in Texas.

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores.
Unique RHP ID: 085144601.3.29 – PASS 2
Performing Provider Name: University of Texas Health Science Center at San Antonio
TPI: 085144601

Outcome Measure Description:
Process Milestones DY 2: P-X- Project planning, where we will engage stakeholders (providers and employees). P-5: Enhance the organizational infrastructure and resources to store, analyze, and share patient experience data, as utilize them for quality improvement; Process Milestones DY 3: P-X: Develop and implement a training program on patient experience; Process Milestones DY 4: (P-X) Continue to assess patient experience scores and utilize results to develop quality improvement projects; Process Milestone DY 5: Process Milestone 6 (P-X): Develop an employee suggestion system that allows for the identification of issues that impact the work environment, patient care and satisfaction, efficiency, and other issues aligned with continuous process improvement.

Rationale:

We selected the Category 3 stand alone outcome domain of Patient Satisfaction. Research has shown that patient care experiences positively correlate to clinical quality processes and outcomes on both the practice and provider levels\(^\text{142}\). Additionally, patients with better care experiences are more engaged and adherent, and have better health outcomes. For example, a recent study in the *Journal of Family Practice* demonstrated that adherence rates were 2.6 times higher among primary care patients whose providers had “whole person knowledge” of them compared to patients of providers without that knowledge\(^\text{143}\). This translates to better, more cost effective healthcare and healthier patients.

There are also other financial implications to consider, in the form of incentives, lower malpractice risk, and increased patient loyalty. Increasingly, patient experience is being tied to financial incentives, as is the case in Massachusetts and California\(^\text{144}\). And with the passage of the new healthcare law, Centers for Medicare and Medicaid Services (CMS) will be making mandatory the implementation and reporting of patient experience survey results, and tying these measures to financial incentives\(^\text{145}\). We will most likely be monetarily penalized for not collecting and reporting on this data. The implementation of CG-CAHPS now puts us in the

position to have better scores once we are mandated to report them publicly.

Tracking patient experience data is cost efficient in other ways. The Journal of the American Medical Association\(^{146}\) has published several articles demonstrating that good patient experience correlates with lower medical malpractice risk\(^{147}\). In fact, a 2009 study found that with each drop in patient-reported score along a five-step scale from “very good” to “very poor”, the likelihood of being named in a malpractice suit increased by 21.7%\(^{148}\). Measuring patient experience using the CG-CAHPS and with the assistance of NRC Picker Service alerts is a hands-on approach for identifying and addressing issues in care that could lead to lawsuits.

Lastly, it is well known that patients keep or change providers based upon experience. Relationship quality is a key predictor of patient loyalty\(^{149}\), and in Bexar County where patients have many choices for their healthcare needs, they can vote with their feet.

### Outcome Measure Valuation:
Implementing CG-CAHPS is a low-cost project that serves not only the current patients of UTHSCSA, but future patients as well. A sampling of 50 responses per provider per year (8750 responses total, per year) ensures that many different patient populations are heard.

---

\(^{148}\) Fullam F, Garman AN, Johnson TJ, and Hedberg EC. The use of patient satisfaction surveys and alternate coding procedures to predict malpractice risk. Medical Care 47 (5).

## Outcome Measure Description:

<table>
<thead>
<tr>
<th>OD-9</th>
<th>Right Care, Right Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>IT-9.2</td>
<td>ED appropriate utilization (Reduce ED visits related to seizures/epilepsy)</td>
</tr>
</tbody>
</table>

Process Milestone for DY2:

P-1 Project Planning – engage stakeholders, identify resources needed, determine timelines

Process Milestone for DY3:

P-2 Establish baseline ED utilization rates

Improvement Targets for DY4 and DY5:

DY4: Decrease ED visits by 25 percent over baseline
DY5: Decrease ED visits by 50 percent over baseline

## Rationale:

Patients with epilepsy who have regular access to epilepsy specialty outpatient care have improved seizure management and increased compliance with epilepsy medication. Noncompliance with epilepsy medication leads to an emergency room visits. With proper medical management, patient compliance with seizure medication will increase, seizure frequency will decrease, and frequency of emergency department visits will decrease.

## Outcome Measure Valuation:

People with epilepsy who do not have access to specialty care generally seek care in an emergency room, at an average cost of $3,000 per visit. Difficulty in accessing needed medications will lead to noncompliance at a cost of about $5,000 per person. For those uninsured and without some type of assistance, epilepsy medications can’t be accessed through Pharma assistance programs ($1,338,525 in such assistance was facilitated by the EFCST in FY 2010 alone) and lost productivity in terms of work-related earnings for people with uncontrolled epilepsy amount to $8,953 per year per household. With seizure control due to appropriate treatment, approximately 60% of could return to work. The cost savings realized by this proposal detailed below is conservative, as it primarily accounts for benefits to those who are uninsured. As mentioned above, approximately 37% have some type of insurance and will be benefitted as well. The table below provides the data used to estimate the conservative value of this proposal in terms of cost savings.

## Cost Savings of This Proposal
<table>

**Outcome Measure Description:**

**Outcome Measure:** number of alcohol offenders who have a new alcohol related driving infraction.

**Process Milestones:** Decrease recidivism for alcohol offenders by 25% to 50%. A 25% to 50% reduction was selected because this would represent a clinically meaningful reduction in alcohol offending. See Table 1 for outcome rates

Milestone 1 is to establish relationship with drug courts. This milestone was chosen because it is allows us access to indigent adults who are in need of alcohol treatment, it provides information used to establish baseline for alcohol offending in our region which is used as comparison to our treatment outcomes. Processes 1, 2, and 3 are utilized to address Milestone 1.

**P-1 Project Planning—engage stakeholders identify current capacity and needed resources.** Milestone 1 is to establish working relationships with hospital emergency departments, social workers and Bexar County Judges and District Attorney's office to develop and pilot our program. During Y2 we will establish working relationships with stakeholders to gain their participation in the development of this program. During Y3, Y4, and Y5 we will sustain involvement by judges and District Attorney's office in pilot programs and to use their input to refine the pilot programs. Process 1 was selected because successful implementation of this treatment program will require partnership with court.

**P-2 Establish baseline rates.** As part of Milestone 1 (establish working relationships with Bexar County Judges and District Attorney's office) we will establish baseline rates for alcohol driving offense recidivism in our local courts and continue to evaluate rates annually during the course of the project. Process 2 was selected because it is necessary to establish baseline rates in order to understand the scope of the health problem.

**P-3 Develop and test data.** As part of Milestone 1 we will analyze current probation practices for alcohol related offenses and conduct analyses of baseline outcome rates. This analyses will be conducted annually, resulting in a written report of our findings. Process 3 was selected because it is necessary to establish current practices of probation courts. This provides some context for comparison to practices and outcomes of this new treatment program.

Milestone 2 is provide a treatment alternative to jail for legally indigent adults convicted of alcohol related driving offenses. This milestone was chosen it represents new access to alcohol treatment for the legally indigent. Process 4 is utilized to address Milestone 2.

**P-4 Conduct Plan Do Study Acts (PDSA) cycles to improve data collection and intervention activities.** Based on our findings from Milestone 1, we will develop a treatment program to reduce alcohol misuse and further alcohol related driving offenses among legally indigent adults convicted of alcohol related driving offenses. This treatment will provide transdermal alcohol monitoring for program participants and utilize this monitoring to individualize treatment plans to reduce alcohol misuse. The goals of this program are to treat the following number of adults by year: 100 in Y2, 150 in Y3, 200 each in Y4 and Y5. This process was selected as a proof of concept program, that is intended to be disseminated to
Milestone 3 is to reduce rates of alcohol recidivism by 25% to 50% of that rate observed for typical probation. This milestone was chosen as an object measure of success of this novel treatment program. Processes 5 and 7 are utilized to address Milestone 3.

P-5 Analyze data from program participants. As part of establishing the effectiveness of Milestone 2, we will compare rates of recidivism from program participants to typical recidivism rates for Bexar county (established in P-2 and P-3).

P-6 Disseminate findings, including lessons learned and best practices, to stakeholders. Test of outcomes from Milestone 3 will be the bases for a report that outlines our success in treating alcohol offenders. Additionally, we will use our experience to develop a manualized treatment plan that drug courts can adopt, which will facilitate their use of transdermal alcohol monitoring to enhance probation success. This process was selected as a means to facilitate adoption of this alcohol program by other drug courts.

P-7 Other activities not described above if any. The treatment providers are interested in developing a training institute to education courts and probation offices on best practices for adopting this novel treatment.

Rationale:
Alternative programs need to be developed to address the issue of intoxicated driving, because the current approach is ineffective and costly. The necessary metrics are clear, and these include number of enrollments in the program, incarceration rates, and reductions in recidivism. Additional metrics will include the number of offenders remaining gainfully employed, reduction in the number of motor vehicle accidents, and those able to continue providing support for their children and/or families.

Outcome Measure Valuation:
Cost of alcohol monitoring and integration with specialized treatment are the two main factors accounting for the valuation of $6,175,000.

1- Cost of alcohol monitoring. An indigent person could not afford the $4,500 cost long term alcohol monitoring used by the therapist to guide treatment.

2.- Cost of therapy. Use of contingency management with motivational interviewing for treatment of substance use disorder is available only at a few academic medical centers (e.g. University of Arkansas for Medical Sciences) and delivered by therapists with specialized training. Treatment cost for these providers is $200/visit. A patient requiring a full 6-months of weekly session could spend almost $5,000 for these services.

### Outcome Measure Description:

- **Process Milestone for DY 2 is P-1**: Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.
- **Process Milestones for DY 3 will be:**
  - P-2 Establish baseline rates
- **Improvement Target for DY 4 and 5 will be:**
  - IT-9.1 Decrease in mental health admissions and readmissions to criminal justice settings.

### Rationale:

DY 2 will be a short year with only 6 months to perform, but important to engage stakeholders, achieve community consensus concerning timelines, location of homes and expectations related to providing these new and innovative services in community settings. We will put our efforts into engagement and development.

DY 3 presents the opportunity to identify and refine data sources and establish the baseline for admission to juvenile justice facilities. We need the juvenile justice system data in order to measure our Improvement Target.

The Improvement Target for DY 4 and 5 is a stand-alone measure. We selected this measure because the goal of this project is to help youth successfully return to family and community. We feel that reductions in removal from home and community is the best measure of success.

### Outcome Measure Valuation:

The project seeks to provide crisis respite to 16 youth in DY 4; and to provide crisis respite to 30 youth in DY 5. These are very high intensity youth who otherwise would be removed from home and placed in a psychiatric hospital or Juvenile Justice residential treatment facilities. Both of these options are expensive and separate the family from the treatment process and seriously reducing the chances for reunification with the family. The valuation calculated for this project used cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units that were applied to the factors existing in this underserved area, including: limited access to primary care and to behavioral health care, poverty and the link between chronic health conditions and chronic behavioral health conditions. The valuation study was prepared by professors H. Shelton Brown, Ph.D. and A. Hasanat Alamgir, Ph.D. both of the UT Houston School of Public Health and Thomas Bohman, Ph.D. of the UT Austin Center for Social Work Research based on a model that included quality-adjusted life-years (QALYs) and an extensive literature of similar interventions and cost savings and health outcomes related to those interventions. The QALY index incorporates costs averted when known (e.g., emergency room visits that are avoided). We assigned a value of $320,101 through DY 5. Complete write-up of project will be available at performing provider site.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $185,320**
Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-3.1 All cause 30 day readmission rate-NQF 1789
Unique RHP ID#: 1268443-05.3.3 – PASS 1
Performing Provider Name: Bluebonnet Trails Community Mental Health and Mental Retardation Center dba/Bluebonnet Trails Community Services
TPI: 1268443-05

Outcome Measure Description:

Process Milestone for DY 2 is P-1 Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.
Process Milestones for DY 3 will be:
P-2 Establish baseline rates
P-3 Develop and test data systems
Improvement Target for DY 4 and 5 will be:
IT-3.1 All cause 30 day readmission rate- NQF 1789 for patients 18 and older

Rationale:

DY 2 We must work with community providers and multiple health care systems to inventory capacity, determine when to initiate program, identify resource needs, complete agreements for data sharing and agreements for site utilization.
DY 3 This population of high frequent visitors to ED is not identified or characterized. We must develop sources of information across multiple health care systems; identify the group and establish a baseline.
The Improvement Target for DY 4 and 5 is a stand-alone measure. We selected this measure because the goal of this project is to help people who have been frequent visitors to ED and even though a root cause might be the presence of behavioral health conditions, the admission cause will vary across a variety of physical and mental conditions. We believe that measuring the reduction in re-hospitalization will be a good indicator of success for the program. Over the four years of the project we expect to dramatically reduce the number of ED visits for the target population and the associated inpatient admissions. These reductions will occur by improved chronic disease management, linkage to a primary care provider and medical home.

Outcome Measure Valuation:

By targeting and serving 30 high utilizers of ED services in DY 4 and 50 in DY 5 we expect to improve lives and cost and effectiveness of the health care system. We are confident we will impact hospitalization use. The valuation calculated for this project used cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units that were applied to the factors existing in this underserved area, including: limited access to primary care and to behavioral health care, poverty and the link between chronic health conditions and chronic behavioral health conditions. The valuation study was prepared by professors H. Shelton Brown, Ph.D. and A. Hasanat Alamgir, Ph.D. both of the UT Houston School of Public Health and Thomas Bohman, Ph.D. of the UT Austin Center for Social Work Research based on a model that included quality-adjusted life-years (QALYs) and an extensive literature of similar interventions and cost savings and health outcomes related to those interventions. The QALY index incorporates costs averted when known (e.g., emergency room visits that are avoided). We established a value of $151,627 through DY 5. Complete write-up of project will be available at performing provider site.

</tbody>
</table>

### Outcome Measure Description:

Process Milestone for DY 2 is P-1 Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.

Process Milestones for DY 3 will be:
- **P-2 Establish baseline rates**
- **P-3 Develop and test data systems**
- **P-4 Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities.**

**Improvement Target for DY 4 and 5 will be:**

**IT-3.8 Behavioral Health/Substance Abuse 30 day readmission rate.**

### Rationale:

DY 2 will be a short year with only 6 months to perform. We elected to put our efforts into engagement and development.

DY 3 presents the opportunity to identify and refine data sources. We will also begin our PDSA cycle and continue that Process Milestone into DY’s 4 and 5.

This is a stand-alone measure. We selected this measure because the goal of this project is to help people who have been hospitalized or experienced a crisis event that could have resulted in a hospitalization to transition to stable living in the community. That transition will be made because of the program interventions that improve functioning and the skills needed for successful community living. When the goal is achieved then program participants will self-manage their recovery and wellness and there should be a reduction in symptoms and a reduction in crisis events. The outcome of this is fewer readmissions to the hospital both for 30 days and in the long term.

### Outcome Measure Valuation:

We expect to provide transitional housing to this group of individuals who have multiple hospital admissions, are frequently homeless and have difficulty with community tenure. We will serve 12 people in DY 4 and 18 people in DY 5. The valuation calculated for this project used cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units that were applied to the factors existing in this underserved area, including: limited access to primary care and to behavioral health care, poverty and the link between chronic health conditions and chronic behavioral health conditions. The valuation study was prepared by professors H. Shelton Brown, Ph.D. and A. Hasanat Alamgir, Ph.D. both of the UT Houston School of Public Health and Thomas Bohman, Ph.D. of the UT Austin Center for Social Work Research based on a model that included quality-adjusted life-years (QALYs) and an extensive literature of similar interventions and cost savings and health outcomes related to those interventions. The QALY index incorporates costs averted when known (e.g., emergency room visits that are avoided). We have assigned a value of $175,559 through DY 5. A description of the method used, titled ‘Valuing Transformation Projects,’ has been posted on the performing provider website which will be linked to www.bbtrails.org under the Medicaid 1115.
Transformation Waiver tab. Complete write-up of the project will be available at performing provider site.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $175,559**
**Identifying Outcome Measure and Provider Information:**

Title of Outcome Measure (Improvement Target): IT-9.4 Other Outcome Target: Decrease mental health admissions and readmissions of persons needing crisis stabilization services to institutional facilities.

Unique RHP outcome identification number: 121990904.3.1 – PASS 1

Performing Provider: CAMINO REAL COMMUNITY SERVICES TPI-121990904

**Outcome Measure Description:**

Camino Real Community Services has selected the following process and improvement measures for Category 3:

P-1 Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.

P-7 (Other activities) Implementation plans: i.e. Facility acquisition, architect drawings, building financing, contractor retention, operational budget including staffing requirements, policy procedure development, etc.

Improvement Target: Decrease in mental health admissions and readmissions of persons needing crisis stabilization services to institutional facilities (hospital emergency rooms, State Hospitals, jails, private psychiatric facilities).

Numerator: The number of individuals receiving project crisis stabilization services who were diverted from institutional facilities.

Denominator: Total number of individuals requiring crisis stabilization services.

Data Source: Project Data: Profile consumers/history of frequent users of institutional facilities. Those meeting profile or having history would be counted.

Crisis stabilization services will increase by at least 25% by the end of the waiver project.

**Rationale:**

The process milestones and outcome improvement targets selected are those most directly respond to the Transformation Waiver goals and objectives. These milestones and outcome improvement targets directly relate to the provision of community based crisis stabilization services and are milestones and outcomes that are measureable. The outcome improvement targets will be determined in DY 2 for implementation in DY3.

The following evidence supports selection of this project and related outcome targets:

2) The preparatory research supported the conclusion that psychiatric crises requiring acute care with hospitalization account for the largest expenditures in community care. Fenton, W>S., Hoch, JS, Herrell, JM, Mosher, L & Dixon, L., Cost and cost-effectiveness of hospital vs. residential crisis care for patients who have serious mental illness. Arch Gen Psychiatry, 202; 59; 357-364.
3) Sledge, et al concluded that alternative programs had not be “widely implemented” because of the existence of an “incentive structure that discourages their use” and because it is assumed that psychiatric hospitalization is the “most effective method of treatment of those acutely ill psychiatric patients.” P. 1075.

**Outcome Measure Valuation:**

Project valuation takes into consideration:

1) Costs for both state operated Psychiatric Hospitals.
2) Costs of private Psychiatric Hospitals.
3) Local Emergency Room and Hospital costs.
4) Cost of local judicial systems.
5) Cost of local City and County law enforcement systems both in their intervention activity as well as the provision of transportation for consumers needing treatment.
6) Significant value will be given to a program that can provide services much more responsive to consumer needs with significantly reduced time frames and efficient use of limited resources!

**Identifying Outcome Measure and Provider Information:**

| Title of Outcome Measures (Improvement Target): | IT-9.2 ED appropriate utilization |
| Unique RHP outcome ID#: | 121990904.3.2 – PASS 2 |
| Performing Provider: | Camino Real Community Services |
| Performing Provider TPI: | 121990904 |

**Outcome Measure Description:**

Camino Real Community Services has selected the following process and improvement measures for Category 3, OD-9 Right Care Right Setting:

**Process Milestones:**

DY 2: P-1 Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.

DY 3: P-7 (Other activities) Implementation plans: i.e. Facility acquisition, architect drawings, building financing, contractor retention, operational budget including staffing requirements, policy procedure development, etc.

**Outcome Improvement Targets:**

DY 4: IT-9.2 ED appropriate utilization

Reduce Emergency Department visits for target conditions: Behavioral Health/Substance Abuse

DY 5: IT-9.2 ED appropriate utilization

Reduce Emergency Department visits for target conditions: Behavioral Health/Substance Abuse

**Rationale:**

The process milestones and outcome improvement targets selected are those that most directly respond to the Transformation Waiver goals and objectives. According to Practice Guidelines: Core Elements for Responding to Mental Health Crisis (HHS Pub. No. SMA-09-4427;2009) about 6 percent of all hospital emergency department visits reflect mental health emergencies and due to a lack of available alternatives, 79 percent of hospital emergency departments report having to “board” psychiatric patients who are in crisis and in need of inpatient care, sometimes for *eight hours or longer*. As further discussed in the Practice Guidelines, in addition to the human case for improving crisis services, a strong business case can be made and data should be collected accordingly. Current approaches to crisis services needlessly perpetuate reliance on expensive, late-stage interventions (such as hospital emergency departments) and on settings that have inherent risks for harm for people with mental health needs (for instance, jails and juvenile justice facilities).

In 2008, Mental Health or Substance Abuse disorders were the principal reason for 1.8 million inpatient community hospital stays, accounting for 4.5 percent of stays in the U.S. This is according to Brief #117 (Agency for Healthcare Research and Quality, June 2011). It was also noted the MH and SA conditions most frequently treated in community hospitals were mood disorders (depression and bipolar disorder), schizophrenia and other psychotic disorders, alcohol-related disorders and drug-related disorders. These MHSA hospital stays cost $9.7 billion ($7.7 billion for MH; $2.1 billion for SA) nationwide, the MH average length of stay was 8.0 days and the SA average length of stay was 4.8 days with an average cost $5100.
Citations:

**Outcome Measure Valuation:**

Project valuation takes into consideration cost avoidance as related to:

1) Costs for state operated Psychiatric Hospitals.
2) Costs of private Psychiatric Hospitals.
3) Local Emergency Room and Hospital costs.
4) Cost of local judicial systems.
5) Cost of local City and County law enforcement systems both in their intervention activity as well as the provision of transportation for consumers needing treatment.

### Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-5.1 Improved cost savings: demonstrate cost savings in care delivery.
Unique RHP ID#: 137251808.3.1 – PASS 1
Performing Provider: Center for Health Care Services
TPI: 137251808

### Outcome Measure Description:

**IT-5.1 Improved cost savings: demonstrate cost savings in care delivery.**

- a. Type of analysis to be determined by provider from the following list:
  - Cost of Illness Analysis, Cost Minimization Analysis, Cost Effectiveness Analysis (CEA), Cost Consequence Analysis, Cost Utility Analysis, Cost Benefit Analysis
- b. Data source: TBD by provider as appropriate for analysis type
- c. Rationale/Evidence: TBD by provider

Process Milestone(s):

- **DY2:**
  - P-1 – Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
- **DY3:**
  - P-1 Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

DY2, plans will be developed and in DY3 these new processes will be piloted. This will enable the project to fully achieve the improvement targets of increased appropriate utilization of emergency departments and reduced costs.

### Outcome Improvement Targets for each year:

- **DY4:**
  - IT-5.1 Improved cost savings: demonstrate cost savings in care delivery
  - Improvement Target: TBD

- **DY5:**
  - IT-5.1 Improved cost savings: demonstrate cost savings in care delivery
  - Improvement Target: TBD

### Rationale:

The addition of a Children’s Crisis Respite Center will provide a new, more appropriate care setting for children in crisis and will connect them to more durable, community-based care. However, maximizing this new resource will require strategic planning and methodical implementation, as is planned for DY2-DY3. The availability of this intervention will trigger achievement of the improvement targets of 30% increase in the utilization of appropriate crisis alternatives in DY4 and a TBD cost avoidance/cost savings factor in DY5.
### Outcome Measure Valuation:

The Category 3 value for this project is $52,595 for DY 2 and $588,512 for all years. The establishment of a Children’s Crisis Respite Center fills an existing gap in the local continuum of behavioral health care for children. The availability of this new resource will ensure children are stabilized, connected to systems of care that will support community living and prevent or reduce costly, avoidable hospitalization, lengthy stays in institutions, further crises and the inappropriate use of emergency departments. This also will be a critical resource and a new option for police departments, schools and child protective services, making it an alternative to more costly and restrictive institutional care. As part of the proposed project, CHCS will quantify cost savings attributable to the approach. CHCS has a significant amount of existing infrastructure from which this project can be launched and only site preparation is required; thereby driving down the required investment and increasing the cost effectiveness of the approach. The cost formulas lowered the scoring for projects with existing investments of infrastructure and resources and increased the scoring for projects requiring the greatest investment. However, CHCS has contracted with a medical economist to conduct studies of the project and their data has determined values that exceed the DSRIP estimates.

Valuations should be based on economic evaluation principles that identify, measure, and value the relevant costs and consequences of two or more alternatives. Typically, one alternative is a new program while the second is treatment as usual. Cost-utility analysis (CUA) measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state. Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across potentially different types of interventions, the common health goal, or outcome, is the number of life-years added.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $588,512**
Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-10.1 Quality of Life
Unique RHP ID: 137251808.3.3 – PASS 1
Performing Provider: Center for Health Care Services
TPI: 137251808

Outcome Measure Description:

**IT-10.1 Quality of Life-275.276.277 (Standalone measure)**

a. Demonstrate improvement in quality of life (QOL) scores, as measured by evidence based and validated assessment tool, for the target population.
b. Data source: Provider may select a validated assessment tool for quality of life. Some examples include AQoL, SF-36, 20 or 12, PedsQL
c. Rationale/Evidence: Although much of health care is focused on increasing longevity, many of the medical treatments are specifically designed to improve symptoms and function, two essential components of health-related quality of life. In many cases, the best way to measure symptoms and functional status is by direct patient survey. The importance of such patient-reported outcomes is evidenced by their increased use in clinical trials and in drug and device label claims. Effective quality improvement requires relentless focus on the patient outcomes.

Process Milestone(s):

- **DY2:** P-1 – Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities
  Data Source: PDSA reports
- **DY3:** P-2 - Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities
  Data Source: PDSA reports

In DY2 the first PDSA cycle will occur and quality-enhancing improvements to processes and methods will be identified. In DY3 these new processes will be implemented and the PDSA cycle will be repeated to verify achievement of the desired impact. This will enable the project to fully achieve the improvement targets of enhanced consumer-perceived quality of life.

Outcome Improvement Targets for each year:

- **DY4:**
  - IT-10.1 Quality of Life.
  - Improvement Target: TBA

- **DY5:**
  - IT-10.1 Quality of Life.
  - Improvement Target: TBD
**Rationale:**
The expansion of Adult Outpatient Capacity will fill existing gaps in care in Bexar County, enhancing quality of life and reducing current waiting times for service. However, an efficient and effective service expansion will be supported with the methodical use of PDSA processes, as is planned for DY2-DY3. Expanded services will support achievement of the improvement target of **improved quality of life** (percentage of change TBD in DY4 and DY5).

**Outcome Measure Valuation:**
The Category 3 value for this project is $210,378 for DY 2 and $2,354,043 for all years. The expansion of Adult Outpatient Capacity fills an existing gap in the local continuum of behavioral health care for adults with mental illness. The availability of this increased resource will support community living and prevent or reduce costly, avoidable hospitalization, lengthy stays in institutions, further crises and the inappropriate use of emergency departments. CHCS has a significant amount of existing infrastructure from which this project can be launched and only site preparation is required; thereby driving down the required investment and increasing the cost effectiveness of the approach. The cost formulas lowered the scoring for projects with existing investments of infrastructure and resources and increased the scoring for projects requiring the greatest investment. However, CHCS has contracted with a medical economist to conduct studies of the project and their data has determined values that exceed the DSRIP estimates. This work will be made available to University Health System to advise project valuation and outcome measures going forward.

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-3.8 Behavioral Health/Substance Abuse 30-day re-admission rate
Unique RHP ID: 137251808.3.4 – PASS 1
Performing Provider: Center for Health Care Services
TPI: 137251808

Outcome Measure Description:

IT-3.8 Behavioral Health/Substance Abuse 30-day re-admission rate
a  Numerator: The number of readmissions, for patients 18 years and older, for any cause, within 30 days of discharge from the index behavioral health and substance abuse admission is indicated as either the primary or secondary diagnosis. If an index admission has more than 1 readmission, only the first is counted as a readmission.
b  Denominator: The number of admissions, for patients 18 years and older, for patients discharged from the hospital with a principal or secondary diagnosis of behavioral health and substance abuse and with a complete claims history for the 12 months prior to admission

Process Milestone(s):

- DY2:
  - P-1 – Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
- DY3:
  - P-1 Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

In DY2, plans will be developed and in DY3 these new processes will be piloted. This will enable the project to fully achieve the improvement target of decreased 30-day re-admission rate for behavioral health or substance abuse.

Outcome Improvement Targets for each year:

- DY4:
  - IT-3.8 Behavioral Health/Substance Abuse 30-day re-admission rate
  - Improvement Target: TBD
- DY5:
  - IT-3.8 Behavioral Health/Substance Abuse 30-day re-admission rate
  - Improvement Target: TBD

Rationale:

The addition of a Crisis Transitional Residential Center will provide a new, more appropriate care setting for adults in crisis and adults leaving long-term hospitalization in need of step-down care. However, maximizing this new resource will require strategic planning and methodical implementation, as is planned for DY2-DY3. The availability of this intervention will trigger achievement of the improvement targets of reductions in the Behavioral Health/Substance Abuse 30-day re-admission rate (TBD for DY4 and DY5).
**Outcome Measure Valuation:**

The Category 3 value for this project is $84,151 for DY 2 and $941,618 for all years. The establishment of a Crisis Transitional Residential program for adults will fill an existing gap in the local continuum of behavioral health care. The availability of this new resource will ensure adults in crisis or those leaving long-term hospitalization are connected to care that will support community living and prevent or reduce costly, avoidable re-hospitalization, lengthy stays in institutions, further crises and the inappropriate use of emergency departments. As part of the proposed project, CHCS will quantify cost savings attributable to the approach. CHCS has a significant amount of existing infrastructure from which this project can be launched and only site preparation is required; thereby driving down the required investment and increasing the cost effectiveness of the approach. The cost formulas lowered the scoring for projects with existing investments of infrastructure and resources and increased the scoring for projects requiring the greatest investment. However, CHCS has contracted with a medical economist to conduct studies of the project and their data has determined values that exceed the DSRIP estimates. This work will be made available to University Health System to advise project valuation and outcome measures going forward.

Valuations should be based on economic evaluation principles that identify, measure, and value the relevant costs and consequences of two or more alternatives. Typically, one alternative is a new program while the second is treatment as usual. Cost-utility analysis (CUA) measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across potentially different types of interventions, the common health goal, or outcome, is the number of life-years added.

### Identifying Outcome Measure and Provider Information:

<table>
<thead>
<tr>
<th>Title of Outcome Measure (Improvement Target):</th>
<th>IT-10.1 Quality of Life</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique RHP ID:</td>
<td>137251808.3.5 – PASS 1</td>
</tr>
<tr>
<td>Performing Provider:</td>
<td>Center for Health Care Services</td>
</tr>
<tr>
<td>TPI:</td>
<td>137251808</td>
</tr>
</tbody>
</table>

### Outcome Measure Description:

**IT-10.1 Quality of Life**

a. Demonstrate improvement in quality of life (QOL) scores, as measured by evidence based and validated assessment tool, for the target population.

b. Data source: Provider may select a validated assessment tool for quality of life. Some examples include AQoL, SF-36, 20 or 12, PedsQL

c. Rationale/Evidence: Although much of health care is focused on increasing longevity, many of the medical treatments are specifically designed to improve symptoms and function, two essential components of health-related quality of life. In many cases, the best way to measure symptoms and functional status is by direct patient survey. The importance of such patient-reported outcomes is evidenced by their increased use in clinical trials and in drug and device label claims. Effective quality improvement requires relentless focus on the patient outcomes.

### Process Milestone(s):

- **DY2:**
  - P-4 – Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities

- **DY3:**
  - P-4 Project planning – Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities

In DY2, the first PDSA cycle will occur and quality-enhancing improvements to processes and methods will be identified. In DY3 these new processes will be implemented and the PDSA cycle will be repeated to verify achievement of the desired impact. This will enable the project to fully achieve the improvement targets of enhanced consumer-perceived quality of life.

### Outcome Improvement Targets for each year:

- **DY4:**
  - IT-10.1 Quality of Life
  - Improvement Target: TBD

- **DY5:**
  - IT-10.1 Quality of Life
  - Improvement Target: TBD
### Rationale:
The expansion of Children’s Mental Health Services will fill existing gaps in care in Bexar County, enhancing quality of life and creating a durable system of care for children with behavioral health needs. However, an efficient and effective service expansion will be supported with the methodical use of PDSA processes, as is planned for DY2-DY3. Expanded services will support achievement of the improvement target of improved quality of life (percentage of change TBD in DY4 and DY5).

### Outcome Measure Valuation:
The Category 3 value for this project is $92,567 for DY 2 and $1,035,779 for all years. The expansion of Children’s Mental Health Services fills an existing gap in the local continuum of behavioral health care for children. The availability of this increased resource will ensure children are stabilized, connected to systems of care that will support community living and prevent or reduce costly, avoidable hospitalization, lengthy stays in institutions, further crises and the inappropriate use of emergency departments. CHCS has a significant amount of existing infrastructure from which this project can be launched and only site preparation is required; thereby driving down the required investment and increasing the cost effectiveness of the approach. The cost formulas lowered the scoring for projects with existing investments of infrastructure and resources and increased the scoring for projects requiring the greatest investment. However, CHCS has contracted with a medical economist to conduct studies of the project and their data has determined values that exceed the DSRIP estimates.

Valuations should be based on economic evaluation principles that identify, measure, and value the relevant costs and consequences of two or more alternatives. Typically, one alternative is a new program while the second is treatment as usual. Cost-utility analysis (CUA) measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across potentially different types of interventions, the common health goal, or outcome, is the number of life-years added.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $1,035,779
Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-9.1 Decrease in mental health admissions and readmissions to criminal justice settings such as jails or prisons
Unique RHP ID: 137251808.3.6 – PASS 1
Performing Provider: Center for Health Care Services
TPI: 137251808

Outcome Measure Description:

IT-9.1 Decrease in mental health admissions and readmissions to criminal justice settings such as jails or prisons

   a Numerator: The number of individuals receiving project intervention(s) who had a potentially preventable admission/readmission to a criminal justice setting (e.g. jail, prison, etc.) within the measurement period.

   b Denominator: The number of individuals receiving project intervention(s)

   c Data Sources: Claims/encounter and clinical record data; anchor hospital and other hospital records, criminal justice system records, local MH authority and state MH data system records

   d Rationale/Evidence: Admission and readmission to criminal justice settings such as jails and prisons is disruptive and deleterious to recovery from behavioral health disorders. Studies of recidivism criminal justice patients in Texas and other states have demonstrated poorer physical health status, increased incidence of homelessness increased propensity to use emergency department and inpatient services. Interventions which can prevent individuals from cycling through the criminal justice system can help avert poor health and mental health outcomes, reduce long term medical costs and improve functioning.

Process Milestone(s):

   • DY2:
     o P-4 – Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities

   • DY3:
     o P-4 Project planning – Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities

In DY2 the first PDSA cycle will occur and quality-enhancing improvements to processes and methods will be identified. In DY3 these new processes will be implemented and the PDSA cycle will be repeated to verify achievement of the desired impact. This will enable the project to fully achieve the improvement targets of decrease in mental health admissions and re-admissions to criminal justice settings.

Outcome Improvement Targets for each year:

   • DY4:
     o IT-9.1 Decrease in mental health admissions and readmissions to criminal justice settings
     o Improvement Target: TBD

   • DY5:
     o IT-9.1 Decrease in mental health admissions and readmissions to criminal justice settings
     o Improvement Target: TBD
Rationale:

The expansion of Adult Outpatient Capacity will fill existing gaps in care in Bexar County. However, an efficient and effective service expansion will be supported with the methodical use of PDSA processes, as is planned for DY2-DY3. Expanded services will support achievement of the improvement target of decrease in mental health admissions and re-admissions to criminal justice settings (percentage of change TBD in DY4 and DY5).

Outcome Measure Valuation:

The Category 3 value for this project is $180,924 for DY 2 and $2,024,476 for all years. The expansion of IOPC fills an existing gap in the local continuum of behavioral health care for adults with mental illness. The availability of this increased resource will support community living and prevent or reduce incarceration and the inappropriate use of emergency departments. CHCS has a significant amount of existing infrastructure from which this project can be launched and only site preparation is required; thereby driving down the required investment and increasing the cost effectiveness of the approach. The cost formulas lowered the scoring for projects with existing investments of infrastructure and resources and increased the scoring for projects requiring the greatest investment. However, CHCS has contracted with a medical economist to conduct studies of the project and their data has determined values that exceed the DSRIP estimates. This work will be made available to University Health System to advise project valuation and outcome measures going forward.

Valuations should be based on economic evaluation principles that identify, measure, and value the relevant costs and consequences of two or more alternatives. Typically, one alternative is a new program while the second is treatment as usual. Cost-utility analysis (CUA) measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across potentially different types of interventions, the common health goal, or outcome, is the number of life-years added.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $2,024,476**
Identifying Outcome Measure and Provider Information:
Title of Outcome Measure (Improvement Target): IT-9.2 ED appropriate utilization
Unique RHP ID: 137251808.3.7 – PASS 1
Performing Provider: Center for Health Care Services
TPI: 137251808

Outcome Measure Description:
IT-9.2 ED appropriate utilization
- Reduce all ED Visits
- Reduce pediatric Emergency Department visits (CHIPRA Core Measure)
- Reduce Emergency Department visits for target conditions:
  - Behavioral Health/Substance Abuse

Process Milestone(s):
- DY2:
  - P-1 – Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
- DY3:
  - P-1 Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

In DY2, plans will be developed and in DY3 these new processes will be piloted. This will enable the project to fully achieve the improvement target of decreased emergency department utilization.

Outcome Improvement Targets for each year:
- DY4:
  - IT-9.2 appropriate utilization
  - Improvement Target: TBD
- DY5:
  - IT-9.2 appropriate utilization
  - Improvement Target: TBD

Rationale:
The addition of integrated behavioral and primary health care will provide new, improved care for high need, homeless adults with substance abuse disorders, mental illness and, in some cases, co-occurring disorders. However, maximizing this new resource will require strategic planning and methodical implementation, as is planned for DY2-DY3. The availability of this intervention will trigger achievement of the improvement targets of increases in the appropriate utilization of emergency departments (TBD for DY4 and DY 5).
Outcome Measure Valuation:
The Category 3 value for this project is $80,996 for DY 2 and $906,307 for all years. The integration of primary and behavioral health care will improve available resources for the target population of high need, homeless adults, most of whom will have chronic behavioral health and physical health conditions. As part of the proposed project, CHCS will quantify cost savings attributable to the approach. CHCS has a significant amount of existing infrastructure from which this project can be launched and only site preparation is required; thereby driving down the required investment and increasing the cost effectiveness of the approach. The cost formulas lowered the scoring for projects with existing investments of infrastructure and resources and increased the scoring for projects requiring the greatest investment. However, CHCS has contracted with a medical economist to conduct studies of the project and their data has determined values that exceed the DSRIP estimates.

Valuations should be based on economic evaluation principles that identify, measure, and value the relevant costs and consequences of two or more alternatives. Typically, one alternative is a new program while the second is treatment as usual. Cost-utility analysis (CUA) measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across potentially different types of interventions, the common health goal, or outcome, is the number of life-years added.

### Identifying Outcome Measure and Provider Information:

| Title of Outcome Measure (Improvement Target): | IT-9.2 ED appropriate utilization |
| Unique RHP ID:          | 137251808.3.8 – PASS 1 |
| Performing Provider:    | Center for Health Care Services |
| TPI:                   | 137251808 |

### Outcome Measure Description:

**IT-9.2 ED appropriate utilization**

- Reduce all ED Visits
- Reduce pediatric Emergency Department visits (CHIPRA Core Measure)
- Reduce Emergency Department visits for target conditions:
  - Behavioral Health/Substance Abuse

**Process Milestone(s):**

- **DY2:**
  - P-1 – Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
- **DY3:**
  - P-1 Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

In DY2, plans will be developed and in DY3 these new processes will be piloted. This will enable the project to fully achieve the improvement target of decreased emergency department utilization.

### Outcome Improvement Targets for each year:

- **DY4:**
  - IT-9.2 appropriate utilization
  - Improvement Target: TBD
- **DY5:**
  - IT-9.2 appropriate utilization
  - Improvement Target: TBD

### Rationale:

The addition of integrated behavioral and primary health care will provide new, improved care for adults with substance abuse disorders and, in some cases, HIV. However, maximizing this new resource will require strategic planning and methodical implementation, as is planned for DY2-DY3. The availability of this intervention will trigger achievement of the improvement targets of increases in the appropriate utilization of emergency departments (TBD for DY4 and DY 5).
**Outcome Measure Valuation:**

The Category 3 value for this project is $88,359 for DY 2 and $988,698 for all years. The integration of primary and behavioral health care will improve available resources for substance abusing adults and adults with a co-occurring substance abuse issue and HIV. As part of the proposed project, CHCS will quantify cost savings attributable to the approach. CHCS has a significant amount of existing infrastructure from which this project can be launched and only site preparation is required; thereby driving down the required investment and increasing the cost effectiveness of the approach. The cost formulas lowered the scoring for projects with existing investments of infrastructure and resources and increased the scoring for projects requiring the greatest investment. However, CHCS has contracted with a medical economist to conduct studies of the project and their data has determined values that exceed the DSRIP estimates.

Valuations should be based on economic evaluation principles that identify, measure, and value the relevant costs and consequences of two or more alternatives. Typically, one alternative is a new program while the second is treatment as usual. Cost-utility analysis (CUA) measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across potentially different types of interventions, the common health goal, or outcome, is the number of life-years added.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $988,698**
**Identifying Outcome Measure and Provider Information:**

| Title of Outcome Measure (Improvement Target): IT-10.1 Quality of Life |
| Unique RHP Identification Number: 137251808.3.9 – PASS 2 |
| Provider Name: Center for Health Care Services |
| TPI: 137251808 |

**Outcome Measure Description:**

**IT-10.1 Quality of Life**

a. Demonstrate improvement in quality of life (QOL) scores, as measured by evidence based and validated assessment tool, for the target population or their caregivers.
b. Data source: AQoL, SF-36, 20 or 12, PedsQL
c. Rationale/Evidence: Although much of health care is focused on increasing longevity, many of the medical treatments are specifically designed to improve symptoms and function, two essential components of health-related quality of life. In many cases, the best way to measure symptoms and functional status is by surveying the patient or their caregivers in the case of children or non-communicative adults. The importance of such patient-reported outcomes is evidenced by their increased use in clinical trials and in drug and device label claims. Effective quality improvement requires relentless focus on the patient outcomes.

**Process Milestone(s):**

- **DY2:**
  - P-4 – Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities
- **DY3:**
  - P-4 Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities

In DY2, the first PDSA cycle will occur and quality-enhancing improvements to processes and methods will be identified. In DY3 these new processes will be implemented and the PDSA cycle will be repeated to verify achievement of the desired impact. This will enable the project to fully achieve the improvement targets of enhanced consumer-perceived quality of life.

**Outcome Improvement Targets for each year:**

- **DY4:**
  - IT-10.1 Quality of Life
  - Improvement Target: TBD

- **DY5:**
  - IT-10.1 Quality of Life
  - Improvement Target: TBD

**Rationale:**

The expansion of integrated, specialized care for children and adults who are dually diagnosed with mental illness and intellectual developmental disabilities (IDD) will fill existing gaps in care in Bexar County, will enhance quality of life and will create a durable system of care for children and adults with special, often unmet needs. An efficient and effective service expansion
will be supported with the methodical use of PDSA processes, as is planned for DY2-DY3. Expanded services will support achievement of the improvement target of improved quality of life (percentage of change TBD in DY4 and DY5).

**Outcome Measure Valuation:**

The Category 3 value for this project is $87,047 for DY 2 and $973,618 for all years. The proposed service expansion fills an existing gap in the local continuum of behavioral health care for dually diagnosed children and adults. The availability of this enhanced resource will ensure the target population is stabilized and connected to durable systems of care that support community living and prevent or reduce costly, avoidable hospitalization, lengthy stays in institutions, further crises and the inappropriate use of emergency departments. CHCS has a significant amount of existing infrastructure from which this project can be launched and only site preparation is required; thereby driving down the required investment and increasing the cost effectiveness of the approach. The cost formulas lowered the scoring for projects with existing investments of infrastructure and resources and increased the scoring for projects requiring the greatest investment. However, CHCS has contracted with a medical economist to conduct studies of the project and their data has determined values that exceed the DSRIP estimates.

Valuations should be based on economic evaluation principles that identify, measure, and value the relevant costs and consequences of two or more alternatives. Typically, one alternative is a new program while the second is treatment as usual. Cost-utility analysis (CUA) measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across potentially different types of interventions, the common health goal, or outcome, is the number of life-years added.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $973,618**
Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-10.1 Quality of life/Functional status
Unique RHP Outcome Identification Number: 137251808.3.10 – PASS 2
Provider Name: Center for Health Care Services
TPI: 137251808

Outcome Measure Description:

IT-10.1 Quality of Life

a. Demonstrate improvement in quality of life (QOL) scores, as measured by evidence based and validated assessment tool, for the target population or their caregivers.
b. Data source: AQoL, SF-36, 20 or 12, PedsQL
c. Rationale/Evidence: Although much of health care is focused on increasing longevity, many of the medical treatments are specifically designed to improve symptoms and function, two essential components of health-related quality of life. In many cases, the best way to measure symptoms and functional status is by surveying the patient or their caregivers in the case of children or non-communicative adults. The importance of such patient-reported outcomes is evidenced by their increased use in clinical trials and in drug and device label claims. Effective quality improvement requires relentless focus on the patient outcomes.

Process Milestone(s):

- DY2:
  - P-4 – Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities
- DY3:
  - P-4 Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities

In DY2, the first PDSA cycle will occur and quality-enhancing improvements to processes and methods will be identified. In DY3 these new processes will be implemented and the PDSA cycle will be repeated to verify achievement of the desired impact. This will enable the project to fully achieve the improvement targets of enhanced consumer-perceived quality of life.

Outcome Improvement Targets for each year:

- DY4:
  - IT-10.1 Quality of Life
  - Improvement Target: TBD

- DY5:
  - IT-10.1 Quality of Life
  - Improvement Target: TBD
**Rationale:**
The addition of a multi-entity continuum of integrated care will yield new, improved services for high-utilizing homeless adults with substance abuse disorders, mental illness and, in some cases, co-occurring disorders, and will improve outcomes and drive down costs. However, maximizing this new resource will require strategic planning and methodical implementation, as is planned for DY2-DY3. The availability of this intervention will trigger achievement of the improvement targets of increases in the appropriate utilization of emergency departments (TBD for DY4 and DY 5).

**Outcome Measure Valuation:**
The Category 3 value for this project is $84,347 for DY 2 and $963,163 for all years. An integrated continuum and a shared treatment plan will improve treatment of the target population. As part of the proposed project, CHCS will quantify cost savings attributable to the approach. CHCS has a significant amount of existing infrastructure from which this project can be launched and only site preparation is required; thereby driving down the required investment and increasing the cost effectiveness of the approach. The cost formulas lowered the scoring for projects with existing investments of infrastructure and resources and increased the scoring for projects requiring the greatest investment. However, CHCS has contracted with a medical economist to conduct studies of the project and their data has determined values that exceed the DSRIP estimates.

**Valuations should be based on economic evaluation principles that identify, measure, and value the relevant costs and consequences of two or more alternatives. Typically, one alternative is a new program while the second is treatment as usual. Cost-utility analysis (CUA) measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.**

Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across potentially different types of interventions, the common health goal, or outcome, is the number of life-years added.

### Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-10.1 Quality of Life  
Unique RHP Identification Number: 137251808.3.11 – PASS 2  
Provider Name: Center for Health Care Services  
TPI: 137251808

### Outcome Measure Description:

**IT-10.1 Quality of Life**

- Demonstrate improvement in quality of life (QOL) scores, as measured by evidenced based and validated assessment tool, for the target based population.
- Data source: SF-36
- Rationale/Evidence: In a similar activity -- Project HOMES -- CHCS has already demonstrated statistically significant quality of life improvements using the SF-36

Process Milestone(s):

- **DY3:**  
  - P-4 Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities

In DY2, the first PDSA cycle will occur and quality-enhancing improvements to processes and methods will be identified. In DY3 these new processes will be implemented and the PDSA cycle will be repeated to verify achievement of the desired impact. This will enable the project to fully achieve the improvement targets of enhanced consumer-perceived quality of life.

### Outcome Improvement Targets for each year:

- **DY4:**  
  - IT-10.1 Quality of Life  
  - Improvement Target: TBD

- **DY5:**  
  - IT-10.1 Quality of Life  
  - Improvement Target: TBD

1 Center For Health Care Services. (2012). SAMHSA Project HOMES Bi-Annual Report. San Antonio, Texas. (Stringfellow)

### Rationale:

The IHWWP will help to meet an existing need for a comprehensive, safe, structured, integrated care management program for high-need, homeless females in Bexar County. Because the target population often has a complex combination of physical and behavioral health care needs combined with concomitant issues of substance abuse, traumatic injury, cognitive challenges and a lack of daily living skills and natural supports, they are frequent users of Emergency Departments (ED) and other public health services. This project will expand available treatment options (SS, WSM, and Matrix Psycho social EBPs) for males and females and will establish a parallel, 24 bed dormitory (IHWWP) for females, which will improve outcomes and drive down
costs. However, maximizing this new resource will require strategic planning and methodical implementation, as is planned for DY2-DY3. The availability of this intervention will trigger achievement of the improvement targets of increases in the appropriate utilization of emergency departments (TBD for DY4 and DY 5).

**Outcome Measure Valuation:**

The Category 3 value for this project is $52,991 for DY 2 and $582,297 for all years. As part of the proposed project, CHCS will quantify cost savings attributable to the approach. CHCS has a significant amount of existing infrastructure from which this project can be launched and only site preparation is required; thereby driving down the required investment and increasing the cost effectiveness of the approach. The cost formulas lowered the scoring for projects with existing investments of infrastructure and resources and increased the scoring for projects requiring the greatest investment. However, CHCS has contracted with a medical economist to conduct studies of the project and their data has determined values that exceed the DSRIP estimates.

*Valuations should be based on economic evaluation principles that identify, measure, and value the relevant costs and consequences of two or more alternatives. Typically, one alternative is a new program while the second is treatment as usual. Cost-utility analysis (CUA) measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.*

Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across potentially different types of interventions, the common health goal, or outcome, is the number of life-years added.

**Identifying Outcome Measure and Provider Information:**

Title of Outcome Measure (Improvement Target): IT-10.2 Activities of Daily Living/Mobile Crisis Outreach Teams

Unique RHP Outcome Identification number: 133340307.3.1 – PASS 1

Performing Provider: Hill Country Community MHMR Center (dba Hill Country MHDD Centers)

TPI: 133340307

**Outcome Measure Description:**

Outcome Measure Description:

IT-10.2 Activities of Daily Living – The percentage of individuals in the targeted population who have received treatment and show improvement on subsequent Activities of Daily Living scales.

Process Milestones:
Not applicable

Outcome Improvement Targets for each year:

DY2 – Not Applicable

DY3 IT10.2 10% of individuals receiving services through the project show improvement on subsequent Activities of Daily Living scale

DY4 IT10.2 15% of individuals receiving services through the project show improvement on subsequent Activities of Daily Living scale

DY5 IT10.2 20% of individuals receiving services through the project show improvement on subsequent Activities of Daily Living scale

**Rationale:**

Rationale for Improvement Targets:
Mobile Crisis Outreach Team service impacts an individual’s mental health and thus their quality of life. It impacts the individual’s self care as well as their ability to cope with their environment. When an individual is unable to properly care for themselves or to cope with their local environment, they are at greater risk of unemployment and poor health. The Activities of Daily Living will be utilized to provide an overview of functional status, determine activity limitations, establish a baseline for treatment, provide a guide for intervention planning, to evaluate interventions and monitor progress and to plan for future and for discharge.

The DLA-20 Functional Assessment is a functional assessment, proven to be reliable and valid, designed to assess what daily living areas are impacted by mental illness or disability. The assessment tool identifies where outcomes are needed so clinicians can address those functional deficits on individualized service plans. THE DLA-20 is intended to be used by all disabilities and ages.

THE DLA-20 utilizes the following 20 domains: Health Practices, Housing Stability and Maintenance, Communication, Safety, Managing Time, Nutrition, Problem Solving, Family Relationships, Alcohol/Drug Use, Leisure, Community Resources, Social Network, Sexuality, Productivity, Coping Skills, Behavior Norms, Personal Care/Hygiene, Grooming, and Dress. For the targeted population, individuals needing Trauma Informed Care, the DLA-20 will help
identify areas the trauma has impacted in their lives such as coping skills, problem solving, family relationships, communication, and safety and be able to track improvement in the areas of the course of treatment.

Outcome measures are based on the number of individuals that have begun treatment in the Trauma Informed Care program and were kept modest due to the intervention requiring a change in the individual’s lifestyle which will take time to implement and due to individuals continuing to enter the program throughout the demonstration years.

The Activities of Daily Living will be utilized to measure how a person is functioning at the present time, and to identify improvement over time. By measuring the Activities of Daily Living of an individual before and after treatment, the impact of the treatment on an individual’s capability to function appropriately in society, thus increasing the potential for employment and for better health, will be captured to demonstrate the success of the project. Outcome measures were kept modest due to the interventions requiring a change in the individual’s lifestyle which will take time to implement or where the individual may be resistant to change.

In addition, throughout the waiver, Hill Country will be working with other Community Centers in a learning collaborative to select a small set of outcome measures for Category 3, based on the valuation studies conducted by health care economists at the University of Texas and University of Houston. The collaborative will develop a strategy for collection of that data through HIEs or other shared data sources in local communities. Centers are currently in the process of engaging a consultant to provide leadership and consultation for this project. The outcome of this project may result in future refinement of the Category 3 Improvement Outcome metrics.

### Outcome Measure Valuation:

Project valuation is based on a weighted average of Achieving Waiver Goals, Addressing Community Needs, Project Scope, and Project Investment. The valuation for this project was based on an economic evaluation model and extensive literature review conducted by professors at the University of Houston School of Public Health and University of Texas at Austin Center for Social Work Research. The valuation is supported by cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). QALYs incorporate costs averted when known (e.g., emergency room visits that area avoided). The valuation on this project is based on 190 consumers over the life of the project resulting in a valuation overall of $15,642 per individual served.

### Outcome Measure Description:

Outcome Measure Description:

IT-12.5 Other USPSTF-endorsed screening outcome measures (PHQ-A/BDI-PC)

Category 3 outcome measures will be based on the following screening categories performed by primary care physicians: PHQ-A/BDI-PC for Adolescents (12-18 years old)

The number of PHQ-A/BDI-PC performed by Primary Care Physicians on patients/individuals enrolled to receive behavioral health consultation will be divided by the population ages 12 to 18 of Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde as determined by Texas Department of State Health Services population estimates

### Process Milestones:

Not applicable

### Outcome Improvement Targets for each year:

</tr>
<tr>
<td>DY5</td>
<td>IT12.5 5% of population 12 to 18 years old have received PHQ-A/BDI-PC assessment</td>
</tr>
</tbody>
</table>

### Rationale:

Screening instruments for depression and substance use disorder are beneficial when behavioral health supports are available. With the addition of Behavioral Health Consultation, it is important that Primary Care Physicians complete assessments to determine individuals needing behavioral health and substance use disorder services in order to begin treatment as soon as possible before symptoms exacerbate.

In addition, throughout the waiver, Hill Country will be working with other Community Centers in a learning collaborative to select a small set of outcome measures for Category 3, based on the valuation studies conducted by health care economists at the University of Texas and University of Houston. The collaborative will develop a strategy for collection of that data through HIEs or other shared data sources in local communities. Centers are currently in the process of engaging a consultant to provide leadership and consultation for this project. The outcome of this project may result in future refinement of the Category 3 Improvement Outcome metrics.

**Outcome Measure Description:**

- IT-12.5 Other USPSTF-endorsed screening outcome measures (CAGE and AUDIT)

Category 3 outcome measures will be based on the following screening categories performed by primary care physicians CAGE and AUDIT for Adult Substance Use Disorder

The number of CAGE/AUDIT performed by Primary Care Physicians on patients individuals enrolled to receive behavioral health consultation will be divided by the population over 18 of Bandera, Comal, Edwards, Gillespie, Kendall, Kerr, Kinney, Medina, Real, Uvalde and Val Verde as determined by Texas Department of State Health Services population estimates

**Process Milestones:**
- Not applicable

**Outcome Improvement Targets for each year:**
- DY2 – Not Applicable
- DY3 IT12.5 2% of population 12 to 18 years old have received CAGE/AUDIT assessment
- DY4 IT12.5 3% of population 12 to 18 years old have received CAGE/AUDIT assessment
- DY5 IT12.5 5% of population 12 to 18 years old have received CAGE/AUDIT assessment

**Rationale:**

Screening instruments for depression and substance use disorder are beneficial when behavioral health supports are available. With the addition of Behavioral Health Consultation, it is important that Primary Care Physicians complete assessments to determine individuals needing behavioral health and substance use disorder services in order to begin treatment as soon as possible before symptoms exacerbate.

In addition, throughout the waiver, Hill Country will be working with other Community Centers in a learning collaborative to select a small set of outcome measures for Category 3, based on the valuation studies conducted by health care economists at the University of Texas and University of Houston. The collaborative will develop a strategy for collection of that data through HIEs or other shared data sources in local communities. Centers are currently in the process of engaging a consultant to provide leadership and consultation for this project. The outcome of this project may result in future refinement of the Category 3 Improvement Outcome metrics.
### Outcome Measure Valuation:

Project valuation is based on a weighted average of Achieving Waiver Goals, Addressing Community Needs, Project Scope, and Project Investment. The valuation for this project was based on an economic evaluation model and extensive literature review conducted by professors at the University of Houston School of Public Health and University of Texas at Austin Center for Social Work Research. The valuation is supported by cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). QALYs incorporate costs averted when known (e.g., emergency room visits that are avoided). The valuation on this project is based on 4,000 consumers over the life of the project (500 during DY3; 1,500 during DY4; and 2,000 during DY5) resulting in a valuation per patient of $1,486.04.

</tbody>
</table>

### Outcome Measure Description:

**Outcome Measure Description:**

IT-10.2 Activities of Daily Living – The percentage of individuals in the targeted population who have received treatment and show improvement on subsequent Activities of Daily Living scales.

**Process Milestones:**

Not applicable

**Outcome Improvement Targets for each year:**

- **DY2 – Not Applicable**
- **DY3** IT10.2 10% of individuals receiving services through the project show improvement on subsequent Activities of Daily Living scale
- **DY4** IT10.2 15% of individuals receiving services through the project show improvement on subsequent Activities of Daily Living scale
- **DY5** IT10.2 20% of individuals receiving services through the project show improvement on subsequent Activities of Daily Living scale

### Rationale:

Co-occurring Psychiatric and Substance Use Disorder impacts an individual’s mental health and thus their quality of life. It impacts the individual’s self care as well as their ability to cope with their environment. When an individual is unable to properly care for themselves or to cope with their local environment, they are at greater risk of unemployment and poor health. The Activities of Daily Living will be utilized to provide an overview of functional status, determine activity limitations, establish a baseline for treatment, provide a guide for intervention planning, to evaluate interventions and monitor progress and to plan for future and for discharge.

The DLA-20 Functional Assessment is a functional assessment, proven to be reliable and valid, designed to assess what daily living areas are impacted by mental illness or disability. The assessment tool identifies where outcomes are needed so clinicians can address those functional deficits on individualized service plans. THE DLA-20 is intended to be used by all disabilities and ages. Developmental Disabilities and Alcohol/Drug Abuse forms are personalized for daily functional strengths and problems associated with those diagnoses.

For the targeted population, individuals with Co-occurring Psychiatric and Substance Use...
Disorder, the DLA-20 will identify and address areas the disorders have impacted such as Alcohol/Drug Use, Social Network, Productivity, Housing Stability and Maintenance and Managing Money.

Outcome measures are based on the number of individuals that have begun treatment in the Co-occurring Psychiatric and Substance Use Disorder program and were kept modest due to the intervention requiring a change in the individual’s lifestyle which will take time to implement and due to individuals continuing to enter the program throughout the demonstration years.

In addition, throughout the waiver, Hill Country will be working with other Community Centers in a learning collaborative to select a small set of outcome measures for Category 3, based on the valuation studies conducted by health care economists at the University of Texas and University of Houston. The collaborative will develop a strategy for collection of that data through HIEs or other shared data sources in local communities. Centers are currently in the process of engaging a consultant to provide leadership and consultation for this project. The outcome of this project may result in future refinement of the Category 3 Improvement Outcome metrics.

**Outcome Measure Valuation:**

Project valuation is based on a weighted average of Achieving Waiver Goals, Addressing Community Needs, Project Scope, and Project Investment. The valuation for this project was based on an economic evaluation model and extensive literature review conducted by professors at the University of Houston School of Public Health and University of Texas at Austin Center for Social Work Research. The valuation is supported by cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). QALYs incorporate costs averted when known (e.g., emergency room visits that are avoided). The valuation on this project is based on 234 consumers over the life of the project resulting in a overall value of $19,054 per individual served.

Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-10.2 Activities of Daily Living/Trauma Informed Care
Unique RHP outcome Identification number: 133340307.3.6 – PASS 1
Performing Provider: Hill Country Community MHMR Center (dba Hill Country MHDD Centers)
TPI: 133340307

Outcome Measure Description:

IT-10.2 Activities of Daily Living – The percentage of individuals in the targeted population who have received treatment and show improvement on subsequent Activities of Daily Living scales.

Process Milestones:
Not applicable

Outcome Improvement Targets for each year:
DY2 – Not Applicable
DY3 IT10.2 10% of individuals receiving services through the project show improvement on subsequent Activities of Daily Living scale
DY4 IT10.2 15% of individuals receiving services through the project show improvement on subsequent Activities of Daily Living scale
DY5 IT10.2 20% of individuals receiving services through the project show improvement on subsequent Activities of Daily Living scale

Rationale:

Trauma impacts an individual’s mental health and thus their quality of life. It impacts the individual’s self care as well as their ability to cope with their environment. When an individual is unable to properly care for themselves or to cope with their local environment, they are at greater risk of unemployment and poor health. The Activities of Daily Living will be utilized to provide an overview of functional status, determine activity limitations, establish a baseline for treatment, provide a guide for intervention planning, to evaluate interventions and monitor progress and to plan for future and for discharge.

The DLA-20 Functional Assessment is a functional assessment, proven to be reliable and valid, designed to assess what daily living areas are impacted by mental illness or disability. The assessment tool identifies where outcomes are needed so clinicians can address those functional deficits on individualized service plans. THE DLA-20 is intended to be used by all disabilities and ages.

THE DLA-20 utilizes the following 20 domains: Health Practices, Housing Stability and Maintenance, Communication, Safety, Managing Time, Nutrition, Problem Solving, Family Relationships, Alcohol/Drug Use, Leisure, Community Resources, Social Network, Sexuality, Productivity, Coping Skills, Behavior Norms, Personal Care/Hygiene, Grooming, and Dress. For the targeted population, individuals needing Trauma Informed Care, the DLA-20 will help identify areas the trauma has impacted in their lives such as coping skills, problem solving.
family relationships, communication, and safety and be able to track improvement in the areas of the course of treatment.

Outcome measures are based on the number of individuals that have begun treatment in the Trauma Informed Care program and were kept modest due to the intervention requiring a change in the individual’s lifestyle which will take time to implement and due to individuals continuing to enter the program throughout the demonstration years.

In addition, throughout the waiver, Hill Country will be working with other Community Centers in a learning collaborative to select a small set of outcome measures for Category 3, based on the valuation studies conducted by health care economists at the University of Texas and University of Houston. The collaborative will develop a strategy for collection of that data through HIEs or other shared data sources in local communities. Identifying Outcome Measure and Provider Information:

Title of Outcome Measure (Improvement Target): IT-10.2 Activities of Daily Living / Whole Health Peer Support
Unique RHP outcome Identification number: 133340307.3.7 – PASS 2
Provider Name: Hill Country Community MFMR Center (dba Hill Country MHDD Centers)
TPI: 133340307

Outcome Measure Description:

IT-10.2 Activities of Daily Living – The percentage of individuals in the targeted population who have received treatment and show improvement on subsequent Activities of Daily Living scales utilizing the Daily Living Activities (DLA-20) Adult Mental Health

Process Milestones:
Not applicable

Outcome Improvement Targets for each year:
DY2 – Not Applicable
DY3 IT10.2 10% of individuals receiving Whole Health Peer Support services through the project show improvement on subsequent Activities of Daily Living scale (DLA-20)
DY4 IT10.2 15% of individuals receiving Whole Health Peer Support services through the project show improvement on subsequent Activities of Daily Living scale (DLA-20)
DY5 IT10.2 20% of individuals receiving Whole Health Peer Support services through the project show improvement on subsequent Activities of Daily Living scale (DLA-20)

Rationale:

Whole Health Peer Support services impact an individual’s mental and physical health and thus their quality of life. It impacts the individual’s self care as well as their ability to cope with their environment. When an individual is unable to properly care for themselves or to cope with their local environment, they are at greater risk of unemployment and poor health. The Activities of Daily Living will be utilized to provide an overview of functional status, determine activity limitations, establish a baseline for treatment, provide a guide for intervention planning, to evaluate interventions and monitor progress and to plan for future and for discharge.

The DLA-20 Functional Assessment is a functional assessment, proven to be reliable and valid, designed to assess what daily living areas are impacted by mental illness or disability. The assessment tool identifies where outcomes are needed so clinicians can address those functional deficits on individualized service plans. THE DLA-20 is intended to be used by all disabilities and ages. Developmental Disabilities and Alcohol/Drug Abuse forms are personalized for daily functional strengths and problems associated with those diagnoses.

THE DLA-20 utilizes the following 20 domains: Health Practices, Housing Stability and Maintenance, Communication, Safety, Managing Time, Nutrition, Problem Solving, Family Relationships, Alcohol/Drug Use, Leisure, Community Resources, Social Network, Sexuality, Productivity, Coping Skills, Behavior Norms, Personal Care/Hygiene, Grooming, and Dress. For the targeted population, individuals with Co-occurring Psychiatric and Substance Use Disorder, the DLA-20 will identify and address areas the disorders have impacted such as Alcohol/Drug Use, Social Network, Productivity, Housing Stability and Maintenance and
Managing Money.

Outcome measures are based on the number of individuals that have begun treatment in the Whole Health Peer Support program and were kept modest due to the intervention requiring a change in the individual’s lifestyle which will take time to implement and due to individuals continuing to enter the program throughout the demonstration years.

No baseline is set as the measure is associated with the number of individuals receiving Whole Health Peer Support services who show improvement on the DLA-20 compared to the total number receiving Whole Health Peer Support services in the program.

In addition, throughout the waiver, Hill Country will be working with other Community Centers in a learning collaborative to select a small set of outcome measures for Category 3, based on the valuation studies conducted by health care economists at the University of Texas and University of Houston. The collaborative will develop a strategy for collection of that data through HIEs or other shared data sources in local communities. Centers are currently in the process of engaging a consultant to provide leadership and consultation for this project. The outcome of this project may result in future refinement of the Category 3 Improvement Outcome metrics.

**Outcome Measure Valuation:**

Project valuation is based on a weighted average of Achieving Waiver Goals, Addressing Community Needs, Project Scope, and Project Investment. The valuation for this project was based on an economic evaluation model and extensive literature review conducted by professors at the University of Houston School of Public Health and University of Texas at Austin Center for Social Work Research. The valuation is supported by cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). QALYs incorporate costs averted when known (e.g., emergency room visits that are avoided). The proposed program’s value is based on the average of benefit-cost studies from Sari et al. 2008 and Kuyken et al. (2008) with an average benefit cost ratio of $23.36 for every dollar invested.

## Outcome Measure Description:

IT-10.2 Activities of Daily Living – The percentage of individuals in the targeted population who have received mental health services and show improvement on subsequent Activities of Daily Living scales utilizing the Daily Living Activities (DLA-20) Adult Mental Health.

Process Milestones:
Not applicable

Outcome Improvement Targets for each year:
- **DY2** – Not applicable
- **DY3** IT10.2 10% of individuals receiving Veteran Mental Health services through the project show improvement on subsequent Activities of Daily Living scale (DLA-20)
- **DY4** IT10.2 15% of individuals receiving Veteran Mental Health services through the project show improvement on subsequent Activities of Daily Living scale (DLA-20)
- **DY5** IT10.2 20% of individuals receiving Veteran Mental Health services through the project show improvement on subsequent Activities of Daily Living scale (DLA-20)

## Rationale:

Veteran Mental Health services impacts an individual’s mental health and thus their quality of life. It impacts the individual’s self care as well as their ability to cope with their environment. When an individual is unable to properly care for themselves or to cope with their local environment, they are at greater risk of unemployment and poor health. The Activities of Daily Living will be utilized to provide an overview of functional status, determine activity limitations, establish a baseline for treatment, provide a guide for intervention planning, to evaluate interventions and monitor progress and to plan for future and for discharge.

The DLA-20 Functional Assessment is a functional assessment, proven to be reliable and valid, designed to assess what daily living areas are impacted by mental illness or disability. The assessment tool identifies where outcomes are needed so clinicians can address those functional deficits on individualized service plans. THE DLA-20 is intended to be used by all disabilities and ages. Developmental Disabilities and Alcohol/Drug Abuse forms are personalized for daily functional strengths and problems associated with those diagnoses.

For the targeted population, individuals with Co-occurring Psychiatric and Substance Use Disorder, the DLA-20 will identify and address areas the disorders have impacted such as Alcohol/Drug Use, Social Network, Productivity, Housing Stability and Maintenance and
Managing Money.

Outcome measures are based on the number of individuals that are referred from Veteran Peer Support to community based wrap around services and were kept modest due to the intervention requiring a change in the individual’s lifestyle which will take time to implement and due to individuals continuing to enter the program throughout the demonstration years.

No baseline is set as the measure is associated with the number of individuals receiving Veteran Mental Health services who show improvement on the DLA-20 compared to the total number receiving Veteran Mental Health services in the program.

In addition, throughout the waiver, Hill Country will be working with other Community Centers in a learning collaborative to select a small set of outcome measures for Category 3, based on the valuation studies conducted by health care economists at the University of Texas and University of Houston. The collaborative will develop a strategy for collection of that data through HIEs or other shared data sources in local communities. Centers are currently in the process of engaging a consultant to provide leadership and consultation for this project. The outcome of this project may result in future refinement of the Category 3 Improvement Outcome metrics.

**Outcome Measure Valuation:**

Project valuation is based on a weighted average of Achieving Waiver Goals, Addressing Community Needs, Project Scope, and Project Investment. The valuation for this project was based on an economic evaluation model and extensive literature review conducted by professors at the University of Houston School of Public Health and University of Texas at Austin Center for Social Work Research. The valuation is supported by cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). QALYs incorporate costs averted when known (e.g., emergency room visits that are avoided). The valuation on this project is based on 180 consumers over the life of the project.

### Outcome Measure Description:

**IT-10.2 Activities of Daily Living** – The percentage of individuals in the targeted population who have received mental health services and show improvement on subsequent Activities of Daily Living scales utilizing the Daily Living Activities (DLA-20) Adult Mental Health.

**Process Milestones:**

Not applicable

**Outcome Improvement Targets for each year:**

- **DY2 – Not Applicable**
- **DY3 IT10.2** 10% of individuals receiving Mental Health Court services through the project show improvement on subsequent Activities of Daily Living scale (DLA-20)
- **DY4 IT10.2** 15% of individuals receiving Mental Health Court services through the project show improvement on subsequent Activities of Daily Living scale (DLA-20)
- **DY5 IT10.2** 20% of individuals receiving Mental Health Court services through the project show improvement on subsequent Activities of Daily Living scale (DLA-20)

### Rationale:

Mental Health Court services impacts an individual’s mental health and thus their quality of life. It impacts the individual’s self care as well as their ability to cope with their environment. When an individual is unable to properly care for themselves or to cope with their local environment, they are at greater risk of unemployment and poor health. The Activities of Daily Living will be utilized to provide an overview of functional status, determine activity limitations, establish a baseline for treatment, provide a guide for intervention planning, to evaluate interventions and monitor progress and to plan for future and for discharge.

The DLA-20 Functional Assessment is a functional assessment, proven to be reliable and valid, designed to assess what daily living areas are impacted by mental illness or disability. The assessment tool identifies where outcomes are needed so clinicians can address those functional deficits on individualized service plans. THE DLA-20 is intended to be used by all disabilities and ages. Developmental Disabilities and Alcohol/Drug Abuse forms are personalized for daily functional strengths and problems associated with those diagnoses.

For the targeted population, individuals with Co-occurring Psychiatric and Substance Use Disorder, the DLA-20 will identify and address areas the disorders have impacted such as Alcohol/Drug Use, Social Network, Productivity, Housing Stability and Maintenance and
Managing Money.

Outcome measures are based on the number of individuals participating in Mental Health Court services and were kept modest due to the intervention requiring a change in the individual’s lifestyle which will take time to implement and due to individuals continuing to enter the program throughout the demonstration years.

No baseline is set as the measure is associated with the number of individuals receiving Mental Health Court services who show improvement on the DLA-20 compared to the total number receiving Mental Health Court services in the program.

In addition, throughout the waiver, Hill Country will be working with other Community Centers in a learning collaborative to select a small set of outcome measures for Category 3, based on the valuation studies conducted by health care economists at the University of Texas and University of Houston. The collaborative will develop a strategy for collection of that data through HIEs or other shared data sources in local communities. Centers are currently in the process of engaging a consultant to provide leadership and consultation for this project. The outcome of this project may result in future refinement of the Category 3 Improvement Outcome metrics.

Outcomes Measure Valuation:

Project valuation is based on a weighted average of Achieving Waiver Goals, Addressing Community Needs, Project Scope, and Project Investment. The valuation for this project was based on an economic evaluation model and extensive literature review conducted by professors at the University of Houston School of Public Health and University of Texas at Austin Center for Social Work Research. The valuation is supported by cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). QALYs incorporate costs averted when known (e.g., emergency room visits that are avoided). The valuation on this project is based on 120 consumers over the life of the project.
| Related Category 1 or 2 Projects: | 133340307.2.7 |
| Starting Point/Baseline: | Baseline will be individual DLA20 assessments as individuals enter program |

<td>082426001</td>
</tr>
</tbody>
</table>

**Outcome Measure Description:**

**Improvement Target** IT-7.1 Percentage of children age 6-9 with a dental sealant on a permanent first molar tooth

**Improvement Target: IT (Non-Stand Alone)**

Measure will track increase in the number of unduplicated encounters for children ages 6-9 over established baseline of children ages 6-9 enrolled in participating programs

| DY 3 | NA |
|      |    |
| DY 4 | X% Increase over baseline |
| DY 5 | X% Increase over baseline |

**Related Process Milestone**-

DY 3 Establish baseline % of participating 3rd grade students with a dental sealant on at least one permanent first molar

**Rationale:**

*Outcome improvement targets will be determined in DY3 for implementation in DY4-5*

**IT-7.1 Dental Sealants:** Percentage of children age 6-9 with a dental sealant on a permanent first molar tooth relative to baseline data

a. **Numerator:** Number of participating 3rd grade students with a dental sealant on at least one permanent molar within the measurement period
b. **Denominator:** Total number of 3rd grade students reporting for 1 year recall/retention check
c. **Data Source:** Assessment data obtained by program staff using the Basic Screening Survey and recorded in data management system, Smiles Maker.
d. **Rationale/Evidence:** Children who have regular access to a dental provider are more likely to have received preventive dental services such as fluoride varnish and dental sealant applications.

**Outcome Measure Valuation:**

Numerous studies have documented the value of preventive oral health services, specifically school-based sealants and fluoride varnish applicants in reducing subsequent dental visits, restorative care and emergency visits. Overall children receiving preventive services incur lower dental costs.

Valuation for category 3 outcomes are based on the same criteria and ranking as the valuation of the associated category 1 project overall.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $376,168**
**Identifying Outcome Measure and Provider Information:**

**Title of Outcome Measure (Improvement Target):** IT-7.3 Percentage of children, age 0-6 years, who received a fluoride varnish application during the measurement period. (Non-Stand Alone)

**Unique RHP outcome identification number:** 091308902.3.2 (PASS 1)

**Provider Name:** San Antonio Metropolitan Health District

**TPI:** 082426001

### Outcome Measure Description:

**Improvement Target IT-7.3** Percentage of children, age 0-6 years, who received a fluoride varnish application during the measurement period. (Non-Stand Alone)

Measure will track increase in the number of unduplicated encounters for children ages 0-6 over established baseline of children ages 0-6 enrolled in participating programs

| DY 3 | NA |
| DY 4 | X% Increase over baseline |
| DY 5 | X% Increase over baseline |

### Related Process Milestone-

DY 3  Establish baseline % of participating pre-school children that have received a fluoride varnish application during the measurement period.

### Rationale:

*Outcome improvement targets will be determined in DY3 for implementation in DY4-5*

**IT-7.3 Early Childhood Caries-Fluoride Varnish Applications (Non-Stand Alone)**

Primary caries prevention as offered by primary care providers, including dentists

Number of at risk children, age 0-6, who received one or more fluoride varnish application during the measurement period

- **Numerator:** Total Number of children ages 0-6 that have received at least one fluoride varnish application through the project during the measurement period relative to baseline data
- **Denominator:** Baseline-Total number of children ages 0-6 years that are enrolled in the project target site during the measurement period
- **Data Source:** Program reports; ChildPlus, Smiles Maker or other data management system used by schools and/or Head Start programs
- **Rationale/Evidence:** Identified by the CDC as a preventive measure that has strong evidence demonstrating effectiveness in the prevention of dental caries and allow for low-income high risk children to receive fluoride varnish applications that otherwise may not have the opportunity to receive them.
Outcome Measure Valuation:
Numerous studies have documented the value of preventive oral health services, specifically school-based sealants and fluoride varnish applicants in reducing subsequent dental visits, restorative care and emergency visits. Overall children receiving preventive services incur lower dental costs.

Valuation for category 3 outcomes are based on the same criteria and ranking as the valuation of the associated category 1 project overall.

</tr>
</tbody>
</table>

**Outcome Measure Description:**

**Improvement Target IT-7.6** Percentage of children with urgent dental care needs *(Standalone measure)*

Urgent dental care is defined as needing dental care within 24-48 hours because of signs or symptoms that include pain, infection, and/or swelling.

Measure will track the decrease in the number of children ages 6-9 presenting with urgent dental care needs relative to the established baseline among children participating in project services

| DY 3 | NA |
| DY 4 | X% Decrease from baseline |
| DY 5 | X% Decrease from baseline |

**Related Process Milestone:**

- DY 3 Establish baseline % of participating children presenting with urgent dental care need

**Rationale:**

*Outcome improvement targets will be determined in DY3 for implementation in DY4-5*

**IT-7.6 Urgent Dental Care Needs in Children:**

**Percentage of children with urgent dental care needs (Stand-alone measure)**

- **Numerator:** Number of participating 3rd grade children identified with urgent dental needs participating at 1 year recall/follow-up visit
- **Denominator:** Total number of 3rd grade children returning for 1 year recall/follow up visit
- **Data Source:** Assessment data obtained by program staff using the Basic Screening Survey and recorded in data management system, SmilesMaker.
- **Rationale/Evidence:** Children are less likely to suffer from more severe, urgent oral health problems with adequate and regular access to dental care.

**Outcome Measure Valuation:**

Numerous studies have documented the value of preventive oral health services, specifically school-based sealants and fluoride varnish applicants in reducing subsequent dental visits, restorative care and emergency visits. Overall children receiving preventive services incur lower dental costs.

Valuation for category 3 outcomes are based on the same criteria and ranking as the valuation of the associated category 1 project overall.

Identifying Outcome Measure and Provider Information:

| Title of Outcome Measure (Improvement Target): | IT-2.13: Other Admissions Rate |
| Unique RHP outcome identification number: | 091308902.3.4 (PASS 1) |
| Provider Name: | San Antonio Metropolitan Health District |
| TPI: | 082426001 |

Outcome Measure Description:

**IT 2.13: Other Admissions Rate**

- **Numerator:** Number of teen girls participating in school evidence-based prevention education that are reported delivering babies in the hospital during the measurement period.
- **Denominator:** Population of teen girls receiving evidence-based prevention education and reproductive healthcare services.
- **Data Source:** Bexar County birth certificate data, school district data

| DY 3 | NA |
| DY 4 | X% reduction in teen births compared to reference population |
| DY 5 | X% reduction in teen births compared to reference population |

Related Process Milestone

**DY 3** Establish baseline and comparison data on teen births in intervention school population

Rationale:

The improvement target IT-2.13, Other Admissions Rate, was selected to demonstrate the decrease in teen births and related healthcare expenses associated with childbirth and infant care. This measure does not fully capture the cost of teen childbearing both in health care expenditures and social and economic effects; however, this provides a stable and consistent measure tied to the ultimate project goal of reducing teen pregnancies and repeat teen pregnancies.

Outcome measures were established based on the current high rates of teen births and approximately a 22% rate of repeat teen births occurred in Bexar County in 2010 and the subsequent cost of teen pregnancy on the overall population. Much of this burden is falling on tax payers supporting the Medicaid program. Medicaid costs average $2,500 per infant delivery at as much as $45,000 for an infant treated in the Neonatal Intensive Care Unit. In 2008, Texas taxpayer costs associated with children born to teen mothers included: $221 million for public health care (Medicaid and CHIP); $111 million for child welfare; and, for children who have reached adolescence or young adulthood, $175 million for increased rates of incarceration and $378 million in lost tax revenue due to decreased earnings and spending. According to the Health and Human Services Commission.

Outcome improvement targets will be determined in DY3 for measurement in DY4-5.

---

150: InTouch - Medicaid initiative seeks to reduce risk of premature births

Outcome Measure Valuation:

Current high rates of teen births for females 15 to 19 (50.3/1000) and a 22% rate of repeat teen births occurred in Bexar County in 2010 and the subsequent cost of teen pregnancy on the overall population. Much of this burden is falling on tax payers supporting the Medicaid program. Medicaid costs average $2,500 per infant delivery at as much as $45,000 for an infant treated in the Neonatal Intensive Care Unit.152 In 2008, Texas taxpayer costs associated with children born to teen mothers included: $221 million for public health care (Medicaid and CHIP); $111 million for child welfare; and, for children who have reached adolescence or young adulthood, $175 million for increased rates of incarceration and $378 million in lost tax revenue due to decreased earnings and spending.153

Valuation for category 3 outcomes are based on the same criteria and ranking as the valuation of the associated category 2 project overall.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD: $1,025,914**
**Identifying Outcome Measure and Provider Information:**

| Title of Outcome Measure (Improvement Target): IT – 12.6 Other Outcome Improvement Target |
| Unique RHP outcome identification number: 091308902.3.6 (PASS 1) |
| Provider Name: San Antonio Metropolitan Health District |
| TPI: 082426001 |

**Outcome Measure Description:**

A representative sample of each intervention neighborhood will be taken to complete baseline and post-intervention assessments which will include assessment of physical activity level. Outcome measurement efforts will focus on increasing the proportion of participants that are physically active and/or meet the national physical activity standard of 150 minutes of physical activity per week.

**IT – 12.6 Other Outcome Improvement Target**

**Increased reported physical activity level from baseline**

| Numerator: % of residents in target neighborhoods that are physically active |
| Denominator: Total population of target neighborhoods |
| Data Source: County-wide BRFSS and target neighborhood surveys |

| DY 3 | NA |
| DY 4 | X% increase in physical activity level compared to baseline assessment or comparison group |
| DY 5 | X% increase in physical activity level compared to baseline assessment or comparison group |

**Related Process Milestone**

| DY 3 | Establish neighborhood baselines for physical activity level |

**Rationale:**

The outcome measure to increase the proportion of adults who engage in regular physical activity was selected because of its impact on reducing obesity and chronic disease. Increasing physical activity can increase an individual’s ability to lose weight or maintain current weight. The specific improvement target will be determined following the health assessment to be conducted in Year 3 in each of the target neighborhoods.

This indicator will be measured using the Behavior Risk Factor Surveillance System (BRFSS) administered by the Centers for Disease Control and Prevention on an annual basis. BRFSS is the world’s largest, on-going telephone health survey system, tracking health conditions and risk behaviors in the United States annually since 1984. CDC goes through a rigorous process to validate the BRFSS analysis using weighted data, and identifying its confidence interval and p-values to show the precision and accuracy of the data. This outcome measure was selected because it represents a critical health behavior for preventing obesity and obesity-related chronic disease.
**Outcome Measure Valuation:**

Many of the demographic risk factors associated with chronic disease as well as high burdens of chronic disease morbidity and mortality are concentrated in neighborhoods within San Antonio and Bexar County that have traditionally lacked infrastructure to support healthy living and experienced higher rates of poverty. The approach that Metro Health will take in the *Neighborhood Based Physical Activity and Health Promotion Project* will focus on providing a comprehensive neighborhood-based approach to obesity and obesity-related chronic disease prevention.

Valuation for category 3 outcomes are based on the same criteria and ranking as the valuation of the associated category 2 project overall.

**Outcome Measure Description:**

A representative sample of each intervention neighborhood will be taken to complete baseline and post-intervention assessments which will include assessment of fruit and vegetable consumption levels by residents. Outcome measurement efforts will focus on increasing the proportion of participants that report eating fruits and vegetables consistent with the BRFSS questionnaire.

**IT -12.6 Other Outcome Improvement Target**

*Increased reported fruit and vegetable consumption from baseline*

- **Numerator:** % of residents in target neighborhoods reporting eating five or more servings of fruits and vegetables per day
- **Denominator:** Total population of target neighborhoods
- **Data Source:** County-wide BRFSS and target neighborhood surveys

**DY 3** NA

**DY 4** X% increase in fruit and vegetable consumption compared to baseline assessment or comparison group

**DY 5** X% increase in fruit and vegetable consumption compared to baseline assessment or comparison group

**Related Process Milestone**

**DY 3** Establish neighborhood baselines for safety level

**Rationale:**

The outcome measure to increase the percentage of adults who report eating five or more servings of fruits and vegetables per day was selected because of the importance of healthy eating in maintaining a healthy weight and reducing risk for chronic disease.

This indicator will be measured using the Behavior Risk Factor Surveillance System (BRFSS) administered by the Centers for Disease Control and Prevention on an annual basis. BRFSS is the world’s largest, on-going telephone health survey system, tracking health conditions and risk behaviors in the United States annually since 1984. CDC goes through a rigorous process to validate the BRFSS analysis using weighted data, and identifying its confidence interval and p-values to show the precision and accuracy of the data.

**Outcome Measure Valuation:**

Many of the demographic risk factors associated with chronic disease as well as high burdens of chronic disease morbidity and mortality are concentrated in neighborhoods within San Antonio and Bexar County that have traditionally lacked infrastructure to support healthy living and experienced higher rates of poverty. The approach that Metro Health will take in the *Neighborhood Based Physical Activity and Health Promotion Project* will focus on providing a comprehensive neighborhood-based approach to obesity and obesity-related chronic disease prevention.

### Identifying Outcome Measure and Provider Information:

| Title of Outcome Measure (Improvement Target): IT-1.10 Diabetes care: HbA1c (HbA1c) poor control (>9.0%) – NQF 0059 (Stand-alone measure) |
| Unique RHP outcome identification number: 091308902.3.9 (PASS 1) |
| Provider Name: San Antonio Metropolitan Health District |
| TPI: 082426001 |

### Outcome Measure Description:

Program participants in both the Stanford Diabetes Self-Management Programs and the YMCA Diabetes Prevention Programs will receive the HbA1c test at baseline, and at six and twelve months. Outcome measurement efforts will focus on decreasing the number of participants that have an HbA1c percentage above 9%, which is indicative of poor glucose control.

**IT-1.10 Diabetes care: HbA1c (HbA1c) poor control (>9.0%) – NQF 0059 (Stand-alone measure)**

**Numerator:** Percentage of participants 18-75 years of age with diabetes (type 1 or type 2) who had hemoglobin A1c (HbA1c) control > 9.0%.

**Denominator:** Participants 18 to 75 years of age as of December 31 of the measurement year with diabetes (type 1 and type 2)

**Data Source:** Program follow up records/lab results

| DY 3 | NA |
| DY 4 | X% reduction in poor HbA1c control (>9.0%) compared to reference population |
| DY 5 | X% reduction in poor HbA1c control (>9.0%) compared to reference population |

### Related Process Milestone

**DY 3** Establish baseline and comparison data on HbA1c control among intervention population

### Rationale:

HbA1c in poor control is associated with increased incidence of the complications from diabetes, including but not limited to cardiovascular disease, nephropathy, neuropathy, and retinopathy. As HbA1c measures average plasma glucose concentration over prolonged periods of time, it is a more accurate indicator of average blood glucose levels in the months prior to the test. The HbA1c test has also been recommended as a diagnostic tool by the American Diabetes Association in 2010, and undiagnosed participants in the YMCA program will receive appropriate medical referrals if found to have values above 7% at baseline. Outcome improvement targets will be determined in DY3, as the increased percentage of program participants within a range of control as measured by les the 7% has not yet been assessed in the local community-based setting.
Outcome Measure Valuation:

Bexar County hospital discharge data estimated that hospitalizations directly related to diabetes in 2009 accounted for $100 million in costs, which excludes care for emergency room visits that did not result in hospitalization, as well as frequency of doctor visits. Overall, San Antonio as a community bears a very heavy economic toll from diabetes when indirect costs such as disability from complications, work loss, and premature death from related complications are taken into account.

Valuation for category 3 outcomes are based on the same criteria and ranking as the valuation of the associated category 2 project overall.

### Identifying Outcome Measure and Provider Information:

| Title of Outcome Measure (Improvement Target): | IT 9.2 - ED Appropriate Utilization (reduce ED visits for Diabetes) |
| Unique RHP outcome identification number: | 091308902.3.10 (PASS 1) |
| Provider Name: | San Antonio Metropolitan Health District |
| TPI: | 082426001 |

### Outcome Measure Description:

Program participants in both the Stanford Diabetes Self-Management Programs and the YMCA Diabetes Prevention Programs will be assessed for a reduction in emergency department visits at baseline through a questionnaire, and reassessed at six and twelve months post-intervention. Outcome measurement efforts will focus on decreasing the frequency of emergency department visits among participants.

**IT-9.2 - ED Appropriate Utilization (reduce ED visits for Diabetes)**

- Decreased reported emergency department utilization from baseline, employing Stanford University recommended metric scales
- **Numerator:** Number of participants with a reduction in emergency department visits from baseline to follow up
- **Denominator:** Total number of program participants

**Data Source:** Program questionnaires

| DY 3 | NA |
| DY 4 | X% reduction in emergency department visits compared to baseline assessment population |
| DY 5 | X% reduction in emergency department visits compared to baseline assessment population |

**Related Process Milestone**

- **DY 3** Establish individual and population baseline for emergency department visits

**Rationale:**

Emergency department visits will be assessed at baseline and at six and twelve months for all program participants. Enhanced self-efficacy, improved communication with healthcare providers and social supports will result in lowered percentages in health care utilization for all participants, which is vital in a population with high healthcare costs. Improved community based education on the primary and secondary prevention of diabetes and its complications will reduce utilization and associated costs by promoting lifestyle interventions (YDPP Program) and patient-empowerment in the primary healthcare setting (Stanford Self-Management Programs). The outcome improvement targets will be assessed and defined by DY3.

### Outcome Measure Valuation:

Bexar County hospital discharge data estimated that hospitalizations directly related to diabetes in 2009 accounted for $100 million in costs, which excludes care for emergency room visits that did not result in hospitalization, as well as frequency of doctor visits. Overall, San Antonio as a community bears a very heavy economic toll from diabetes when indirect costs such as disability from complications, work loss, and premature death from related complications are taken into account.

### Identifying Outcome Measure and Provider Information:

| Title of Outcome Measure (Improvement Target): | IT-10.7 Other Outcome Improvement Target |
| Unique RHP outcome identification number: | 091308902.3.11 (PASS 1) |
| Provider Name: | San Antonio Metropolitan Health District |
| TPI: | 082426001 |

### Outcome Measure Description:

Program participants in both the Stanford Diabetes Self-Management Programs and the YMCA Diabetes Prevention Programs will be assessed for their self-reported overall health status at baseline through a questionnaire, and reassessed at six and twelve months post-intervention. Outcome measurement efforts will focus on increasing the proportion of participants that report excellent, very good or good health.

**IT-10.7 Other Outcome Improvement Target**

Increased self-reported overall health status from baseline

**Numerator:**  Number of participants that report excellent, very good or good health

**Denominator:**  Total number of program participants

**Data Source:**  Program questionnaires

| DY 3   | NA |
| DY 4   | X% increase in self-reported overall health status compared to baseline assessment population |
| DY 5   | X% increase in self-reported overall health status compared to baseline assessment population |

### Related Process Milestone

**DY 3**  Establish individual and population baseline for self-reported overall health status

### Rationale:

Self-reported overall health status will be assessed at baseline and at six and twelve months for all program participants. Enhanced self-efficacy, improved communication with healthcare providers, improved access to physical activity resources and social supports will result in improved self perceptions of health. Improved community based education on the primary and secondary prevention of diabetes and its complications will reduce utilization and associated costs by promoting lifestyle interventions (YDPP Program) and patient-empowerment in the primary healthcare setting (Stanford Self-Management Programs). The outcome improvement targets will be assessed and defined by DY3.

### Outcome Measure Valuation:

Bexar County hospital discharge data estimated that hospitalizations directly related to diabetes in 2009 accounted for $100 million in costs, which excludes care for emergency room visits that did not result in hospitalization, as well as frequency of doctor visits. ### Identifying Outcome Measure and Provider Information:

Outcome Measure (Improvement Target): IT-12.5: Other USPSTF Outcome – HIV Screening  
Unique RHP outcome identification number: 091308902.3.12 (PASS 2)  
Provider Name: San Antonio Metropolitan Health District  
TPI: 082426001

### Outcome Measure Description:

**IT-12.5 Other USPSTF-endorsed screening outcome measures**  
Numerator: Number of high risk adults and adolescents (13 years of age or greater) screened for HIV infection  
Denominator: Number of high risk adults and adolescents (13 years of age or greater)  
Data Source: San Antonio Metropolitan Health District’s STD*MIS database, primary data collection among high risk populations, other sources TBD

Note that this improvement target differs from the project improvement metrics provided for DY3-5 in that the improvement metrics focus on quantifying the specific number of individuals tested for HIV directly by Metro Health STD Branch staff. However, this improvement target seeks to show an increase in the proportion of high risk population that report that they have been screened for HIV. Ideally 100% of high risk individuals would report having been tested for HIV infection.

<p>| | |</p>
<table>
<thead>

</tr>
<tr>
<td>DY 5</td>
<td>X% increase in proportion of high risk adults and adolescents (13 years of age or greater) screened for HIV infection</td>
</tr>
</tbody>
</table>

**Related Process Milestones**  
DY 3 Establish baseline and comparison data on HIV screening rates

**Rationale:**  
The outcome improvement target was selected to demonstrate the increase in the number of high risk people age 13 years and older that are tested for HIV. This information will demonstrate the STD/HIV Branch’s reach in the community and helps to focus and strengthen outreach efforts more efficiently. Testing, education and risk reduction all are part of screening individuals in the community for HIV. The more high risk clients screened and counseled, the faster the ultimate goal of preventing new HIV infections is achieved.

### Outcome Measure Valuation:

Based on recommendations from the United States Preventive Services Task Force (USPSTF) screening for HIV is important for detecting new HIV cases and increased opportunities to treat these individuals. Increasing the number of individuals screened for HIV will lead to an increase in use of clinical services, linkage to care, and ultimately achieve the goal of reducing HIV transmission.

Data shows that one in three Texans with HIV received a late diagnosis of their infection. A late diagnosis is associated with increased morbidity and mortality.

---

http://www.uspreventiveservicestaskforce.org/3rduspsft/syphilis/syphilis.htm
diagnosis means the person was also diagnosed with AIDS within one year of an HIV diagnosis.157 Because of the substantial survival advantage resulting from earlier diagnosis of HIV infection when therapy can be initiated before severe immunologic compromise occurs, screening reaches conventional benchmarks for cost-effectiveness even before including the important public health benefit from reduced transmission to sex partners.

Linking patients who have received a diagnosis of HIV infection to prevention and care is essential. HIV screening without such linkage confers little or no benefit to the patient. Although moving patients into care incurs substantial costs, it also triggers sufficient survival benefits that justify the additional costs.158 Even if only a limited fraction of patients who receive HIV-positive results are linked to care, the survival benefits per dollar spent on screening represent good comparative value. Mean cumulative treatment expenditures ranged from $27,275 to $61,615 higher for late than early presenters. After 7 to 8 years in care, the difference was still substantial.159

Valuation for category 3 outcomes are based on the same criteria and ranking as the valuation of the associated category 2 project overall.

### Outcome Measure Description:

**IT-12.5 Other USPSTF-endorsed screening outcome measures**

<table>
<thead>
<tr>
<th>Numerator</th>
<th>Number of high risk adults and adolescents (13 years of age or greater) screened for syphilis</th>
</tr>
</thead>
<tbody>
<tr>
<td>Denominator</td>
<td>Number of high risk adults and adolescents (13 years of age or greater)</td>
</tr>
</tbody>
</table>

Data Source: San Antonio Metropolitan Health District’s STD*MIS database, primary data collection among high risk populations, other sources TBD

Note that this improvement target differs from the project improvement metrics provided for DY3-5 in that the improvement metrics focus on quantifying the specific number of individuals tested for syphilis directly by Metro Health STD Branch staff. However, this improvement target seeks to show an increase in the proportion of high risk population that report that they have been screened for syphilis. Ideally 100% of high risk individuals would report having been tested for syphilis infection.

- **DY 3** N/A
- **DY 4** X% increase in the proportion of high risk adults and adolescents (13 years of age or greater) screened for syphilis
- **DY 5** X% increase in the proportion of high risk adults and adolescents (13 years of age or greater) screened for syphilis

### Related Process Milestones

- **DY 3** Establish baseline and comparison data on syphilis screening rates

### Rationale:

The outcome improvement target was selected to demonstrate the increase in the number of high risk people age 13 years and older that are tested for syphilis. This information will demonstrate the STD/HIV Branch’s reach in the community and helps to focus and strengthen outreach efforts more efficiently. Testing, education and risk reduction all are part of screening individuals in the community for syphilis. The more high risk clients screened and counseled, the faster the ultimate goal of preventing new syphilis infections is achieved.

### Outcome Measure Valuation:

The outcome measure selected addresses a need to screen for syphilis within high risk populations in Bexar County. Bexar County’s primary and secondary syphilis rate in 2011 was 2.3 times higher than the national and state rate. There was a 309% increase in primary and secondary syphilis cases, between the year 2002 and 2011 in the county. Additionally, disparities among racial/ethnic groups in Bexar County are deep, with the 2011 rate for non-Hispanic African Americans, the highest at 20.4, compared to 11.8 for Hispanics and 6.2 for the non-Hispanic Whites.
Based on recommendations from the United States Preventive Services Task Force (USPSTF) screening for syphilis is important for detecting new syphilis cases and increased opportunities to treat these individuals.\textsuperscript{160} Furthermore, the USPSTF states that “the benefits of screening persons at increased risk for syphilis infection substantially outweigh the potential harms.”\textsuperscript{1} If left untreated, even during pregnancy, the syphilis infection can lead to a multitude of costly complications for the individual and even the newborn baby.\textsuperscript{161}

Valuation for category 3 outcomes are based on the same criteria and ranking as the valuation of the associated category 2 project overall.

\textsuperscript{161} Centers for Disease Control and Prevention. \textit{Congenital Syphilis ---United States, 2003-2008}. http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5914a1.htm

**Identifying Outcome Measure and Provider Information:**

Title of Outcome Measure (Improvement Target): IT – 12.6: Other Outcome Improvement Target – Third Trimester Syphilis Screening in High Risk Women

Unique RHP outcome identification number: 091308902.3.14 (PASS 2)

Provider Name: San Antonio Metropolitan Health District

TPI: 082426001

**Outcome Measure Description:**

*IT- 12.6 Other Outcome Improvement Target*

**Numerator:** Number of high risk pregnant women that receive a third trimester syphilis test

**Denominator:** Number of high risk pregnant women referred to STD case management services which include all women presenting to the STD clinic for any reason and all pregnant women referred by community physicians to the STD surveillance unit.

Data Source: San Antonio Metropolitan Health District’s STD*MIS database, clinic records, case management records, other sources TBD

<td>X% increase in the proportion of high risk pregnant women that receive a third trimester congenital syphilis test</td>
</tr>
<tr>
<td>DY 5</td>
<td>X% increase in the proportion of high risk pregnant women that receive a third trimester congenital syphilis test</td>
</tr>
</tbody>
</table>

**Related Process Milestones**

DY 3 Establish baseline data on third trimester congenital syphilis testing

**Rationale:**

The CDC recommends that all pregnant women living within high prevalence jurisdictions for syphilis be tested once during the first trimester of pregnancy (as required by law in Texas) and once during the third trimester of pregnancy. Bexar County is considered a high prevalence area for syphilis based on current rates. With 18 cases in 2012, the congenital syphilis rate in Bexar County was 75.3 per 100,000 live births, a rate far surpassing any recent year. From 2008-2011 the Bexar County annual rate was 40.9 per 100,000 live births, which is 30% higher than the average rate for Texas for that same period (at 28.6 per 100,000 live births) and five times the national average (8.5 per 100,000 in 2011).

Third trimester syphilis testing is important to the prevention of congenital syphilis due to the potential for infection during the pregnancy after first trimester testing has been completed and because of the effectiveness of available treatments in preventing congenital syphilis if the woman is treated during her pregnancy.

This outcome improvement target was selected to reflect CDC recommendations and to demonstrate the impact of case management activities on third trimester congenital syphilis screening which should lead to the identification and prevention of potential congenital syphilis cases. Additional supportive information will be available based on reports of congenital syphilis cases and case manager files documenting clinical outcomes.
**Outcome Measure Valuation:**

Based on locally obtained data for 2011 the average cost to deliver and treat an infant born with congenital syphilis was $54,677. The average length of hospital stay in these cases was 14 days (ranging from 1 to 45 days). These costs do include the costs to the mother or of ongoing care needed for infants that may be born with significant physical and/or developmental disabilities. Using the 2011 average cost to an infant, the projected cost of care to the 18 infants with a presumptive diagnosis of congenital syphilis in 2012 would be $984,186. Bexar county hospitals could see these costs reduced when a pregnant woman with syphilis is also tested for syphilis in the third trimester, in accordance with CDC STD treatment guidelines\(^{162}\) to prevent congenital syphilis in the infant.

Valuation for category 3 outcomes are based on the same criteria and ranking as the valuation of the associated category 2 project overall.

| DY 5 | X % increase in the proportion of postpartum women initiating breastfeeding who accessed services at the Baby Café |

**Related Process Milestone**

DY 3 Establish baseline and comparison data on breastfeeding initiation rates

**Rationale:**
The improvement target IT-8.9, Other Outcome Improvement, was selected to demonstrate that participation in the Baby Café prepares and motivates women to initiate breastfeeding. Outcome improvement targets will be determined in DY3 for measurement in DY4 and DY5.

**Outcome Measure Valuation:**

Breastfeeding is not only the most nutritious way of feeding an infant but also cost effective. Breastfeeding can save parents anywhere between $700 to $3000 dollars during the first year of life (on money not spent on formula). A study by Montgomery et al. also showed that breastfed infants had a cost saving of $112 in Medicaid expenditures during the first six month of life versus formula fed infants. A 2010 UNICEF report assessing the economic benefits of breastfeeding estimated that around $13 billion would be saved if breastfeeding were increased from current levels (13.3%) to 90 percent of women breastfeeding exclusively for six months.

Valuation for category 3 outcomes are based on the same criteria and ranking as the valuation of the associated category 2 project overall.

**Domain 1 - Potentially Preventable Admissions**

**Description:**
AHRQ reports that our nation’s hospitals spend approximately 10% of all care provided or up to 4 million patient hospitalizations which may be preventable with effective outpatient care. Reducing preventable hospitalizations is a priority in reducing the rise of healthcare costs.

**Reporting Measures:**
- Congestive heart failure admission rates
- Diabetes admission rates
- Behavioral health and substance abuse admission rate
- Chronic obstructive pulmonary disease or asthma in adults admission rates
- Hypertension admission rates
- Pediatric asthma returns to ED visit within 15 days
- Increase in bacterial pneumonia immunizations
- Increase in influenza immunizations

**Exempt Domains:** Baptist does not expect to report on preventable admissions for Behavioral Health and Substance Abuse as we do not have ambulatory Behavioral Health programs to address preventable admissions.

Baptist does not expect to report on preventable admission rates for diabetes short term complications, since we cannot track the denominator which is # of residents > 18 years with diabetes who have had 2 or more primary care visits in past 12 months within the RHP.

Baptist projects were selected to impact the triple aim goals of assuring patients receive high-quality, patient-centered care, though cost effectiveness and to meet our community needs.

All of our Category 1,2,3 projects relate to and should improve preventable admissions:

**Expand primary care capacity 1.1.1:**
- **Baptist** plans to expand existing sites and add additional primary care physicians over the next four years. This expansion will increase access to vital preventative care and early intervention in acute episodes which should reduce decrease preventable admissions. RHP 6 and Texas overall has a demonstrated need to improve quality of care for prevalent chronic conditions such as diabetes and cardiac care as well as other health disparities.

**Expand specialty care capacity 1.9.2:**
- **Baptist** plans to expand existing sites and add additional specialty care physicians over the next four years. This expansion will increase access to vital preventative care and early intervention in acute episodes which should reduce decrease preventable admissions. RHP 6 and Texas overall has a demonstrated need to improve access and quality of care in cardiac disease, maternal/infant care and behavioral health all of which will be addressed through BHS plans.
for expansion of specialty care.

**Enhance performance improvement and reporting capacity 1.10.1**

**Design, develop and implement a program of continuous, rapid process improvement methodology to improve quality/efficiency 2.8.1:**

- Through the implementation of lean and six sigma performance improvement methodology in our health system, **Baptist** will create a PI infrastructure focused on educating employees and physicians. Through the implementation of these tools we will change work processes, improve cost efficiency, **improve patient care and outcomes**, and address RHP goals of
  - Triple Aim - Improve health care infrastructure to better serve Medicaid and uninsured
  - Further develop and maintain a coordinated care delivery system
  - Improve outcomes while containing cost growth

Through the PI structure and training, we will examine clinical care processes seeking reduced variation, improve patient teaching and transitional care, change physician practices, all of which can lead to reduced inpatient care and prevent admissions.

Baptist expects these projects to result in improved outcomes for this domain’s measures to benefit the RHP population by reducing preventable admissions, improving overall ambulatory health management and providing improved, effective inpatient care for chronic conditions.

**Valuation:**

Baptist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

In valuing the project, Baptist took into account the extent to which Potentially Preventable Admissions reporting could meet the goals of the Wavier (improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and costs necessary to implement the project.

**Performing Provider:**

Performing Provider name: VHS San Antonio Partners, LLC d/b/a Baptist Health System

TPI: 159156201

**Domain 2: Potentially Preventable Readmissions – 30 days**

**Description:**

**REPORTING MEASURES:**

- Congestive Heart Failure (HF): 30 Day Readmissions
- Diabetes: 30-Day Readmissions
- Behavioral health & Substance Abuse: 30-Day Readmissions
- Chronic Obstructive Pulmonary Disease (COPD): 30-Day Readmissions
- Stroke: 30-Day Readmissions
- Pediatric Asthma: 30-Day Readmissions
- All–Cause: 30-Day Readmissions

Exempt domain(s): None known at this time
Baptist projects were selected to impact the triple aim goals of assuring patients receive high-quality, patient-centered care, though cost effectiveness and to meet our community needs.

All of our Category 1,2,3 projects relate to and should improve 30 day readmissions:

Expand primary care capacity 1.1.1
Expand specialty care capacity 1.9.2
Enhance performance improvement and reporting capacity 1.10.1
Design, develop and implement a program of continuous, rapid process improvement methodology to improve quality/efficiency 2.8.1

Improving access to primary and specialty care and linking the patient and provider post acute care status will result in decreased readmissions through appropriate ambulatory management.

BHS is developing teams at each hospital for continuous review of the patient’s experience that trigger re-admission including representatives from Nursing, Case Management, Social Service and Medical staff. The centerpiece of the BHS re-admission strategy is early intervention through a team approach. BHS has a process to identify both high risk and moderate risk patients for re-admission. With readmission a notification is sent electronically to Case Managers who then visit the patients. During rounding, the Case Manager in conjunction with nursing and physicians communicate and monitor handoffs together. This helps the patient and family members understand the diagnosis, treatment plan and post discharge care. It also facilitates and enhances communication between the multi-disciplinary care team.

BHS will work with the medical staff to complete the discharge summaries on all discharged patients within 24 hours post discharge. Copies are sent to the primary/referring physician to facilitate continuity of care. We are also engaging the medical staff to use the physician portal by granting all affiliated physicians access to the electronic record.

We are currently using PI to simplify what we teach patients and assess patient's understanding of what has been taught and then revising. We will use “Teach Back” during hospitalization, follow-up phone calls assessing patient and family caregiver understanding of instructions as well as ability to perform self care. Using PI tools we continue review of processes and policies to standardize care, ensuring appropriate treatment and discharge instructions.

We will be recruiting Case Managers for Transition Care Manager (TCM) position at all five hospitals. Their primary responsibility is to improve discharge planning and transition out of the hospital by improving that transition, providing care coordination at the interfaces between care settings as well as enhancing coaching, education and self management. Part of the TCM responsibility will be to work with other health care providers for follow up visits of at risk patients. TCMs will ensure that chronically ill patients and elderly have appointments with their primary physicians, scheduled by the TCMs. The TCM will provide the physician with an electronic summary of the discharge summary, make follow up call to the patients do the patient sees their primary care physician within five days.

We also continue to develop partnerships and relationships with our Home Health Agencies and Nursing Homes to ensure that they are equipped with the resources to take care of the patients assigned to their service and care.

BHS is enhancing the admission reconciliation of medications. The patient and family caregivers
are involved during the medication history taken at admission. The assessment includes over-the-counter and alternative or herbal medicines. The medication reconciliation is documented as part of the medical record.

**Valuation:**

Baptist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

In valuing the project, Baptist took into account the extent to which Potentially Preventable Admissions reporting could meet the goals of the Wavier (improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and costs necessary to implement the project.

**Performing Provider:**

Performing Provider name: VHS San Antonio Partners, LLC d/b/a Baptist Health System
TPI: 159156201

**Domain 3: Potentially Preventable Complications**

**Description:**

Reporting Measure: Hospital performing providers subject to required Category 4 reporting must report on the 64 PPC measures listed in Domain 3 in DY 4-5.

The metrics for Potentially Preventable Complications (PPC) span the full spectrum of care provided and intersect within the populations cared for in cardiovascular, cancer, diabetic, maternal and child health, as well as behavioral health as outlined in Categories 1, 2 and 3. Efforts to improve organizational performance improvement acumen assist in reducing the incidences of PPCs.

Baptist Health System (BHS) actively monitors and sets safety and improvement goals to meet or exceed the state/national averages for all of the PPCs. The system utilizes improvement tools such as Crimson, a quality and financial database based on coded data, to provide information related to PPCs down to the individual practitioner level. This data can then provide the team valuable insights for system improvements as well as information to the individual provider via the Ongoing Performance Practice Evaluation (OPPE).

Reduction in the PPC impacts outcomes for all acute care populations, reduces length of stay, and reduces the overall cost of care. To provide examples of the system’s focus on reducing PPCs the following is the focus on some of the current improvement efforts that tie to our Category 1 and 2 projects:

**Enhance performance improvement and reporting capacity 1.10.1**

Design, develop and implement a program of continuous, rapid process improvement methodology to improve quality/efficiency 2.8.1:
Cardiovascular Co-Management Agreement:
- Cardiovascular improvements and a focused approach within the cardiovascular surgery arena strives to reduce postoperative infections, sepsis, post-hemorrhage, AMI, ventricular fibrillation, etc. Efforts on CABG procedures initially focus on achieving metric goals to national and/or state averages with the outcome to improve to the top decile performance. Several efforts are underway to create these improvements; this includes a cardiovascular co-management agreement that encompasses superior care as outlined by the Society for Thoracic Surgeons metrics – that include many of these particular PPCs. A Cardiovascular Surgery Site Infection Task Force has been implemented to bring together Surgeons, Operational leaders and Infection Prevention to consider operational and process improvements in order to reduce the incidence of postoperative infections.

DRG-Care Reliability Lean Team:
- Improvements within the bowel procedure (APR-DRG 221) arena will have an anticipated reduction in major and other gastrointestinal complications, postoperative infections, gastrointestinal ostomy complications, and infections due to central venous catheters. With a focused improvement in the utilization of TPN there can be a direct correlation found with the evidence of a decrease in infections related to central venous catheters.

Beyond the targeted areas, all patients receive care that focuses on reduction of PPC. In the current year, there are targeted efforts to improve sepsis recognition and timely treatment as well as timely and appropriate screening and treatment for VTE. BHS uses data obtained from the E-ICU and Emergency Services to evaluate evidence-based care provided.

Baptist Health System is also actively focused on “driving to zero” with hospital-acquired infections which account for a number of the PPCs. BHS participates in a collaborative with the Texas Medical Care Foundation (TMF) to reduce the incidence of catheter associated urinary tract infections (CAUTI). This collaboration has resulted in significant improvements in the past quarter 2012. This was accomplished with a grass-roots education targeted to the bedside nurse. Additionally, in January 2013, the system will participate in the TMF collaborative to reduce the incidence of surgical site infections (SSI) as well as a clostridium difficile colitis in the inpatient populations.

Valuation:
Baptist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

In valuing the project, Baptist took into account the extent to which Potentially Preventable Admissions reporting could meet the goals of the Wavier (improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and costs necessary to implement the project.
Performing Provider:
Performing Provider name: VHS San Antonio Partners, LLC d/b/a Baptist Health System
TPI: 159156201

Domain 4: Patient-Centered Healthcare

Description:

Reporting Measures:
- **Patient Satisfaction**
- **Medication management**

To provide examples of the system’s focus on improving patient satisfaction and medication management, the following is the focus on some of the current improvement efforts that tie to Category 1 and 2 projects:

**Enhance performance improvement and reporting capacity 1.10.1**

**Design, develop and implement a program of continuous, rapid process improvement methodology to improve quality/efficiency 2.8.1:**

Patient Satisfaction is tracked via Press Ganey HCHAPs. MTD scoring is reported weekly although all of our Department Directors have system access to review daily. Each facility conducts weekly patient experience meetings with department staffs that are not at goal. PI tools are used intradepartmentally to evaluate processes such as the effectiveness of hourly rounding, patient communication boards, bedside shift reporting, key words at key times and numerous other “Best Practice” techniques. Through the Studer organization Baptist contracts for a coach that assists both facility senior leaders as well as new and experienced department leaders on “must haves” to improve patient experience.

We currently have a monthly scorecard for all five facilities and those results are shared at employee department meetings, employee CEO forums and at all medical staff meetings. Most of our physician contracts have patient experience tied to reimbursement.

Baptist is currently evaluating a rapid cycle improvement movement to reach and sustain patient satisfaction at the 75th percentile.

To improve medication management, BHS pharmacy department will begin to deploy a pharmacist at the point of care to facilitate the medication reconciliation process. The clinical pharmacist will review medications, teach patients regarding new medications or medication changes and review discontinued medications. They will also track adverse drug events and serve as a resource to the bedside nurse.

Valuation:
Baptist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

In valuing the project, Baptist took into account the extent to which Potentially Preventable Admissions reporting could meet the goals of the Wavier (improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and costs necessary to implement the project.
Performing Provider:
Performing Provider name: VHS San Antonio Partners, LLC d/b/a Baptist Health System
TPI: 159156201
Domain 5: Emergency Department

Description:
Reporting Measures:
- Admit decision to departure time for admitted patients

To provide examples of the system’s focus on improving patient satisfaction and medication management, the following is the focus on some of the current improvement efforts that tie to Category 1 and 2 projects:
Enhance performance improvement and reporting capacity 1.10.1
Design, develop and implement a program of continuous, rapid process improvement methodology to improve quality/efficiency 2.8.1

The disposition to admit metric is monitored monthly by Vanguard and included in executive monthly performance reviews. Using PI processes and techniques, Baptist uses data and analyzes, breaking down the time into the following components: decision to admit, time to get orders and time to move to nursing unit. As an example, this PI process identified opportunity to use bridge orders that would eliminate the time associated with waiting for admission orders.

We will pilot a transition team to aid in a patient-centered safe and timely transition of patients from ED care to care on the floor and ensure orders are not missed, care continues, and patient is moved to appropriate level of care.

BHS is adding hospitalist mid-level providers during peak hours to work with nocturnists between admissions to provide cross call coverage and support patient codes which will allow for a smoother inpatient admission flow.

BHS has a system-wide initiative on increasing discharge by noon percentages. The point of this is to create capacity and precede the demand peak from the ED allowing for quicker patient transition to the floor. The delays to discharges are discussed and analyzed in several forums including daily nursing leadership huddles and daily hospitalist meetings.

We will continue to evaluate and trial new and streamlined processes to impact the time the patient waits in the ED before being transferred to a nursing unit bed as the PI tools yield new information.

Valuation:
Baptist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

In valuing the project, Baptist took into account the extent to which Potentially Preventable Admissions reporting could meet the goals of the Wavier (improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and costs necessary to implement the project.

Performing Provider:
Performing Provider name: Children’s Hospital of San Antonio
TPI: 020844903

Domain 1: Potentially Preventable Admissions

Description:
According to the Agency for Healthcare Research and Quality, American hospitals spent nearly $31 billion, 10 percent of their total patient care budget, in 2006 on more than 4 million patient stays that could possibly have been prevented with timely and effective ambulatory care. Reducing preventable hospitalizations is a proven way to help reduce these rising costs.

Each project submitted by Children’s Hospital of San Antonio will help to decrease preventable admissions:

- **Establish More Primary Care Clinics (1.1.1):** Children’s hospital of San Antonio (CHofSA) will develop a geographically dispersed network of pediatric primary care clinics throughout Bexar County to enhance access points, increase available appointment times, and promote patient awareness of available services and overall primary care capacity, all of which will ultimately result in better health outcomes, patient satisfaction, appropriate utilization and reduced cost of services.

- **Improve Access to Specialty Care (1.9.2):** The primary goal of this project is to increase the capacity to provide pediatric sub-specialty care services and the availability of targeted specialty providers to better accommodate the high demand for such services.

Children’s Hospital of San Antonio expects the above projects to result in improved outcomes for the following measures under this domain:

1. Decrease in the number of pediatric asthma patients that return to the ED for treatment within 15 days of their last ED visit
2. Increase in bacterial pneumonia immunizations
3. Increase in influenza immunizations

Children’s Hospital of San Antonio requests to be exempt from reporting on the following measures due to the identified age specifications:

1. Congestive Heart Failure Admission Rates (patients 18 and older)
2. Diabetes Admission Rates (patients 18 and older)
3. Chronic Obstructive Pulmonary Disease or Asthma in Adults Admission Rates (patients 18 and older)
4. Hypertension Admission Rates (patients 18 and older)

Additionally, Children’s Hospital of San Antonio does not offer behavioral health and substance abuse services; therefore it requests to be exempt from reporting on this specific measure under this domain.

On a monthly basis, Children’s Hospital of San Antonio will review our Electronic Health Records (EHR) for all patient cases for relevant medical record coding that identifies the specific patient populations to be monitored.
**Valuation:**

In valuing this domain, Children’s Hospital of San Antonio took into account the extent to which each of its projects would potentially impact the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.

Each submitted project will play a significant role in reducing preventable admissions by ensuring that patients receive the right care, in the right setting, at the right time.

---

**Performing Provider:**

Performing Provider name: Children’s Hospital of San Antonio  
TPI: 020844903  
**Domain 2: Potentially Preventable Readmissions**

**Description:**

A number of studies have demonstrated that improvements in care at the time of patient discharge can significantly reduce 30-day readmission rates. Hospitals, in collaboration with other healthcare providers, can take a number of actions to reduce readmissions: ensure patients are clinically ready at discharge; reduce risk of infection; reconcile medications; improve communications among providers involved in transition of care; implement strategies that promote disease management; and educate patients about symptoms to monitor, whom to contact with questions, and where and when to seek follow-up care (source: National Quality Forum Measure Submission and Evaluation Worksheet 5.0).

Each project submitted by Children’s Hospital of San Antonio will help to reduce readmission:

- **Establish More Primary Care Clinics (1.1.1):** The primary goal of this objective is to expand the capacity of Pediatric primary care to better accommodate the needs of children in the community. Increased access to primary care allows patients to receive the right care at the right time in the right setting, which will result in fewer readmissions.

- **Improve Access to Specialty Care (1.9.2):** The primary goal of this project is to increase the capacity to provide pediatric sub-specialty care services and the availability of targeted specialty providers to better accommodate the high demand for such services.

Children’s Hospital of San Antonio expects the above projects to result in improved outcomes for the following measures under this domain:

1. Decrease in pediatric asthma 30-day readmissions.

Children’s Hospital of San Antonio requests to be exempt from reporting on the following measures due to the identified age specifications:

1. Congestive Heart Failure 30-day Readmissions (patients 18 and older)
2. Diabetes 30-day Readmissions (patients 18 and older)
3. Chronic Obstructive Pulmonary Disease 30-day Readmissions (patients 18 and older)
4. Stroke 30-day Readmissions (patients 18 and older)
5. All-Cause 30-day Readmissions (patients 18 and older)

Additionally, Children’s Hospital of San Antonio does not offer behavioral health and substance abuse services; therefore it requests to be exempt from reporting on this specific measure under this domain.

On a monthly basis, Children’s Hospital of San Antonio will review our Electronic Health Records (EHR) for all patient cases for relevant medical record coding that identifies the specific patient populations to be monitored.

**Valuation:**

In valuing this domain, Children’s Hospital of San Antonio took into account the extent to which each of its projects would potentially impact the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.

Each submitted project will play a significant role in reducing readmissions by ensuring that patients receive the right care, in the right setting, at the right time.

### Performing Provider:

Performing Provider name: Children’s Hospital of San Antonio  
TPI: 020844903

**Domain 3: Potentially Preventable Complications**

**Description:**

Inpatient hospital complications can result in substantial adverse outcomes for patients and in some cases can have life threatening consequences. These events often result in increased hospital stays and consume additional costly healthcare resources. Reducing complications has been identified as an approach to improving care and reducing healthcare costs.

Each Children’s Hospital of San Antonio project will help to reduce complications:

- **Establish More Primary Care Clinics (1.1.1):** The primary goal of this objective is to expand the capacity of pediatric primary care to better accommodate the needs of children in the community. By expanding access to pediatric primary care, patients will have increased access to preventative care, which can help reduce complications associated with existing chronic conditions.

- **Improve Access to Specialty Care (1.9.2):** The primary goal of this project is to increase the capacity to provide pediatric sub-specialty care services and the availability of targeted specialty providers to better accommodate the high demand for such services. This increase will result in more available appointment times, increased patient awareness of available services, improved patient health outcomes, improved patient satisfaction, improvement in utilization patterns, and reduction in cost of services.

Children’s Hospital of San Antonio expects the above projects to result in improved outcomes for the 64 measures under this domain.
On a monthly basis, Children’s Hospital of San Antonio will review our Electronic Health Records (EHR) for all patient cases for relevant medical record coding that identifies the specific patient populations to be monitored.

**Valuation:**

In valuing this domain, Children’s Hospital of San Antonio took into account the extent to which each of its projects would potentially impact the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.

Each submitted project will play a significant role in reducing preventable complications by ensuring that patients receive the right care, in the right setting, at the right time.

---

**Performing Provider**

Performing Provider name: Children’s Hospital of San Antonio  
TPI: 020844903

**Domain 4: Patient-Centered Healthcare**

**Description:**

The following two projects are Outpatient focused and therefore will have no impact on this domain.

- **Establish More Primary Care Clinics (1.1.1): (TPI Pending).1.2:** The primary goal of this objective is to expand the capacity of Pediatric primary care to better accommodate the needs of children in the community. Increased access to primary care allows patients to receive the right care at the right time in the right setting, which will result in a better patient experience.

- **Improve Access to Specialty Care (1.9.2) (TPI Pending).1.1:** The primary goal of this project is to increase the capacity to provide pediatric sub-specialty care services and the availability of targeted specialty providers to better accommodate the high demand for such services. This increase will result in more available appointment times, increased patient awareness of available services, improved patient health outcomes, improved patient satisfaction, improvement in utilization patterns, and reduction in cost of services.

**Valuation:**

In valuing this domain, Children’s Hospital of San Antonio took into account the extent to which each of its projects would potentially impact the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.

Each submitted project will play a role in improving the patient experience by ensuring that patients receive the right care, in the right setting, at the right time.
Performing Provider:

Performing Provider name: Children’s Hospital of San Antonio  
TPI: 020844903  
**Domain 5: Emergency Department**

**Description:**

Evidence indicates that reducing the time patients remain in the emergency department can improve access to treatment and improve quality of care. Emergency department overcrowding and increased demand for emergency resources leads to ED diversions, prolonged patient wait times, decreased patient satisfaction, rushed treatment environments, and poor patient outcomes.

Each Children’s Hospital of San Antonio project will help to improve admit decision time:

- **Establish More Primary Care Clinics (1.1.1):** The primary goal of this objective is to expand the capacity of Pediatric primary care to better accommodate the needs of children in the community. In doing so, patients will have a provider who is familiar with their healthcare needs and can make quick and informed decisions when contacted by the ED.

- **Improve Access to Specialty Care (1.9.2):** The primary goal of this project is to increase the capacity to provide pediatric sub-specialty care services and the availability of targeted specialty providers to better accommodate the high demand for such services. This increase will result in more available appointment times, increased patient awareness of available services, improved patient health outcomes, improved patient satisfaction, improvement in utilization patterns, and reduction in cost of services.

Children’s Hospital of San Antonio expects the above projects to result in improved outcomes for the following measures under this domain:

1. Improved admit decision time to ED departure time for admitted patients.

On a monthly basis, Children’s Hospital of San Antonio will review our Electronic Health Records (EHR) for all patient cases for relevant medical record coding that identifies the specific patient populations to be monitored.

**Valuation:**

In valuing this domain, Children’s Hospital of San Antonio took into account the extent to which each of its projects would potentially impact the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.

Each submitted project will play a role in improving admit decision time by ensuring that patients receive the right care, in the right setting, at the right time.

Performing Provider:
Performing Provider name: CHRISTUS Santa Rosa Health System
TPI: 020844901

Domain 1: Potentially Preventable Admissions

Description:
According to the Agency for Healthcare Research and Quality, American hospitals spent nearly $31 billion, 10 percent of their total patient care budget, in 2006 on more than 4 million patient stays that could possibly have been prevented with timely and effective ambulatory care. Reducing preventable hospitalizations is a proven way to help reduce these rising costs. Each CHRISTUS Santa Rosa Health System project was carefully selected for its ability to impact the triple aim goals of assuring patients receive high-quality and patient-centered care, in the most cost effective ways.

- **Expand Primary Care Capacity (1.1.2):** CSRHS plans to expand beyond its existing clinic space and add an additional 4 primary care physicians over the next four years. In doing so, CSRHS will increase access to much needed preventative care, which will result in a decrease preventable admissions.

- **Patient-Centered Medical Homes (2.1.2):** As a result of this project, CSRHS expects to see a marked increase in access to primary care and a significant improvement in the management of chronic conditions over the next 5 years, which has been proven to successfully reduce the number of unnecessary hospital admissions.

- **Care Transitions – Intervention Nurse Program (2.12.1):** The primary goal of this project is to significantly reduce unplanned re-admissions for patient populations with the principal diagnosis of congestive heart failure (CHF), pneumonia (PN) and acute myocardial infarction (AMI).

CHRISTUS Santa Rosa Health System expects the above projects to result in improved outcomes for the following measures under this domain:

4. Decrease in congestive heart failure admission rates
5. Decrease in diabetes admission rates
6. Decrease in obstructive pulmonary disease or asthma in adults admission rates
7. Decrease in hypertension admission rates
8. Decrease in the number of pediatric asthma patients that return to the ED for treatment within 15 days of their last ED visit
9. Increase in bacterial pneumonia immunizations
10. Increase in influenza immunizations

CHRISTUS Santa Rosa Health System does not offer behavioral health and substance abuse services; therefore it requests to be exempt from reporting on this specific measure under this domain.

On a monthly basis, CHRISTUS Santa Rosa will review our Electronic Health Records (EHR) for all patient cases for relevant medical record coding that identifies the specific patient populations to be monitored.
Valuation:
In valuing this domain, CHRISTUS Santa Rosa took into account the extent to which each of its projects would potentially impact the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.

Each of the three submitted projects will play a significant role in reducing preventable admissions by ensuring that patients receive the right care, in the right setting, at the right time.

Performing Provider:
Performing Provider name: CHRISTUS Santa Rosa Health System
TPI: 020844901
Domain 2: Potentially Preventable Readmissions – 30 days
Description:
A number of studies have demonstrated that improvements in care at the time of patient discharge can significantly reduce 30-day readmission rates. Hospitals, in collaboration with other healthcare providers, can take a number of actions to reduce readmissions: ensure patients are clinically ready at discharge; reduce risk of infection; reconcile medications; improve communications among providers involved in transition of care; implement strategies that promote disease management; and educate patients about symptoms to monitor, whom to contact with questions, and where and when to seek follow-up care (source: National Quality Forum Measure Submission and Evaluation Worksheet 5.0).

Each CHRISTUS Santa Rosa Health System project will help to reduce readmissions.

- **Expand Primary Care Capacity (1.1.2):** CSRHS plans to expand beyond its existing clinic space and add an additional 4 primary care physicians over the next four years. In doing so, CSRHS will increase access to much needed preventative care.

- **Patient-Centered Medical Homes (2.1.2):** As a result of this project, CSRHS expects to see a marked increase in access to primary care and a significant improvement in the management of chronic conditions over the next 5 years. This project addresses demonstrated public health challenges in the community by catering to the complex, chronic care needs of the population; improving adherence to care plans through comprehensive preventative and primary care services; providing active follow-up in between office visits; and, promoting continuity of care.

- **Care Transitions – Intervention Nurse Program (2.12.1):** This project will create smooth transitions of care from inpatient to outpatient settings or to alternative inpatient settings so that patients being discharged understand the care regimen, have follow-up care scheduled, and are at reduced risk for avoidable readmissions.
CHRISTUS Santa Rosa Health System expects the above projects to result in improved outcomes for the following measures under this domain:

2. Decrease in congestive heart failure 30-day readmissions.
3. Decrease in diabetes 30-day readmissions.
4. Decrease in chronic obstructive pulmonary disease 30-day readmissions.
5. Decrease in stroke 30-day readmissions.
6. Decrease in pediatric asthma 30-day readmissions.
7. Decrease in all-cause 30-day readmissions.

CHRISTUS Santa Rosa Health System does not offer behavioral health and substance abuse services; therefore it requests to be exempt from reporting on this specific measure under this domain.

On a monthly basis, CHRISTUS Santa Rosa will review our Electronic Health Records (EHR) for all patient cases for relevant medical record coding that identifies the specific patient populations to be monitored.

**Valuation:**

In valuing this domain, CHRISTUS Santa Rosa took into account the extent to which each of its projects would potentially impact the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.

Each of the three submitted projects will play a significant role in reducing readmissions by ensuring that patients receive the right care, in the right setting, at the right time.

**Performing Provider:**

Performing Provider name: CHRISTUS Santa Rosa Health System
TPI: 020844901

**Domain 3: Potentially Preventable Complications**

**Description:**

Inpatient hospital complications can result in substantial adverse outcomes for patients and in some cases can have life threatening consequences. These events often result in increased hospital stays and consume additional costly healthcare resources. Reducing complications has been identified as an approach to improving care and reducing healthcare costs.

Each CHRISTUS Santa Rosa Health System project will help to reduce complications:

- **Expand Primary Care Capacity (1.1.2):** By expanding access to primary care, patients will have increased access to preventative care, which can help reduce complications associated with existing chronic conditions.
- **Patient-Centered Medical Homes (2.1.2):** As a result of this project, CSRHS expects to see a marked increase in access to primary care and a significant improvement in the management of chronic conditions over the next 5 years. This project addresses
demonstrated public health challenges in the community by catering to the complex, chronic care needs of the population; improving adherence to care plans through comprehensive preventative and primary care services; providing active follow-up in between office visits; and, promoting continuity of care.

- **Care Transitions – Intervention Nurse Program (2.12.1):** This project will create smooth transitions of care from inpatient to outpatient settings or to alternative inpatient settings so that patients being discharged understand the care regimen, have follow-up care scheduled, and are at reduced risk for complications and avoidable readmissions.

CHRISTUS Santa Rosa Health System expects the above projects to result in improved outcomes for the 64 measures under this domain.

On a monthly basis, CHRISTUS Santa Rosa will review our Electronic Health Records (EHR) for all patient cases for relevant medical record coding that identifies the specific patient populations to be monitored.

**Valuation:**

In valuing this domain, CHRISTUS Santa Rosa took into account the extent to which each of its projects would potentially impact the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.

Each of the three submitted projects will play a significant role in reducing complications by ensuring that patients receive the right care, in the right setting, at the right time.

**Performing Provider:**

Performing Provider name: CHRISTUS Santa Rosa Health System
TPI: 020844901

**Domain 4: Patient-Centered Healthcare**

**Description:**

Patient-centered care is an effective method for improving the health of the population and helping to reduce the rising costs of healthcare. Improving the patient experience will require a redesign of primary care to meet the needs of patients for timely, patient-centered, continuous, and coordinated care and must be centered on cultural change at the organizational level. Each CHRISTUS Santa Rosa Health System project was carefully selected for its ability to impact the triple aim goals of assuring patients receive high-quality and patient-centered care, in the most cost effective ways.

- **Expand Primary Care Capacity (1.1.2) 020844901.1.1:** By expanding access to primary care, patients will have increased access to preventative care, which will improve quality outcomes and improve overall patient satisfaction.

- **Patient-Centered Medical Homes (2.1.2) 020844901.2.1:** This project meets the Triple Aim goals of the Waiver by promoting better health, better patient experience of care, and ultimately better cost-effectiveness By providing the right care at the right time and in the right setting, patients not only have better access to primary care, they may see their health
improved, will rely less on costly ED visits, will incur fewer avoidable hospital stays and report greater patient satisfaction.

- **Care Transitions – Intervention Nurse Program (2.12.1) 020844901.2.2:** The Care Transitions Intervention was designed in response to the need for a patient-centered, interdisciplinary intervention that addresses continuity of care across multiple settings and practitioners. This project will create smooth transitions of care from inpatient to outpatient settings or to alternative inpatient settings so that patients being discharged understand the care regimen, have follow-up care scheduled, and are at reduced risk for complications and avoidable readmissions.

Of the three projects listed below, Care Transitions is the only one focused on the inpatient setting. CHRISTUS Santa Rosa Health System expects this project to result in improved outcomes for the following measures under this domain:

1. Improved patient satisfaction.
2. Improved medication management.

On a monthly basis, CHRISTUS Santa Rosa will review our Electronic Health Records (EHR) for all patient cases for relevant medical record coding that identifies the specific patient populations to be monitored.

**Valuation:**

In valuing this domain, CHRISTUS Santa Rosa took into account the extent to which each of its projects would potentially impact the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.

Each of the three submitted projects will play a significant role in improving the patient experience by ensuring that patients receive the right care, in the right setting, at the right time.

**Performing Provider:**

Performing Provider name: CHRISTUS Santa Rosa Health System  
TPI: 020844901  
**Domain 5: Emergency Department**  
**Description:**

Evidence indicates that reducing the time patients remain in the emergency department can improve access to treatment and improve quality of care. Emergency department overcrowding and increased demand for emergency resources leads to ED diversions, prolonged patient wait times, decreased patient satisfaction, rushed treatment environments, and poor patient outcomes.

CHRISTUS Santa Rosa Health System has two projects that will help to improve admit decision time:
- **Expand Primary Care Capacity (1.1.2):** By expanding access to primary care, patients will have a provider who is familiar with their healthcare needs and can make quick and informed decisions when contacted by the ED.

- **Patient-Centered Medical Homes (2.1.2):** This project addresses demonstrated public health challenges in the community by catering to the complex, chronic care needs of the population; improving adherence to care plans through comprehensive preventative and primary care services; providing active follow-up in between office visits; and, promoting continuity of care.

CHRISTUS Santa Rosa Health System expects the above projects to result in improved outcomes for the following measures under this domain:

2. Improved admit decision time to ED departure time for admitted patients.

On a monthly basis, CHRISTUS Santa Rosa will review our Electronic Health Records (EHR) for all patient cases for relevant medical record coding that identifies the specific patient populations to be monitored.

**Valuation:**

In valuing this domain, CHRISTUS Santa Rosa took into account the extent to which each of its projects would potentially impact the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.

Each submitted project will play a role in improving admit decision time by ensuring that patients receive the right care, in the right setting, at the right time.

Performing Provider:
Performing Provider name: Clarity Child Guidance Center
TPI: 112742503

Domain 1: Potentially PreventableAdmissions

Description:
Clarity Child Guidance Center is in the process of implementing electronic medical records which will greatly improve our capability to report data. Our Category 1 Project, to enhance service availability, directly links to potentially preventable admissions, a key outcome of 2.13. Improving the health of low-income populations will lead to long-term sustainable outcomes while decreasing societal burden.

The selected Category 3 measure is located within OD-2, “Potentially Preventable Admissions” and the related standalone outcome measure of 3-IT 2-4. This measure’s goal is to reduce Emergency Department visits for one of several optional target conditions, one of which is behavioral health/substance abuse. However, because this measure is available only for patients 18 and older, we were advised by HHSC to utilize the custom/optional measure of 2.13 to address that our outcomes would be related to youth, ages 3-17. Our project is of benefit to all performing providers in the region, as children are presenting in local Emergency Rooms without access to “right care, right setting” and displacing beds for treatment plans that can be addressed effectively by the local hospitals. Further, treating children when they are children prevents a host of unwelcome outcomes, including but not limited to suicide, incarceration, dropout, alcohol and drug abuse and many other societal ills.

Valuation:
The total scope of adding additional services, including a bed expansion, hiring additional providers, infrastructure updates, etc., is close to $8M in scope. Local funding is in the form of IGT funding by our affiliation partner, University Health System, who will provide $1,968,152. The 1115 Waiver will add $2,350,064 in funding for a total of $3,936,807. The remaining costs will be covered through development efforts of our nonprofit agency and self-funding through bonds. The populations that will be served are youth ages 3-17, and the community benefit is immense, not only in line with the Community Needs Analysis, but with Texas’ woeful lack of providers and access to mental healthcare.

Performing Provider:
Performing Provider name: Clarity Child Guidance Center
TPI: 112742503

Domain 2: Potentially Preventable Readmissions – 30 days

Description:
Potentially Preventable Readmissions relates directly to our Category 1 project, as we seek to divert youth from presenting at Emergency Rooms with behavioral health issues for which psychiatric care is not available at said Emergency Rooms. By providing the right care in the right setting, we can provide services that lead to more effective outcomes, thereby preventing readmissions.
Valuation:
The domain valuation was based upon guidelines from HHSC that the entireties of Category 4 not exceed a certain percentage of value in the year selected. As noted in the overall valuation, the total scope of adding additional services, including a bed expansion, hiring additional providers, infrastructure updates, etc., is close to $8M in scope. Local funding is in the form of IGT funding by our affiliation partner, University Health System, who will provide $1,968,152. The 1115 Waiver will add $2,350,064 in funding for a total of $3,936,807. The remaining costs will be covered through development efforts of our nonprofit agency and self-funding through bonds. The populations that will be served are youth ages 3-17, and the community benefit is immense, not only in line with the Community Needs Analysis, but with Texas’ woeful lack of providers and access to mental healthcare.

Performing Provider:
Performing Provider name: Clarity Child Guidance Center
TPI: 112742503

Domain 3: Potentially Preventable Complications

Description:
Potentially Preventable Complications measures relates directly to our Category 1 project, as we seek to divert youth from presenting at Emergency Rooms with behavioral health issues for which psychiatric care is not available at said Emergency Rooms. By providing the right care in the right setting, we can provide services that lead to more effective outcomes, thereby preventing complications. Clarity Child Guidance Center reports PPCs as part of our internal measurement system and also provides hospital provide raw discharge data to DSHS, through HCIC. In consultation with HHSC, we were advised that our data may not be statistically significant since we offer specialized services, and HHSC would report to us as a provider that we are not required to report. At reporting time, if HHSC advises us, we would note that we “lack sufficient data, as confirmed by HHSC.”

With all of this noted, research does reveal that hospital emergency rooms are the least effective method of creating a therapeutic alliance for a child/adolescent suffering from mental illness. By providing the right care in the right setting, we believe we can reduce PPCs. As an example, a local emergency room boards psychiatric patients presenting in their hospital in the NICU area, where a child who is suicidal or homicidal has access to syringes and other potentially damaging items. Our setting is safe, secure and nurturing in order to create a trusted relationship for therapeutic care.

Valuation:
The domain valuation was based upon guidelines from HHSC that the entireties of Category 4 not exceed a certain percentage of value in the year selected. As noted in the overall valuation, the total scope of adding additional services, including a bed expansion, hiring additional providers, infrastructure updates, etc., is close to $8M in scope. Local funding is in the form of IGT funding by our affiliation partner, University Health System, who will provide $1,968,152. The 1115 Waiver will add $2,350,064 in funding for a total of $3,936,807. The remaining costs will be covered through development efforts of our nonprofit agency and self-funding through bonds. The populations that will be served are youth ages 3-17, and the community benefit is immense, not only in line with the Community Needs Analysis, but with Texas’ woeful lack of providers and access to mental healthcare.
Performing Provider:
Performing Provider name: Clarity Child Guidance Center
TPI: 112742503

Domain 4: Patient-Centered Healthcare

Description:
Patient-Centered Healthcare measures relates directly to our Category 1 project, as we seek to divert youth from presenting at Emergency Rooms with behavioral health issues for which psychiatric care is not available at said Emergency Rooms. By providing the right care in the right setting, we can provide services that lead to more effective outcomes, whether medication management related or patient satisfaction.

Our internally administered survey approach (based on HCAHPS) for patients who have been hospitalized benchmarks against both local and nationally respected organizations. Since we serve children ages 3-17, the caregiver/responsible party completes the survey. Clarity Child Guidance Center created the internal process several years ago, since HCAHPS does not currently make available a survey for children, which is our primary patient. HHSC has advised us to report as follows - “we will not have data to report for Cat 4 for HCAHPS as the measures currently address adult care.” However, internal data can be made available if required. HCAHPS is conducting field trials for children focused surveys and it’s possible that by DY5 HCAHPS would have measures related to our patient population, children.
We anticipate patient satisfaction and medication management to improve as a result of treatment.

Valuation:
The domain valuation was based upon guidelines from HHSC that the entireties of Category 4 not exceed a certain percentage of value in the year selected. As noted in the overall valuation, the total scope of adding additional services, including a bed expansion, hiring additional providers, infrastructure updates, etc., is close to $8M in scope. Local funding is in the form of IGT funding by our affiliation partner, University Health System, who will provide $1,968,152. The 1115 Waiver will add $2,350,064 in funding for a total of $3,936,807. The remaining costs will be covered through development efforts of our nonprofit agency and self-funding through bonds. The populations that will be served are youth ages 3-17, and the community benefit is immense, not only in line with the Community Needs Analysis, but with Texas’ woeful lack of providers and access to mental healthcare.
**Performing Provider:**
Performing Provider name: Clarity Child Guidance Center  
TPI: 112742503  
**Domain 5: Emergency Department**

**Description:**
The Emergency Department measure relates directly to our Category 1 project, as we seek to divert youth from presenting at Emergency Rooms with behavioral health issues for which psychiatric care is not available at said Emergency Rooms. By providing the right care in the right setting, we can expedite care, versus the 12+ hours of “boarding time” for a psychiatric patient presenting at a local ER that has no psychiatric services. This is a measure that Clarity Child Guidance Center already has in place.

**Valuation:**
The domain valuation was based upon guidelines from HHSC that the entireties of Category 4 not exceed a certain percentage of value in the year selected. As noted in the overall valuation, the total scope of adding additional services, including a bed expansion, hiring additional providers, infrastructure updates, etc., is close to $8M in scope. Local funding is in the form of IGT funding by our affiliation partner, University Health System, who will provide $1,968,152. The 1115 Waiver will add $2,350,064 in funding for a total of $3,936,807. The remaining costs will be covered through development efforts of our nonprofit agency and self-funding through bonds. The populations that will be served are youth ages 3-17, and the community benefit is immense, not only in line with the Community Needs Analysis, but with Texas’ woeful lack of providers and access to mental healthcare.

### Performing Provider:
Performing Provider name: Connally Memorial Medical Center  
TPI: 135151206

### Domain 1: Potentially Preventable Admissions

#### Description:
As part of our Pass 2, Category 1 project Connally Memorial Medical Center is proposing to establish more primary care clinics.

Additional primary care clinics and providers will provide care for unassigned patients and will coordinate care with specialists and hospital emergency department to expand access to health services. The increased access to primary care and thus specialty services will allow patients suffering from chronic conditions such as cardiovascular disease to have local access to care. In turn, there will be better coordination between the primary care provider and specialist to prevent hospital admissions.

#### Valuation:
One of the community needs addressed in our RHP Plan is that the high prevalence of chronic disease and related health disparities require greater prevention efforts and improved management of patients with chronic conditions. Moreover, hospitalization rates are an important indicator of quality of life and patient morbidity. Patients admitted with CHF, COPD, and ESRD caused by diabetes account for the majority of hospitalizations and Medicare expenditures. Measures of the frequency of hospitalization help efforts to control escalating medical costs, and play an important role in providing cost effective healthcare.

Additionally, the leading causes of death in Wilson county are related to cardiovascular conditions (30% of all deaths) and heart diseases (24%). This project and associated outcomes’ focus on disease management and risk reduction allows Connally Memorial Medical Center the opportunity to achieve our RHP goals of Improves outcomes while containing cost growth. This project will also help meet our goal to assure patients receive high-quality and patient-centered care in the most cost effective way.

### Performing Provider
Performing Provider name: Connally Memorial Medical Center  
TPI: 135151206

### Domain 2: Potentially Preventable Readmissions – 30 days

#### Description:
Hospital readmission rates have been proposed as an important indicator of quality of care because they may result from actions taken or omitted during the initial hospital stay. A readmission may result from incomplete treatment or poor care of the underlying problem, or may reflect poor coordination of services at the time of discharge and afterwards, such as incomplete discharge planning and/ or inadequate access to care. This is directly related to our Category 1 project of increasing access to primary care and establishing additional clinics.
**Valuation:**

The relationship between hospital readmission rates and quality of care is well-documented, and is driven by a general consensus that readmissions may result from circumstances surrounding the initial hospital stay. Readmission rates for the following individual medical conditions: Congestive heart failure, diabetes, COPD, stroke and asthma. All of these conditions are identified as community needs in our Regional Health plan.

**Performing Provider**

Performing Provider name: Connally Memorial Medical Center  
TPI: 135151206  
**Domain 3: Potentially Preventable Complications**

**Description:**

In Category 1, Connally Memorial Medical Center proposes to establish hospital owned and operated primary care clinics. These clinics will provide services for unassigned patients and will coordinate care with necessary specialists, and hospital emergency department to expand access to specialty and primary care services. Although, Connally Memorial Medical Center serves a population of over 40,000 residents there are limitations to our community having the full scope of primary and specialty services and thus being able to prevent certain potential complications.

As part of our goal to expand primary care capacity, CMMC hopes to provide additional services to prevent complications such as stroke and intracranial hemorrhage. By providing these services we can also work to prevent complications from congestive heart failure, acute myocardial infarction and cardiac arrhythmias.

**Valuation:**

With increasing medical care costs and a weakening economy more attention is being placed upon obtaining value from how health care dollars are spent. Initiatives to obtain increased value from health care purchases are especially focused upon perceived waste. The frequency and cost of hospital acquired complications are at the forefront of perceived waste since hospitals, patients and payers are all adversely impacted by their occurrence. While there have many advances in medicine preventable complications and conditions remain a substantial cause of morbidity and mortality among hospitalized patients.
### Domain 4: Patient-Centered Healthcare

**Description:**
An organizational strategy will be developed so that the Hospital will manage patient experience and create avenues to implement the strategic plan. Performance will be measured by the extent to which patient experience improves systematically. Data and performance measurement will be collected by utilizing patient experience of care measures from the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) in addition to CAHPS and/or other systems and methodologies to measure patient experience.

The overall goal of this project is to improve how the patient experiences care and the patient’s satisfaction with the care provided.

**Valuation:**
The state healthcare transformation is counting on a robust healthcare system to improve quality as well as the patient experience. Over time, implemented projects have the potential to yield improvements in outcomes while containing cost growth, maintaining a coordinated care delivery system and ensuring patients receive high quality, patient centered care.

CMMC will implement a survey of employee experience as well as integrating the patient experience into employee training. Integrating patient experience into organizational learning is considered a best practice as it prompts staff to consider the patient experience in all parts of their day-to-day job duties.

---

### Domain 5: Emergency Department

**Description:**
Connally Memorial Medical Center will measure the admit decision time to ED departure time for admitted patients. This measure is important because it measures not only the processes of care that occur while the patient is in the emergency department, but also reflects the coordination of care, communication, and efficiency of service provision beyond the walls of the emergency department. These measures also assess the prevalence of “boarding” which is the length of time a patient actually stays in the ED, after the patient has been admitted to the hospital, but before being transferred to an inpatient unit. They are more significant to patient safety and quality and a growing body of evidence has shown that boarding can increase the patient’s length of stay in the hospital and can compromise quality care. This reporting domain ties in with one of the overall aims of the waiver: to reduce inappropriate use of the ED. It also ties with other reporting domains such as creating a strategy for Patient Centered Healthcare and reducing Preventable complications. One cause of extended ED departure times results from an overcrowded ED. CMMC intends to expand access to primary care for patients who currently are unable to access primary care due to factors such as the lack of primary care providers in the community, and to improve follow-up care for discharged patients diagnosed with chronic health conditions, which CMMC expects will reduce the number of inappropriate ED visits.
and therefore allow for better management of ED processes such as admit decisions.

Valuation:
The value Connally Memorial Medical Center placed on this domain is based upon the value the hospital attributes to knowing how well it is currently performing in the ED and to making goals for self-improvement. Long ED wait times can lead to complications, poor outcomes and patient dissatisfaction. The goals of the Waiver are to reduce the cost of providing care and to improve patient health outcomes. Understanding our starting point and tracking our improvement is essential to making progress. CMMC values this reporting domain at $71,333 over DY 3-5.

### Performing Provider:

Provider Name: Guadalupe Regional Medical Center  
TPI: 138411709  

**Domain 1: Potentially Preventable Admissions**

**Description:**

RD1- Potentially preventable admissions (PPA) for CHF, diabetes, behavioral health and substance abuse, COPD, hypertension, pediatric asthma, and pneumonia and influenza vaccination rates relate to the following categories as outlined below:

Category 1 (1.1.2) - project I.T. 1.10 Expand Primary Care Capacity aims to improve primary care access and outcomes of the uninsured population with identified chronic illnesses. Expansion of clinic hours will provide improved healthcare access, which will reduce unnecessary emergency room visits, and admission rates for chronic illnesses. This will provide a dedicated resource for care to those in the community who are less fortunate, and provide access to medications to help the management of chronic illness.

Category 2 (2.9.1) Establish/Expand a Patient Care Navigation Program aims to establish a patient navigation system to assist high utilizers of the ED to receive coordinated, timely and appropriate healthcare services. Patient navigators will help patients and their families navigate the healthcare system and the obstacles that it entails thereby reducing PPA's.

Category 2 (2.12.2) Implement/Expand Care Transitions Program aims to promote the Triple Aim of improving the health of our population, enhancing the patient experience of care, and reducing the per capita cost of care. Through the development of a Transitional Care program, targeting patients with a primary diagnosis of CHF, COPD, DM, Pneumonia, as well as being highly sensitive to those uninsured, covered by Medicaid, or at / below the 2012 HHS poverty level, GRMC will have a positive material effect on said Triple Aim goals. GRMC has identified a gap in care transitions that create potentially preventable readmissions. Through a Transitional Care Coordinator and established policy and procedures GRMC will educate the targeted population, monitor and support through the discharge process to the home, and ensure necessary resources are referred.

Category 3 (I.T. 1.10) Expand Existing Primary Care Capacity- Diabetes Care: HbA1c poor control  
The outcome improvement target to control diabetic HbA1c levels was chosen in conjunction with our process improvement measures of expanding primary care access, clinic hours and staffing as a way to make the greatest impact on community need.  
Due to the high prevalence of uncontrolled diabetic cases in the Seguin community, it was determined that creating a system to identify patients through this newly established clinic would assist in providing care and/or management of patients diabetic A1c levels which will assist in reducing PPA's.

**Valuation:**

Our rural service area includes many low income and uninsured/under-insured individuals and families. Significantly reducing unnecessary admissions will improve the quality of life for our community as well as contribute to the continued viability of our organization and opportunities to expand services.  
The scope of the Navigation Program project should be categorized as large, due to the various coordination efforts and data collection processes that will need to be developed to manage and achieve short and long-term goals. The number of diabetic related ER visits and patient admissions...
is frequent do to the lack of primary care access for those patients who are uninsured, and unable to pay for their diabetic medications. This populations’ education level also presents challenges for long-term success and adds to the complexity of this project, because of their ability to understand the importance of their disease and their need to comply with treatment.

<td><strong>Domain 2: Potentially Preventable Readmissions – 30 days</strong></td>
</tr>
<tr>
<td><strong>Description:</strong></td>
</tr>
</tbody>
</table>
| RD2 Potentially Preventable 30 day readmissions for CHF, diabetes, behavioral health and substance abuse, COPD, stroke, and pediatric asthma relate to the following categories as outlined below:

- Category 1 (1.1.2)- project I.T. 1.10 Expand Primary Care Capacity will improve primary care access and outcomes of the uninsured population with identified chronic illnesses. Expansion of clinic hours will provide improved healthcare access, which will reduce unnecessary emergency room visits, admission and readmission rates for chronic conditions. This will provide a dedicated resource for care to those in the community who are less fortunate, and provide access to medications to help the management of chronic illness, as well as patients suffering strokes.

- Category 2 (2.9.1) Establish/Expand a Patient Care Navigation Program will establish a patient navigation system that assists high utilizers of the ED to receive coordinated, timely and appropriate healthcare services. Patient navigators will help patients and their families navigate the healthcare system and the obstacles that it entails thereby reducing PPA's and PPR’s.

- Category 2 (2.12.2) Implement/Expand Care Transitions Program will promote the Triple Aim of improving the health of our population, enhancing the patient experience of care, and reducing the per capita cost of care. Through the development of a Transitional Care program, targeting patients with a primary diagnosis of CHF, COPD, DM, Pneumonia, as well as being highly sensitive to those uninsured, covered by Medicaid, or at / below the 2012 HHS poverty level, GRMC will reduce admissions and readmissions.

- All-cause 30 day readmissions for GRMC relates to the project expanding primary care capacity, which will provide access to patient care for uninsured populations and promote disease prevention and management of chronic illnesses, specifically: diabetes. The project to implement/expand care transitions would implement improvements in transitioning patients and coordination of care from inpatient to outpatients, post-acute care, and home care settings, whereby, decreasing readmissions. Lastly, the establishment of a patient care navigation program will assist patients to manage their health issues through outpatient resources, clinics and counseling services outside of the acute care setting. Through implementation of these programs GRMC will see a reduction in 30 readmissions and unnecessary Emergency Department visits.
**Valuation:**

Acute care readmissions within 30 days of discharge create an economic and capacity hardship for the healthcare system. The Centers for Medicare and Medicaid Services (CMS) estimates the cost of avoidable readmissions at more than $17 billion each year. Additionally, such readmissions have a negative impact on the quality of life for patients and their families. The ability to coordinate care across the continuum is increasingly recognized as an indicator of the effectiveness of healthcare organizations. Adequately preparing patients for discharge and providing support during the transition process has been shown to contribute significantly to that coordination.

Our rural service area includes many low income and uninsured/under-insured individuals and families. Significantly reducing readmission rates will improve the quality of life for our community as well as contribute to the continued viability of our organization and opportunities to expand services. The Navigation Program will assist patients through outpatient resources, clinics and counseling services outside of the emergency department.

The project should be categorized as large, due to the various coordination efforts and data collection processes that will need to be developed to manage and achieve short and long-term goals. The number of diabetic related ER visits and patient admissions is frequent do to the lack of primary care access for those patients who are uninsured, and unable to pay for their diabetic medications. This populations’ education level also presents challenges for long-term success and adds to the complexity of this project, because of their ability to understand the importance of their disease and their need to comply with treatment.

The lack of diabetic resource management in the community is a real issue. By implementing and improvement target, we will help reduce the level of chronic disease currently recognized in the community, and hopefully, reduce the future rise of this illness. GRMC is currently receiving no local funding to support the management of this type of project.

**Performing Provider:**

Provider Name: Guadalupe Regional Medical Center  
TPI: 138411709  
**Domain 3: Potentially Preventable Complications**

**Description:**

RD 3 Potentially Preventable Complications:

Implementation of a transitional care program that begins assessing and educating patients at admission will assist in decreasing or avoiding potentially preventable complications of congestive heart failure and pneumonia patients.

The expansion of primary care will provide patients the resource to obtain care to prevent or improve their comorbid conditions, which will decrease the potential for preventable complications.

**Valuation:**

Guadalupe Regional Medical Center’s projects are strictly outpatient and therefore exempt from domain 3. Even though this domain will not affect the measures, GRMC will report on this domain.
Performing Provider:
Provider Name: Guadalupe Regional Medical Center
TPI: 138411709

Domain 4: Patient-Centered Healthcare

Description:
Through the implementation of GRMC's chosen category 1, 2, and 3 projects patient satisfaction will increase through improving care transitions, decreasing ED visits, condition specific education, medication education, and resource identification. The medication management measure is related to GRMC's Category 2 (2.12.2) Implement/Expand Care Transitions Program and Category 2 (2.9.1) Establish/Expand a Patient Care Navigation Program. The Transition program will improve patient medication management by providing medication education and medication reconciliation at the bedside and in their home as needed.

Valuation:
Guadalupe Regional Medical Center’s projects are strictly outpatient and therefore exempt from domain 4. Even though this domain will not affect the measures, GRMC will report on this domain.

Performing Provider:
Provider Name: Guadalupe Regional Medical Center
TPI: 138411709

Domain 5: Emergency Department

Description:
Expanding primary care project will provide for care to be provided in an office setting, which will decrease the number of ED visits. Decreasing the number of ED visits improves ED throughput by decreasing the number of unnecessary visits, which will improve admit decision time to ED departure by increasing the amount of time ED providers have to assess patients and make the decision to admit.

RD 5 Emergency department admit decision time to ED departure time for admitted patients relates to GRMC's category 3 project The Navigation Program which will assist in the management of behavior health/substance abuse patients through outpatient resources, clinics and counseling services outside of the emergency department, which will decrease the number of ED patients, allowing providers to decrease the amount of time it takes to make a decision to admit.

<tr>
<td>TPI: 136430906</td>
</tr>
</tbody>
</table>

**Domain 1: Potentially Preventable Admissions**

**Description:**
With the introduction of widespread preventive care screening in our community through project 136430906.2.1, it is very likely that, in the short-term and the long-term, uninsured patients with ambulatory care sensitive conditions will be less frequent visitors to both the emergency room and then to inpatient units. Since we will be testing for diabetes, hypertension, colorectal cancer, cervical cancer, obesity, hypertension, and many other conditions in project 136430906.2.1, we will be identifying cases of chronic disease in earlier stages than they would have otherwise been found. If these conditions are caught early in the disease process, then care can be received in an appropriate setting rather than inpatient admissions becoming necessary. Secondary preventive interventions can be initiated and the patients can begin to receive care in the appropriate outpatient setting. If the conditions are not screened for and noted early, patients are more likely to end up in the emergency or inpatient setting in either more critical condition or because they have no medical home. We anticipate that the number of uninsured individuals with potentially preventable admissions will decrease by at least 5% by the end of DY5. A decrease of this size would be a cost savings to the community of at least $500,000 based on average costs of chronic disease care for the target population size.

**Valuation:**
The National Quality Forum identifies the value of measuring potentially preventable admissions as: “A significant portion of all costs incurred by patients and payers in today’s healthcare system is due to “care defects” – errors, avoidable hospitalizations, and other process failures that cause patients to incur unnecessary services and some harm. For example, a recent report by the Agency of Health Care Research and Quality (AHRQ) highlighted that, in 2006, 4.4 million out of 39 million (11%) hospital stays could have been prevented (amounting to $30.8 billion of hospital costs), and one in five admissions for Medicare beneficiaries were for a potentially preventable condition. To improve accountability in the delivery of chronic care, AHRQ has developed a list of prevention quality indicators (PQIs) to identify ambulatory care sensitive conditions (ACSCs) and to measure rates of admissions that could have been potentially avoided with good outpatient care. While most of these studies (and their associated metrics) focus on a condition, our approach has been to focus on the patient and include all potentially avoidable complications that impact that patient. The core principle is to develop a patient-centered metric that creates accountability for all physicians that manage and co-manage the patient – whether they co-manage consciously or not. While cardiologists may feel that they should only be responsible for PACs related to a patient’s diabetes or lung disease, we consider that a patient’s cardiologist, internist, pulmonologist and any other physician should be jointly accountable for the management of the patient’s CHF, Diabetes and Asthma, and that any PAC related to any of these co-morbid conditions would be counted as such and tagged to each physician. It is only by creating accountability in this fashion that we can hope to encourage the true coordination of care and the development of systems of care centered around the patient” (NATIONAL QUALITY FORUM, National Voluntary Consensus Standards for Patient Outcomes, Measure, Summary Measure Number: OT2-022-09, Measure Name: Proportion of patients with a chronic condition that have a potentially avoidable complication during a calendar year). Systems will need to be developed to ensure we are appropriately capturing this key data, especially during the transition to ICD 10 coding. So, in addition to the funding requested for this category,
Performing Provider:
Performing Provider name: Hill Country Memorial Hospital
TPI: 136430906
Domain 2: Potentially Preventable Readmissions
Description:
Though preventive care screenings (project 136430906.2.1) that this performing provider has selected for Categories 2 and 3 are not interventions that directly impact readmissions, it is anticipated that the overall health of the community will improve through the program. Patients who do not enter the hospital with a chronic condition in the first place because it is being managed appropriately in a medical home, will not have readmissions for conditions that are preventable with this kind of care. Though our readmission rate is already at benchmark performance levels of 5-6% for all cause, 30 day readmissions, we believe that we may see a decrease in this number as well over the next several years as the health of the uninsured community improves. Even a slight decrease in readmissions has a major impact on cost to the community.
Valuation:
The Centers for Medicaid and Medicare Services have reported the value of readmission reduction: Beyond improving the quality of care for Medicare beneficiaries with chronic conditions—who comprise over 80 percent of all Medicare enrollees—the CMS Office of the Actuary (OAct) projects that this provision, when fully implemented, will reduce Medicare costs by $8.2 billion from implementation through 2019 (ACA Update, Implementing Medicare Cost Savings). The June 2007 MedPAC report to Congress on “Promoting Greater Efficiency in Medicare” highlighted that, in 2005, $12 billion were spent on potentially preventable readmissions alone within 30 days of discharge from the hospital. Another study by Jencks and colleagues found that roughly 19.6% of Medicare patients incurred re-hospitalizations within 30 days of discharge. When hospitalizations do occur, they must be managed expeditiously and readmissions following discharge should be avoided. Readmissions after admissions for chronic conditions such as readmissions after heart failure hospitalizations form a subset of our PAs. Some studies have reported readmission rates after heart failure discharge as high as 45% at 6 months (NATIONAL QUALITY FORUM, National Voluntary Consensus Standards for Patient Outcomes, Measure, Summary Measure Number: OT2-022-09, Measure Name: Proportion of patients with a chronic condition that have a potentially avoidable complication during a calendar year). A study of Texas Medicaid readmissions found that the most common reasons for readmission, in roughly equal proportions, are medical readmissions for the same condition, medical readmissions for other acute conditions, and readmissions for mental illness or substance abuse (Texas Health and Human Services Commission, Potentially Preventable Readmissions in the Texas Medicaid Population, Fiscal Year 2009). Hill Country Memorial Hospital will be providing an estimated additional $50,000 in staff time and technical systems to support this metric.
Performing Provider:
Performing Provider name: Hill Country Memorial Hospital
TPI: 136430906

**Domain 3: Potentially Preventable Complications**

**Description:**
Though it is not directly related to the Category 2 project (Project 136430906.2.1) that we have submitted, the outcomes in this measure set are relevant to several projects in our region. Through our learning collaboratives, we look forward to learning best practices from other providers in our region to improve our care and decrease our rate of complications. Potentially preventable complications are a key focus of Hill Country Memorial Hospital, and we anticipate that the numbers of these events should decrease by at least 5% over the next for years. We have a number of teams and initiatives in place to address the complication rates at the hospital, especially surgical site infections, venous thromboembolism, and birth injuries. Preventing even one additional complication is a cost savings of around $10,000.

**Valuation:**
High complication rates, after adjusting for patient characteristics and severity of illness, indicate low-quality care, waste, and, therefore, potential cost savings. In fact, the estimated incremental increase in cost per potentially preventable complication is approximately $10,000. So for every complication that’s eliminated, $10,000 on average is saved and profit margin improves. According to the study, savings generated by many of our national improvement priorities can be substantial. For each catheter-related bloodstream infection avoided, savings average $18,000 to $22,000 per case. For every decubitus ulcer avoided, $17,500 to $28,000 is saved. Postoperative infections with deep wound disruption costs an additional $14,400, and venous thrombosis costs approximately $11,000 to $16,000. The implications for our hospitals are staggering. Potentially preventable complications add approximately 9.5 percent to our inpatient costs, or $88 billion per year to our national healthcare expense, according to the study. (Fuller, R. L., McCullough, E. C., Bao, M. Z., and others, “Estimating the Costs of Potentially Preventable Hospital Acquired Complications,” Health Care Financing Review, Summer 2009, pp. 17-32)

---

Performing Provider:
Performing Provider name: Hill Country Memorial Hospital
TPI: 136430906

**Domain 4: Patient-Centered Healthcare**

**Description:**
Though it is not directly related to the Category 2 project (project 136430906.2.1) that we have submitted, several projects in our region are focused on improving the patient experience. Through our learning collaboratives, we look forward to learning best practices from other providers in our region to improve the patient experience for our customers as well. Our goal is to be in the 95th percentile on every HCAHPS and Press Ganey indicator of patient satisfaction and engagement. The majority of our metrics do fall at or close to this goal. Those that fall short are being aggressively addressed through strategic objectives. Therefore, we anticipate that our performance on all four these indicators will improve to at least 95th percentile by the end of the fifth demonstration year. An improvement in the patient experience assures that our community is receiving better value care.
Valuation:
The HCAHPS (Hospital Consumer Assessment of Healthcare Providers and Systems) survey is the first national, standardized, publicly reported survey of patients' perspectives of hospital care. HCAHPS (pronounced "H-caps"), also known as the CAHPS® Hospital Survey, is a survey instrument and data collection methodology for measuring patients' perceptions of their hospital experience. While many hospitals have collected information on patient satisfaction for their own internal use, until HCAHPS there was no national standard for collecting and publicly reporting information about patient experience of care that allowed valid comparisons to be made across hospitals locally, regionally and nationally.

Three broad goals have shaped HCAHPS. First, the survey is designed to produce data about patients' perspectives of care that allow objective and meaningful comparisons of hospitals on topics that are important to consumers. Second, public reporting of the survey results creates new incentives for hospitals to improve quality of care. Third, public reporting serves to enhance accountability in health care by increasing transparency of the quality of hospital care provided in return for the public investment. With these goals in mind, the Centers for Medicare & Medicaid Services (CMS) and the HCAHPS Project Team have taken substantial steps to assure that the survey is credible, useful, and practical. (Centers for Medicare & Medicaid Services (CMS). CAHPS® Hospital Survey (HCAHPS). Quality assurance guidelines. Version 7.0. Baltimore (MD): Centers for Medicare & Medicaid Services (CMS); 2012 Mar. p. 586) Hill Country Memorial Hospital will be providing an estimated additional $50,000 in staff time and technical systems to support this metric.

Performing Provider:
Performing Provider name: Hill Country Memorial Hospital
TPI: 136430906
Domain 5: Emergency Department
Description:
This is not something that is currently systematically measured at Hill Country Memorial Hospital, so beginning to measure and set targets for improvement will have significant positive impact on our ability to see patients quickly and move them to the appropriate level of care. Though it is not directly related to the Category 2 (Project 136430906.2.1) or 3 projects that we have submitted, it is similar to several projects in our region. Through our learning collaboratives, we look forward to learning best practices from other providers in our region to improve our care and ED efficiency.

Valuation:
Reducing the time patients remain in the emergency department (ED) can improve access to treatment and increase quality of care. Reducing this time potentially improves access to care specific to the patient condition and increases the capability to provide additional treatment. In recent times, EDs have experienced significant overcrowding. Although once only a problem in large, urban, teaching hospitals, the phenomenon has spread to other suburban and rural healthcare organizations. According to a 2002 national U.S. survey, more than 90% of large hospitals report EDs operating "at" or "over" capacity. Approximately one third of hospitals in the U.S. report increases in ambulance diversion in a given year, whereas up to half report crowded conditions in the ED. In a recent national survey, 40% of hospital leaders viewed ED crowding as a symptom of workforce shortages. ED crowding may result in delays in the administration of medication such as antibiotics for pneumonia and has been associated with perceptions of compromised emergency
For patients with non-ST-segment-elevation myocardial infarction, long ED stays were associated with decreased use of guideline-recommended therapies and a higher risk of recurrent myocardial infarction. Overcrowding and heavy emergency resource demand have led to a number of problems, including ambulance refusals, prolonged patient waiting times, increased suffering for those who wait, rushed and unpleasant treatment environments, and potentially poor patient outcomes. When EDs are overwhelmed, their ability to respond to community emergencies and disasters may be compromised (Specifications manual for national hospital inpatient quality measures, version 3.1a. Centers for Medicare & Medicaid Services (CMS), The Joint Commission; 2010 Apr 1. various p.). Hill Country Memorial Hospital will be providing an estimated additional $50,000 in staff time and technical systems to support this metric.

### Domain 1: Potentially Preventable Admissions

#### Description:

**Reporting Measures:**

1. Congestive Heart Failure Admission rate
2. Diabetes Admission Rates (i. Exempt)
3. Behavioral Health and Substance Abuse Admission rate
4. Chronic Obstructive Pulmonary Disease or Asthma in Adults Admission rate
5. Hypertension Admission rate
6. Pediatric Asthma
7. Bacterial pneumonia immunization
8. Influenza Immunization

*Note: Exempt domains will be determined during reporting period.*

For the diagnoses with a denominator of residents > 18 years old living in RHP counties (CHF, uncontrolled diabetes, diabetes long term complications, COPD, HTN,) we will use our EHR (electronic health record) to determine the numerator value of patients discharged. We do not qualify for metrics involving RHP primary clinics such as the diabetic short term complication denominator (2. i. Diabetes, short term complications (derived from AHRQ PQI #1). For behavioral health and substance abuse admission rate, we will use our EHR to determine the patients and rates. For pediatric asthma, we will track ED visits by our ED EHR. Once these rates and patients are identified, we can target selected patients and patients living in selected zip codes within the RHP counties to admit at risk patients to our navigator programs through hospital based navigators (CHF) and home care partners (all others) to coordinate a Medical Home and appropriate outpatient care to reduce potentially avoidable admissions. We expect to improve preventable admissions in DYs 2-5 by using these reporting requirements and making improvements to clinical care. We will continue our current physician-approved management protocols, tracking and reporting for Bacterial Pneumonia and Influenza Immunization rates in hospitalized patients.

Relates to Category 1,2,3:

- Implement telemedicine program to provide or expand specialists referral services in an area identified as needed to the region (1.7.1) and improve access to Care- Increase number of ED locations (1.9.2): Methodist plans to implement projects that will expand care to areas identified as needed in the region. In doing so, Methodist will increase access to much needed care, which will result in a decrease preventable admissions.

#### Valuation:

Methodist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

In valuing the project, Methodist took into account the extent to which Potentially Preventable...
Admissions reporting would potentially meet the goals of the Waiver (improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and costs necessary to implement the project.

<tr>
<td>Expected Improvement(s): to decrease readmissions</td>
</tr>
</tbody>
</table>

- Within a 30-day time frame, readmissions are more likely attributable to care received during the index hospitalization and during the transition to the outpatient setting. A number of studies have demonstrated that improvements in care at the time of patient discharge can reduce 30-day readmission rates.\(^{19,20,22,27-34,38}\) Hospitals, in collaboration with their medical communities, can take a number of actions to reduce readmissions: ensure patients are clinically ready at discharge; reduce risk of infection; reconcile medications; improve communications among providers involved in transition of care; encourage strategies that promote disease management principles; and educate patients about symptoms to monitor, whom to contact with questions, and where and when to seek follow-up care.\(^{19,20,22,27-34,38}\) Studies also show that it can take more than 14 days for the benefits of these interventions to appear.\(^{39}\) (source: National Quality Forum Measure Submission and Evaluation Worksheet 5.0)

- 30-day timeframe is consistent with the other CMS readmission measures approved by the National Quality Forum (NQF) and publicly reported by CMS.

- Factors most relevant to readmission risk:
  - medication reconciliation
  - patient education
  - post- discharge follow up
  - communication with outpatient clinicians

- How this relates to categories 1, 2 & 3
  - As addressed in category 1, expanding Telemedicine/Telehealth programs for patients, so they may be able to access specialty care programs, and expanding specialty care capacity in the emergency departments, may assist in reducing readmissions.
As addressed in categories 2 & 3, improving patient experience may help in reducing readmissions as the following areas can directly reduce readmission rates: quality of care during the initial admission; improvement in communication with patients, their caregivers and their clinicians; patient education; predischarge assessment; and coordination of care after discharge.

**Valuation:**

Methodist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

In valuing the project, Methodist took into account the extent to which Potentially Preventable Readmissions reporting would potentially meet the goals of the Waiver (improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and costs necessary to implement the project.

**DOMAIN 2 References:**

---

**Performing Provider:**

Performing Provider name: Methodist Hospital  
TPI: 094154402

**Domain 3: Potentially Preventable Complications**

**Description:**

Reporting Measure: Hospital performing providers subject to required Category 4 reporting must report on the 64 PPC measures listed in Domain 3 in DY 4-5.

MHS has a system reporting potentially avoidable complication with a focus on AHRQ Patient Safety Indicator software since 2009. This has allowed us to identify and track many of these complications that have been identified as AHRQ PSIs. We have developed specific procedures and protocols to reduce those that were above national rates such as pressure sores, falls, central line associated blood steam infections, etc. We have also been able to participate in several improvement projects through MHS hospital network. There are additional complications listed in this project that we have not been tracking. The funding from this project will allow us to include these additional complications and apply our demonstrated performance improvement methodologies to reduce these complications. This will require an attentive focus from our Quality Improvement and Patient Care teams. We expect to improve potentially preventable complications in DY’s 2-5 by using these reporting measures and adjusting clinical care as necessary.

Relates to Category 1,2,3:

- Implement telemedicine program to provide or expand specialists referral services in an area identified as needed to the region (1.7.1) and improve access to Care- Increase number of specialty ED locations (1.9.2): Methodist plans to implement projects that will expand care to areas identified as needed in the region. In doing so, Methodist will increase access to much needed care, which will result in a reduce preventable complications.
- Redesign to Improve Patient Experience (2.4.2) and (3 IT 6.1)- Percent Improvement over baseline of patient satisfaction scores: Methodist plans to implement projects to improve the patient experience. This will include follow-up with patients to reduce/track preventable complications.
Valuation:
Methodist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

In valuing the project, Methodist took into account the extent to which Potentially Preventable Complications reporting would potentially meet the goals of the Waiver (improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and costs necessary to implement the project.

**Domain 4: Patient-Centered Healthcare**

**Description:**

- **Reporting Measures:**
  - Patient Satisfaction
  - Medication management

Our Care measures across the entire MHS are divided into 5 areas: Care process, outcomes, efficiency, safety and experience. The patient experience scores are shared in this format at every medical specialty and medical executive meeting, every nursing care unit meeting and at every board meeting. We expect to improve patient satisfaction in DYs 2-5 by improving clinical teamwork which leads to improved patient experience of care.

In Medication Management, we are critically analyzing medications at every level of transition: admission, change to OR or nursing unit, and discharge. We have an electronic hospital information record that enhances this medication reconciliation process to improve safety. We expect to improve medication management in DYs 2-5 by improving the medication reconciliation process with help from our electronic systems that flag significant drug interactions.

Relates to Category 1,2,3:

- Redesign to Improve Patient Experience (2.4.2) and (3 IT 6.1)- Percent Improvement over baseline of patient satisfaction scores: Methodist plans to implement projects to improve the patient experience. Improvement in communication with patients, their caregivers and their clinicians; patient education; predischarge assessment; and coordination of care after discharge.
Valuation:
Methodist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

In valuing the project, Methodist took into account the extent to which **Patient-Centered Healthcare** reporting would potentially meet the goals of the Waiver (improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and costs necessary to implement the project.

Performing Provider:
Performing Provider name: Methodist Hospital
TPI: 094154402
**Domain 5: Emergency Department**

Description:
Reporting Measures:

- Admit decision to departure time for admitted patients

We expect to improve Emergency Department decision time to transfer an emergency patient to another facility.

Relates to Category 1,2,3:

- Improve access to Emergency Care- Increase ED locations (1.9.2): Methodist plans to implement projects that will expand Emergency Department care to areas identified as needed in the region. In doing so, Methodist will increase access to much needed care, this will enable MHS to track decision time to transfer an emergency patient to another facility.

Valuation:
Methodist values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

In valuing the project, Methodist took into account the extent to which **Emergency Department** reporting would potentially meet the goals of the Waiver (improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and costs necessary to implement the project.

### Domain 1: Potentially Preventable Admissions

#### Description:

*How does this Category 4 measure relate to other Category 1, 2, or 3 projects?*

Category 2.1 – Medical Homes: patients’ chronic conditions will be better managed by the physician-led care team and steps will be taken to proactively avoid hospitalizations.

Category 3.12 – Pneumonia Vaccinations, Colon Cancer Screening, and Breast Cancer Screening: through preventive screening and vaccinations, the Medical Home patients will be at reduced risk for admission.

Category 2.8 - Performance Improvement Initiative related to Geriatric Patients: the patients’ entire health will be considered and addressed during hospitalization rather than focusing solely on the acute illness requiring admission. This will reduce readmissions as well as address issues that may be the cause of subsequent admissions further in the future.

Category 2.9 – Patient Navigator Program: patients that are at high risk for admission will be identified and referred to the program and staff will work directly with the patient and their family/care givers to take proactive steps in managing their health which should result in fewer hospital admissions.

*Describe the expected improvements in each Category 4 domain for DYs 2-5.*

We expect to see a decrease in all of the Potentially Preventable Admissions for these illnesses:

- Congestive Heart Failure
- Diabetes Admission Rates
  - Diabetes short-term complications
  - Uncontrolled Diabetes
  - Diabetes long-term complications Admission Rate
- Behavioral Health/Substance Abuse Admission Rate
- Chronic Obstructive Pulmonary Disease or Asthma in Adults Admission Rate
- Hypertension Admission Rate
- Bacterial Pneumonia Vaccination
- Influenza related-admissions

We do not expect to see a change in Pediatric Asthma since we do not admit pediatric med/surg patients

*Is this domain measure exempt? If so, why?*

No, this domain measure is not exempt

#### Valuation:

Nix Health is participating in the required 5 Category 4 Domains, but not in the Optional 6th Domain. Therefore, our Category 4 funding is 5% of our total DSRIP funding in DY2 and 10% in DY3-DY5. Per the Program Funding and Mechanics Protocol, milestones within a demonstration year for Category 4 shall be valued equally, so this domain will be valued at 1% of our total DSRIP funding for DY2 and 2% of our total DSRIP funding for DY3-DY5.
It is reasonable to value this project as $451,380 over the remaining 4 years of this waiver because reporting on the Potentially Preventable Admissions will help us identify ways that we can better work with our physicians, especially through our Patient Navigator Program, to educate patients on self-management of chronic diseases and identify community and health care resources that are available to patients so they can proactively manage their conditions and avoid potentially preventable hospitalizations.

**Performing Provider:**
Provider Name: Nix Health Care System  
TPI: 297342201 *(old TPI 112676501)*

**Domain 2: Potentially Preventable Readmissions – 30 days**

**Description:**

*How does this Category 4 measure relate to other Category 1, 2, or 3 projects?*

Category 2.1 – Medical Homes: after discharge, contact will be made with Medical Home patients to ensure they understand their post-discharge instructions and have any of their questions answered and this will impact readmission rates.

Category 3.12 – Pneumonia Vaccinations, Colon Cancer Screening, and Breast Cancer Screening: through preventive screening and vaccinations, the Medical Home patients will be at reduced risk for readmission.

Category 2.8 - Performance Improvement Initiative related to Geriatric Patients: we will be implementing evidence-based measures to improve quality and outcomes which will directly impact readmission rates.

Category 3.3 – All-Cause 30-day Readmissions: As a Category 3 measure for our Category 2.8 project, we will be monitoring the 30-day readmission rates for the particular patient population.

Category 2.9 – Patient Navigator Program: patients that are at high risk for readmission will be identified and referred to the program and staff will work directly with the patient and their family/care givers to take proactive steps in managing their health which should result in fewer hospital admissions.

**Describe the expected improvements in each Category 4 domain for DYs 2-5.**

We expect to see a decrease in all of the 30-day readmissions for these illnesses:

- Congestive Heart Failure
- Diabetes
- Behavioral Health & Substance Abuse
- Chronic Obstructive Pulmonary Disease
- Stroke
- All Cause

We do not expect to see a change in Pediatric Asthma readmissions since we do not admit pediatric med/surg patients.
**Is this domain measure exempt? If so, why?**

No, this domain measure is not exempt

---

**Valuation:**

Nix Health is participating in the required 5 Category 4 Domains, but not in the Optional 6th Domain. Therefore, our Category 4 funding is 5% of our total DSRIP funding in DY2 and 10% in DY3-DY5. Per the Program Funding and Mechanics Protocol, milestones within a demonstration year for Category 4 shall be valued equally, so this domain will be valued at 1% of our total DSRIP funding for DY2 and 2% of our total DSRIP funding for DY3-DY5.

It is reasonable to value this project as $451,380 over the remaining 4 years of this waiver because reporting on the Potentially Preventable Readmissions will help us identify ways that we can better work with our physicians and be more actively engaged with patients post-discharge to answer any questions they have, ensure they are following their discharge instructions and taking their medications as prescribed. As we identify trends in potentially preventable readmissions, we can implement evidence-based approaches to minimize these readmissions.

---

**Performing Provider:**

Provider Name: Nix Health Care System  
TPI: 297342201 *(old TPI 112676501)*

**Domain 3: Potentially Preventable Complications**

**Description:**

*How does this Category 4 measure relate to other Category 1, 2, or 3 projects?*

Category 3.12 – Pneumonia Vaccinations: Vaccinating patients proactively for pneumonia will help avoid PPCs

Category 2.8 - Performance Improvement Initiative related to Geriatric Patients: PI projects that we implement will be aimed at reducing pressure ulcers, and minimizing fall risks to reduce in-hospital trauma and fractures

**Describe the expected improvements in each Category 4 domain for DYs 2-5.**

We will take measures to improve our rates of Potentially Preventable Complications throughout the system, but we specifically expect to see improvements in these PPCs given our Category 1, 2 and 3 projects outlined above:

- Pneumonia and Other Lung Infections
- In-Hospital Trauma and Fractures
- Decubitus Ulcer

**Is this domain measure exempt? If so, why?**

No, this domain measure is not exempt
Valuation:

Nix Health is participating in the required 5 Category 4 Domains, but not in the Optional 6th Domain. Therefore, our Category 4 funding is 5% of our total DSRIP funding in DY2 and 10% in DY3-DY5. Per the Program Funding and Mechanics Protocol, milestones within a demonstration year for Category 4 shall be valued equally, so this domain will be valued at 1% of our total DSRIP funding for DY2 and 2% of our total DSRIP funding for DY3-DY5.

It is reasonable to value this project as $311,803 over the remaining 4 years of this waiver because reporting on the Potentially Preventable Complications will help us identify areas of improvement and take necessary steps for improving our complication rates and overall outcomes.

Performing Provider:

Provider Name: Nix Health Care System
TPI: 297342201 (old TPI 112676501)

Domain 4: Patient-Centered Healthcare

Description:

How does this Category 4 measure relate to other Category 1, 2, or 3 projects? Category 2.1 – Medical Homes: relationships between patients and physicians/care teams will be improved through the medical home model which will improve patient satisfaction. Since these physicians will attend on their patients when admitted, inpatient satisfaction scores will be impacted as well.

Category 2.8 - Performance Improvement Initiative related to Geriatric Patients: the evidence-based initiatives we will be implementing will directly affect patient satisfaction scores.

Describe the expected improvements in each Category 4 domain for DYs 2-5.

We expect inpatient medication management and patient satisfaction scores to improve.

Is this domain measure exempt? If so, why? No, this domain measure is not exempt

Valuation:

Nix Health is participating in the required 5 Category 4 Domains, but not in the Optional 6th Domain. Therefore, our Category 4 funding is 5% of our total DSRIP funding in DY2 and 10% in DY3-DY5. Per the Program Funding and Mechanics Protocol, milestones within a demonstration year for Category 4 shall be valued equally, so this domain will be valued at 1% of our total DSRIP funding for DY2 and 2% of our total DSRIP funding for DY3-DY5.

It is reasonable to value this project as $451,380 over the remaining 4 years of this waiver because reporting on the Inpatient Medication Management and Patient Satisfaction Scores gives us valuable insight into the patient’s experience and communication gaps that may exist in our system. By understanding and examining these gaps, we can take steps to improve these patient experience targets.
### Performing Provider:

Provider Name: Nix Health Care System  
TPI: 297342201 (old TPI 112676501)  
**Domain 5: Emergency Department**

### Description:

**How does this Category 4 measure relate to other Category 1, 2, or 3 projects?**

Category 2.9 – Patient Navigator Program: patients that are high ED utilizers, or those who utilize the ED for episodic care will be identified and enrolled in the patient navigator program which will reduce the ED traffic and allow for improved ED throughput and shorter Admission-Decision times.

Category 2.1 – Medical Homes: patients who receive care through a Medical Home will be less likely to seek treatment through the ED for care that can be managed through their Medical Home, which will help reduce unnecessary utilization of the ED and allow for improved ED throughput and shorter Admission-Decision times.

**Describe the expected improvements in each Category 4 domain for DYs 2-5.**

Our ED is opening in late 2012, and we expect to have an accurate baseline established by the end of DY3. From that baseline, we expect to see an improvement in the Admission-Decision times due to improved processes, as well as by better managing the high ED utilizers and connecting them with routine primary care.

**Is this domain measure exempt? If so, why?**

No, this domain measure is not exempt.

### Valuation:

Nix Health is participating in the required 5 Category 4 Domains, but not in the Optional 6th Domain. Therefore, our Category 4 funding is 5% of our total DSRIP funding in DY2 and 10% in DY3-DY5. Per the Program Funding and Mechanics Protocol, milestones within a demonstration year for Category 4 shall be valued equally, so this domain will be valued at 1% of our total DSRIP funding for DY2 and 2% of our total DSRIP funding for DY3-DY5.

It is reasonable to value this project as $451,380 over the remaining 4 years of this waiver because reporting on the Admission-Decision Time in the ED gives us valuable insight into the throughput and efficiency of our emergency department. By understanding and examining these trends in these times, we can take steps to improve these metrics.

Domain 1: Potentially Preventable Admissions

Description:

Potentially preventable hospitalizations—inpatient stays that might be avoided with the delivery of high quality outpatient treatment and disease management—serve as useful indicators of possible unmet community health needs. By measuring the frequency of these types of hospitalizations among patient subpopulations, PRMC and its providers can identify those areas most in need of improvements in discharge teaching and education as well as post-hospitalization follow-up from the discharge advocate (DA). Rates of potentially preventable hospitalizations are higher for vulnerable populations with limited access to care. During the patients hospitalization the DA can target issues in access to primary care that may serve to narrow disparities in health outcomes and improve the quality of care while reducing costs.

Hospitalizations for diabetes complications are generally considered preventable with high-quality health care and patient adherence to treatment. Clinical studies suggest that prevention activities, quality outpatient care, and greater patient self-management of diabetes may prevent or reduce the prevalence of cardiovascular disease, lower extremity amputations, and multiple hospitalizations associated with diabetes. Patient self-management—taking medications appropriately, controlling blood sugar levels, and managing diet with regular exercise—are important components an important component of the DA’s patient education of diabetes care. With appropriate primary care for diabetes complications, nearly $2.5 billion in hospital costs might have been averted, with significant potential savings obtained in Medicare ($1.3 billion of total costs) and Medicaid ($386 million of total costs).

PRMC’s Health care/system redesign involves making systematic changes to chronic care management, transition of care, and patient discharge planning to improve the quality, efficiency, and effectiveness of patient care. Frameworks, models, and concepts such as the Chronic Care Model and the evidence based care transition/discharge model, Patient Re-Engineered Discharge (Project RED), can be used together to reorganize care delivery for the purpose of improving patient outcomes.

The redesign of these practices includes the following:

- Adopting strategies for transforming our practice to improve quality, reduce costs, and better satisfy the needs of patients and families.
- Include preventive services and self-management support into patient care and discharge teaching.
- Empowering all clinic staff to suggest and help implement effective changes.
- Develop leadership for change and ongoing quality improvement.
- Involvement of the DA, Chronic Disease Educator, and the Care Coordination Department to help with the process of health care redesign

Diabetes is one chronic condition whose treatment and outcomes are heavily dependent on how well the patient monitors and manages the disease outside the health care setting. An important approach to quality improvement for diabetes is improving patient self-management. Project RED will emphasize and focus on patient education and behavior modification. The DA will work with patients to build their confidence in managing their own disease, in working within the health care system and the community to have their needs met, and in managing the emotional effects of their illness prior to being discharged from the hospital. Patients are
informed about their disease and trained using evidence-based information in how they should manage their condition. Thus, the DA using the discharge model, Project RED, emphasizes a collaborative approach among health care teams to develop new and better clinical procedures and systems that support providers and patients in treating and managing chronic illness over time.

When patients that are considered high risk for a preventable admission come into the hospital, the triage nurse can alert the emergency department case manager or if available, the DA whom discharged the patient during their last hospital admission. Patients who meet criteria for an intervention include patients who were discharged from the hospital in the past 30 days, or have had five emergency department visits in the last year, those who are homeless, living in a shelter, or who have tenuous housing situations. These “patient navigators” can meet with the patient before he or she is evaluated by the physician. They work with the physician to determine an alternative to hospitalization by arranging services in the community. We will emphasize to the emergency department staff and physicians that we are not telling them not to admit patients if they need it, but that we are working with them to provide resources to prevent an unnecessary admissions if reasonable.

Some admissions are not preventative because patients have complex medical conditions that require a hospital stay, but by having case managers in the emergency department and the discharge advocates collaborating with the clinicians and providing feedback to the people who take care of the person at home and/or in the outpatient setting (home health, primary care provider, etc.), we can establish continuity in care across settings and into the community. This program will play a significant role in changing the mindset of the emergency department team. It will give them the confidence and comfort level to discharge people back to the community when resources are in place and available for the patients use. Changes in these potentially preventable admission rates over time should signal an improvement in the quality of our ambulatory care environment, patient access to timely and effective treatment, or in patient adoption of healthy behaviors.

<td>TPI: 127294003</td>
</tr>
<tr>
<td><strong>Domain 2: Potentially Preventable Readmissions – 30 days</strong></td>
</tr>
<tr>
<td><strong>Description:</strong></td>
</tr>
<tr>
<td>Hospital readmissions are an important measure for assessing performance of the health care system. One strategy for improving health care quality and lowering costs is to reduce the rates of preventable readmissions. Health care costs are three times higher for diabetes patients with multiple hospitalizations as compared to diabetes patients with a single stay in a given year. Patients with diabetes who are racial/ethnic minorities, enrolled in public insurance programs, or living in low-income communities are more likely to experience multiple hospitalizations and have higher hospital costs than their counterparts.</td>
</tr>
<tr>
<td>According to Pat Rutherford, RN, MS, vice president at the Institute for Healthcare</td>
</tr>
</tbody>
</table>
Improvement, hospitals can improve patients’ discharge from the hospital by enhancing current discharge processes and by making the following changes:

- Gain a deeper understanding of the comprehensive post-discharge needs of the patient through an ongoing dialogue with the family, caregivers, and community providers.
- Gain a deeper understanding of patient and family caregiver comprehension of the clinical condition and self-care needs after discharge.
- Develop a post-acute care plan based on the assessed needs and capabilities of the patient and family caregivers.
- Effectively communicate post-acute care plans to patients and community-based providers of care.

A readmission may result from incomplete treatment or poor care of the underlying problem, or may reflect poor coordination of services at the time of discharge and afterwards, such as incomplete discharge planning and/or inadequate access to care. Assessing the reason for readmissions is important not only as quality screens, but also because they are expensive, consuming a disproportionate share of expenditures for inpatient hospital care. The DAs can therefore focus their attention on the critical time of a patient’s acute illness when the patient is in transition between inpatient and outpatient phases of treatment.

PRMC’s hospital administrators and patient care unit directors view discharge planning as a major part of the solution to meet their financial woes, assuming that good discharge planning will reduce costs and increase reimbursement. Equally important, patients, and families value the discharge planning process, which has become a significant quality indicator for institutional accreditation. Specifically, JCAHO has established expectations that health care providers coordinate care and include patients in their planning of care, and has emphasized that the hospital staff should recognize that they are one part of an integrated system of health care practitioners, settings, and services.

Another key to the success of Project RED is to encourage patients and their family members or caregivers to ask questions and then ask them questions to verify their understanding of what they were just taught. The idea is to communicate to patients frequently, that it’s important to us that they ask questions and understand the answer. Some of our patients, in the past, have made comments about not wanting to ask questions because they feel that they’re being a burden when they ask them. PRMC and its staff will constantly reinforce that we want them to ask any questions they have so they can know as much as possible when/before they go home. The entire staff, including the non-clinical staff, such as social workers and dieters, will reinforce the need for patients to ask questions when they make rounds and invite them to ask questions. In addition to writing the discharge orders, physicians reconcile medication, and if the patients are getting new medication the DAs will make sure, they understand which medications at home they should continue to take or stop taking. The DAs will also call patients two days after discharge to make sure that all the patients’ questions are answered, and to find out if there are other issues, such as health workers not showing up or worsening in their condition that might potentially cause them to need to return to the hospital. They make sure the patients have a number to call with questions and concerns, and they have their medication and understand how to take it.

Using Project RED, the DA will educate the patient and their family members or caregivers on the patient’s reconciled medication list they will receive at discharge and the transition record (with all elements to be received by the patients PCP and specified elements to be received by patient/family/caregiver). Project RED’s components include timely transmission
Elements of the patients transition record will include:

1. Principal diagnosis and problem list (PCP and patient)
2. Medication list (reconciliation) including OTC/herbals, allergies and drug interactions (PCP and patient)
3. Clearly identified transferring physician/institution and their contact information (PCP and patient)
4. Patient’s cognitive status (PCP)
5. Test results/pending results (PCP and patient)

**Valuation:**

### Domain 3: Potentially Preventable Complications

**Description:**
An AHRQ publication (2005) reported, national inpatient hospital costs for diabetes with complications were nearly $3.8 billion in 2001. Up to about $2.5 billion—roughly two-thirds of the total—might have been averted with appropriate primary care for individuals with diabetes complications. A significant amount of these potential savings might have been obtained from public insurance programs. The Medicare program had the largest share of potentially preventable costs—$1.3 billion was attributable to diabetes-related hospital costs. Costs to the Medicaid program for potentially preventable hospital stays were $386 million.

As diabetes rates continue to rise in our community, substantial gaps in care for diabetes exist, preventable complications occur all too frequently, and the Nation is paying the price in higher health care costs and lower productivity and quality of life. Diabetes is the sixth most expensive condition nationally (Cohen and Krauss, 2003). On average, medical expenditure for a person with diabetes in 2002 cost more than $13,000 per year versus just $2,500 for the average person without diabetes (Hogan, Dall, Nikolov, 2003). About half of the lifetime, health care costs for patients with diabetes are related to potentially preventable complications (Herman and Eastman, 1998).

AHRQ also reports that diabetes has tremendous impact on both public and private health care spending and on the quality of life for those diagnosed with the disease. Yet Type 2 Diabetes, the most common form of diabetes, can be prevented and controlled. It is not inevitable that more Americans develop diabetes as they age, nor is it inevitable that people with diabetes experience the long-term complications such as lower limb amputations, kidney failure, and premature death.

As the health care reform unfolds, PRMC like many other hospitals are looking for ways to control costs while maintaining or improving quality. By implementing Project RED and disease management program targeting diabetes, we seek to increase patient knowledge and self-management skills and implement technology to track patients more effectively. Improved care management for diabetes is aimed at decreasing preventable complications, thereby controlling
costs and potentially improving long term health outcomes. A few of our goals in implementing this project include:

- Prevention of acute and long-term diabetic complications
- Providing quality of diabetes care to our community
- An intervention and treatment that can potentially prevent development of complications for diabetics
- The potential for return on investment for our health care system as a whole with diabetes quality improvement

The presence of too much glucose in the blood causes damage to blood vessels and, subsequently, to nerves, organs, and tissues; over time this results in various long-term complications, including: heart disease, hypertension, heart attacks, stroke, nerve damage, lower limb ulcers, eye problems and blindness, kidney disease or failure, critically high or low glucose levels and many other complications. None of the complications listed is a predestined outcome of having diabetes. With quality care and proper self-management education provider with Project RED, individuals with diabetes can prevent or delay the onset of these complications.

**Valuation:**
Please see last page for narrative on Valuation

---

**Performing Provider**
Provider name: Peterson Regional Medical Center
TPI: 127294003

**Domain 4: Patient-Centered Healthcare**

**Description:**
Project RED was developed and tested ensuring components and strategies to improve the hospital discharge process in a way that promoted patient safety and reduced rehospitalization rates. Project RED was founded on 12 discrete and mutually reinforcing components, and has been proven to reduce rehospitalizations and yield high rates of patient satisfaction. It contains interventions that are patient-centered, and allows for a more standardized approach to discharge planning. Initially developed through research conducted by Dr. Brian Jack of the Boston University Medical Center and funded by the Agency for Healthcare Research and Quality (AHRQ), Project RED improves patient preparedness for self care and reduces preventable readmissions.

It is an in-hospital discharge planning and case management protocol for patients and incorporates many principles of patient-centeredness and self–care aimed at improving the patient's preparedness for self care and at reducing the likelihood of readmission. This intervention is a patient-centered, standardized approach to discharge planning and discharge education. Proper health care and patient empowerment can help control and minimize the complications of diabetes for those who have the disease.

Diabetes is a complicated chronic condition that requires patients to take charge of many aspects of their care. Project RED will encourage good patient self-management after discharge; this has been shown to decrease the rates of diabetes complications in other hospitals already using this model. Providing adequate information, good patient-physician communication, and the use of participatory decision-making are critical to enhancing patient self-management.
Measures that assess patients’ satisfaction with the information they are provided and the adequacy of self-management support will be considered as additions to technical measures for the evaluation of Project RED’s quality.

Patient self-management is particularly important for managing diabetes and preventing complications. Studies have demonstrated that patient self-management programs that include measures which are also used in Project RED are effective tools for improving patient outcomes. One Stanford University study funded by AHRQ found that over a 2-year period participants in a chronic disease self-management program showed reductions in health distress, made fewer visits to the doctor’s office and emergency room, had not experienced any further increases in disability and had increased self-efficacy (Lorig, Ritter, Stewart, et al., 2001). Systematic reviews of the literature on self-management programs for diabetes found positive effects on patients’ knowledge, self-monitoring of blood glucose, diet, and glycemic control (Norris, Nichols, Caspersen, et al., 2002; Norris, Engelgau, Narayan, 2001).

**Valuation:**

Please see last page for narrative on Valuation

---

**Performing Provider**

Provider name: Peterson Regional Medical Center

TPI: 127294003

**Domain 5: Emergency Department**

**Description:**

Emergency departments (EDs) are an important consideration in today’s health policy dialogue. Previous studies note that annual ED visits have increased over time, while reimbursement for emergency care by insurers has steadily decreased. These challenges are magnified in rural areas, which typically have fewer health care resources, including medical staff, facilities, adequate financing, and modern technologies.

Our healthcare system will make system wide changes to better manage patients who have chronic disease such as diabetes; have emergency physicians work with case managers and community-based services; and improve collaboration between the emergency and primary-care teams. Using Project RED, hospital stays could possibly be prevented with better ambulatory care, improved access to effective treatment, or patient adoption of healthy behaviors. Proactively engaging a population of patients and focusing on their health goals, needs, and abilities to achieve desired health outcomes.

Reducing hospital admission rates for uncontrolled diabetes and for the short-term complications of diabetes, as with most other preventable hospital admissions, can be achieved by proper outpatient treatment and patient adherence to recommended care. Uncontrolled high blood or low blood sugar ultimately results in life-threatening short-term and/or long-term complications. While transition programs show promise in helping hospitals reduce their readmission rates, predictive models are also being used successfully in tandem with these programs.

One AHRQ-sponsored study conducted by Stanford University researchers showed that 2 years after participating in a self-management program, study participants showed reductions in health distress, made fewer visits to the doctor’s office and emergency room, had not...
experienced any further increases in disability, and had increased self-efficacy (Lorig, Ritter, Stewart, et al., 2001).

Valuation:
Please see last page for narrative on Valuation

Performing Provider
Provider name: Peterson Regional Medical Center
TPI: 127294003
**OPTIONAL Domain 6: Children and Adult Core Measures**

Description:
As an organization, we have chosen not to report on Optional Domain 6 at this time.

**Category 4 VALUATION for ALL Domain Measures**

Valuation:

Deciding which health care options represent best value for money depends on being able to weigh up the benefits and costs of each. Given a fixed budget, spending on one option means those same resources cannot be used in another way. That is, every decision carries an opportunity cost – the benefits that would have been possible from the next best alternative use of them. Weighing up the benefits possible from each potential option imposes the important requirement that the benefits be measured in a comparable way. This task requires an evaluation of the costs and effects (outcomes) of different treatments.

The measure, known as the quality, weighs the outcome of an intervention also to include the patient’s perception/experience of that intervention and its outcome. Assessing value for money in health care involves evaluating the change in quality that is caused by the treatment relative to the cost of achieving those quality gains. Patient reported outcome measures are now beginning to capture important aspects of health care’s impact on the things that patients most value - their mental wellbeing, their ability to carry out normal physical activities, understanding of their disease and treatment of it, their discharge experience and so on. Healthcare process improvements, like any other area of public policy, have to be about making people’s lives better.

Outcome measures designed for use in healthcare services provide a way of monitoring impact of innovative patient care models and to compare the impact of different interventions to evaluate their impact on patient outcomes as well as their value on health care costs. The ultimate goal of quality measurement in diabetes is to motivate quality improvement and decrease long-term diabetes complications within and throughout our community and those that
surround it.

There is evidence that some improvements in processes of care are motivated by the quality monitoring process itself, especially when incentives for better performance were incorporated. We anticipate seeing this once Project RED has been implemented. Project RED has been demonstrated to be effective in ensuring patients have clear and correct instructions, solid education and appropriate follow up care that result in meeting the needs of each of these quality measures in some way, shape or form. This project will allow PRMC to help patients realize the value of this evidence based approach while improving the quality of their care in our health care system.

Performing Provider
Performing Provider name: Southwest General Hospital
TPI: 136491104

Domain 1: Potentially Preventable Admissions

Description:

Project 1: Through the development of a mobile specialty care unit dedicated to vascular screening, the surrounding rural communities will have the opportunity to access a vital health resource to identify potentially serious cardiovascular events in a timely and cost effective manner. Through the goal of improving access to specialty care, the project will impact the following:

- Enhance availability of resources to assess and refer residents of rural communities for cardiovascular healthcare resulting from mobile screening assessment, which could also result in incidental recognition/detection of signs and symptoms of CHF, adult COPD/asthma, new onset of diabetes and hypertension.
- By early recognition/detection, referral and treatment of these disease processes this could decrease ED utilization and inpatient admissions thru early intervention and management as an outpatient.
- Pneumococcal and influenza vaccination screening could be included in the mobile screening assessment.

Project 2 - Through the development of a Gestational Diabetes Program for RHP 6 region, pregnant women at risk for or diagnosed with gestational diabetes will have access to high-quality, patient centered care with the goal of improved outcomes for mother and baby. Through the goal of early identification, management and education of gestational diabetes in the pregnant woman, the project could result in:

- A decrease in hospital admissions due to undiagnosed gestational diabetes and/or resultant stillbirths.
- A decrease in hospital days for both mother and baby for birth of newborn.
- A decrease in babies admitted to the NICU due to premature delivery, low birth weight and birth trauma related to diabetes in pregnancy.
  - A decrease in fetal deaths due to undiagnosed or poorly managed gestational diabetes in the pregnant woman.

Through the implementation of a structured Gestational Diabetes program involving Obstetricians and Maternal Fetal Medicine physicians, perinatal nurses and a diabetic educator pregnant women in the RHP6 region would have access to care on a flexible outpatient basis that would meet their needs.

Valuation:

Project 1 - The approach for valuing each domain and rationale/justification would be as follows:

CHF - currently the hospital participates in Core Measure (HF is one of the measures) reporting through CMS. The number of CHF cases identified and referred through incidental recognition and intervention during the mobile assessment screening could be tracked and compared to the number of the CHF patients admitted at our facility. Cost avoidance would be evidenced each time early diagnosis, intervention, referral and treatment was provided that resulted in avoidance of ED utilization and/or hospital admission.

Adult COPD/asthma and hypertension - The number of COPD/asthma and hypertension cases identified and referred through incidental recognition and intervention could be tracked and compared to the number of the COPD/asthma and hypertensive patients admitted and treated at our facility for the same time period through utilization of CPT codes. Cost avoidance would be
evidenced each time early diagnosis, intervention, referral and treatment was provided that resulted in avoidance of ED utilization and/or hospital admission for these diagnoses.

**Diabetes**-Currently Healthways, Inc. manages the Diabetes Service Line within the facility. The number of newly diagnosed cases identified and referred through incidental recognition and intervention during the mobile assessment screening could be tracked and compared to the number of the newly diagnosed patients admitted and treated at our facility. The project scope would include adults diagnosed with newly diagnosed diabetes within RHP 6.

**Pneumococcal and influenza vaccination**-By providing pneumococcal and influenza vaccines through the mobile specialty care unit screening this would provide another avenue for the targeted population to receive preventative care. The number of patients admitted for pneumonia and influenza could be tracked, trended and compared to previous years to determine if this additional vaccination site impacted ED utilization as well as hospital.

**Project 2**- The project for Southwest General Hospital is designed to increase the capacity to provide specialty care services and the availability of targeted specialty providers to better accommodate the high demand for services and thus have increased access to services. Southwest General Hospital will develop and implement a Gestational Diabetes program to educate and monitor patients, therefore, improving fetal outcomes.

Valuation could be realized thru:
- Number of ED visits and hospital admissions resulting from undiagnosed or poorly managed gestational diabetes could be monitored, measured and compared to present as well as previous years admissions.
- Number of births admitted to NICU of mothers with gestational diabetes could be monitored, measured and compared to present as well as previous years admission.
- Number of clinic visits and referrals could be monitored and measured to determine utilization of program by pregnant women in the RHP 6 region.

<table>

<tr>
<td><strong>Domain 2: Potentially Preventable Readmissions – 30 days</strong></td>
</tr>
<tr>
<td><strong>Description:</strong></td>
</tr>
<tr>
<td><strong>Project 1</strong></td>
</tr>
<tr>
<td>• The Mobile Cardiovascular Screening Program will contribute to assuring patients receive high-quality, patient centered care with the goal of improved access to care to support the identification and intervention for cardiovascular problems and any other disease processes incidentally identified during the assessment process such as CHF, COPD/asthma, new onset of diabetes and hypertension.</td>
</tr>
<tr>
<td>• By incidental recognition/detection, referral and treatment of these disease processes ED utilization and inpatient admissions could be decreased as well as readmissions thru early intervention and management as an outpatient.</td>
</tr>
<tr>
<td>• Since many of the patients treated within RHP 6 have co-morbidities any incidental</td>
</tr>
</tbody>
</table>
identification and management during the mobile screening possess could potentially avoid an acute exacerbation of the co-morbidity thus decreasing ED utilization and possible hospital admission.

- By providing easier and more convenient access to services such as pneumococcal and influenza vaccines the incidence of pneumonia and flu cases should be decreased in RHP 6 and thus resulting in decreased ED utilization and hospital admission not only by person screened but by avoidance of transmission of disease to others due to having been vaccinated.

**Project 2**

- Of the 7 potentially preventable readmissions listed the impact that the Gestational Diabetes program and clinic would have the greatest impact on would be diabetes. With screening, identification, education and provision of prenatal care for the pregnant woman with gestational diabetes this could greatly decrease preventable readmissions.

- Unless pre-existing conditions of CHF, Behavioral Health and Substance Abuse, COPD and Stroke existed in population domain measures would be exempt.

**Valuation:**

**Project 1**
The valuation for this domain is not applicable as this does not pertain to the vascular screening mobile assessment project which is outpatient.

**Project 2**
To evaluate the usage and effectiveness of the Gestational Diabetes program by pregnant women of the RHP 6 region readmissions due to diabetes would need to be monitored. Internal reports already available could be utilized without additional costs.

**Performing Provider**
Performing Provider name: Southwest General Hospital
TPI:136491104

**Domain 3: Potentially Preventable Complications**

**Description:**

**Project 1**-The potentially preventable complications related to the mobile specialty care unit for vascular screening relate to the decrease in ED utilization and hospital admission. By early recognition and outpatient management of not only cardiovascular disease but any incidental disease processes identified during the screening the multiple complications associated with inpatient admission could be prevented to include:

- Pneumonia and Other Lung Infections
- Pulmonary Embolism
- Shock
- Venous Thrombosis
- Clostridium Difficile Colitis
• Urinary Tract Infection
• Decubitus Ulcer
• Other Complications of Medical Care
• Inflammation and Other Complications of Devices, Implants or Grafts Except Vascular Infection
• Infection, Inflammation and Clotting complications of Peripheral Vascular Catheters and Infusions
• Infections Due to Central Venous Catheters

Since the cardiovascular screening is non-invasive none of the above preventable complications would be applicable, whereas an ED visit or inpatient admission could potentially be susceptible to the above complications during the course of treatment.

Project 2-
Of the potentially preventable complications listed expected improvements would be seen in the following for those pregnant women who accessed and utilized the services offered by the Gestational Diabetes clinics:
• Pulmonary embolism
• Shock
• Urinary Tract Infection
• Poisonings due to Anesthesia
• Transfusion Incomptability Reaction
• Post-operative Infection and Deep Wound Disruption with Procedure
• Diabetic Ketoacidosis and Coma
• Obstetrical Hemorrhage without transfusion
• Obstetrical Hemorrhage with Transfusion
• Obstetric Lacerations and other Trauma without Instrumentation
• Obstetric Lacerations and other Trauma With Instrumentation
• Medical and Anesthesia Obstetric Complications
• Major Puerperal Infection and Other Major Obstetric Complications
• Other Complications of Obstetrical Surgical and Perineal Wounds
• Delivery with Placental Complications
• Other In-Hospital Adverse Events

Valuation:

Project 1
Refer to Project Description, Starting Point/Baseline, Rationale and Related Category 3 Outcome Measure and Project Valuation for specific size factor, project scope, populations served, community benefit, cost avoidance, addressing community need and estimated local funding.

Project 2
The potentially preventable complications listed above do not directly pertain to the Gestational Diabetes Program and clinic but to the resultant hospitalization for mother and baby upon delivery of the newborn. The above could be tracked and trended for those pregnant women with gestational diabetes who utilized the services and resources related to the Gestational Diabetes Program versus those that did not.
### Domain 4: Patient-Centered Healthcare

**Description:**

**Projects 1 and 2**

The reporting of Patient Satisfaction and Medication Management measures are limited to the inpatient setting. Southwest General Hospital will report on these measures though the identified project will not affect the measures.

**Valuation:**

The reporting of Patient Satisfaction and Medication Management measures are limited to the inpatient setting. Southwest General Hospital will report on these measures though the identified project will not affect the measures.

---

### Domain 5: Emergency Department

**Description:**

**Project 1**

The reporting of the Emergency Department measure will be reported but the SWGH project will not affect the measures.

**Project 2**

This ED measure does not directly relate to the Gestational Diabetes program project. The reporting of the Emergency Department measure will be provided but the SWGH project will not affect the measures.

**Valuation:**

**Project 1**

The reporting of the Emergency Department measure will be reported but the SWGH project will not affect the measures.

**Project 2**

This ED measure does not directly relate to the Gestational Diabetes program project. The reporting of the Emergency Department measure will be provided but the SWGH project will not affect the measures.

|                           | Grand Total Payments Across Category 4 | $55,256 | $84,400 | $114,195 | $124,125 |
Performing Provider:
Performing Provider name: Texas Center for Infectious Disease
TPI: 133257904

**Domain 4: Patient-Centered Healthcare**

**Description:**
This system redesign demonstration project (2.7.6 “Other”) is structured to transform the treatment of TB for patients who live in an urban (RHP Region 6) of the state to demonstrate an evidence-based regime for the diagnosis of Latent TB Infection (LTBI) using interferon gamma release assays instead of tuberculin skin testing to minimize false positives; and to provide routine treatment for LTBI using a 12 dose, 12 week regimen administered by Direct Observed Therapy. In addition, the project will facilitate hospitalization for TB care of those patients who cannot be successfully treated as outpatients, thereby reducing the risk of disease spread. The Category 2 metrics for this project include I-7-1: Increase the percentage of relevant minority target populations in RHP 6 by 3% over baseline and I-7.2: Increase the number of encounters as defined by the intervention. The related Category 3 Improvement Target is: IT-11.1 Improvement in the clinical indicator in the identified Disparity Group.

Category 4 RD 1-3 Do not apply to this demonstration project because, as a specialty hospital the number of preventable admissions, readmissions, and potentially preventable complications is statistically insignificant for reporting purposes.

As such, the appropriate Category 4 measure that will demonstrate improvement resulting from program implementation is Domain 4: Patient Centered Healthcare. Within Domain 4 the standardized Patient Satisfaction Tool, HCAHPS will be used to assess patient satisfaction with the categories of interaction with the healthcare system and providers. Critical to the successful management of TB for those patients who require hospitalization is adherence to the patient care plan. Therefore, the Domain 4 category of Medication Management is the second metric that will be used for Category 4 reporting.

RD5 – Emergency Department reporting does not apply. This specialty hospital does not have an emergency department.

**Valuation:**
TB continues to be a significant and expensive public health issue in Texas. The project includes targeted testing for latent TB infection (LTBI), effective treatment of LTBI in order to **prevent** future cases, case identification with referral for appropriate therapy (inpatient or outpatient) with aggressive contact investigation. The project will be implemented in **RHP 6** to demonstrate a model of case identification and treatment delivery that is effective in reducing the spread of the disease while providing **better health outcomes with improved patient satisfaction**. Minority populations especially those who are poor, continue to experience an undue burden of this chronic, infectious disease. Effective new treatment regimens are available however, not implemented broadly enough at this time to reduce the spread of the disease. People who do not have access to primary care services are the least likely to be diagnosed with LTBI and therefore, present a risk for spreading as well as developing the disease. This creates an unnecessary burden on the healthcare system that can be managed and avoided. The valuation of this project is justified.
based on the following elements that will improve access to care, improve patient satisfaction, reduce health care costs, improve the health of populations, and provide access to specialty consultation 24 hours per day, seven days per week.

- The project will serve residents of one large urban region of Texas
- The project will be provided through the Texas Center for Infectious Disease which specializes in treatment of tuberculosis.
- Targets minority populations who are at highest risk for disease exposure and spread with an evidence-base, cost-effective management and prevention strategy
- Provides enhanced access to comprehensive, fully integrated TB care
- This approach will reduce the current and future financial burden on the healthcare system by contributing to the decline of TB rates among Texas residents.

Performing Provider
Performing Provider name: University Hospital
TPI: 136141205

**Domain 1: Potentially Preventable Admissions**

**Description**

**Relationship to Category 1,2,3 projects:**
University Hospital projects were selected to impact the triple aim-plus goals of assuring patients receive high-quality care, improved patient experience, cost effectiveness, and improved access to meet our community needs. Specific projects related to **Potentially Preventable Admissions** include the following:

- **1.1.1** – Establish more primary care clinics: Partner with a local FQHC to establish and expand clinical and community preventive services via the patient-centered medical home and thereby expand access to care to a rapidly growing section of Bexar County, Texas.

- **1.9.2** – Expand access to specialty care (outpatient psychiatry): Increase access to specialty care by expanding its provider base and having patients receive behavioral health services through its integrated patient-centered medical home.

- **1.1.3** – Expand mobile clinics: Expand a mobile health clinic within major urban school districts.

- **2.12.1** – Develop, implement, and evaluate standardized clinical protocols and evidence-based care delivery model to improve care transitions: Implement a care transitions program specifically to address the window of time between discharge and either a return EC visit and/or PCP/clinic visit.

- **2.10.1** – Implement a Palliative Care Program to address patients with end-of-life decisions and care needs: Lifelong Intensive Family Emotional (L.I.F.E.) Care/Palliative Medicine Service: Provide access to comprehensive supportive care services for patients in Bexar County who are at risk for serious illness and to improve quality of life for patients and families facing serious illness through intensive communication, pain and symptom management, advanced care planning, and coordination of care.

- **2.11.2** – Evidence-based interventions that put in place the teams, technology and processes to avoid medication errors: Dedicates one specially trained, culturally competent pharmacist to a selected Health System ambulatory “hub” clinic to implement chronic disease medication management among the patients assigned to that clinic.

- **IT-9.3** – Pediatric/Young Adult Asthma Emergency Department Visits – NQF 1381

- **IT-1.18** – Follow-Up After Hospitalization for Mental Illness- NQF 0576236

- **IT-2.13** – Other Admission Rate

- **IT – 10.1** – Demonstrate improvement in quality of life (QOL) scores, as measured by evidence based and validated assessment tool for the target population
University Hospital expects these projects to result in improved outcomes for this domain’s measures to benefit the RHP population by reducing potentially preventable admissions related to congestive heart failure; diabetes; behavioral health and substance abuse; chronic obstructive pulmonary disease or asthma in adults; hypertension; and pediatric asthma returns to ED visit within 15 days. University Hospital expects increases in bacterial pneumonia immunization rates and influenza immunization rates.

Valuation
University Hospital values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project. In valuing these projects, University Hospital took into account the extent to which Potentially Preventable Admissions reporting could meet the goals of the Wavier, the extent to which it will address the community needs, the population served, and resources and costs necessary to implement the project.

Performing Provider
Performing Provider name: University Hospital
TPI: 136141205

Domain 2: Potentially Preventable Readmissions – 30 days

Description

Relationship to Category 1,2,3 projects:
University Hospital projects were selected to impact the triple aim-plus goals of assuring patients receive high-quality care, improved patient experience, cost effectiveness, and improved access to meet our community needs. Specific projects related to Potentially Preventable Readmissions – 30 days include the following:

- 1.1.1 – Establish more primary care clinics: Partner with a local FQHC to establish and expand clinical and community preventive services via the patient-centered medical home and thereby expand access to care to a rapidly growing section of Bexar County, Texas.
- 1.9.2 – Expand access to specialty care (outpatient psychiatry): Increase access to specialty care by expanding its provider base and having patients receive behavioral health services through its integrated patient-centered medical home.
- 1.1.3 – Expand mobile clinics: Expand a mobile health clinic within major urban school districts.
- 2.12.1 – Develop, implement, and evaluate standardized clinical protocols and evidence-based care delivery model to improve care transitions: Implement a care transitions program specifically to address the window of time between discharge and either a return EC visit
and/or PCP/clinic visit.

- 2.10.1 – Implement a Palliative Care Program to address patients with end-of-life decisions and care needs: Lifelong Intensive Family Emotional (L.I.F.E.) Care/Palliative Medicine Service: Provide access to comprehensive supportive care services for patients in Bexar County who are at risk for serious illness and to improve quality of life for patients and families facing serious illness through intensive communication, pain and symptom management, advanced care planning, and coordination of care.

- 2.11.2 – Evidence-based interventions that put in place the teams, technology and processes to avoid medication errors: Dedicates one specially trained, culturally competent pharmacist to a selected Health System ambulatory “hub” clinic to implement chronic disease medication management among the patients assigned to that clinic.

- IT-9.3 – Pediatric/Young Adult Asthma Emergency Department Visits – NQF 1381
- IT-1.18 – Follow-Up After Hospitalization for Mental Illness- NQF 0576236
- IT-2.13 – Other Admission Rate
- IT – 10.1 – Demonstrate improvement in quality of life (QOL) scores, as measured by evidence based and validated assessment tool for the target population
- IT – 12.1 – Breast Cancer Screening
- IT – 12.2 – Cervical Cancer Screening
- IT – 12.3 – Colorectal Cancer Screening

**Expected Improvements:** University Hospital expects these projects to result in improved outcomes for this domain’s measures to benefit the RHP population by reducing potentially preventable 30-day readmissions related to congestive heart failure; diabetes; behavioral health and substance abuse; chronic obstructive pulmonary disease; stroke; pediatric asthma; and all-cause readmissions with exclusions as noted in the RHP Planning Protocol.

**Valuation**

University Hospital values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project. In valuing these projects, University Hospital took into account the extent to which Potentially Preventable Readmissions – 30 days reporting could meet the goals of the Wavier, the extent to which it will address the community needs, the population served, and resources and costs necessary to implement the project.

Domain 3: Potentially Preventable Complications

Description:

Relationship to Category 1,2,3 projects:
University Hospital projects were selected to impact the triple aim-plus goals of assuring patients receive high-quality care, improved patient experience, cost effectiveness, and improved access to meet our community needs. Specific projects related to Potentially Preventable Complications include the following:

- 1.1.1 – Establish more primary care clinics: Partner with a local FQHC to establish and expand clinical and community preventive services via the patient-centered medical home and thereby expand access to care to a rapidly growing section of Bexar County, Texas.

- 1.1.2 – Expand existing primary care capacity: Expand existing primary care clinic space, expand hours of operations at primary care clinic sites and expand the primary care clinic staffing.

- 2.8.1 – Design, develop, and implement a program of continuous, rapid process improvement that will address issues of safety, quality and efficiency: Implement the Lean methodology to determine the use of materials and human resources, improve value to the patient, distinguish how and why inputs into certain processes translate into value, and find ways to eliminate wasteful components.

- 2.12.1 – Develop, implement, and evaluate standardized clinical protocols and evidence-based care delivery model to improve care transitions: Implement a care transitions program specifically to address the window of time between discharge and either a return EC visit and/or PCP/clinic visit.

- IT-9.3 – Pediatric/Young Adult Asthma Emergency Department Visits – NQF 1381

- IT – 10.1 Demonstrate improvement in quality of life (QOL) scores, as measured by evidence based and validated assessment tool for the target population

Expected Improvements: University Hospital expects the above projects to result in improved outcomes for the 64 risk-adjusted rates listed for this domain in the RHP Planning Protocol.

Valuation

University Hospital values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project. In valuing these projects, University Hospital took into account the extent to which Potentially Preventable Complications reporting could meet the goals of the Wavier, the extent to which it will address the community needs, the population served, and resources and costs necessary to implement the project.

**Description**

**Relationship to Category 1,2,3 projects:**
University Hospital projects were selected to impact the triple aim-plus goals of assuring patients receive high-quality care, improved patient experience, cost effectiveness, and improved access to meet our community needs. Specific projects related to **Patient-Centered Healthcare** include the following:

- **1.7.1** – Implement telemedicine program to provide or expand specialist referral services in an area identified as needed to the region: Employ telemedicine services to the Medicaid and uninsured pediatric/young adult asthma patient populations in the ambulatory setting.

- **2.9.1** – Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care: Establish and enhance patient navigators consisting of social workers and case managers beyond acute care and within the emergency center and defined ambulatory clinics to support the patients within the region. The project will work as a support network and educational system to aid and facilitate patient activation and empowerment.

- **1.1.3** – Expand mobile clinics: Expand a mobile health clinic within major urban school districts.

- **1.4.1** – Expand Access to Written and Oral Interpretation Services: Strengthen access to culturally competent patient-centered care through strategies that promote timely oral interpretation/translation services, improve the fluid exchange of health information between patients and healthcare professionals and promote opportunities for patient to adhere to prescribed clinical care and treatment regimens.

- **2.4.1** – Implement processes to measure and improve patient experience: Develop and implement a comprehensive patient experience training program.

- **2.10.1** – Implement a Palliative Care Program to address patients with end-of-life decisions and care needs: Lifelong Intensive Family Emotional (L.I.F.E.) Care/Palliative Medicine Service

- **2.7.1** – Implement innovative evidence-based strategies to increase appropriate use of technology and testing for targeted populations (e.g., mammograms, immunizations): Implement an innovative community-based intervention model to increase access to clinical preventive services throughout Bexar County, Texas.

- **2.11.2** – Evidence-based interventions that put in place the teams, technology and processes to avoid medication errors: Dedicates one specially trained, culturally competent pharmacist to a selected Health System ambulatory “hub” clinic to implement chronic disease
medication management among the patients assigned to that clinic.

- IT-6.1 – Percent improvement over baseline of patient satisfaction scores
- IT-13.1 – Pain assessment (NQF-1637)
- IT-13.2 – Treatment Preferences (NQF 1641)
- IT-13.5 – Percentage of patients receiving hospice or palliative care services with documentation in the clinical record of a discussion of spiritual/religions concerns or documentation that the patient/caregiver did not want to discuss. (NQF 1647 modified)

**Expected Improvements:** University Hospital expects the above projects to result in improved outcomes for patient satisfaction as measured by HCAHPS and CG-CAPHS as well as improved medication management.

**Valuation**
University Hospital values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project. In valuing these projects, University Hospital took into account the extent to which Patient-Centered Healthcare reporting could meet the goals of the Wavier, the extent to which it will address the community needs, the population served, and resources and costs necessary to implement the project.

**Performing Provider**
Performing Provider name: University Hospital
TPI: 136141205
**Domain 5: Emergency Department**

**Relationship to Category 1,2,3 projects:**
University Hospital projects were selected to impact the triple aim-plus goals of assuring patients receive high-quality care, improved patient experience, cost effectiveness, and improved access to meet our community needs. Specific projects related to Emergency Department include the following:

- 1.7.1 – Implement telemedicine program to provide or expand specialist referral services in an area identified as needed to the region: Employ telemedicine services to the Medicaid and uninsured pediatric/young adult asthma patient populations in the ambulatory setting.

- 2.8.1 – Design, develop, and implement a program of continuous, rapid process improvement that will address issues of safety, quality and efficiency: Implement the Lean methodology to determine the use of materials and human resources, improve value to the patient, distinguish how and why inputs into certain processes translate into value, and find ways to eliminate wasteful components.
- IT-9.2 – ED Appropriate Utilization

**Expected Improvements:** University Hospital expects the above projects to result in improved outcomes for patients resulting in improved admit decision time to ED departure time for admitted patients.

**Valuation**

University Hospital values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project. In valuing these projects, University Hospital took into account the extent to which *Emergency Department* reporting could meet the goals of the Wavier, the extent to which it will address the community needs, the population served, and resources and costs necessary to implement the project.

| $4,439,682 | $10,553,060 | $11,399,175 | $12,502,810 |
**Performing Provider:**
Performing Provider: Uvalde County Hospital Authority, DBA Uvalde Memorial Hospital (UMH)
TPI: 121782003

**Domain 1: Potentially Preventable Admissions**

**Description:**

**Congestive Heart Failure (CHF) Admission rate** – related to: 121782003.1.1. This project teaches chronic disease patients how to manage their condition(s) and health effectively. If chronic disease patients more effectively manage their condition(s), fewer will be admitted for CHF. The Category 3 measures associated with this project are related to and will impact this Category 4 measure. These Cat. 3 outcomes are: 121782003.3.2 – ED appropriate utilization (reduced ED admits for target conditions – including CHF) and 121782003.3.1 – All cause 30 day readmission rate. Achieving reductions in these rates will directly impact the CHF admission rate. This project is also focused on filling RHP 6 community needs (CN.1 and CN.2), the fulfillment of which would directly impact CHF admission rates throughout the region.

**Diabetes Admission Rates** – related to: 121782003.1.1. This project teaches chronic disease patients how to manage their condition(s) and health effectively. If chronic disease patients more effectively manage their condition(s), fewer diabetic patients will be admitted. The Category 3 measures associated with this project are related to and will impact this Category 4 measure. These Cat. 3 outcomes are: 121782003.3.2 – ED appropriate utilization (reduced ED admits for target conditions – including Diabetes) and 121782003.3.1 – All cause 30 day readmission rate. Achieving reductions in these rates will directly impact the diabetic admission rate. This project is also focused on filling RHP 6 community needs (CN.1 and CN.2), the fulfillment of which would directly impact diabetes admission rates throughout the region.

**Behavioral Health and Substance Abuse Admission rate** - This reporting measure is unlikely to be affected by currently planned DSRIP projects.

**Chronic Obstructive Pulmonary Disease or Asthma in Adults Admission rate** - related to: 121782003.1.1. This project teaches chronic disease patients how to manage their condition(s) and health effectively. If chronic disease patients more effectively manage their condition(s), fewer will be admitted for COPD. The Category 3 measures associated with this project are related to and will impact this Category 4 measure. These Cat. 3 outcomes are: 121782003.3.2 – ED appropriate utilization (reduced ED admits for target conditions – including COPD) and 121782003.3.1 – All cause 30 day readmission rate. Achieving reductions in these rates will directly impact the COPD admission rate. This project is also focused on filling RHP 6 community needs (CN.1 and CN.2), the fulfillment of which would directly impact COPD admission rates throughout the region.

**Hypertension Admission rate** - related to: 121782003.1.1. This project teaches chronic disease patients how to manage their condition(s) and health effectively. If chronic disease patients more effectively manage their condition(s), fewer will be admitted for Hypertension. The Category 3 measures associated with this project are related to and will impact this Category 4 measure. These Cat. 3 outcomes are: 121782003.3.2 – ED appropriate utilization (reduced ED admits for target conditions – including Cardiovascular Disease/Hypertension) and 121782003.3.1 – All cause 30 day readmission rate. Achieving reductions in these rates will directly impact the Hypertension admission rate. This project is also focused on filling RHP 6 community needs (CN.1 and CN.2), the fulfillment of which would directly impact Hypertension admission rates throughout the region.

**Pediatric Asthma** – This reporting measure is unlikely to be affected by currently planned DSRIP projects.

**Bacterial pneumonia immunization** – This reporting measure is unlikely to be affected by currently planned DSRIP projects.
**Influenza Immunization** – This reporting measure is unlikely to be affected by currently planned DSRIP projects.

**Valuation:**
The dollar amount we have allocated to each required category 4 reporting domain was divided proportionally between all required reporting domains. Since almost all reporting measures have not been measured or reported, previous to this 1115 Medicaid Waiver, the effort and means necessary to report this data was deemed to be of equal value across all reporting domains.

**Performing Provider:**
Performing Provider: Uvalde County Hospital Authority, DBA Uvalde Memorial Hospital (UMH)
TPI: 121782003

**Domain 2: Potentially Preventable Readmissions – 30 days**

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
</table>
| **Congestive Heart Failure (HF): 30-Day Readmissions** - related to: 121782003.1.1. This project teaches chronic disease patients how to manage their condition(s) and health effectively. If chronic disease patients more effectively manage their condition(s), fewer will be re-admitted for CHF. The Category 3 measures associated with this project are related to and will impact this Category 4 measure. These Cat. 3 outcomes are: 121782003.3.2 – ED appropriate utilization (reduced ED admits for target conditions – including CHF) and 121782003.3.1 – All cause 30 day readmission rate. Achieving reductions in these rates will directly impact the CHF re-admission rate. This project is also focused on filling RHP 6 community needs (CN.1 and CN.2), the fulfillment of which would directly impact CHF readmission rates throughout the region.

**Diabetes: 30-Day Readmissions** - related to: 121782003.1.1. This project teaches chronic disease patients how to manage their condition(s) and health effectively. If chronic disease patients more effectively manage their condition(s), fewer diabetic patients will be re-admitted. The Category 3 measures associated with this project are related to and will impact this Category 4 measure. These Cat. 3 outcomes are: 121782003.3.2 – ED appropriate utilization (reduced ED admits for target conditions – including Diabetes) and 121782003.3.1 – All cause 30 day readmission rate. Achieving reductions in these rates will directly impact the diabetic readmission rate. This project is also focused on filling RHP 6 community needs (CN.1 and CN.2), the fulfillment of which would directly impact diabetes readmission rates throughout the region.

**Behavioral health & Substance Abuse: 30-day Readmissions** - This reporting measure is unlikely to be affected by currently planned DSRIP projects.

**Chronic Obstructive Pulmonary Disease (COPD): 30-day Readmissions** - related to: 121782003.1.1. This project teaches chronic disease patients how to manage their condition(s) and health effectively. If chronic disease patients more effectively manage their condition(s), fewer will be re-admitted for COPD. The Category 3 measures associated with this project are related to and will impact this Category 4 measure. These Cat. 3 outcomes are: 121782003.3.2 – ED appropriate utilization (reduced ED admits for target conditions – including COPD) and 121782003.3.1 – All cause 30 day readmission rate. Achieving reductions in these rates will directly impact the COPD readmission rate. This project is also focused on filling RHP 6 community needs (CN.1 and CN.2), the fulfillment of which would directly impact COPD readmission rates throughout the region.

**Stroke: 30-day Readmissions** - related to: 121782003.1.1. This project teaches chronic disease patients how to manage their condition(s) and health effectively. If chronic disease patients more
effectively manage their condition(s), fewer will be readmitted for stroke. Improvement in one of the Category 3 outcomes linked to 121782003.1.1 will also impact 30-day stroke readmissions. This outcome, 21782003.3.1, is the all-cause 30-day readmission rate. Reducing this rate throughout the project may also reduce stroke readmissions. This project is also focused on filling RHP 6 community needs (CN.1 and CN.2), the fulfillment of which could directly impact 30-day stroke readmission rates throughout the region.

**Pediatric Asthma: 30-day Readmissions** - This reporting measure is unlikely to be affected by currently planned DSRIP projects.

**All-Cause: 30-Day Readmissions** - related to: 121782003.1.1. This project teaches chronic disease patients how to manage their condition(s) and health effectively. If chronic disease patients more effectively manage their condition(s), fewer may be re-admitted for all causes. The Category 3 measures associated with this project are related to and will impact this Category 4 measure. These Cat. 3 outcomes are: 121782003.3.2 – ED appropriate utilization and 121782003.3.1 – All-cause 30-day readmission rate. Achieving reductions in these rates will directly impact all-cause 30-day readmissions. This project is also focused on filling RHP 6 community needs (CN.1 and CN.2), the fulfillment of which may reduce all-cause 30-day readmissions throughout the region.

**Valuation:**
The dollar amount we have allocated to each required category 4 reporting domain was divided proportionally between all required reporting domains. Since almost all reporting measures have not been measured or reported, previous to this 1115 Medicaid Waiver, the effort and means necessary to report this data was deemed to be of equal value across all reporting domains.

---

**Performing Provider:**
Performing Provider: Uvalde County Hospital Authority, DBA Uvalde Memorial Hospital (UMH)
TPI: 121782003

**Domain 3: Potentially Preventable Complications**

**Description:**
At this time, none of the planned DSRIP projects are likely to have an impact on any of the 64 PPC measures.

**Valuation:**
The dollar amount we have allocated to each required category 4 reporting domain was divided proportionally between all required reporting domains. Since almost all reporting measures have not been measured or reported, previous to this 1115 Medicaid Waiver, the effort and means necessary to report this data was deemed to be of equal value across all reporting domains.
### Domain 4: Patient-Centered Healthcare

**Description:**

**Patient Satisfaction** – related to: 121782003.2.1 This project will impact patient satisfaction as palliative care appropriate patients will receive consults from the palliative care team. This team will be focused on the relief of suffering as well as the cure of disease. They will work to improve the quality of life for patients and their families by efficiently transitioning them from inpatient care to care settings that best fit patients’ needs. Specifically, this palliative care project has the potential to impact patient satisfaction through accomplishment of Cat. 3 improvement targets (3.IT-13.1, 3.IT-13.2, 3.IT-13.5) and through monitoring of patient/family satisfaction (accomplished through I-12). Milestone goals for DY 4 and DY 5 have been set for I-12. A 15% improvement in DY 4 patient/family experience survey scores over DY 3 and a 25% improvement in DY 5 patient/family experience survey scores over DY 3. Reaching these improvement goals has the potential to impact overall inpatient satisfaction scores for the hospital.

**Medication management** - 121782003.2.1 This project’s palliative care team will have little or no impact on medication management as defined by the DSRIP planning protocol. However, the palliative care team will provide consults to palliative care appropriate patients. Part of the consult will be devoted to pain/symptom management through appropriate medications. In this way, quality of life will be improved and medication management may also be influenced and/or improved indirectly.

**Valuation:**

The dollar amount we have allocated to each required category 4 reporting domain was divided proportionally between all required reporting domains. Since almost all reporting measures have not been measured or reported, previous to this 1115 Medicaid Waiver, the effort and means necessary to report this data was deemed to be of equal value across all reporting domains.

---

### Domain 5: Emergency Department

**Description:**

At this time, none of the planned DSRIP projects are likely to have an impact on “Admit decision time to ED departure time for admitted patients (NQF 0497)”.

**Valuation:**

The dollar amount we have allocated to each required category 4 reporting domain was divided proportionally between all required reporting domains. Since almost all reporting measures have not been measured or reported, previous to this 1115 Medicaid Waiver, the effort and means necessary to report this data was deemed to be of equal value across all reporting domains.

Performing Provider:
Performing Provider name: Val Verde Regional Medical Center (VVRMC)
TPI: 119877204
Domain 1: Potentially Preventable Admissions
Description:
The overwhelming outcome of the Val Verde County/Del Rio community needs assessment was to increase the supply of medical providers to our rural, medically-underserved community. As such, VVRMC has chosen DSRIP projects that will aim to expand access to care, both primary and specialty care. RD-1 (potentially preventable admissions) ought to be favorably impacted—all other things equal—by virtue of having more primary care providers and specialists among the community.

**Congestive Heart Failure (CHF) Admission rate** – related to: 119877204.1.1, 119877204.1.2, 119877204.1.3. All three projects have the potential to reduce the hospital’s CHF admission rate. In 119877204.1.1, VVRMC will expand primary care capacity. This increased access to primary care providers should correlate with a higher percentage of the population receiving regular health screenings and check-ups. As primary care capacity expands, providers will have more time to ensure best practices (e.g. patient follow-up) are followed concerning chronic disease management. This will improve CHF prevention efforts and may reduce the CHF admission rate. In 119877204.1.2 specialty care capacity will be expanded. One targeted specialty for expansion is cardiology. Increasing patient access to cardiologists has the potential to reduce CHF admissions through prevention and disease management. In 119877204.1.3, a telemedicine program will be developed for specialties where permanent specialist recruitment is not feasible (see 119877204.1.2). This may include cardiology, in which case a telemedicine program allowing access to a cardiologist should have some impact on the CHF admission rate.

**Diabetes Admission Rates** – related to: 119877204.1.1. Implementing 119877204.1.1 will increase primary care capacity. This increase in access to primary care may correlate with an increased percentage of the population who receive regular screenings and check-ups. As primary care capacity expands, providers will have more time to ensure best practices (e.g. patient follow-up) are followed concerning chronic disease management. This will improve diabetes prevention efforts and has the potential to reduce diabetes admission rates

**Behavioral Health and Substance Abuse Admission rate** – related to: 119877204.1.2, 119877204.1.3 The behavioral health measure stands to be improved upon by virtue of adding specialists in our service area that are experts in psychiatry. Like most rural communities, Del Rio is lacking an abundance of behavioral health specialists. If we are successful in bringing more resources to our community, reduced utilization of hospital inpatient and ER services is likely (i.e. potential reductions in the behavioral health and substance abuse admission rate). If recruiting a psychiatrist (119877204.1.2) is not feasible for our region, then accessing this specialty through a telemedicine program may occur (119877204.1.3).

**Chronic Obstructive Pulmonary Disease or Asthma in Adults Admission rate** - related to: 119877204.1.1. Implementing 119877204.1.1 will increase primary care capacity. This increase in access to primary care may correlate with an increased percentage of the population who receive regular screenings and check-ups. As primary care capacity expands, providers will have more time to ensure best practices (e.g. patient follow-up) are followed concerning chronic disease...
management. This will improve COPD and Asthma prevention/management efforts and has the potential to reduce admission rates for these conditions.

**Hypertension Admission rate** - related to: 119877204.1.1 Implementing 119877204.1.1 will increase primary care capacity. This increase in access to primary care may correlate with an increased percentage of the population who receive regular screenings and check-ups. As primary care capacity expands, providers will have more time to ensure best practices (e.g. patient follow-up) are followed concerning chronic disease management. This will improve Hypertension prevention/management efforts and has the potential to reduce admission rates for these conditions.

**Pediatric Asthma** – related to: 119877204.1.1 Implementing 119877204.1.1 will increase primary care capacity. This increase in access to primary care may correlate with an increased percentage of the population who receive regular screenings and check-ups. As primary care capacity expands, providers will have more time to ensure best practices (e.g. patient follow-up) are followed concerning chronic disease management. This will improve Pediatric Asthma management efforts and has the potential to reduce admission rates for these conditions.

**Bacterial pneumonia immunization** – related to: 119877204.1.1 This project will provide greater access to primary care providers. This should increase the number of people who receive the bacterial pneumonia immunization.

**Influenza Immunization** – related to: 119877204.1.1 This project will provide greater access to primary care providers. This should increase the number of people who receive the influenza immunization.

**Valuation:**

When considering how to weigh the value of reporting and improving in five key areas: preventable admissions, 30-day readmissions, complications, patient experience and ED, we decided to weigh the five equally. In many respects, they are intertwined. As the team mobilizes resources to prepare for these projects, it will not be difficult to have the experts address multiple projects given their similarities (especially preventable admissions, readmissions and complications) at the same time. Patient experience ought to be a result of improved progress in each of these domains as well as with progress with our other Category 1 projects.

Progress across all of these initiatives will work to meet the needs of the community as identified by those asked of their opinion earlier this year. There is not any one of these Category 4 initiatives that substantially outweighs the other to think that a reasonable approach would not be to value them equally.

**Performing Provider:**

Performing Provider name: Val Verde Regional Medical Center (VVRMC)

TPI: 119877204

**Domain 2: Potentially Preventable Readmissions – 30 days**

**Description:**

**Relation of Category 4 Measures to VVRMC Category 1 & 3 Projects**

The overwhelming outcome of the Val Verde County/Del Rio community needs assessment was to
increase the supply of medical providers to our rural, medically-underserved community. As such, VVRMC has chosen DSRIP projects that will aim to expand access to care, both primary and specialty care. RD-2(30-day readmissions) ought to be favorably impacted—all other things equal—by virtue of having more primary care providers and specialists among the community. Better access to doctors we believe will move more care to the outpatient/clinic setting and reduce the stress placed on the hospital.

Several of the measures (HF readmission rate, diabetes readmission rate, COPD readmission rate and stroke readmission rate) are high-profile diagnoses that in Del Rio the primary care doctors are actively managing in the clinic. As clinic resources are expanded, and knowing that the prevalence of these diseases is so high in and around Del Rio, there will be a focus to more proactively manage these patient populations.

The behavioral health measure stands to be improved upon by virtue of adding specialists in our service area that are experts in psychiatry which is also tied to a Category 1 project. Like most rural communities, Del Rio is lacking an abundance of behavioral health specialists, and to the extent we are successful in bringing more resource to our community, reduced utilization of hospital inpatient and ER services is likely.

So often the cause of immediate readmission into the hospital is due to lack of coordination and follow-up after initial discharge from the hospital. For those patients being followed in the hospital clinic, there will be added focus on the hand off and care coordination to ensure that patients receive efficient and appropriate care as an outpatient in order to prevent unnecessarily returning to the hospital for readmission. If additional primary care providers create an environment which encourages and allows better access for preventative and more routine care, then readmissions stand the chance of being reduced.

**Expected Improvements in Category 4 Domains**

The expected improvements will be to reduce 30-day readmissions. In order to accomplish this goal, which is impacted by so many things, it will take great coordination between the clinic and the hospital to transition care back-and-forth.

The impact on these initiatives as well as our overall strategy to improve access to care we believe will significantly drive patient satisfaction with the healthcare system in Val Verde County. It is our desire that for members of our community who chose to seek healthcare elsewhere, which adds the cost of travel time at least 2½ hours in both directions, they will gain more confidence in the local system. For those patients who do not have the means to travel elsewhere and depend solely on VVRMC and the local clinics for their healthcare needs, we hope to educate them on how best to access the services and do an outstanding job while all are under our care either in the hospital or the clinic.

**Valuation:**

When considering how to weigh the value of reporting and improving in five key areas: preventable admissions, 30-day readmissions, complications, patient experience and ED, we decided to weigh the five equally. In many respects, they are intertwined. As the team mobilizes resources to prepare for these projects, it will not be difficult to have the experts address multiple projects given their similarities (especially preventable admissions, readmissions and complications) at the same time. Patient experience ought to be a result of improved progress in each of these domains as well as with progress with our other Category 1 projects.
Progress across all of these initiatives will work to meet the needs of the community as identified by those asked of their opinion earlier this year. There is not any one of these Category 4 initiatives that substantially outweighs the other to think that a reasonable approach would not be to value them equally.

### Performing Provider:
Performing Provider name: Val Verde Regional Medical Center (VVRMC)  
TPI: 119877204

**Domain 3: Potentially Preventable Complications**

**Description:**
The current DSRIP projects selected will have little or no impact on this reporting domain (RD-3). 119877204.1.2 may have some impact on PPCs if we are able to recruit specialists with very low risk-adjusted complication rates.

**Valuation:**
When considering how to weigh the value of reporting and improving in five key areas: preventable admissions, 30-day readmissions, complications, patient experience and ED, we decided to weigh the five equally. In many respects, they are intertwined. As the team mobilizes resources to prepare for these projects, it will not be difficult to have the experts address multiple projects given their similarities (especially preventable admissions, readmissions and complications) at the same time. Patient experience ought to be a result of improved progress in each of these domains as well as with progress with our other Category 1 projects.

Progress across all of these initiatives will work to meet the needs of the community as identified by those asked of their opinion earlier this year. There is not any one of these Category 4 initiatives that substantially outweighs the other to think that a reasonable approach would not be to value them equally.

### Performing Provider:
Performing Provider name: Val Verde Regional Medical Center (VVRMC)  
TPI: 119877204

**Domain 4: Patient-Centered Healthcare**

**Description:**

**Relation of Category 4 Measures to VVRMC Category 1 & 3 Projects**
VVRMC’s Category 3 project related to its Category 1 initiatives involves improving patient satisfaction. While this effort will be focused on clinic activity, clearly the mechanics of improving patient experience are consistent whether in the outpatient or inpatient setting. RD-4 (Patient-centered Healthcare) in large part is about tracking patient satisfaction (through HCAHPS) and showing progress toward set goals.

VVRMC is very focused on improving the patient experience both in the clinic as well as the inpatient setting.
**Expected Improvements in Category 4 Domains**

The impact on these initiatives as well as our overall strategy to improve access to care we believe will significantly drive patient satisfaction with the healthcare system in Val Verde County. It is our desire that for members of our community who chose to seek healthcare elsewhere, which adds the cost of travel time at least 2 ½ hours in both directions, they will gain more confidence in the local system. For those patients who do not have the means to travel elsewhere and depend solely on VVRMC and the local clinics for their healthcare needs, we hope to educate them on how best to access the services and do an outstanding job while all are under our care either in the hospital or the clinic.

**Valuation:**

When considering how to weigh the value of reporting and improving in five key areas: preventable admissions, 30-day readmissions, complications, patient experience and ED, we decided to weigh the five equally. In many respects, they are intertwined. As the team mobilizes resources to prepare for these projects, it will not be difficult to have the experts address multiple projects given their similarities (especially preventable admissions, readmissions and complications) at the same time. Section VI. RHP Participation Certifications

Each RHP participant that will be providing State match or receiving pool payments has certified the following:

- I am legally authorized to sign this document on behalf of my organization;
- I have read and understand this document;
- The statements on this form regarding my organization are true, correct, and complete to the best of my knowledge and belief.

Signed certifications are included for these Performing Providers:

- Baptist Health System
- Bluebonnet Trails Community Services
- Camino Real Community Services
- Center for Health Care Services
- Children’s Hospital of San Antonio
- CHRISTUS Santa Rosa Health System
- Clarity Child Guidance Center
- Community Medicine Associates
- Connally Memorial Medical Center
- Dimmit Regional Hospital
- Frio Regional Hospital
- Guadalupe Regional Medical Center
- Hill Country Memorial Hospital
- Hill Country Mental Health and Developmental Disabilities Center
- Medina Regional Hospital
- Methodist Hospital
- Nix Health Care System
- Peterson Regional Medical Center
- San Antonio Metropolitan Health District
- San Antonio State Hospital
- South Texas Regional Medical Center
- Southwest General Hospital
- Texas Center for Infectious Disease
- University Hospital
- University of Texas Health Science Center at San Antonio
- Uvalde Memorial Hospital
- Val Verde Regional Medical Center
Section VII. Addendums

Region 6 is submitting the following addendums

A. List of Stakeholder Meetings
B. Region 6 Website
C. Supporting Documentation Related to Public Engagement
D. List of DSRIP Projects
E. Affiliation Agreements and Certifications
F. Checklist and Response to HHSC Feedback
### Addendum A: List of Stakeholder Meetings

Numerous meetings and calls were held within RHP 6 to discuss and collaborate on the waiver. The list below documents some of these key meetings.

Addendum B: Region 6 Website

The press release marking the launch of www.TexasRHP6.com and screenshots from the Website are provided below.

University Health System launches Regional Healthcare Partnership website

(SAN ANTONIO, TX - May 3, 2012) University Health System has launched a website to provide a resource for information regarding the Texas Healthcare Transformation and Quality Improvement Program, commonly referred to as the Medicaid 1115 Waiver. The site, TexasRHP6.com, will be updated regularly with news and developments related to the Waiver and the establishment of a new Regional Healthcare Partnership (RHP) for Region 6.

Through the website, hospitals participating in the Region 6 RHP, and others interested in the new program, will be able to sign up for email updates, send comments, and connect with other hospital partners. In the near future, this website will be expanded to collect data, compile proposed healthcare improvement projects and produce a regional plan.

RHPs are a key component of the Medicaid 1115(a) waiver approved by The Centers for Medicare and Medicaid (CMS) on December 12, 2011. According to the Texas Health and Human Services Commission (HHSC), the Texas Healthcare Transformation and Quality Improvement Program “allows the state to expand Medicaid managed care while preserving hospital funding, provides incentive payments for health care improvements and directs more funding to hospitals that serve large numbers of uninsured patients.”

HHSC is currently finalizing the geographic boundaries for each RHP, which will be directed by a public hospital or local governmental entity. The lead or “anchor” entity is also responsible for coordinating with participating hospitals in the development of the region’s RHP plan. The plan will identify participating partners, community needs, proposed projects and funding distribution.
**To download the current draft of the proposed RHP Plan, click here.**

The Texas Health and Human Services Commission (HHSC) has received federal approval of a waiver that allows the state to expand Medicaid managed care while preserving hospital funding, provides incentive payments for health care improvements, and directs more funding to hospitals that serve large numbers of uninsured patients.

HHSC has established geographic boundaries for new Regional Healthcare Partnerships (RHP). Each RHP will develop a plan that will identify the participating partners, community needs, proposed projects and funding distribution.

RHP 6 is anchored by University Health System and includes the following counties: Atascosa, Bandera, Bexar, Comal, Dimmit, Edwards, Frio, Gillespie, Guadalupe, Kendall, Kerr, Kinney, La Salle, McMullen, Medina, Real, Uvalde, Val Verde, Wilson, and Zavala.
Message from University Health System CEO

University Health System is honored to be the anchor for RHP 6. It is our pleasure to coordinate with the UT Health Science Center at San Antonio, our hospital partners and other stakeholders to transform healthcare in our 20-county region. Through this waiver, we have the opportunity to work together to make significant progress toward the Triple Aim goals of assuring patients receive high-quality and patient-centered care, in the most cost-effective ways.

We strive to keep this site up to date with information regarding Medicaid 1115 waiver developments in our region and throughout the state. We hope you “bookmark it” and find it to be a useful resource as you work on your organization’s DSRIP plans. Please don’t hesitate to contact me or members of our RHP team if you have any questions or suggestions.

Best Regards,

Baseline/outcome teleconference

Baseline/outcome teleconference: The teleconference on baselines and outcomes will be on Thursday, Nov. 1 from 2 – 4. Dr. Betsy Shenkman, our Texas Medicaid EORO quality expert, will take questions from all stakeholders during this call, so feel free to send the access information to other interested parties. We will have many lines, but since there is a lot of interest, we encourage you to call from a single location as you are able to ensure access for all.

Dr. Shenkman will first address questions emailed to the waiver mailbox,
TXHealthcareTransformation@hhsc.state.tx.us,

by COB Wednesday, Oct. 31. Please precede your subject line on your email with “Baseline/outcome question” so we can easily identify your questions.

To access the teleconference: Dial 877-331-7677. You will be placed directly into conference.
State Waiver Resources

HHSC has posted information about the waiver on its [website](#). You can also access selected materials below:

**Medicaid 1115 Waiver**

- [CMS Approval Letter and Standard Terms and Conditions](#)
- [Transformation Waiver Terminology](#)

**Regional Healthcare Partnerships**

Regional Healthcare Partnerships are locally-developed collaborations that fund the state share of all waiver payments in a partnership. Counties and other entities providing state share will determine how their funds are used in the Regional Healthcare Partnership consistent with waiver requirements. Each Intergovernmental Transfer (IGT) provider controls its own fund use and commitments, provided that participating healthcare providers that may be affiliated with the transferring entity adequately document levels of uncompensated care or meet required performance goals.

- [RHP map](#) - final as of August 7, 2012
- [Contact information](#) - final as of May 30, 2012
- [FINAL RHP Plan Template](#) - HHSC has finalized this template, which all RHPs will be responsible for completing and submitting to HHSC. HHSC also has developed a companion document and RHP plan checklist that will help RHPs in the development of their RHP plan. This companion document will be updated as new resources become available.

**Delivery System Reform Incentive Pool**

HHSC released the [FINAL Regional Healthcare Partnership (RHP) Planning Protocol (DSRIP Menu)](#) which was approved by CMS on September 28, 2012.

**Waiver Funding**

These [guidelines](#) include principles and examples of potential intergovernmental transfers under the 1115 waiver. HHSC intends for RHPs to use this document as high level guidance, not an exhaustive list of possible IGT scenarios.

Partners

University Health System is pleased to partner with the following hospitals, local mental health authorities, and academic health science centers in Region 6:

Atascosa County
- South Texas Regional Medical Center
- Camino Real Community Services

Bandera County
- Hill Country Mental Health & Developmental Disabilities Centers

Bexar County
- University Health System
- Baptist Health System
- Methodist Healthcare
- CHRISTUS Santa Rosa Health System
- Nix Hospital
- Southwest General Hospital
- University of Texas Health Science Center San Antonio
- The Center for Healthcare Services
- Clarity Child Guidance Center
- Community Medicine Associates
Comments & Feedback

We value your comments and ideas as we develop our Regional Healthcare Partnership. To submit general comments or questions, please use the form below. To submit comments related to the proposed RHP Plan, click here.

Addendum C: Supporting Documentation Related to Public Engagement

The communications below include press releases and emails to Region 6 stakeholders who registered online at www.TexasRHP6.com to receive email updates. Numerous additional emails were sent directly to Performing Providers with specific instructions related to submission of documents for inclusion in the RHP Plan. A letter from the Bexar County Medical Society in support of the Regional Plan is also included in this addendum.

July 9, 2012

Proposed DSRIP Projects

Performing Providers interested in participating in the Delivery System Reform Incentive Payment (DSRIP) Pool are asked to submit proposed projects using the DSRIP Template. Proposed projects must be emailed by Wednesday, July 18, 2012, to carol.huber@uhs-sa.com. Please note that this template was designed based on the most recent release of protocols from HHSC and is subject to change as we receive further direction.

RHP Planning Summit

HHSC has announced a RHP Planning Summit in August. Each Region was allocated a limited number of invitations by HHSC. Due to this limited seating, HHSC will broadcast the conference online so people not able to attend in-person can watch presentations, hear discussions, and submit questions through an online chat window.

The following organizations will represent Region 6 at the meeting:

- University Health System (Region 6 Anchor)
- University of Texas Health Science Center at San Antonio
- Center for Health Care Services
- CHRISTUS Santa Rosa Health System
- Baptist Health System
- Methodist Healthcare
- South Texas Regional Medical Center (Atascosa County)
- Uvalde Memorial Hospital
- Peterson Regional Medical Center (Kerr County)
- Val Verde Regional Medical Center

Learn more about the RHP Planning Summit
July 9, 2012, continued.

**Updated RHP Planning Protocol released**

HHSC has posted the revised DSRIP Menu – now referred to as the Regional Healthcare Partnership (RHP) Planning Protocol. Learn more...

**Public Comment Requested**

HHSC seeks public comment on the revised Program Funding and Mechanics (PFM) Protocol. Comments are due Friday, July 13.

- Download Program Financing and Mechanics Protocol
- Download the Public Comments Form

**Upcoming Webinars**

Program Funding and Mechanics (PFM) Protocol Webinar  
Tuesday, July 10th, 10 to 11:30 a.m. Central Time.

Delivery System Reform Incentive Payments (DSRIP) RHP Planning Protocol Webinar  
Wednesday, July 11th, 10 to 11:30 a.m. Central Time.

For access information, visit our Upcoming Webinar page.

**For More Information**

Please visit www.TexasRHP6.com often for all Region 6 updates.

---

July 19, 2012

University Health System wishes to thank those of you who submitted your DSRIP projects yesterday. We are working to compile the proposed projects for inclusion in the draft RHP plan and will contact you individually if we need further clarification or documentation for your submissions. The RHP Planning Protocol and the Program Financing and Mechanics Protocol remain subject to change until CMS approves them. Performing Providers will have an opportunity to modify their submissions based on any forthcoming revisions.

We understand that the 1115 waiver is a complicated process which continues to develop. As the RHP 6 Anchor, we are committed to providing you with information and timely guidance as we receive it from HHSC. Please continue to check our website, www.TexasRHP6.com, for updates. If you have any questions, you may contact us at rhp6waiver@uhs-sa.com or call Carol Huber at 210 358 8792.

---

Please send questions and requests to unsubscribe to carol.huber@uhs-sa.com. If this email was forwarded to you, and you would like to be added to distribution, please register here: http://www.texasrhp6.com/comments-feedback/
Two announcements have been posted to www.TexasRHP6.com:

Pre-RHP Planning Summit Webinar: Friday, August 3, 1:30 - 3 p.m.

During Friday’s webinar, HHSC will discuss changes to the Program Funding and Mechanics (PFM) protocol, address public comments received on the PFM protocol, and provide a brief overview of the Delivery System Reform Incentive Payment (DSRIP)/RHP Planning Protocol. HHSC is continuing to negotiate the details of the PFM and RHP Planning Protocols with CMS. This information will provide a helpful foundation for the RHP Summit.

For more information: www.TexasRHP6.com/pre-rhp-planning-summit-webinar-friday-august-3/

RHP Summit Webcast Information Now Available

The HHSC Regional Healthcare Partnership (RHP) Planning Summit is scheduled for August 7 - 8, 2012. The agenda and webcast information are now available.

For more information: www.TexasRHP6.com/rhp-summit-webcast-information-now-available/

Please send questions and requests to unsubscribe to osrl.huber@uha-aa.com. If this email was forwarded to you, and you would like to be added to distribution, please register here: http://www.texasrhp6.com/comments/feedback/
RHP Planning Summit

The RHP Planning Summit was held August 7-8. HHSC will make the summit presentations available on its website. While we await the official postings, we have made scanned copies of the materials available here for your review.

Download the RHP Planning Summit Materials

Uncompensated Care (UC) Tool

HHSC’s Rate Analysis Department website has been updated to include information about the 1115 waiver, including the newly posted Uncompensated Care (UC) tool.

The tool must be completed by all hospitals claiming UC payments for DY 1 and submitted to HHSC no later than September 10, 2012.

Next Steps

HHSC and CMS continue to negotiate many of the 1115 waiver details. While HHSC has extended the deadline for RHP Plans, RHP 6 remains committed to submitting its plan as soon as possible pending receipt of the next round of documents due to the Regions from HHSC. This will maximize time for HHSC to review and provide feedback on our region’s plan prior to its submission to CMS. University Health System will continue to post updates to our dedicated website: www.TexasRIP6.com.

Performing Providers and other stakeholders are advised to be on alert for the latest announcements and continue to refine your DSRIP proposals accordingly.

Please send questions and requests to unsubscribe to carol.huber@uhhsa.com. If this email was forwarded to you, and you would like to be added to distribution, please register here: http://www.texasrip6.com/comments-feedback/
Summary of August 17 Anchor Call

HHSC held an 1115 Waiver Anchor Call on Friday, August 17.

Main issues included:

- UC tool
- Proposed dates for release of PFM and RHP Planning Protocol documents
- Changes to RHP Plan as relates to Category 3
- Issues still being negotiated with CMS

Visit our Web site to view the summary documents.

August 28, 2012

Updated PFM Protocol Released

HHSC has released the latest draft of the Program Financing and Mechanics Protocol. Key changes are highlighted within the document. In general, please note:

- Category 4 reporting will begin in DY 3 for the PPA and PFR domains, and in DY 4 for the PPC domain and continue through DY 5.
- A learning collaborative will be conducted annually during DYs 3-5 to share learning, experiences, and best practices acquired from the DSRIP program across the State.
- RHPs must meet participation requirements for major safety net hospitals.
- RHPs must meet participation requirements for non-profit and other private hospitals.
- The funding allocation among categories has changed to give more weight to category 3 in DYs 3-5.
- Pass 1 DSRIP Allocations for Hospital Performing Providers are now available.

Updated RHP Planning Protocol Released

HHSC has released updated drafts for Category 1 and Category 2. These drafts do not include the behavioral health project area. We anticipate this area will be added back in a future release.

Delayed Implementation of UC Tools

The Texas Hospital Uncompensated Care Tool (TXHUC) and the Texas Physician Uncompensated Care Tool (TXPUC) and instructions for both tools are being removed from the Health and Human Services Commission’s (HHSC’s) Rate Analysis Department website. The TXHUC and TXPUC tools are being revised and will be reposted on the website during the first week in September.

For more information, click http://www.texasrhp6.com/notice-of-delayed-implementation-of-uc-tools/
Advanced UC Payments to Hospitals

To avoid potential financial hardship resulting from delayed implementation of the UC tool, HHSC will make advanced uncompensated-care (UC) payments to most hospitals participating in the 1115 waiver. The advanced UC payments are considered interim and subject to reconciliation once each hospital’s final UC limit is determined. HHSC is currently working to process advanced UC payments for hospitals for which HHSC has already calculated a 2012 hospital-specific limit (HSL) or transition cap. These advanced UC payments will likely be processed in October, 2012, and will be reconciled to the UC maximum payment amount calculated from the TXHUC after it is submitted. More information on advanced payments will be forthcoming in September.

For more information, click http://www.texasrhp6.com/notice-of-delayed-implementation-of-uc-tools/

Upcoming Webinar: PFM Protocol Update

HHSC will host a webinar to update stakeholders on the PFM Protocol.

For more information, click http://www.texasrhp6.com/489/#more-489

RHP 6 Community Needs Assessment

The first draft of the RHP 6 Community Needs Assessment is now available. University Health System will continue to revise this document based on guidance from HHSC. Performing Providers and other stakeholders are encouraged to review this assessment and send comments to carol.huber@uhs-sa.com.

Notice to Performing Providers:

- Please continue to submit evidence of stakeholder meetings using the secure portal. For assistance, please contact Carol Huber at carol.huber@uhs-sa.com.
- Identify your current initiatives funded by U.S. Department of Health & Human Services (HHS). Please submit these with your DSIP proposals, or in advance to carol.huber@uhs-sa.com.
- Use the updated RHP Planning Protocol documents to update your proposed Category 1 and Category 2 projects.
- For each proposed Category 1 and 2 projects, Performing Provider must have a related Category 3 outcome. HHSC is still developing Category 3.
- Be prepared to describe how each of your proposed projects represent a new initiative or significantly enhances an existing initiative, including which initiatives may have related activities that are funded by HHS.
- Review the draft RHP6 Community Needs Assessment and provide feedback to carol.huber@uhs-sa.com.
RHP 6 Methodology for Project Prioritization, Selection, and Valuation

University Health System has developed a methodology for prioritizing, selecting, and valuing proposed DSRIP projects. (Click to view RHP 6 Methodology) Custom valuation templates will be emailed directly to Performing Providers. Performing Providers who intend to participate in the DSRIP program must complete and return the valuation tool by September 14, 2012.

Revised RHP 6 DSRIP Project Template
We are anticipating HHSC will provide a tool for Performing Providers to document proposed milestones, metrics, and estimated IGT for the DSRIP projects. To assist Providers in drafting the narrative required for each project, University Health System has developed a new project template. Due dates for these completed documents will be announced once HHSC releases the final CMS-approved RHP Planning Template.

New HHSC Webinars

HHSC is hosting two webinars on Friday, September 7.

- RHP Planning Protocol Webinar from 10 a.m. – 11:30 a.m.
- PFM Protocol Webinar from 1:30 pm – 3 p.m.

For more information on these webinars please visit the Texas RHP 6 Website.

Please send questions and requests to unsubscribe to carol.huber@uhs-sa.com. If this email was forwarded to you and you would like to be added to distribution, please register here: http://www.texasrhp6.com/comments-feedback/
September 12, 2012

DSRIP Project Valuations
As a reminder, Performing Providers must submit DSRIP Project Valuation spreadsheets by Friday, September 14, 2012. Click here for more information.

Request for Information
University Health System has been asked to provide HHSC with a list of potential Performing Providers interested in participating in DSRIP that have identified a source of non-federal match AND are one of the following:

- Hospitals that did not receive a Pass 1 Allocation
- Local health departments
- Community Mental Health Centers
- Physician Practices affiliated with an academic health science center
- Physician Practices not affiliated with an academic health science center

If your organization meets these criteria AND you did not receive a valuation template sent out on September 6, please email the following information to RHP6waiver@uhs-aa.com by September 14, 2012:

- Type of Performing Provider (Hospital, Local Health Department, Physician Practice)
- Performing Provider Name
- County
- TIP
- TIN (if available)

HHSC Webinars
HHSC held two webinars on Friday, September 7. During these presentations, HHSC announced that new/revised waiver documents and tools will be released by September 21. Trainings on these tools, including the RHP Plan Template, Electronic Workbook, and RHP Planning Protocol, will be held the week of September 17. The presentations are available here.
HHSC held an Anchor Call on Friday, September 14. Please note:

- View the complete online summary of the Anchor Call.

- Hospitals participating in the waiver will need to indicate “Ownership Type” to align with the UC application. Private entities contracted by hospital districts may need to submit affiliation agreements and certifications with the RHP plan. For more information, please email RHP6Waiver@UHS-SA.com.

- HHSC is seeking final CMS approval of the RHP Planning Protocol by September 21. Updated DRAFTs of the following documents are now available online:
  - Category 1
  - Category 2
  - Category 1 and 2 Project Options and Components
  - Category 3

- HHSC anticipates the Pass 1 electronic workbook and RHP Plan template to be available by September 21. The revised DRAFT RHP Plan template is available online.

- HHSC has tentatively scheduled upcoming webinars for September 25 and 26.

- HHSC has proposed a new timeline for development, review, and submission of the RHP Plans. The timeline targets submission of Pass 1 by October 31 and Pass 2 by November 30.

Performing Providers are encouraged to review the Anchor Call Notes and updated DRAFT documents, continue developing project proposals, and be prepared for quick turnaround deadlines once the final protocols and workbooks are released.

Please send questions and requests to unsubscribe to carol.huber@uhs-sa.com. If this email was forwarded to you, and you would like to be added to distribution, please register here: http://www.texasrhp6.com/comments-feedback/
RHP Planning Protocol Update

HHSC expects federal approval of the complete Regional Healthcare Partnership (RHP) Planning Protocol (DSRIP menu) for the Medicaid 1115 Transformation Waiver on Monday, September 24, 2012. The protocol provides the menu of project areas approved by HHSC and the Centers for Medicare & Medicaid Services (CMS), and options that contribute to delivery transformation and quality improvement. Only projects from this menu and performed as outlined in an HHSC and a CMS-approved RHP Plan with corresponding measures, milestones and performance targets are eligible for payments from the DSRIP pool.

The Program Funding and Mechanics (PFM) Protocol and the RHP Planning Protocol (DSRIP menu) serve as the basis for RHP Plan development. The PFM Protocol was approved on August 31, 2012.

Final RHP Plan Template

The FINAL RHP Plan Template and a draft Companion document with additional instructions are now available. The electronic workbooks for Pass 1 Performing Providers, as specified in the PFM, are also posted. The Companion document includes a target timeline for RHP Plan submission for review and approval by HHSC and CMS. A final Checklist will follow this week.

HHSC is Hosting Two Webinars for RHP Plan Development and Submission

**RHP Planning Protocol Webinar**

Tuesday, September 25, 2012 from 9:00 a.m. – 10:30 a.m.:
1) Go to [www.webex.com](http://www.webex.com)
2) Click on Attend Meeting
3) Enter Meeting Number: 804 935 154 (no password necessary)
4) Call 1-800-396-3172 (no password necessary)

**RHP Plan Template Webinar**

Wednesday, September 26, 2012 from 10:30 a.m. – 12:00 p.m.:
1) Go to [www.webex.com](http://www.webex.com)
2) Click on Attend Meeting
3) Enter Meeting Number: 804 128 626 (no password necessary)
4) Call 1-800-396-3172 (no password necessary)
October 25, 2012 (resent November 1, 2012)

Dear Regional Healthcare Partnership 6 Stakeholders:

The University Health System will host a public meeting on the Regional Healthcare Partnership (RHP) 6 Plan, which includes the region’s first round of proposed projects under the state’s Medicaid 1115 Waiver. The meeting will take place:

Wednesday, November 7
10 a.m. to 11:30 a.m.
La Quinta Inn & Suites San Antonio Medical Center
4431 Horizon Hill Blvd.
San Antonio, TX 78229

The first round of projects, or Pass 1, under the Delivery System Reform Incentive Payment (DSRIP) Pool will be presented, followed by an opportunity for public comments. Both verbal and written comments will be accepted at the meeting. Comments also can be submitted online on the Regional Healthcare Partnership Region 6 website.

The deadline for submission of Pass 1 projects to the Texas Health and Human Services Commission (HHSC) is Nov. 16. The final RHP Plan, including Pass 2 projects, must be submitted by Dec. 31.

RHP 6 is anchored by University Health System and includes Atascosa, Bandera, Bexar, Comal, Dimmit, Edwards, Frio, Gillespie, Guadalupe, Kendall, Kerr, Kinney, La Salle, McMullen, Medina, Real, Uvalde, Val Verde, Wilson and Zavala counties.

The Texas HHSC was awarded the demonstration waiver under Section 1115 of the Social Security Act from the Centers for Medicare and Medicaid Services on Dec. 12, 2011. DSRIP Pool Payments are intended as incentives to hospitals and other Performing Providers to develop projects that broaden access to health care, improve the quality of care and enhance the health of residents.

Performing Providers are encouraged to send representation to this meeting, but are not required to do so. Other interested parties are encouraged to attend. Attendance at the meeting will be documented.

For questions about the meeting, and to RSVP, please contact Sylvia Garcia at 210-358-0674 or Sylvia.garcia2@uhs-sa.com.
Public Meeting to Discuss Healthcare Improvement Projects

(SAN ANTONIO, TX – November 1, 2012) Hospitals and other healthcare providers from throughout 20 South Texas counties are working together on a plan with more than 70 proposed projects aimed at improving the quality of medical care and the health of families in our area. And at a gathering in San Antonio next week, the public can learn about the plan and comment on those projects before they’re submitted to state and federal health officials for approval.

The meeting will be held from 10 a.m. to 11:30 a.m. Wednesday, November 7 at the La Quinta Inn & Suites San Antonio Medical Center, 4431 Horizon Hill Blvd.

The projects would be funded under one part of the state’s Medicaid waiver, approved by the federal government in December under Section 1115 of the Social Security Act. Under the terms of the waiver, federal funds will be available over the next four years to fund projects within the 20 counties that make up Regional Healthcare Partnership 6. Those include Atascosa, Bandera, Bexar, Comal, Dimmit, Edwards, Frio, Gillespie, Guadalupe, Kendall, Kerr, Kinney, La Salle, McMullen, Medina, Real, Uvalde, Val Verde, Wilson and Zavala counties.

Four categories of projects are eligible for funding under the waiver: infrastructure development, program innovation and redesign, quality improvements and population-focused improvements.

University Health System, which is hosting the public meeting, serves as anchor for the region. The meeting will highlight the first round of projects proposed for funding under the waiver. A second round of projects is being finalized. The final plan is due to the Texas Department of Health and Human Services on December 31.

Comments are invited at the hearing and can also be submitted online at www.texasrhp6.com.
University Health System, other South Texas providers seeking project funding

San Antonio Business Journal by W. Scott Bailey, Reporter/Project Coordinator
Date: Thursday, November 1, 2012, 4:07pm CDT

Hospitals and other health care providers from 20 South Texas counties are collaborating on a plan to seek funding for 70 proposed projects they contend would improve the quality of medical care and the health of families in the region.

The projects would be funded under a portion of the state’s Medicaid waiver approved by the federal government nearly a year ago.

The stakeholders must have their finalized plan to the Texas Department of Health and Human Services by Dec. 31.

San Antonio’s University Health System anchors the Regional Healthcare Partnership, which includes the counties of Atascosa, Bexar, Comal, Dimmit, Edwards, Frio, Gillespie, Guadalupe, Kendall, Kerr, Kinney, La Salle, McMullen, Medina, Real, Uvalde, Val Verde, Wilson and Zavala.
November 6, 2012

Dear Regional Healthcare Partnership 6 Stakeholders:

University Health System is pleased to release the first draft of the RHP 6 Plan. Visit the website to receive a copy of the RHP 6 Plan. Comments and proposed changes will be accepted using the Regional Healthcare Partnership 6 Plan Public Comment Form, which is also available on the RHP website. Completed comment forms are due Friday, November 9 at 12:00 PM and may be submitted online through the RHP website.

As a reminder, the public meeting will take place:

Wednesday, November 7
10 a.m. to 11:30 a.m.
La Quinta Inn & Suites San Antonio Medical Center
4431 Horizon Hill Blvd.
San Antonio, TX 78229

For questions about the meeting and to RSVP, please contact Sylvia Garcia at 210-355-0674 or Sylvia.garcia2@uhs-sa.com.

Please send questions and requests to unsubscribe to carol.huber@uhs-sa.com. If this email was forwarded to you, and you would like to be added to distribution, please register here: http://www.texasrhp6.com/comments-feedback/

November 30, 2012

RHP 6 Stakeholders:

University Health System submitted Phase 1 of the RHP Plan for Region 6 on November 16, 2012. We are currently compiling Phase 2 projects to complete the plan, which is due to HHSC on December 31, 2012.

University Health System is planning to host a webinar on December 13 to share the latest draft of the full plan. Further details regarding the webinar will be forthcoming. You can expect to receive an email next week inviting you to the webinar. You will be required to register for the webinar to receive the login instructions. The full RHP Plan will be posted to the website prior to the webinar.

Thank you for your interest in our Regional Healthcare Partnership.

Please send questions and requests to unsubscribe to carol.huber@uhs-sa.com. If this email was forwarded to you, and you would like to be added to distribution, please register here: http://www.texasrhp6.com/comments-feedback/
December 7, 2012

RHP 6: RHP Plan Update
Join us for a Webinar on December 13

REGISTER NOW
Space is limited.
Reserve your Webinar seat now at:
https://www2.gotomeeting.com/register/725951250
During this event, representatives from University Health System will provide an updated summary of the RHP Plan which is due to the Texas Health and Human Services as part of the Texas Health Care Transformation and Quality Improvement Program (CMS 1115 waiver).
Title: RHP 6: RHP Plan Update
Date: Thursday, December 13, 2012
Time: 11:00 AM - 12:00 PM CST
After registering you will receive a confirmation email containing information about joining the Webinar.

System Requirements
PC-based attendies
Required: Windows® 7, Vista, XP or 2003 Server
Mac®-based attendies
Required: Mac OS® X 10.5 or newer
Mobile attendees
Required: iPhone®, iPad®, Android™ phone or Android tablet

Please send questions and requests to unsubscribe to carol.huber@uhs-sa.com. If this email was forwarded to you, and you would like to be added to distribution, please register here: http://www.texasrhp6.com/comments-feedback/
## Addendum D: List of DSRIP Projects

Region 6 is submitting the following DSRIP projects:

<table>
<thead>
<tr>
<th>Regional Medical Center</th>
<th>primary care capacity targeted population. Providers would consist of mostly nurse practitioners that would have been overseen by one of our hospitalists as the medical director.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peterson Regional Medical Center</td>
<td>2.2.1 Redesign the outpatient delivery system to coordinate care for patients with chronic disease Implement a Chronic Disease Management program that would assist with patient education on disease process and self-management, assist case management department in arranging post hospital follow up and resources, assist healthcare providers in closing the gaps of care transition from inpatient to outpatient, as well as frequent follow-up checks with patient to ensure better patient and health care outcomes.</td>
</tr>
<tr>
<td>Peterson Regional Medical Center</td>
<td>2.10.1 Implement a palliative care program to address patients with end-of-life decisions and care needs Open a palliative care outpatient practice</td>
</tr>
<tr>
<td>Peterson Regional Medical Center</td>
<td>2.4.1 Implement processes to measure and improve patient experience To give mothers and newborns better post hospital access to and education for breastfeeding support. Certified breastfeeding instructor will provide opportunities for mothers to return for continued breastfeeding assistance.</td>
</tr>
<tr>
<td>Southwest General Hospital</td>
<td>1.9.2 Increase service availability (hours, clinic locations, etc.). Improve access to specialty care. Expand mobile clinics. Redesign Primary Care. Redesign to improve patient experience Through the development of a mobile primary care unit, the surrounding rural communities will have the opportunity to access a variety of health resources in a timely and cost effective manner. Expand the capacity of primary care through a mobile care unit to better accommodate the needs of the patient population and community so that patients can receive the right care, at the right time, in the right setting.</td>
</tr>
<tr>
<td>Southwest General Hospital</td>
<td>1.9.2 Increase service availability (hours, clinic locations, etc.) Improve access to specialty care. Establish or expand initiatives to increase the availability of targeted specialty providers The development of a specialty care program dedicated to cardiac testing and interventions will provide the opportunity to access a vital health resource to identify potentially serious cardiovascular events in a timely and cost effective manner. The service is critical to support the patients requiring further assessment and intervention when identified as high risk by Primary Care Provider.</td>
</tr>
<tr>
<td>University Hospital</td>
<td>1.9.1 Expand high impact specialty care capacity in most impacted medical In order to develop the first civilian Emergency Medicine residency training program in South Central Texas, the UT Medicine Division of Emergency Medicine will partner with University Health System as</td>
