## Executive Summary

This *Assessment of Texas Medicaid Rural Teleservices* deliverable fulfills one of the eight milestones included in the Delivery System Reform Incentive Payment (DSRIP) Transition Plan<sup>1</sup>, which explains how the Texas Health and Human Services Commission (HHSC) will further develop delivery system reform efforts in Texas Medicaid without DSRIP funding. The objective of this milestone is to assess the current capacity and use of telemedicine and telehealth, particularly in rural areas of Texas, to inform next steps to address access gaps.

Rural Texans face certain healthcare access challenges and telemedicine and telehealth (referred to in this report as teleservices<sup>a</sup>) are valuable tools to address challenges. The use of teleservices—for instance, to provide specialty care in remote areas—has been increasing over the years, but significantly accelerated with the onset of the Coronavirus Disease 2019 (COVID-19) public health emergency (PHE). In response to the PHE, insurers, including Medicare and Texas Medicaid, provided flexibility to promote the provision and use of teleservices. Consequently, utilization of teleservices increased dramatically. For example, there was a 3,410 percent increase in the total number of teleservices provided to Texas Medicaid clients after the onset of the PHE.<sup>b</sup> All types of teleservices increased across a wide variety of provider types.

However, teleservice utilization did not increase equally for all. For example, in Texas Medicaid, rural beneficiaries' utilization did not increase as much as utilization by beneficiaries in urban and suburban areas. This may be due at least in part to a lack of broadband access in certain rural areas of the state. However, telephone (audio-only) services appeared to play a more important role in maintaining rural Medicaid clients' access to services during the PHE, particularly behavioral health services.

---

<sup>a</sup> The term “teleservices” as used in this report is defined in the Background section.

<sup>b</sup> The percentage increase was from the “pre-COVID-19 period” of September 1, 2019 through February 29, 2020 to the “during COVID-19 period” of March 1, 2020 through August 31, 2020. Service counts are based on distinct procedure codes.

The state continues to take actions to expand teleservices as well as broadband access to help address healthcare access challenges faced by rural Texans. Federal and state collaboration is needed for states to fully realize the potential of teleservices.

# 1. Background

HHSC submitted a DSRIP Transition Plan<sup>2</sup> to the Centers for Medicare and Medicaid Services (CMS) describing how Texas will further develop delivery system reform efforts in Texas Medicaid when DSRIP funding ends on September 30, 2021. The DSRIP Transition Plan approved by CMS includes five goals and eight milestones. One of the goals is to strengthen supporting infrastructure for increased access to healthcare and improved health for Texans. The milestone associated with this goal is an assessment of the current capacity and use of telemedicine and telehealth, particularly in rural areas of Texas, to inform next steps to address access gaps. This report is the deliverable for this milestone.

Telemedicine medical (“telemedicine”) services are defined in Texas statute as healthcare services delivered by a physician or a health professional under physician delegation and supervision to a patient at a different physical location using telecommunications or information technology.<sup>3</sup> Telehealth services are defined in Texas statute as healthcare services delivered by a non-physician health professional to a patient at a different physical location using telecommunications or information technology.<sup>4</sup> Medicare, however, does not differentiate between telemedicine (physician services) and telehealth (healthcare professional services). For the purposes of this report, the term “teleservices” will be used to encompass both telemedicine and telehealth services. This term, however, will not encompass telemonitoring.

The importance of teleservices has been recognized throughout DSRIP. The inclusion of this milestone in the DSRIP Transition Plan was driven by the goal to prioritize access to care when DSRIP funding ends and sustain DSRIP best practices.

- Of the 1,340 DSRIP projects implemented by participating providers during DSRIP demonstration years (DYs) 2-6 (October 1, 2012 – September 30, 2017), 77 (about 6 percent) had a teleservices component.
- In DY 9 (October 1, 2020 – September 30, 2021), providers reported that at least 112 of the 664 Core Activities implemented (at least 17 percent) use teleservices to deliver some services.

- In DSRIP DYs 9-10 (October 1, 2019 – September 30, 2021), providers reported on Related Strategies<sup>c</sup>, which included four strategies related to teleservices.
  - In November 2019, 39 percent of providers reported implementing at least one of these teleservices Related Strategies to some extent (101 of 256 providers).
  - Based on the most recent preliminary data as of April 2021, 72 percent of providers reported implementing at least one of these teleservices Related Strategies to some extent (183 of 254 providers).

Additionally, the significance of these teleservices initiatives was highlighted by the Best Practices Workgroup (BPW), a group of 84 DSRIP participating providers, anchors, and Executive Waiver Committee members convened to identify key measures and key practices that impacted the health status of clients served in DSRIP. The third top-rated key practice identified by the BPW was “Telehealth to provide virtual medical appointments and/or consultations with a psychiatrist.”

In part because of DSRIP, the use of teleservices—for instance, to provide specialty care in remote areas—has been slowly increasing over the years, including in the Texas Medicaid program.<sup>5</sup> The COVID-19 PHE, however, significantly accelerated this upward trend in utilization. The PHE required changes in the way healthcare is delivered to reduce healthcare staff exposure to ill persons, preserve personal protective equipment, and minimize the impact of patient surges on facilities.<sup>6</sup> Healthcare systems adjusted the way they triage, evaluate, and care for patients using methods that do not rely on in-person services.<sup>7</sup> Teleservices provided a means, at least in part, to meet this challenge and continue providing caring for patients while minimizing risks faced by healthcare personnel and patients.<sup>8</sup>

Texas Governor Greg Abbott has recognized the key role of expanded teleservices in helping the state respond to the COVID-19 PHE.<sup>9,10</sup> House Bill (H.B.) 4, 87th Texas Legislature, 2021, builds on the state’s recent experience with teleservices,

---

<sup>c</sup> DSRIP Related Strategies related to teleservices include: 1) Telehealth to provide virtual medical appointments and/or consultations with a primary care provider; 2) Telehealth to provide virtual medical appointments and/or consultations with a specialty care physician (physical health only); 3) Telehealth to provide virtual medical appointments and/or consultations with a psychiatrist; and 4) Telehealth to provide virtual appointments and/or consultations with a dentist.

making permanent many teleservices flexibilities provided by Texas Medicaid and other health and human services programs during the PHE.<sup>11</sup>

A range of HHSC advisory committees have also recommended ideas for expanding teleservices in the state, including, but not limited to, the State Medicaid Managed Care Advisory Committee,<sup>12</sup> the e-Health Advisory Committee<sup>13</sup>, the Texas Value-Based Payment and Quality Improvement Advisory Committee<sup>14</sup>, the Statewide Behavioral Health Coordinating Council's Behavioral Health Workforce Workgroup,<sup>15</sup> the State of Texas Access Reform (STAR) Kids Advisory Committee, and the Palliative Care Interdisciplinary Advisory Council.<sup>16</sup> These recommendations are consistent with actions taken by the 87th Texas Legislature (2021).

In addition to support for teleservices, state leadership has also supported an expansion in broadband access. H.B. 5, 87th Legislature, Regular Session, 2021 creates a state broadband development office and broadband development program that could make a significant contribution toward narrowing the digital divide in Texas, particularly for residents of rural counties.<sup>17</sup>

## **2. Rural Healthcare Access Barriers and the Role of Teleservices in Addressing Them**

### **Rural Healthcare Access Barriers**

Approximately 25.1 million people reside in Texas, more than 3 million, about 12 percent of the population, in rural areas.<sup>d</sup> As of March 2020, 473,000 of these rural residents received healthcare services through the state's Medicaid program. Under Texas Medicaid, managed care organizations (MCOs) operating in 13 service areas (see Appendix A) coordinate and ensure the delivery of necessary care for almost 95 percent of Medicaid beneficiaries. Within each service area, MCOs act with significant flexibility to innovate, but are required to establish adequate networks to deliver necessary primary, specialty, behavioral health, home health, pharmaceutical, and facility-based care and to meet other contractual standards. Ten of the Medicaid service areas include rural members and two-thirds of the state's rural Medicaid beneficiaries reside in the three Medicaid rural service areas (MRSAs), generally encompassing the population and healthcare resources of rural and smaller metro and suburban counties (see Table 1).

---

<sup>d</sup> 2010 U.S. Census. Rural areas include counties: 1) not designated by the Office of Management and Budget as Metropolitan; or 2) not part of a larger Metropolitan Statistical Area.

**Table 1. Texas Medicaid Clients by Service Area and Client County of Residence, March 2020\***

| Service Area          | Rural          | Suburban       | Urban            | Total            |

\*Clients whose county of residence was unknown were excluded from the table but included in the Grand Total. Therefore, the column and row totals do not sum up to the Grand Total.

Data Source: Healthcare Statistics, 2020 Historical Medicaid Enrollment by County. Retrieved April 7, 2021, from <https://hhs.texas.gov/about-hhs/records-statistics/data-statistics/healthcare-statistics>.

Prepared by: Value-based Initiatives, HHSC. (2021, April).

Rural residents often encounter barriers to accessing healthcare services, regardless of the type of health insurance they may have.<sup>18</sup> A primary barrier is distance—rural populations are more likely to travel long distances to access healthcare services.<sup>19</sup> According to the Texas Organization of Rural & Community Hospitals, 74 of Texas' 254 counties do not have a hospital, and some parts of Texas are more than 75 miles from the nearest hospital.<sup>20</sup> This can be a significant burden in terms of travel time, cost, and time away from the workplace.<sup>21</sup>

Lack of reliable transportation can be another barrier to healthcare access for rural residents.<sup>22,e</sup> In urban areas, public transit is generally an option for patients to get to medical appointments; however, these transportation services are often unavailable in rural areas. Rural communities often have more elderly residents with chronic conditions that require multiple visits to outpatient healthcare facilities.<sup>23</sup> It can be challenging for them to make it to appointments without available public or private transportation.<sup>24</sup>

Healthcare provider shortages are a third barrier to healthcare access in rural areas—a barrier that has become even harder to surmount during the current PHE.<sup>25</sup> Across the nation, the Health Resources and Services Administration (HRSA) identifies Health Professional Shortage Areas (HPSAs) based on a standard methodology that includes population to provider ratios, percent of the population living below the federal poverty level, travel time to the nearest source of care for residents of the area and other relevant metrics. Of Texas’s 172 rural counties:

- 96.5 percent currently are designated as whole county or partial county HPSAs; and
- 100 percent are whole county mental health HPSAs.<sup>26,f</sup>

In addition, 26 rural Texas hospitals have closed (permanently or temporarily) since the beginning of 2010.<sup>27</sup> When hospitals close, rural communities lose access not only to inpatient and emergency care, but to preventive and specialty services as well, as local physicians may relocate out of the impacted region. Experts believe the rural hospital closures stem from a difficult mix of demographic, social, and economic pressures. These underlying trends include high poverty and lower rates of private insurance in rural communities, lower average incomes and loss of population. They have been further exacerbated by shifts in healthcare consumption caused by COVID-19.

Finally, social stigma and privacy concerns are more likely to be healthcare access barriers in rural areas where there is little anonymity.<sup>28</sup> Rural residents can have concerns about seeking care for mental health, substance abuse, sexual health,

---

<sup>e</sup> Texas Medicaid’s Medical Transportation Program provides non-emergency medical transportation for Medicaid clients who need help going to a healthcare provider for covered health services.

<sup>f</sup> Data do not include facility HPSAs, previously withdrawn or proposed for withdrawal.

pregnancy, or even common chronic illnesses due to unease or privacy concerns.<sup>29</sup> Patients may have healthcare providers or others working in healthcare facilities in their personal social networks or may have apprehensions that friends, family members or co-workers may notice them using services for health conditions that are typically not openly discussed, such as counseling or HIV testing services.<sup>30</sup>

## **Role of Teleservices in Addressing Rural Healthcare Access Barriers**

Expanding the availability of teleservices is a key strategy for addressing rural healthcare access issues, as, in many circumstances, these services can reduce travel and provide more timely care in remote, rural areas.<sup>31</sup> Many rural communities are losing providers and having difficulty recruiting new ones, which makes teleservices an appealing way to augment limited provider resources.<sup>32</sup> Patients do not have to find childcare, transportation, or parking.<sup>33</sup> Providers have found that it can decrease patient no-show rates.<sup>34,35</sup> Increased teleservices may also give providers a better capability to assess a patient's living environment and how it contributes to health outcomes.<sup>36</sup>

Teleservices have become even more critical during the COVID-19 PHE, helping healthcare providers to maximize their community impact and patients to maintain access to care while minimizing the risk of exposure to the virus.

While teleservices present these opportunities, the "digital divide" poses a major challenge to realizing them.<sup>37</sup>

### **The Digital Divide**

The ability to fully benefit from digital services, such as teleservices, largely depends on three factors: 1) a connection to broadband or highspeed internet; 2) routine access to or ownership of hardware technologies, such as audio/visual enabled desktops, laptops, and smartphones and 3) the digital literacy to effectively operate these technologies. The 'digital divide' is the gap between meeting and not meeting these conditions.<sup>38</sup>

Rural residents may be particularly impacted by inequities that exist in access to different forms of broadband technologies. According to a study by the Harvard School of Public Health, 21 percent of Americans living in rural areas reported that access to high-speed internet was a problem for them or their households in 2019.<sup>39</sup> According to Connected Nation Texas, as of December 2020, broadband

internet was available to 96 percent of households (though not all of these households were connected);<sup>9</sup> however, at least 316,700 households remained unserved, about 89 percent of which are rural households.<sup>40</sup> While much of the focus on broadband has been on fixed technologies, such as fiber optic cables, mobile technology is growing in importance as a means for ensuring access to teleservices for rural Texans.

Even where high speed internet is available, individuals may have difficulty connecting due to financial and other reasons. In 2016, for example, only 58 percent of households with an annual income below \$25,000 in Texas reported usage of any type of broadband subscriptions.<sup>41</sup> Rural areas, which tend to be lower income than urban and suburban areas, may be disproportionately impacted by the cost of broadband services. People living in rural areas also report lower rates of ownership of computer technology needed to use the internet.<sup>42</sup>

Technology literacy is the ability of an individual to effectively use technology tools to access, manage, integrate, evaluate, create and communicate information. Accessing teleservices requires patients to use the required technology (such as a desktop, laptop or smartphone) to communicate with their provider. According to the US Department of Education, close to 32 million Americans face challenges with technology literacy.<sup>43</sup> Rural areas, with higher populations of older and lower-income residents, may benefit from increased focus on improving technology literacy.

---

<sup>9</sup> The Federal Communication Commission (FCC) speed benchmark for fixed broadband is a download speed of at least 25 megabits per second (Mbps) and an upload speed of at least 3 Mbps. See Federal Communications Commission "2020 Broadband Deployment Report." Online. Available: <https://www.fcc.gov/reports-research/reports/broadband-progress-reports/2020-broadband-deployment-report>. Accessed: February 8, 2021.

### **3. Medicare and Texas Medicaid Teleservices Policy**

Rural hospitals are more reliant on Medicare and Medicaid for revenue than are hospitals in urban and suburban population centers. According to data collected through Texas's American Hospital Association Annual Survey, which covers practically all Texas hospitals, Medicare provides the largest share of rural hospitals' net patient revenue, while third-party (commercial) sources are the largest category for urban and suburban hospitals (See Table 2). Moreover, Medicaid also comprises a far greater proportion of rural hospitals' revenue, compared to urban and suburban hospitals (24.5 percent in rural counties versus 17.3 percent in urban and 8.6 percent in suburban counties). Together, Medicare and Medicaid comprise 62.8 percent of Texas rural patient hospitals' net patient revenue. Consequently, Medicare and Medicaid teleservices reimbursement policies are particularly important drivers of teleservice utilization for rural Texas hospitals and likely for other rural providers facing a similar payer mix.

**Table 2. Texas Hospital Net Patient Revenue by Payer and County<sup>h</sup>, 2019<sup>i</sup>**

| <b>Payor</b>                | <b>Rural</b> | <b>Suburban</b> | <b>Urban</b> | <b>Total</b> |
|-----------------------------|--------------|-----------------|--------------|--------------|
| <b>Medicare</b>             | 38.3%        | 31.3%           | 32.2%        | 32.4%        |
| <b>Medicaid<sup>j</sup></b> | 24.5%        | 8.6%            | 17.3%        | 16.3%        |
| <b>Third Party</b>          | 31.8%        | 55.6%           | 47.7%        | 48.1%        |

## Medicare

### Existing Policy

Medicare telehealth services are codified in section 1834(m) of the Social Security Act. This statute restricts Medicare coverage of telehealth services to those services provided in certain geographic areas and at certain originating (patient) sites. It also limits Medicare coverage of telehealth services to those rendered by certain types of distant site practitioners and identified on the Medicare Telehealth Services List<sup>k</sup> maintained by CMS as updated through agency notice-and-comment rulemaking.<sup>44</sup> Notably, the statute does not explicitly define “telecommunications system” and instead delegates that authority to CMS. CMS has promulgated

---

<sup>h</sup> “Urban” includes counties that are home to the largest city, according to population size (as per the 2010 U.S. Census), within a Metropolitan Statistical Area (MSA) designated by the Office of Management and Budget. “Suburban” includes all counties within an MSA that are not home to the largest city in the MSA, with one exception: due to its large population size, Tarrant County, which is part of the Dallas-Fort Worth-Arlington MSA, is classified as an urban county. “Rural” includes all other counties not classified as “urban” or “suburban.”

<sup>i</sup> The survey instructions recommend that hospitals report data for the fiscal year they follow. Many hospitals chose to report data for calendar year 2019.

<sup>j</sup> Includes Medicaid supplemental payments.

<sup>k</sup> The [Medicare Telehealth Services List](#) is the list of services payable under the Medicare Physician Fee Schedule when furnished via telehealth.

regulations defining “telecommunications system” to mean two-way audio and video communication.<sup>45</sup>

In recent years, Congress authorized exceptions to the section 1834(m) requirements that apply to telehealth in fee-for-service (FFS) Medicare for substance use disorder, end-stage renal disease (ESRD), and stroke care through the Substance Use-Disorder Prevention that Promotes Opioid Recovery and Treatment (SUPPORT) Act and Bipartisan Budget Act of 2018, which also allowed additional telehealth benefits in Medicare managed care (Medicare Advantage).<sup>46</sup> In addition, beginning in January 2019, CMS used its regulatory authority to provide for payment for communication technology-based services. These include virtual check-ins (i.e., short patient-initiated communications with a healthcare provider), remote patient monitoring of established patients, e-visits (i.e., non-face-to-face patient-initiated communications through an online patient portal), and tele-consults between professionals.<sup>47,48</sup> The services enabled by the 2019 CMS regulations fall outside of the section 1834(m) definition of Medicare telehealth.

## **COVID-19 PHE Flexibilities**

To increase access to care and help limit community spread of COVID-19 during the PHE, for 1834(m) defined services, CMS temporarily expanded Medicare FFS coverage of telehealth by:

1. Removing geographic and originating site restrictions, allowing for services to be provided to patients in their homes;
2. Removing the restriction on the types of distant site practitioners who could provide telehealth services; including rural health clinics (RHCs);
3. Allowing certain telehealth services to be provided through audio-only communications technology; and
4. Vastly expanding the scope of services that could be provided by telehealth.

Importantly, the HHS Office of Civil Rights (OCR) also indicated that it would not enforce some Health Insurance Portability and Accountability Act of 1996 (HIPAA) privacy requirements for video-conferencing during the COVID-19 PHE.<sup>49</sup> Under the notification, healthcare providers are not subject to penalties for violations of HIPAA privacy and security rules that occur in good faith. In its communications, OCR stated that it believes many widely available, non-public facing electronic communication products, such as FaceTime, Skype, and Zoom, include security features to protect patient information.<sup>50</sup> However, providers cannot use public

facing electronic communication platforms (e.g., TikTok, Facebook Live or Twitch) under the notification.

These flexibilities allowed healthcare providers to deliver more services through telehealth. The Medicare telehealth requirements and flexibilities provided during the COVID-19 PHE are summarized in Appendix B.

Several of the Medicare coverage and reimbursement changes that have been implemented during the PHE would require action by the U.S. Congress to become permanent. At the conclusion of the PHE or the end of the calendar year in which the PHE terminates, as applicable, the waivers, interim final rules, and OCR notification will expire, and Medicare coverage and reimbursement for telehealth services will be subject to policies in place prior to the PHE.<sup>51</sup> For example, once the PHE expires, legislative action will be necessary to allow for audio-only communications for Medicare telehealth services and to allow most patients to conveniently receive reimbursable telehealth services in their home rather than at, for instance, a hospital or physician office.<sup>52</sup>

## **Texas Medicaid**

### **Existing Policy**

Teleservices can be delivered through many different modalities, subject to certain conditions.<sup>53</sup> For instance, in telemedicine, a physician-patient relationship must be established prior to providing services through a telemedicine medical service, unless the physician-patient relationship is established pursuant to a call coverage agreement, or established using an audio and visual modality.<sup>54</sup> Additionally, any telemedicine or telehealth services must comply with the same standard of care required for a corresponding in-person healthcare service.<sup>55</sup> Notably, “mental health services” are not subject to either of these conditions and may be provided in a manner that complies with HHSC’s and the Texas Medical Board’s policies.<sup>56</sup>

Additional terms associated with the reimbursement of teleservices by the Texas Medicaid program are also defined in Texas statute. The location where the health professional rendering the teleservice is referred to as the distant site.<sup>57</sup> The location where the Medicaid client is located while receiving the teleservice is referred to as the patient site.<sup>58</sup>

Texas statute requires HHSC to encourage healthcare providers and healthcare facilities to provide teleservices.<sup>59</sup> In both Texas Medicaid FFS and managed care,

teleservices are benefits for clients of any age. The Medicaid FFS teleservice benefits are specified in the Telecommunication Services Handbook of the Texas Medicaid Provider Procedures Manual (TMPPM).<sup>60</sup> Appendices C and D provide a summary of the existing Medicaid FFS teleservices reimbursement policy.

Services covered under the existing Texas Medicaid FFS policy include, but are not limited to, evaluation and management services, psychiatric diagnostic evaluations, psychotherapy and occupational and speech therapies in school-based settings.<sup>61</sup> A range of places of service are permissible for both the distant site and patient site, including the use of the patient's home as a patient site. All benefit limitations and prior authorization requirements are the same for teleservices as for similar in-person services.

Differences exist between the Medicaid FFS and managed care policies for teleservices. Following the passage of Senate Bill 1107 (85<sup>th</sup> Legislature, Regular Session, 2017), MCOs were permitted to set their own approval processes before a provider can receive reimbursement for providing teleservices.<sup>62</sup> Building on Senate Bill 1107, the 86<sup>th</sup> Texas Legislature passed Senate Bill 670 (2019), which allowed Medicaid MCOs to set their own reimbursement policies and gave additional direction in how an MCO should craft their teleservice benefits. Statutory language added by the bill prohibited Medicaid MCOs from denying claims for services covered by Medicaid solely because they were delivered remotely as teleservices or based on the provider's choice of platform.<sup>63</sup> Medicaid MCOs are directed to use clinical and cost-effectiveness, among other factors, in determining which services to cover as teleservices. The Telecommunication Services Handbook of the TMPPM was updated to provide general guidelines to Medicaid MCOs on coverage of teleservices.<sup>64</sup>

## **COVID-19 PHE Flexibilities**

To ensure safety and continuity of care during the COVID-19 PHE, HHSC has expanded Texas Medicaid coverage of teleservices. These flexibilities, listed below, are comprehensive, covering acute care, behavioral health, and long-term services and supports (LTSS) and apply to both MCO functions (such as service coordination) and provider services, so long as they are delivered in accordance with the healthcare provider's licensure:

- The following services may be delivered by telephone (audio-only)<sup>l</sup>:
  - Certain behavioral health services;
  - Medical (physician delivered) evaluation and management services;
  - Early Childhood Intervention (ECI)<sup>m</sup> specialized skills training;
  - Nutritional counseling services;
  - Determination of Intellectual Disability Assessments
  - Supportive employment assistance
  - Community Attendant Services (CAS) case manager visits
- The following services may be delivered by audio-video:
  - School Health and Related Services (SHARS);
  - Physical therapy;
  - Occupational and speech therapy delivered to Medicaid clients who are not also enrolled in ECI outside of a school-based setting<sup>n</sup>;
  - Certain components of Texas Health Steps checkups;
  - Rural health clinic (RHC) services; and
  - Federally Qualified Health Center (FQHC) services.<sup>o</sup>

HHSC has encouraged Medicaid MCOs to take advantage of these flexibilities, including the provision of teleservices to members in their homes. HHSC also implemented new telephonic procedure codes for use during the PHE.<sup>p</sup>

Appendices C and D provide a full summary of Medicaid teleservices related reimbursement policy during the COVID-19 PHE for acute care and LTSS.

---

<sup>l</sup> These services may also be delivered by audio-video except for the telephonic procedure codes 99441-99443.

<sup>m</sup> Medicaid covers ECI services identified in an Individualized Family Service Plan for children eligible for both ECI and Medicaid.

<sup>n</sup> Under existing FFS Medicaid policy, occupational and speech therapy are covered when provided to clients in a school-based setting or to clients also enrolled in ECI in any setting.

<sup>o</sup> Reimbursement for FQHC telemedicine and telehealth services became permanent Texas Medicaid FFS policy effective December 1, 2020.

<sup>p</sup> HHSC authorized certain types of providers to bill codes 99201-99205 and 99211-99215 for telephone (audio-only) medical (physician delivered) evaluation and management services. However, providers authorized to bill these codes are not required to bill them; they have the option to use the standard allowable procedure code with a teleservices modifier (95). Therefore, at this time, HHSC cannot always distinguish audio-only from audio-visual services in its claims/encounter data.

## 4. Recent Trends in Rural Texas Teleservice Utilization

The COVID-19 PHE changed the landscape of teleservices use in Texas and revealed the potential of these technologies to help maintain and enhance patient access to care. Prior to the PHE, state and Medicaid policy and practice primarily focused on connecting patients living in areas with shortages of behavioral health and specialized healthcare resources to qualified providers located in other areas of the state. With the onset of the PHE and associated policy flexibilities, teleservices quickly emerged as a modality for delivering additional types of care and connecting patients to providers both within and outside of their local area. An analysis of Texas Medicaid teleservices data over the past fiscal year, a period split almost exactly in half by the PHE (Pre PHE: September 2019 – February 2020; PHE: March – August 2020) shows the extent of this change in healthcare delivery. Prior to March 2020, utilization rates of teleservices, though somewhat higher in rural areas, remained steady for urban, rural, and suburban regions alike at what now would be considered a very low level. However, with the onset of the PHE, teleservices utilization in Texas rose at an unprecedented rate (see Figure 1). Overall, the total number of teleservices provided to Texas Medicaid clients increased by 3,410 percent in the second half of SFY 2020, after the onset of the PHE.<sup>9</sup>

---

<sup>9</sup> Note: While this section mainly focuses on trends in acute care healthcare services for which historic teleservices data are available, the PHE also has led to significant increases in teleservices use to support LTSS. For example, between March – August 2020, about half of all assessments for determination of intellectual disability (DID) were performed using audio or audio-visual technology. These technologies were not generally used for DID assessments prior to the PHE. Assessments with components that are not amenable to teleservices continue to be conducted in-person.

**Figure 1. Texas Medicaid Teleservices per 1,000 Clients by Month and Client County of Residence in SFY 2020**

Data source: Medicaid CHIP Data Analytics (MCDA) Analytical Data Store (ADS), TMHP.  
 Data provided by: MCDA, Center for Analytics and Decision Support, HHSC. (2021, April).  
 Additional analysis conducted by Value-based Initiatives, HHSC. (2021, April).

Though this expansion was rapid, it was not uniform. As Figure 1 also shows, and as confirmed by an independent study by the Institute for Child Health Policy, the

Texas Medicaid external quality review organization (EQRO), teleservices use peaked in rural areas at a much lower level than in urban areas.<sup>r,65,s,t</sup>

## Teleservice Utilization and Broadband Access

One, though not the only, explanation for geographic variation in the use of teleservices during the PHE may be differing levels of broadband access.<sup>u</sup> A key finding in the EQRO's report was that teleservice use varied by MCO and service delivery area (SDA), likely due in part to geographic differences in resources that facilitate teleservices uptake.<sup>66</sup> The EQRO recommended that HHSC investigate SDA-level barriers in access to resources that facilitate teleservices, such as broadband internet.<sup>67</sup>

To follow up on this finding, HHSC analyzed Medicaid utilization data to better understand the impact of broadband availability on access to teleservices. According to the Federal Communications Commission, to meet the standard for broadband, an internet connection should operate with a minimum download speed of 25 Megabits per second (Mbps) with an upload speed of at least three Mbps (25x3 Mbps).<sup>68</sup> Table 3 divides the number of Texas counties into three groups based on the availability of broadband internet access using estimates from Connected Nation Texas in July 2020.<sup>69</sup> The table shows that while a majority of rural Texas enjoys a high level of broadband service, roughly 40 percent of counties still do not have access that is equitable to levels found in nearly all urban and suburban counties.

---

<sup>r</sup> The EQRO used a different definition of "Rurality" compared to the previous mention of the term. The use of "rural" by the EQRO refers to counties with a population size of 49,999 or less whereas throughout this report it refers to counties not designated by the Office of Management and Budget (OMB) as metropolitan, or that are not part of a federally delineated metropolitan statistical area (MSA).

<sup>s</sup> This study considered "teleservices" to include telemedicine, telehealth, and telemonitoring.

<sup>t</sup> The study was of adults and children (without dual Medicare eligibility) continuously enrolled in the same Medicaid STAR or STAR+PLUS MCO between October 1, 2019 and July 31, 2020.

<sup>u</sup> Other important explanations include regional differences in COVID-19 infection rates, the availability of physicians and other providers offering teleservices to a region, and other factors related to the "digital divide".

**Table 3. Number of Texas Counties by Level of Broadband Access\* as of July 2020**

|                 | <b>Low</b> | <b>Medium</b> | <b>High</b> | <b>Total</b> |
|-----------------|------------|---------------|-------------|--------------|
| <b>Rural</b>    | 36         | 36            | 100         | 172          |
| <b>Suburban</b> | 4          | 7             | 45          | 56           |
| <b>Urban</b>    | 0          | 0             | 26          | 26           |
| <b>Total</b>    | 40         | 43            | 171         | 254          |

\*Broadband access categories are based on the distribution of percentages of households in each Texas county with 25x3 Mbps internet speeds. These percentages are estimated biannually by Connected Nation Texas. This table uses the July 31, 2020 update. For this report, low access is defined as less than 60% of county households having access to 25x3 Mbps internet speeds. Medium access is defined as 60%-79% with access. High access is defined as 80% or higher.

Data source: Connected Nation Texas. (2020, July).

Additional analysis conducted by Value-based Initiatives, HHSC. (2021, April).

As Figure 2 indicates, throughout the PHE, rural counties with higher levels of broadband access also had higher teleservices utilization. Rural areas with better access to broadband achieved levels of teleservices utilization about halfway between urban centers and rural counties. While this utilization pattern suggests a possible relationship between broadband access and the capacity of an area to fully use teleservices, additional study is warranted. As the Governor's Broadband Development Council states in their 2020 report, broadband access and broadband subscription remain two distinct measures. A Medicaid client may have access to broadband internet but might not purchase a subscription.<sup>70</sup> Further, some increase in Medicaid teleservices utilization during the COVID-19 PHE was via telephone only and did not require internet enabled technology. Finally, during COVID-19, the association between access to broadband internet and teleservices use may have been impacted by the availability of providers that historically serve a particular area, especially in the early months of the PHE.

**Figure 2. Texas Medicaid Teleservices per 1,000 Clients Living in Rural Counties vs. Urban Counties by Month and Broadband Access Category\***

## Teleservice Utilization Across Provider Types

One enduring impact from the COVID-19 PHE will be the sheer number of providers who gained experience incorporating teleservices into their practice. Statewide, compared to the first six months of state fiscal year 2020, during the PHE nearly 11,000 additional providers served Medicaid beneficiaries using teleservices, with about 5,000 of this group providing a teleservice to a rural resident. As Table 4 and Appendix E show, the increase was far-reaching, encompassing providers in many

specialties.<sup>∨</sup> This trend was likely due to many reasons, including but not limited to provider and patient preferences during the PHE, new flexibilities enacted at the state and federal level, changes to the enforcement of HIPAA regulations by OCR, and investments in teleservice infrastructure made by MCOs and providers prior to and during the PHE. Though gains were significant for specialty providers, primary care physicians, clinics and group practices saw the biggest increases in teleservices use. Home health agency teleservices use also rose substantially as many in-home therapy services moved to remote delivery. Similarly, the data by service type show robust increases for a wide swath of non-facility services, including office visits for physical and mental health and therapies (see Appendix F).

**Table 4. Teleservices Provided by Select Provider Types by Client County of Residence in SFY 2020**

| <b>Provider Type (PT)</b>     | <b>PT Code</b> | <b>Client County</b> | <b>Pre-COVID-19*</b> | <b>During COVID-19**</b> | <b>Difference</b> | <b>Percent Change (%)</b> |
|-------------------------------|----------------|----------------------|----------------------|--------------------------|-------------------|---------------------------|
| <b>Clinic/ Group Practice</b> | 22             | Rural                | 22,459               | 149,611                  | 127,152           | 566                       |
|                               |                | Suburban             | 13,400               | 250,559                  | 237,159           | 1,770                     |
|                               |                | Urban                | 42,423               | 1,161,333                | 1,118,910         | 2,638                     |
|                               |                | <b>Total</b>         | <b>78,282</b>        | <b>1,561,503</b>         | <b>1,483,221</b>  | <b>1,895</b>              |

Additional analysis conducted by: Value-based Initiatives, HHSC. (2021, April).

## Telephone (Audio-only) Services

Face to face encounters for rural, urban and suburban Medicaid beneficiaries at local mental health authorities (LMHAs) and local behavioral health authorities (LBHAs) dropped by as much as 85 percent at the onset of the COVID-19 PHE. To counter this decline, HHSC began allowing reimbursement for telephonic or audio only services.<sup>w</sup> As a result, in terms of volume, audio only LMHA and LBHA

---

<sup>w</sup> Note: Unlike some other services, HHSC is able to reliably distinguish audio only from audio-visual services in its LMHA and LBHA data.

encounters filled much of the access gap caused by the PHE, including for rural residents (see Figure 3). During this same time, more traditional audio/visual teleservice encounters remained unchanged. The same pattern of utilization also held for urban and suburban counties. While study is needed to assess the quality of audio only services, access to crucial mental health services for Medicaid and indigent populations could have been severely limited during the PHE without swift adoption of this flexibility.

**Figure 3. Total Medicaid Encounters at LMHAs from Clients in Rural Counties by Month and Encounter Type**

Data provided by: Office of Decision Support (ODS) Data Services, HHSC. (2021, April).

## HHSC Rural Hospital and Rural Health Clinic (RHC) Teleservices Survey

In September 2020, HHSC surveyed Texas rural hospitals and RHCs to assess their participation in teleservices both prior to, and during, the COVID-19 PHE, as well as barriers to their participation in these services. For full details on the survey and complete survey results, see Appendix G.

The survey found significant increases in the numbers of rural hospitals and RHCs providing teleservices during the COVID-19 PHE (see Figure 4) compared to the pre PHE time period. These increases are likely due in large part to:

- FFS Medicare allowing for the provision of teleservices to patients in their homes during the COVID-19 PHE.
- FFS Medicare and Texas Medicaid allowing for the provision of certain audio-only services during the COVID-19 PHE.
- FFS Medicare and Texas Medicaid allowing RHCs to provide teleservices during the COVID-19 PHE.

**Figure 4. Rural Hospitals and RHCs Providing Teleservices prior to COVID-19 and during COVID-19**

Other key findings include:

- *Increased number providing services to patients in their homes/residences.*  
The number of rural hospitals providing teleservices to patients in their

homes increased significantly during the COVID-19 PHE. Similarly, RHCs provided a significant volume of services to patients in their homes and at nursing facilities. These increases were enabled by federal and state flexibilities that allowed RHCs to provide teleservices and that facilitated the provision of teleservices in the patient's home.

- *Modalities used.* Audio-visual technology has been the dominant teleservice modality used by rural hospitals and RHCs during the PHE, though high use of audio-only technology was also reported.
- *Types of services provided.* Rural hospitals and RHCs are primarily using teleservices during the COVID-19 PHE to provide primary and mental healthcare. The most common types of teleservices in which rural hospitals are participating during COVID-19 are family medicine and psychiatry. The most common types of teleservices in which RHCs are participating are family medicine, pediatrics, and geriatrics.

## **Barriers and Flexibilities Influencing Rural Hospital and RHC Participation in Teleservices**

Figure 5 shows that the most significant barriers reported by rural hospitals and RHCs regarding participation in teleservices generally involve issues related to provider reimbursement and patients' lack of broadband and other technology.

**Figure 5. Most Significant Barriers to Rural Hospitals' and RHCs' Participation in Teleservices**

The survey also assessed which COVID-19 Medicare FFS and Texas Medicaid medical policy flexibilities rural hospitals and RHCs found to be most helpful during the COVID-19 pandemic. While a significant percentage of survey respondents reported that all of the flexibilities had been helpful, the leading categories reported as most helpful include:

- FFS Medicare allowing patients to receive teleservices in their home/residence.
- FFS Medicare allowing teleservice videoconference visits to be delivered via smartphone.
- FFS Medicare and Texas Medicaid allowing RHCs to provide teleservices.

## **5. Strategies for Facilitating Teleservices in Rural Texas**

Texas is moving forward on opportunities to improve teleservices, some previously planned and others becoming apparent through the state's COVID-19 PHE response. Generally, these statutory and regulatory changes and other initiatives will support telehealth practitioners and users across the entire state, including rural areas. This assessment identifies the key initiatives to promote appropriate and enhanced use of teleservices.

### **Making Certain Texas Medicaid COVID-19 Teleservice Flexibilities Permanent**

Building on a succession of previous legislation that provided the foundation for the expansion of teleservices in the Texas Medicaid program, H.B. 4, passed by the 87th Legislature in 2021 directs HHSC to make permanent many COVID-19 Texas Medicaid teleservice policy flexibilities, including, but not limited to, recognizing RHCs as a reimbursable distant site provider, expanding the types of services Medicaid MCOs may provide through teleservices, allowing MCOs to conduct certain assessment and care coordination activities via teleservices, and allowing for the provision of telephone (audio-only) behavioral health services.<sup>71</sup>

HHSC is already assessing options for continuing COVID-19 Texas Medicaid teleservice policy flexibilities. The agency's evidence-based medical benefit review process includes consideration of clinical literature; practice recommendations from academies, colleges, and professional associations; coverage determinations by other State Medicaid Agencies, and state licensure requirements. The process will incorporate direction from the 87th Legislature.

### **Making Certain Medicare COVID-19 Telehealth Flexibilities Permanent**

Supportive federal action also has played a key role facilitating states to expand teleservices during the PHE. For example, over 80 percent of rural hospital and RHC survey respondents rated FFS Medicare's decision to allow patients to receive teleservices in their homes as significantly helpful for their participation in

teleservices. A high percentage of survey respondents also indicated that FFS Medicare permitting some services to be delivered via telephone was helpful. After the PHE, CMS may have the authority to make permanent some of the flexibilities that rural hospitals and RHCs indicated have been helpful to their participation in telemedicine and telehealth services, such as CMS guidance interpreting “telecommunications system” to include an audio-only telephone call (after an initial face-to-face visit or in other circumstances) for some services provided as a telehealth service.

## **Modifying Audio-Only Medicaid Teleservice Billing Requirements to Capture Data on Audio-Only Service Provision**

To respond quickly to the need for audio-only services during the COVID-19 PHE, HHSC authorized providers to bill Texas Medicaid for the provision of audio-only services the same way they bill for the provision of services via televideo—by using the established procedure code with the appropriate (95) modifier. HHSC also gave certain types of providers the option to bill telephonic procedure codes directly. To follow up on actions by the 87th Legislature, HHSC plans to revise Texas Medicaid billing requirements, develop medical policy for the appropriate use of audio-only services, and ensure that adequate data is collected on audio-only services to inform future policymaking.

## **Implementing Directed Payment Programs with a Teleservice Component**

Directed payment programs are authorized under 42 CFR 438.6(c)(1)(i) through (iii), which details ways states may set parameters for Medicaid managed care spending to achieve goals for delivery system and payment reform, as well as improved performance. Specifically, it allows Medicaid MCOs to make payments to healthcare providers at the direction of the Medicaid agency when the payments support specific Medicaid program goals and objectives.

HHSC has recently requested CMS approval to implement directed payment programs as part of the DSRIP transition. Some of these programs have a teleservice component. These programs and their teleservice components are described below.

## **Rural Access to Primary and Preventive Services (RAPPS)**

The RAPPS program is a directed payment program for RHCs that incentivizes primary and preventive services for persons in rural areas of the state enrolled in the STAR, STAR+PLUS and STAR Kids Medicaid managed care programs. RAPPS focuses on the management of chronic conditions and is comprised of two payment components:

- Component 1 is a monthly prospective uniform dollar increase paid to all participating RHCs to promote improvement activities with a focus on access to primary and preventive care services. Providers report semi-annually on certain structure measures, including telemedicine/telehealth capabilities.
- Component 2 is a uniform percent rate increase for certain services. Providers report their progress on process measures for preventive care and screening and management of chronic conditions.

Component 1 requires participating RHCs to report twice per year on the status of, or progress on, certain structure measures. One of these structure measures is “Telehealth to provide virtual medical appointments with a primary care or specialty care provider.”

## **Directed Payment Program for Behavioral Health Services (DPP BHS)**

The DPP BHS incentivizes the Certified Community Behavioral Health Clinic (CCBHC) model of care for persons enrolled in the STAR, STAR+PLUS and STAR Kids Medicaid managed care programs. Eligible providers include community mental health centers (CMHCs).

The CCBHC model provides a comprehensive range of evidence-based mental health and substance use disorder services with an emphasis on offering 24-hour crisis care, care coordination with local primary care and hospital providers, and integration with physical healthcare. DPP BHS is comprised of two payment components:

- Component 1 pays a monthly uniform dollar increase paid to all participating CMHCs. CMHCs must report their progress towards gaining or maintaining certification for the CCBHC model and other activities foundational to quality improvement, such as telehealth services.

- Component 2 is a uniform percent increase applied to certain CCBHC services based on achieving quality metrics that align with the model's measures and goals.

Component 1 requires participating CMHCs to report twice per year on the status of, or progress on, certain structure measures. One of these structure measures is "Provide patients with services by using remote technology including audio/video, client portals and apps for the provision of services such as telehealth, assessment collection and remote health monitoring/screening."

### **Texas Incentives for Physicians and Professional Services (TIPPS)**

TIPPS is a value-based directed payment program for certain physician groups providing healthcare services to persons enrolled in the STAR, STAR+PLUS, and STAR Kids Medicaid programs. Eligible physician groups include health-related institution physician groups, physician groups affiliated with hospitals that receive indirect medical education funding and other physician groups. These classifications allow HHSC to direct reimbursement increases where they are most needed and to align with the quality goals of the program.

TIPPS payments are paid to MCOs through three components in their capitation rates and distributed to eligible physician groups based on each physician group meeting performance requirements:

- Component 1 is a monthly performance incentive payment based upon the implementation of quality improvement activities, including telemedicine/telehealth.
- Component 2 is a semi-annual performance incentive payment based on the achievement of quality metrics focused on primary care and chronic care. Health-related institutions and indirect medical education physician groups are the only classes eligible for Components 1 and 2.
- Component 3 is a uniform rate increase on paid claims for certain outpatient services based on the achievement of quality metrics that measure aspects of maternal health, chronic care, behavioral health, and social determinants of health. All participating physician groups are eligible for Component 3.

Component 1 requires participating physician practices to report twice per year on the status of, or progress on, certain structure measures. One of these structure measures is "Telehealth to provide virtual medical appointments and/or consultations for specialty services, including both physical health and behavioral health services."

## **Applying for Federal Community Health Access and Rural Transformation (CHART) Model Funding**

In August 2020, CMS announced a cooperative agreement funding opportunity called the CHART Model.<sup>72</sup> The CHART Model is a voluntary payment model for rural communities to test healthcare transformation supported by payment reform. It includes two tracks: Community Transformation Track and Accountable Care Organization Transformation Track. The CHART Model Community Transformation Track will test whether aligned financial incentives, increased operational flexibility, and robust technical support can assist rural providers to implement an effective redesign of their health care delivery system. The CMS Innovation Center will evaluate the impact of the CHART Model on Medicare and Medicaid expenditures, access to care, quality of care, and health outcomes.

Under the Community Transformation Track, CMS will award funding of up to \$5 million to a maximum of 15 lead organizations that will represent a group of rural hospitals in a single county or census tract or a set of contiguous or non-contiguous counties or census tracts. The lead organizations will be responsible for ensuring compliance with CHART Model requirements and driving delivery system redesign with participant rural hospitals. Fourteen potential participant hospitals in 13 rural Texas counties and federal census tracts have submitted a nonbinding letter of intent in support of HHSC's application.

Of the \$5 million cooperative agreement funding to be awarded, up to \$2 million may be made available upfront.<sup>73</sup> Participant hospitals will receive a monthly Medicare capitated payment amount in the form of a prospectively set annual payment that will provide rural hospitals with a stable revenue stream and create incentives to reduce both fixed costs and avoidable utilization.<sup>74</sup> If awarded the funding, HHSC plans to pass through some of the cooperative agreement funding to participating hospitals for a telemedicine/telehealth project

HHSC submitted its application to CMS as the Texas lead organization in May 2021. Additional information about HHSC's CHART Model application can be found on the [HHSC website](#).

## **Improving Broadband Access in Rural Texas Communities**

H.B. 5, 87th Legislature, Regular Session, 2021 will help to close the digital divide in Texas by increasing access to affordable broadband service. The new legislation establishes a broadband development office in Texas to:

- Serve as a resource for information regarding broadband service in Texas.
- Engage in outreach to communities regarding the expansion, adoption, and affordability of broadband service and the programs administered by the broadband office.
- Serve as an information clearinghouse to help local entities engage with federal programs that provide assistance and resources for broadband service.

H.B. 5 also requires the broadband office to establish a program to award grants, low-interest loans, and other financial incentives to applicants for the purpose of expanding access to and adoption of broadband service in designated areas determined to be eligible. In addition, it would require the broadband office to prepare, update and publish a state broadband plan that establishes long-term goals for greater access to and adoption of affordable broadband service in Texas.

## **Developing Evidence on Teleservices' Value**

Further analysis of Medicaid teleservices data generated during the COVID-19 PHE is warranted. This recent utilization has had a fundamentally different character than in the past. Some of the largest expansion involves the extension of teleservices into new service areas, such as primary care, in-home therapies and assessments for LTSS. The PHE also brought an increase in the use of paid audio-only services to support core behavioral and some physical healthcare services. To date, related analyses, like those included in this report, have looked mainly at access and disparities in access to these services. For the future, the state has an opportunity to leverage the considerable amount of data from this period to better understand the impact of teleservices on the value (quality and cost) of healthcare. These analyses will need to account for many confounding factors linked to the PHE, but Texas has developed advanced analytical capabilities within its HHS

agencies as well as strong relationships with its EQRO and other academic research institutions in Texas and across the nation from which to draw expertise.<sup>x</sup>

---

<sup>x</sup> For an example of a recent academic partnership to study teleservices, see Appendix E (conducted by Texas A&M) of HHSC's biennial report to the Texas Legislature, "Telemedicine, Telehealth, and Home Telemonitoring Services in Texas Medicaid," (December 2020): <https://hhs.texas.gov/sites/default/files/documents/laws-regulations/reports-presentations/2020/sb-789-telemedicine-telehealth-hts-medicaid-dec-2020.pdf>.

## 6. Conclusion

Teleservices have proved an invaluable tool for sustaining access to healthcare during the COVID-19 PHE. When the pandemic began, Medicaid MCOs, providers, and policymakers affected a rapid transformation of prevailing models of care to accommodate remote service delivery. These swift actions helped avert an even deeper public health crisis and served to protect the health of many Texans. With the passage of H.B. 4, state policymakers have taken another step to ensure that the benefits from the expansion of teleservices endure long after the PHE subsides.

Rural areas have benefited from this expansion of teleservices. During the PHE, rural county residents have used remote services to receive care from primary, specialty, rural health clinics, therapy, and other providers. Evidence available through this report and other analyses suggests that many rural counties enjoy relatively good levels of access to teleservices. However, meaningful pockets of rural Texas still lack connectivity to broadband internet and face other challenges to the full utilization of digital technologies. Texas policymakers have taken proactive steps to address this digital divide through H.B. 5 and the creation of a new state broadband development office and broadband development program.

The experience gained during the PHE will likely help to catalyze continued adoption of teleservices by providers and patients in the future. As a permanent feature of the healthcare landscape, enhanced use of teleservices offers some advantages over traditional practice. As discussed previously, in some circumstances, compared to office-based visits, teleservices may enhance a provider's ability to assess a patient's living environment and how it contributes to health outcomes. Patients facing challenges with transportation or travel distance have a more convenient option for engaging with the healthcare system. Some evidence suggests, other things being equal, that teleservices lead to fewer missed appointments and less delayed care. More study is warranted to evaluate the value of care delivered through teleservices during the PHE, in particular for more novel aspects of utilization. Most importantly, as Medicaid teleservices' policy evolves in Texas, it should do so in alignment with the program's emerging value-based principles and initiatives and with a strong connection to payment for outcomes rather than for volume.

<sup>36</sup> H.B. 4, 87<sup>th</sup> Legislature, Regular Session, 2021, requires HHSC to implement audio-only delivery of behavioral health services and allow audio-only delivery in any other program under HHSC jurisdiction, in accordance with federal and state law, that HHSC determines cost-effective and clinically effective.

<sup>37</sup> On March 30, 2020, CMS approved Texas’s Section 1135 waiver request for Coronavirus Disease 2019, which included suspension of State Plan Amendment (SPA) public notice requirements for changes to Medicaid payment rates. Through this flexibility, HHSC used an expedited rate setting process to adopt procedure codes 99441, 99442, and 99443, effective March 1, 2020 through the end of the COVID-19 PHE, to reimburse providers for telephonic services.

|                           | Existing FFS Policy           | FFS Policy during COVID-19 PHE  |

| <b>Reimbursement rate</b> | Same as for in-person service | No change <sup>39</sup>   |

---

<sup>38</sup> Procedure codes 99441, 99442, and 99443 are also reimbursed to providers of telehealth services effective March 1, 2020 through the end of the COVID-19 PHE.

<sup>39</sup> Procedure codes 99441, 99442, and 99443 are reimbursed at different rates than procedure codes used to reimburse for both remotely delivered and in-person services.

## **Appendix D. Texas Medicaid Long-term Services and Supports Teleservices COVID-19 PHE Flexibilities**

### **Community Living Assistance & Supports Services (CLASS)**

- Allow the following CLASS therapies to be delivered via teleservices to recipients in their homes:
  - Occupational therapy;
  - Physical therapy;
  - Speech therapy;
  - Recreational therapy;
  - Music therapy;
  - Dietary;
  - Behavior supports; and
  - Cognitive rehabilitation therapy.
- Allow billable activities for supported employment assistance through teleservices (including telephonic).
- Allow nursing assessments and comprehensive nursing assessments to be delivered through teleservices.

### **Deaf Blind with Multiple Disabilities (DBMD)**

- Allow billable activities for supported employment assistance through teleservices (including telephonic).
- Allow nursing assessments and comprehensive nursing assessments to be delivered through teleservices.

### **Home and Community-based Services (HCS)**

- Allow billable activities for supported employment assistance through teleservices (including telephonic).
- Allow nursing assessments and comprehensive nursing assessments to be delivered through teleservices.

## **Texas Home Living (TxHmL)**

- Allow billable activities for supported employment assistance through teleservices (including telephonic).
- Allow nursing assessments and comprehensive nursing assessments to be delivered through teleservices.

## **State Plan LTSS**

### **Community Attendant Services (CAS)**

- Waive the requirement for CAS case managers to visit individuals in the home or care setting at least every 90 days and allow case managers to conduct visits via teleservices (including telephonic) and document the reason it was not completed in the home.

### **Hospice**

- Permit hospice reassessment to be conducted via teleservices on a case-by-case basis.

## **Service Planning**

- Allow the use of teleservices to develop service plans for members receiving waiver and state plan LTSS.

## **Case Management**

- Suspend case management requirements for face-to-face visits, offering telephonic case management for a mix of state plan LTSS and acute care services.

## Appendix E. Texas Medicaid Teleservices by Provider Type, Month and Client County for SFY 2020

\*Service types are groupings of procedure codes consisting of the 30 individually billed procedure codes with the highest total volume of telemedicine and telehealth services in SFY 2020. Therefore, many other procedures codes that were billed during this time could belong to these groups but are not represented in this table. Table 9 provides the individual procedure codes in each service type.

\*\*Pre-COVID-19 is defined as September 1, 2019 through February 29, 2020.

\*\*\*During COVID-19 is defined as March 1, 2020 through August 31, 2020. Data source: Medicaid CHIP Data Analytics (MCDA) Analytical Data Store (ADS), TMHP.

Data provided by: MCDA, Center for Analytics and Decision Support, HHSC, (2021, April).

Additional analysis conducted by: Value-based Initiatives, HHSC. (2021, April).

**Table 9. Procedure Codes for Service Types**

| <b>Service Type</b>   | <b>Procedure Codes</b>            |
|---|-----------------------------------|
| <b>Office/Outpatient Visit – Established Client</b>                           | 99212, 99213, 99214, 99215        |
| <b>Office/Outpatient Visit – New Client</b>                                   | 99203, 99204                      |
| <b>Physical or Occupational Therapy Services</b>                              | 97110, 97112, 97530               |
| <b>Speech-Language Pathology Services</b>                                     | 92507, 92508, 92526               |
| <b>Mental Health Rehabilitation</b>   | H0034, H2014, H2017,              |
| <b>Psychotherapy</b>  | 90832, 90833, 90834, 90837, 90847 |
| <b>Psychiatric Diagnostic Evaluation</b>                                      | 90791, 90792                      |
| <b>Targeted Case Management</b>   | T1017**                           |
| <b>Clinician-directed Care Coordination for Clients in Nursing Facilities</b> | 99308, 99309                      |
| <b>Telephonic Evaluation and Management Service – Established Client</b>      | 99441, 99442, 99443               |
| <b>FQHC and RHC Encounter</b>   | T1015                             |
| <b>Early Childhood Intervention (ECI) Specialized Skills Training</b>         | T1027                             |

\*Includes the 30 procedure codes with the highest volume of teleservices.

\*\*T1017 can be used in Texas Medicaid to bill for mental health and ECI targeted case management.

## **Appendix G. HHSC Rural Hospital and Rural Health Clinic (RHC) Teleservices Survey**

In mid-2020, HHSC worked with the Texas Organization of Rural & Community Hospitals (TORCH), the Texas Association of Rural Health Clinics (TARHC), and the e-Health Advisory Committee to develop a survey to assess the participation of Texas rural hospitals and RHCs in teleservices both prior to, and during, the COVID-19 pandemic, as well as barriers to their participation in these services. This survey was not specific to Texas Medicaid teleservices – it asked respondents to provide information on teleservices provided to all patients regardless of payer type.

TORCH distributed the survey to their member hospitals, and TARHC disseminated the survey to their member RHCs. The survey was open from August 31, 2020 through September 23, 2020. Table 10 below provides the number of rural hospitals and RHCs in Texas, the number in each provider organization, and the number that responded to the survey.

**Table 10. Number of Rural Hospitals and RHCs in Texas, in their Provider Organization, and that Responded to the Survey**

| <b>Provider Type</b>   | <b># in Texas</b> | <b># in Provider Organization (TORCH or TARHC)</b> | <b># Responded to Survey</b> |
|------------------------|-------------------|--|------------------------------|
| <b>Rural hospitals</b> | 157               | 148  | 52                           |
| <b>RHCs</b>            | 312               | 120  | 67                           |

There are two main types of RHCs: hospital-based RHCs and freestanding RHCs. Because TARHC members are primarily hospital-based RHCs, the survey results may not be representative of all RHCs.

### **Rural Hospitals and RHCs Participating in Teleservices**

As shown in Figure 6, survey results demonstrated that the number of rural hospitals and RHCs at which patients received teleservices from providers at another site increased during the COVID-19 PHE.

**Figure 6. Rural Hospitals and RHCs Receiving Teleservices from Providers at Another Site Prior to COVID-19 and during COVID-19**

The number of rural hospitals and RHCs providing teleservices also increased during the COVID-19 PHE, though much more dramatically, as shown in Figure 7.

**Figure 7. Rural Hospitals and RHCs Providing Teleservices prior to COVID-19 and during COVID-19**

These increases are likely due in large part to:

- FFS Medicare allowing for the provision of teleservices to patients in their homes during the COVID-19 PHE.
- FFS Medicare and Texas Medicaid allowing for the provision of certain audio-only services during the COVID-19 PHE.
- FFS Medicare and Texas Medicaid allowing RHCs to provide teleservices during the COVID-19 PHE.

## **Location of Patients Receiving Teleservices from Rural Hospitals and RHCs**

Existing Texas Medicaid FFS policy allows for the provision of teleservices to patients in their homes, except that occupational and speech therapy provided to clients who are not also enrolled in ECI must be provided in a school-based setting. Existing Medicare FFS policy does not allow for telehealth services to be provided to patients in their homes.

However, during the COVID-19 PHE, Texas Medicaid FFS policy and Medicare FFS policy allows for the provision of teleservices to patients in their homes. As shown in Figure 8, the number of rural hospitals providing teleservices to patients in their homes increased significantly during the COVID-19 PHE. This increase is likely due in large part to the Medicare FFS flexibility allowing for the provision of telehealth services in the patient's home during the COVID-19 PHE.

**Figure 8. Rural Hospitals Providing Teleservices to Patients at Each Type of Patient Site prior to COVID-19 and during COVID-19**

Similarly, Figure 9 shows the number of RHCs providing teleservices to patients in their homes or at a nursing facility increased significantly during the COVID-19 PHE. These increases are likely due in large part to the Medicare and Texas Medicaid FFS flexibilities allowing RHCs to provide teleservices, and the Medicare FFS flexibility allowing for the provision of teleservices in the patient's home.

**Figure 9. RHCs Providing Teleservices to Patients at Each Type of Patient Site prior to COVID-19 and during COVID-19**

## Teleservice Modalities Used by Rural Hospitals and RHCs

Different teleservice modalities can be used to allow healthcare providers at rural hospitals and RHCs to connect with patients. Results from the survey shown in Figure 10 demonstrate that for rural hospitals and RHCs, teleservices were

delivered most commonly using audio-visual followed by audio only modalities during the COVID-19 PHE.

**Figure 10. Rural Hospitals and RHCs Providing Teleservices via Each Modality during COVID-19**

## **Types of Teleservices in which Rural Hospitals and RHCs are Participating during the COVID-19 PHE**

Figure 11 shows the number of rural hospitals participating in each type of teleservice during the COVID-19 PHE. Family medicine is the type of teleservice in which the greatest number of rural hospitals are participating, followed by psychiatry.

**Figure 11. Rural Hospitals Participating in Each Type of Teleservice during COVID-19**

Similarly, Figure 12 shows the number of RHCs participating in each type of teleservice during the COVID-19 PHE. As with rural hospitals, family medicine is the type of service in which the greatest number of RHCs are participating, followed by pediatrics and geriatrics.

**Figure 12. RHCs Participating in Each Type of Teleservice during COVID-19**

This data indicates that rural hospitals and RHCs are primarily using teleservices during the COVID-19 PHE to provide primary care.

## **Barriers and Flexibilities Influencing Rural Hospital and RHC Participation in Teleservices**

Figure 13 shows the most significant barriers to rural hospitals' and RHCs' participation in teleservices relate to reimbursement - that payers do not offer sufficient reimbursement for the services and that payer reimbursement policies are unclear. Other significant barriers relate to patients' lack of broadband and technology.

**Figure 13. Most Significant Barriers to Rural Hospitals' and RHCs' Participation in Teleservices**

The survey also assessed which COVID-19 Medicare FFS and Texas Medicaid medical policy flexibilities rural hospitals and RHCs found to be most helpful during the COVID-19 pandemic. Results in Figure 14 indicate that while a high percentage of survey respondents found all of these flexibilities to be significantly helpful, the highest percentage of respondents found FFS Medicare allowing patients to receive teleservices in their homes/residences to be significantly helpful. Other helpful flexibilities included FFS Medicare allowing teleservice videoconference visits to be delivered via smartphone and Texas Medicaid allowing RHCs to provide teleservices.

**Figure 14. COVID-19 Flexibilities Most Helpful for Rural Hospital and RHC Participation in Teleservices**
