COVID-19 RESPONSE FOR INTERMEDIATE CARE FACILITIES FOR INDIVIDUALS WITH AN INTELLECTUAL DISABILITY OR RELATED CONDITIONS

This document provides guidance to Intermediate Care Facilities on Response Actions in the event of a COVID-19 exposure.

1. Purpose

This document provides Intermediate Care Facilities for People with an Intellectual Disability or Related Conditions (ICFs) with guidance in the event of a positive COVID-19 case associated with the facility.

Individuals of ICFs are more susceptible to COVID-19 infection and the detrimental impact of the virus than the general population. In addition to the susceptibility of individuals, an ICF environment presents challenges to infection control and the ability to contain an outbreak, partly due to individuals living in close proximity to others, which could result in potentially rapid spread among a highly vulnerable population.

This document provides ICFs immediate actions to consider and actions for extended periods after a facility is made aware of potential infection of an individual, provider or visitor.
2. Goals

- Rapid identification of COVID-19 situation in an ICF
- Prevention of spread within the facility
- Protection of individuals, staff and visitors
- Provision of care for an infected individual(s)
- Recovery from an in-house ICF COVID-19 event
3. To Do’s for Intermediate Care Facilities:

- Review the CDC’s Key Strategies to Prepare for COVID-19 in Long-term Care Facilities.
- Review the CDC’s Preparing for COVID-19: Long-term Care Facilities, Nursing Homes.
- Review the CDC’s Strategies to Mitigate Healthcare Personnel Staffing Shortages.
- Review the CDC’s Guidance for Group Homes for Individuals with Disabilities.
- Review the CDC’s Guidance for Direct Service Providers.
- Review the CDC’s Guidance for Direct Service Providers, Caregivers, Parents, and People with Developmental and Behavioral Disorders.
- [Review the CDC’s Quarantine vs. Isolation].
- [Review HHSC’s Expansion of Reopening Visitations].
- Review the WHO’s Visual Tools.
- Review CMS’s blanket (1135) waivers, which include:
  - Individual Care and Program Requirements
    - staffing flexibilities;
    - suspension of community outings;
    - suspend mandatory training requirements; and
    - modification of adult training programs and active treatment
  - Physical Environment and LSC
    - inspection, testing, and maintenance of systems and equipment;
    - individual bedroom outside window or door;
    - ABHR dispensers;
    - fire drills; and
    - temporary construction, including temporary walls or barriers between individuals

Note: Temporary walls or barriers or plastic sheeting must not impede or obstruct the means of egress, fire safety components, or fire safety systems (e.g., corridors, exit doors, smoke barrier doors, fire alarm pulls, fire sprinklers, smoke detectors, fire alarm panels, or fire extinguishers).

- Review individual isolation and quarantine plans with staff.
- Review handwashing, surface-cleaning, and other environmental hygiene precautions with staff.
- Develop a staffing contingency plan in case a large number of staff must self-quarantine or isolate because of potential exposure, being suspected of, or positive for COVID-19.
- Report [all] confirmed COVID-19 cases to the local health department (LHD) [with jurisdiction over the facility. In instances where there is no local health authority, report to DSHS directly].
- Report the first case in either an individual or employee and the first case that occurs in either an individual or employee after the ICF has been without COVID-19 infection for 14 days or more to [HHSC Complaint and Incident Intake (CII)]. Report the incident within 24 hours of receiving the COVID-19 positive test result.
- Obtain and properly use PPE.
Review the CDC’s LTC Webinar Series, including:
- Clean Hands;
- Closely Monitor Individuals;
- Keep COVID-19 Out;
- PPE Lessons; and
- Sparkling Surfaces

Utilize the ASPR TRACIE workforce virtual toolkit.

Comply with all CMS and CDC guidance related to infection control. ICFs need to frequently monitor CDC and CMS guidance as it is being updated often. This will ensure the ICF is operating off the most current guidance.

For the duration of the state of emergency, all ICF personnel should wear a facemask while in the facility. Staff who are have been appropriately trained and fit-tested can use N95 respirators. Staff who are caring for individuals with COVID-19 or caring for individuals in a building with widespread COVID-19 infection, should wear an N95 respirator and all suggested PPE. See guidance in the section related to PPE use when caring for individuals with COVID-19.

If N95 or other respirators are used, review OSHA’s Respiratory Protection Training Videos.

Actively screen, monitor, and surveil everyone who comes into the facility.

To avoid transmission within facilities, ICFs to the best of their ability should use separate staffing teams for COVID-19-positive individuals and designate separate ICFs or units within an ICF to separate COVID-19-negative individuals from COVID-19-positive individuals and people with unknown COVID-19 status.

Quarantine individuals with exposure or symptoms.

Isolate individuals with positive cases.

Clean and disinfect the facility if there is a positive case.

Coordinate individual diagnoses and symptoms with transferring and receiving hospitals and other ICFs.

Communicate with individuals, staff, and family when there is exposure to or suspected or confirmed cases in the facility.

Keep an up-to-date list of all staff who work in other facilities. The list does not have to include the names or locations of the other facilities, just whether the staff member works at other facilities.

Minimize the movement of staff between facilities as much as possible.

Require staff self-monitoring on days they work. Ask staff to self-monitor on days they don’t work.

Require staff to report via phone prior to reporting for work if they have known exposure or symptoms.

Follow the guidance beginning on page 32 of this document to determine when staff can return to work after recovering from an illness.

Post a list of state contacts where it is visible on all shifts. The list should at least include phone numbers for the local health authority or DSHS office and the regional HHSC LTCR office.

Follow physician’s plan for immediate care of any individual with a positive case. Orders can include increased assessment frequency, increased monitoring of fluid intake and output, supportive care, a treatment plan, and what to do in case of a change in the individual’s status.
• Inform the individual of treatment or supportive healthcare plans; individuals have the right to participate in their own care.
• Upon the first positive test result of an ICF staff member or individual, consider testing of all ICF staff and individuals.
• If needed, request deployment of the TCAT-ICF team.
Recognizing a potential COVID-19 situation in a facility can result in disorientation, questions, and confusion; this document suggests ICFs focus on the following five basic actions (S.P.I.C.E.) to anchor activities:

- **Surveillance** – Monitor for symptoms – fever, cough, shortness of breath, or difficulty breathing – for each individual at least once each shift.
- **Protection/PPE** – Protect workforce and individuals through soap/water; hand sanitizer; facemask. If coughing or potential splash precautions are needed, wear a gown and face/eye shields. Refer to DSHS guidance. [Keep a two week supply of PPE on hand as per 551.46(c)(4)]
- **Isolate** – Individuals with suspected and confirmed cases need to be isolated. [Ensure cohorting is set up by potential infection status.]
- **Communicate** – Call local health department/authority or DSHS and HHSC Long-term Care Regulation to report confirmed cases. [Have contact information available for people such as: facility management, staff, local health department, the hospital, etc.]
- **Evaluate** – Infection control processes, spread of infection and mitigation efforts, and staffing availability need to be assessed. [Prevent delay of critical actions and ensure there is a plan for communication.]

S.P.I.C.E. is not meant to be all-encompassing. It is suggested to assist initial actions and be a reminder of necessary activities.
For a report of a positive COVID-19 test (individual or staff) in an ICF, HHSC will take the following steps:

- Verify the ICF is prohibiting non-essential visitors.
- Generate a priority 1 intake (must be investigated within 24 hours).
- Conduct a focused review of facility infection control processes.
- Communicate with the local health department/local health authority and DSHS.
- Determine the number of individuals suspected or positive for COVID-19.
- Determine the number of staff suspected or positive for COVID-19.
- Review facility isolation precautions and determine how individuals are isolated in the facility to ensure compliance with requirements.
- Determine that all staff suspected or positive for COVID-19 have been sent home and the facility knows to coordinate any return to work with the local health department.
- Determine if facilities have sufficient PPE.
- Determine if facilities are screening individuals and staff, and at what frequency.
- Determine if others (contract staff, family members) are also being tested.
- Determine if there is a control or quarantine order.
- Ensure the control/quarantine orders are followed.
- Perform a call-down to all other facilities in the county when staff at one facility tests positive for COVID-19.
- Determine if facilities are following rules and regulations related to admission and discharge and are readmitting individuals when appropriate.
- Determine if staff, individuals, and families are notified of positive COVID-19 cases in the facility.
- Track facilities by program type and number of positive and suspected cases.
- Track hospitalizations of COVID-19 positive ICF individuals.
- Track deaths of COVID-19 positive ICF individuals.
- Maintain communication with facilities after investigations are complete.
6. Facility Activities Required for LTC COVID-19 Response

In Advance (actions focused on response)

- [Review the CDC information in Section 3 of this document.]
- Review the HHSC information in Section 3 of this document.
- Review the WHO information in Section 3 of this document.

Immediate (0-24 hours)

- Activate individual isolation/facility cohort plan, including establishing a unit, wing, or group of rooms for any positive individuals.
- Supply PPE to care for individuals positive for COVID-19. See attachment 6 about donning (putting on) and doffing (taking off) PPE, and attachment 5 about optimizing the use of facemasks and do’s and don’ts for facemask use.
- Screen individuals for signs and symptoms at least once each shift.
- Screen staff for signs and symptoms at least at the beginning of their shift.
- Clean and disinfect facility.
- Confirm case definitions.
- Identify DSP outside activities.
- Activate individual transport protocols (for transporting individuals out).
- Establish contact with receiving agencies (hospitals, other facilities).
- Identify lead at facility and determine stakeholders involved external to facility.
- Engage with community partners (public health, health care, organizational leadership, local/state administrators).
- Review/establish testing plan.
- Activate all communication plans.
- Determine need for facility restrictions/lock-down.
- Evaluate supply resources.
- Maintain individual care.
- Report [all] confirmed COVID-19 cases to the local health department (LHD)[with jurisdiction over the facility. In instances where there is no local health authority, report to DSHS directly.]
- [Report the first case in either an individual or employee and the first case that occurs in either an individual or employee after the facility has been without COVID-19 infection for 14 days or more to HHSC CII. Report the incident within 24 hours of receiving the COVID-19 positive test result.]
- If needed, request deployment of the Rapid Assessment Quick Response Force.

Extended (24-72 hours)

- Supply PPE for health care workers and staff.
- Screen individuals for signs and symptoms at least once each shift.
- Screen staff for signs and symptoms at least at the beginning of their shift.
- Continue specialized infection control procedures.
- Activate individual transport protocols (for transporting individuals out/in).
• Establish contact with transporting/receiving agencies (hospitals, other facilities).
• Engage with external partners.
• Continue testing.
• Determine need for facility restrictions/lock-down.
• Consider additional healthcare needs.
• Maintain individual care.
• Establish an individual recovery plan, including when an individual is considered recovered and next steps for care.

**Long Term (72 hours plus)**

• Screen individual for signs and symptoms at least once each shift.
• Screen staff for signs and symptoms at least at the beginning of their shift.
• Continue cleaning and disinfecting procedures.
• Activate transport (individuals in) protocols.
• Establish contact with transporting/receiving agencies (hospitals, other facilities).
• Lift of facility restrictions/lock-down.
• Consider additional healthcare needs.
• Maintain individual care.
7. State\Regional\Local Support

Texas HHSC will serve as the lead state agency in the state’s response to an LTC COVID-19 event. HHSC actions will include:

- Developing testing recommendations, in consultation with DSHS;
- Ensuring appropriate/assistance with individual movement;
- Providing subject matter experts (SME): LTC, epidemiology, etc.; and
- Coordination of HHSC, DSHS, emergency management and local actions.

**Texas COVID-19 Assistance Team - LTC**

In addition to the activities of Section VI of this response and those above, HHSC will coordinate formation of a Texas COVID-19 Assistance Team – ICF (TCAT-ICF). This team will include representatives from HHSC, DSHS, local health department (as applicable) and emergency management (as applicable.)

This team will assist ICFs with management of a COVID-19 event by providing subject matter expertise, resource request management, and other support to facility actions through initial response activities. The TCAT-ICF will remain available for a maximum of 48 hours from activation. State and local entities will provide SMEs and continued assistance after TCAT-ICF deactivation.

To activate TCAT-ICF assistance, contact the [LTCR Associate Commissioner](mailto:ltcrassociatecommissioner@hhsc.texas.gov).
8. ICFs and COVID-19

Intermediate Care Facilities for Individuals with an Intellectual Disability or Related Conditions provide residential and habilitation services to people with intellectual disabilities or a related condition.

Environment

A small ICF home is often integrated into the community and is typical of other residences in the community. These residential settings include a mix of semi-private and private individual bedrooms; many of the bedrooms are shared, accommodating two to three people. The bedrooms usually do not have physical barriers like walls or partitions separating the space allotted for each individual inside the room.

Rules require a minimum of 80 square feet for a private (one person) bedroom, 60 square feet per person in multiple occupant rooms, and a minimum dimension of 8 feet for a private room and 10 feet for a shared room. The common areas in an ICF are intended for use by the individuals of the facility. These areas include dining and living room spaces, activity areas, and common bathing units, which are provided at a ratio of one tub or shower for every 8 individuals.

A large ICF might be made up several cottages similar to a small ICF home, a larger building more similar in design to a nursing facility, or both. A large ICF is also typically a mix of semi-private and private individual bedrooms; many of the bedrooms are semi-private, accommodating two to three people. The bedrooms usually do not have physical barriers like walls or partitions separating the space allotted for each individual inside the room.

Rules require a minimum of 80 square feet for a private (one person) bedroom, 60 square feet per person in multiple occupant rooms, and a minimum dimension of 8 feet. Many of the common areas in a large ICF are intended for use by groups of people. These areas include dining and living room spaces, activity and therapy areas, and common bathing units, which are provided at a ratio of one tub or shower for every 15 individuals.

Impact of environment on COVID-19 response:

The relatively small size of a typical ICF residence makes it challenging for providers to effectively support [physical] distancing measures or accommodate quarantine or isolation measures. A single shared kitchen can pose infection control challenges when both individuals and staff access the kitchen throughout the day.

ICFs can promote [physical distancing] in a variety of ways. While adhering to the core principles of COVID-19 infection prevention, communal activities and dining can occur. Residents can eat in the same room and should follow the physical distancing requirements listed below. Additionally, group activities can be facilitated for residents who have fully recovered from COVID-19, as well as for those not in isolation for observation or with suspected or confirmed COVID-19 status. Facilities can offer a variety of activities while also taking necessary precautions. For example, book clubs, crafts, movies, exercise, and
bingo are all activities that can be facilitated with alterations to adhere to the guidelines for preventing transmission. Group activities that adhere to the following criteria are acceptable:

- Limit the number of people in an area of the facility participating in an activity to a number that will ensure physical distance is maintained at all times.
- Maintain physical distancing of at least 6 feet between each resident.
- Staff and residents perform appropriate hand hygiene before and after each activity.
- Staff wear facemasks and residents wear facemasks or face coverings.
- Do not use shared items.
- Clean and sanitize the activity area and all items used before and after each activity.]

[Facilities should consider additional limitations based on status of COVID-19 infections in the facility.]

[For residents with COVID-19 positive status and residents with unknown COVID-19 status, per CMS guidance, all group activities should be cancelled.]

**Facility Demographics**

ICFs are located in metropolitan, urban, and rural locales. Each locale has specific characteristics that impact workforce availability, health care system support, and interactions with public health, emergency care, and jurisdictional administration. Texas currently has 786 community ICFs and 13 State Supported Living Centers (SSLCs).

**Impact of facility demographics on COVID-19 response:**

ICFs in more densely populated locations are likely to experience higher risk for exposure among staff and visitors. As a result, facilities in metropolitan and urban areas have a higher risk of infection and face more challenges controlling spread when infection occurs. ICFs in more rural locations have less health care system support, might not have local health authorities, and have smaller staffing pools, making it harder to cover shortages that result from suspected exposure. Facilities in both metropolitan and rural areas are likely to face staffing shortages because of competitive job markets and have challenges finding PPE.

**Facility Considerations**

Facilities have small or large bed capacity and differ in age, size, available space, and equipment. Available services also differ by facility, affecting the level of available care; ventilator support might not be present, and the types of health care providers available or on-site will also vary.

**Impact of facility considerations on COVID-19 response:**

Most ICFs have limited or no isolation rooms available. Most small ICFs are not equipped to care for individual with fragile medical conditions. Bed capacity along with staff and PPE availability
also affects the number of individuals for which each facility can provide care. COVID-19 positive individuals will increase the staff and resources required to provide care further limiting the number of individuals for which a facility can care.

**Individual Demographics**

All ICF individuals must have an intellectual disability (IDD) or related condition. While all have an IDD or related condition, each individual is unique and might require habilitation services, minimal supportive care, or significant medical care. Individuals’ conditions will vary physically and mentally, impacting mobility and intellectual capacity.

**Impact of individual demographics on COVID-19 response:**

In addition to having an IDD or related condition, many ICF individuals need care from medical professionals who are in increasingly short supply as the pandemic continues. Also, the population of individuals with IDD and related conditions are often unable to express when they experience symptoms and could unknowingly (and without staff knowing) spread the virus if infected. This population is also less likely to understand why [physical] distancing and quarantine are necessary and can present challenging behaviors when staff attempt to enforce such restrictions. Having COVID-19 infections in a facility will increase the demands on and for staff.

**ICF Staffing Considerations**

The ICF workforce includes qualified intellectual disability professionals (QIDPs), house managers, medical professionals, and direct care staff including: registered nurses (RNs), licensed vocational nurses (LVNs), facility support staff and other skilled and non-skilled workers. Rules require ICFs to provide nursing services as needed, and most small ICFs use contract medical providers rather than staff providers to do so.

**Impact of ICF staffing considerations on COVID-19 response:**

Many ICF individual’s daily activities, such as dining, bathing, grooming, and ambulating, require partial or total assistance from facility staff. Caring for someone with COVID-19 requires additional time and resources, including PPE, to maintain infection control and protect other individuals and staff. As staff are exposed, become symptomatic, or test positive for COVID-19, the available workforce will decline, making it even more challenging for ICFs to provide care.

Additionally, ICFs don’t normally have a physician on-site. Typically, direct care staff are in the facility and health care professionals are available by phone. Staffing shortages resulting from possible exposure could lead to ICFs refusing to admit individuals because they won’t have the ability to provide care. It is also common for ICF staff to work in more than one ICF, so if an employee is exposed, it is likely they will expose individuals and staff in more than one ICF, making it difficult to contain spread.

**Impact of Visitors**

During routine ICF operations, visitors including family members, volunteers, consultants, external providers, and contractors routinely enter facilities. Many perform essential services necessary for
facility function. It is important to note current CMS and state guidance to ICFs requires they limit visitors to only those who are providing critical assistance.

**Impact of visitors on COVID-19 response:**

Despite efforts to screen visitors prior to allowing them to enter the facility, every person allowed inside the building increases the risk of infection. Some people will present as asymptomatic during screening but will have COVID-19 and unknowingly spread the virus. Some visitors will not follow standard precautions including proper hand-washing, use of hand sanitizer, use of PPE, isolation protocols, and limiting the number of areas in the building that they access, all of which increase the risk of infection for individuals and staff.
ATTACHMENT 1: Immediate Response Guidelines (0-24 hours)

**FACILITY ACTIONS**

**REVIEW** *S.P.I.C.E.* ACTIVITIES

**Prevent further disease spread:**

- Determine number of individuals potentially infected.
- Determine number of staff potentially infected.
- Invoke isolation precautions/plans.
- Determine who has been tested.
- If applicable, invoke quarantine or control order.
- Identify if exposed staff are working in other facilities. [As per Executive Order GA-30 dated September 17, 2020, staff movement between facilities should continue to be limited as much as possible.]
- Report [all] confirmed COVID-19 cases to the local health department ([LHD](https://www.dshs.texas.gov)) with jurisdiction over the facility. In instances where there is no local health authority, report to DSHS directly.
- [Report the first case in either an individual or employee and the first case that occurs in either an individual or employee after the facility has been without COVID-19 infection for 14 days or more to HHSC CII. Report the incident within 24 hours of receiving the COVID-19 positive test result.]

**Protect from infection:**

- [Enact PPE plans;](#)
- Determine PPE supplies;
- Screen individuals/essential visitors;
- Contact other facilities where exposed individuals might have visited/worked;
- Consult with LHD or DSHS regarding testing; and
- Limit staff in contact with infected or exposed individuals.

**Care for individuals who are infected:**

- Isolate individuals who are infected and identify cohorts (exposed, infected);
- Determine level of required care;
- Determine if hospitalization and transport are required;
- Notify local health care/EMS;
- Track signs/symptoms;
- Establish an individual recovery plan, including when an individual is considered recovered and next steps for care; and
- Upon the first positive test result of an ICF staff member or individual, consider testing of all ICF staff and individuals.

**Other:**
• Contact HHSC, LHD/DSHS regional office/health authority (HA);
• Ensure all relevant regulations/rules are followed;
• Notify families, staff, individuals;
• Track tested, suspected, positive, isolated, quarantined, hospitalized, and deaths;
• Activate emergency response command structure;
• Identify specific points of contact (POCs) for communication with HHSC, local government, clinical staff, and press; and
• Maintain central database of external contacts and phone numbers.

**HHSC ACTIONS**

**Prevent further disease spread:**

• Conduct Priority 1 intake investigation;
• Review facility infection control practices; and
• Determine if staff work at other facilities.

**Protect others from infection:**

• Review isolation precautions/plans;
• Determine if facility has sufficient PPE;
• Determine if facility has enacted screening for individuals/staff;
• Determine if local quarantine order is in effect; and
• Ensure contact of other facilities where exposed individuals are working.

**Care for individuals who are infected:**

• Ensure appropriate isolation and quarantine;
• Ensure timely individual care; and
• Ensure clinical support.

**Other:**

• Review all relevant rules/regulations with facility;
• Track tested, suspected, positive, isolated, quarantined, hospitalized, and deaths;
• Identify POCs and maintain communication; and
• Contact DSHS to review response activities.

**EXTERNAL ACTIONS**

- Individual Movement
- Emergency Management
- Infection control plan
- LHD
- Resource Request
ATTACHMENT 2: Interim Guidance for Prevention, Management, and Reporting of COVID-19 Outbreaks in Long-Term Care Facilities

Purpose

This document provides guidance to ICFs for the prevention, management, and reporting of COVID-19 outbreaks. Prompt recognition and immediate isolation of suspected cases is critical to prevent outbreaks in residential facilities.

Background

Because of their congregate nature and individuals served (adults with IDD or a related condition, often with underlying medical conditions), ICF populations are one of the most at risk of serious illness caused by COVID-19. Every effort must be made to prevent the introduction and spread of disease within these facilities.

People at high risk for developing severe COVID-19 include those who are 65 or older, immunocompromised (including cancer treatment), or have other high-risk conditions such as chronic lung disease, moderate to severe asthma, and heart conditions. People of any age with severe obesity or certain underlying medical conditions, particularly if not well-controlled, such as diabetes, renal failure, or liver disease, might also be at risk.

COVID-19 is most likely to be introduced into a facility by ill DSP or visitors. ICFs should implement aggressive visitor restrictions and strictly enforce sick leave policies for ill DSP. Facilities must take the extreme action of restricting visitors except in compassionate care situations, such as end-of-life. Facilities must also restrict entry of non-essential personnel, and essential personnel should be screened for fever and other symptoms before they enter the facility to begin their shift.

Immediate Prevention Measures

Supplies for Recommended Infection Prevention and Control Practices

- Hand hygiene supplies:
  - Put alcohol-based hand sanitizer with 60–95 percent alcohol in every individual room (ideally inside and outside of the room) and other individual care and common areas (outside dining room, in living room); and
  - Make sure sinks are well-stocked with soap and paper towels for handwashing.

- Respiratory hygiene and cough etiquette:
  - Make tissues and facemasks available for people who are coughing; and
  - Consider designating staff to steward those supplies and encourage appropriate use by individuals, essential visitors, and staff.

- Make necessary PPE available in areas where individual care is provided. Put a trash can near the exit inside the individual room to make it easy for staff to discard PPE prior to
Exiting the room or before providing care for another individual in the same room.
Facilities should have supplies of:
- Facemasks;
- N95 respirators (if available and the facility has a respiratory protection program with trained, medically cleared, and fit-tested DSP);
- Gowns;
- Gloves; and
- Eye protection (face shield or goggles).

- See guidance in the section related to **PPE use when caring for individuals with COVID-19**.
- Consider implementing a respiratory protection program compliant with the OSHA respiratory protection standard for employees if not already in place. The program should include medical evaluations, training and fit testing.
- Ensure environmental cleaning and disinfection.
- Make sure EPA-registered, hospital-grade disinfectants are available to allow for frequent cleaning and disinfection of high-touch surfaces and shared individual care equipment:
  - [Refer to **List N** on the EPA website for EPA-registered disinfectants that have qualified under EPA’s emerging viral pathogens program for use against COVID-19;]
  - Clean and disinfect all high-touch surfaces frequently including items like doorknobs, light switches, handrails, countertops, remote controls, bathroom surfaces/fixtures;
  - Workstations include items like computers, chairs, keypads, common-use items (pens, pads, phones) - clean and disinfect frequently; and
  - Equipment includes items like blood pressure cuffs, hoyer lifts, adaptive equipment, wheelchairs and other shared equipment used for individual care - clean and disinfect after each use.]

**Screening and Education**

**Active screening** – **[HHSC COVID-19 rules require an ICF]** to screen all staff prior to entering the facility at the beginning of their shift for fever and symptoms consistent with COVID-19. Actively take their temperature and document absence of or shortness of breath, new or change in cough, and sore throat. If they are ill, immediately send them home to self-isolate. For the SSLCs, HHSC recognizes that documenting the absence of symptoms on all staff daily might pose a challenge and will educate surveyors accordingly.

DSHS has created a **screening log template** for facility. Facilities should also screen any essential visitors who are permitted to enter the building, including health care providers. Maintain a log of all visitors who enter the building that at minimum includes name and current contact information and documents the results of the screening.

**Education** – Share the latest information about COVID-19 and review CDC guidance. Educate individuals and families about COVID-19, actions the facility is taking to protect them and their loved ones (including visitor restrictions) and actions individuals and families can take to protect themselves in the facility. Educate and train DSP and reinforce sick leave policies and adherence to infection prevention and control measures, including hand hygiene and selection and use of...
PPE. Have DSPs demonstrate competency with putting on and removing PPE. Remind DSPs not to report to work when ill.

Educate consultant personnel (therapists of different disciplines, behavior support specialists, etc.). Including consultants is important because they often provide care in multiple facilities and can be exposed to, or serve as, a source of pathogen transmission.

**Visitor restriction**

On March 30, 2020, CMS released a memorandum directing all ICFs to restrict visitors except those deemed medically necessary. This is an important measure to prevent the introduction of the virus that causes COVID-19 into ICFs. DSHS recommends all ICFs restrict all non-essential visitation except in end-of-life situations.

End-of-life care is the care given to people who have stopped treatment for their disease and are near the end of life.

1. For people allowed in the facility (in end-of-life situations only when death is imminent), provide instruction before visitors enter the facility and the individual’s rooms on hand hygiene, limiting surfaces touched, and use of PPE according to current facility policy while in the individual’s room. Screen visitors and exclude those with fever and/or symptoms. Decisions about visitation during an end-of-life situation should be made on a case-by-case basis.
2. Visitors who are allowed in the facility must wear a facemask while in the building and restrict their visit to the individual’s room or other location designated by the facility. Visitors who are not providing care to individuals, such as visitors in end-of-life scenarios, can wear a cloth face cover instead of a facemask if no facemasks are available.
3. Facilities should communicate through multiple channels to inform people and non-essential health care personnel of the visitation restrictions, such as through signage at entrances/exits, letters, emails, phone calls, and recorded messages for receiving calls.
4. In lieu of visits, facilities should consider offering alternative means of communication for people who would otherwise visit.
5. When visitation is necessary or allowable, facilities should make efforts to allow for safe visitation for individuals and loved ones:
   a. Remind visitors to refrain from physical contact with individuals other than their loved ones while in the facility. Practice [physical] distancing by not shaking hands or hugging and remaining 6 feet apart.
   b. If possible (pending design of building), create a dedicated visiting room near the entrance to the facility where individuals can meet with visitors in a sanitized environment. Facilities should disinfect rooms after each individual-visitor meeting.

Advise visitors, and any person who entered the facility, to monitor for signs and symptoms of respiratory infection and COVID-19 for at least 14 days after exiting the facility. If symptoms occur, advise them to self-isolate at home and immediately notify the facility of the date they were in the facility, the people they were in contact with, and the locations within the facility they visited. Facilities should immediately screen the people who were in reported contact and take all necessary actions based on findings.
Restrict non-essential personnel – Review and revise how the facility interacts with vendors and delivery personnel, agency staff, EMS personnel and equipment, transportation providers (when taking individuals to offsite appointments, etc.), and other non-health care providers (food delivery, etc.). This should include taking necessary actions to prevent any potential transmission. For example, do not have supply vendors bring supplies inside the facility. Instead, have vendors drop off supplies at a dedicated location, such as a front or back patio.

Restrict non-essential personnel including volunteers and non-essential consultant personnel (i.e. delivery personnel) from entering the building.

Essential services such as therapists of different disciplines, behavior support staff, or direct support professionals should still be permitted to enter the facility provided they are wearing all appropriate PPE and undergo the same fever and symptom screening process as facility staff. Facilities can allow entry of these essential staff only after screening.

HHSC surveyors should not be restricted. HHSC surveyors are conducting surveys and investigations remotely, by regional offsite review, or through the use of telecommunications to the extent practicable, as well as limiting surveys and investigations to essential activities only. CMS and state survey agencies are constantly evaluating their surveyors to ensure they don’t pose a transmission risk when entering a facility. For example, surveyors might have been in a facility with COVID-19 cases in the previous 14 days, but because they were wearing PPE effectively per CDC guidelines, they pose a low risk to transmission in the next facility and must be allowed to enter. However, there are circumstances under which surveyors should still not enter, such as if they have a fever or any additional signs or symptoms of illness.
9. Control Measures

Control Measures for Individuals

Most of the actions to prevent or control COVID-19 outbreaks in ICFs are not new, and include: increasing hand hygiene compliance among staff, individuals, and essential visitors through education and on-the-spot coaching; and providing facemasks and hand hygiene supplies at the entrance to the facility. Additional critical control measures are described below.

Monitoring

Ask individuals to report if they feel feverish or have symptoms of respiratory infection and COVID-19. Actively monitor all individuals upon admission and at least three times daily for fever and respiratory symptoms and COVID-19 (including shortness of breath, new or change in cough, and sore throat). If the individual has fever or symptoms, implement recommended infection prevention and control measures. For the SSLCs, HHSC recognizes that daily fever checks for every individual might pose a challenge and will educate surveyors accordingly.

People with COVID-19 have had a wide range of symptoms reported – ranging from mild symptoms to severe illness. Symptoms may appear 2-14 days after exposure to the virus. People with these symptoms may have COVID-19:

- Fever or chills
- Cough
- Shortness of breath or difficulty breathing
- Fatigue
- Muscle or body aches
- Headache
- New loss of taste or smell
- Sore throat
- Congestion or runny nose
- Nausea or vomiting
- Diarrhea

Isolation

If a case of COVID-19 is identified in the facility, immediate action must be taken to isolate the individual who is positive for COVID-19 away from other individuals.

Symptoms of COVID-19 can vary in severity. Initially, symptoms can be mild and not require transfer to a hospital if the facility can follow the infection prevention and control practices recommended by the CDC. Individuals with known or suspected COVID-19 do not need to be placed into an airborne infection isolation room but should be placed in a private room with their own bathroom if possible.
If an individual requires a higher level of care or the facility cannot fully implement all recommended precautions, the individual should be transferred to another facility capable of implementation. Transport personnel and the receiving facility should be notified about the suspected diagnosis prior to transfer. While awaiting transfer, symptomatic individuals should wear a facemask (if tolerated) and be separated from others (kept in their room with the door closed). Appropriate PPE should be used by staff when encountering the individual.

Any roommates should be moved and monitored for fever and symptoms three times a day (once each shift) [per CDC guidance]. Room-sharing might be necessary if there are multiple individuals with known or suspected COVID-19 in the facility. As roommates of symptomatic individuals might already be exposed, it is generally not recommended to separate them in this scenario. Public health authorities can assist with decisions about individual placement.

Create a plan for cohorting individuals with symptoms of respiratory infection and COVID-19, including dedicating DSP to work only on affected units. [Per the COVID-19 rules and as part of the facility infection control plan, individuals must be cohorted only with other individuals who have the same COVID-19 status (positive, negative or unknown) and there should be designated staff for each cohort. Staff should not work with more than one cohort per shift or from day to day unless it’s required to provide necessary staffing coverage.]

If the individual is transferred to a higher level of care, perform a final, full clean of the room, and use an EPA-registered disinfectant that has qualified under EPA’s emerging viral pathogens program for use against COVID-19. These products can be found on EPA’s List N. [See Attachment 10 for actions to consider when isolating an individual with COVID-19.]

**Source control**

All individuals who are ill should wear a facemask at all times as tolerated, except for when they are eating or drinking, taking medications, or performing personal hygiene like bathing or oral care. If the individual cannot tolerate a surgical mask, personnel who enter the room must wear N95 respirators, if available and staff are fit-tested. If they are not available or staff are not trained or fit-tested, facemasks should be worn. Respiratory protection should be worn in addition to gown, gloves, and face shield.

Ensure staff have been appropriately trained and fit-tested before using N95 masks. See guidance in the section related to PPE use when caring for individuals with COVID-19.

All individuals who are not ill should wear a cloth face covering for source control whenever they leave their room or are around others, including whenever they leave the facility for essential medical appointments.

If COVID-19 is identified in the facility, restrict all individuals to their rooms and have DSP wear all recommended PPE for care of all individuals (regardless of symptoms) on the affected unit (or facility-wide, depending on the situation). This includes: an N95 or higher-level respirator (or facemask if a respirator is not available), eye protection, gloves, and gown. DSP should be trained on PPE use, including putting it on and taking it off.
[Physical Distancing]

Remind individuals to practice [physical] distancing and perform frequent hand hygiene. [Physical] distancing means avoiding unnecessary physical contact and keeping a distance of at least 6 feet from other people. Cancel communal dining and all group activities, such as internal and external activities.

[Quarantine]

The CDC guidance recommends that individuals be restricted to their bedroom if they are confirmed or suspected of having COVID-19. It does not recommend restricting individuals to their bedroom [if they are not confirmed or suspected of having COVID-19. If an individual leaves the ICF and returns, they should be kept separated from the other individuals who have not left the ICF.] Being separated from other individuals after returning from a home visit does not automatically mean an individual is confirmed or suspected of having COVID-19; rather, it means they had the potential for being exposed to COVID-19, are considered to have unknown COVID-19 status, and should be kept away from others while they are under observation. [The individual should be monitored for signs and symptoms of COVID-19.]

[Individuals with unknown COVID-19 status must be quarantined per CDC guidance. While the CDC still endorses a 14-day quarantine period, it now offers two alternatives and guidance to reducing quarantine time. Local public health authorities make the final decisions about how long quarantine should last, based on local conditions and needs. CDC’s two alternatives are:

- **Alternative #1** - Quarantine can end after Day 10 without testing if the person has no symptoms as determined by daily monitoring.

- **Alternative #2** - Quarantine can end after Day 7 if the person tests negative and has no symptoms as determined by daily monitoring. The test must occur on Day 5 or later. Quarantine cannot be discontinued earlier than after Day 7.]

[Guidance includes the following information:

- Persons can discontinue quarantine at either alternative described above only if the following criteria are also met:
  
  - No COVID-19 symptoms were detected by daily symptom monitoring during the entirety of quarantine up to the time at which quarantine is discontinued; and
  - Daily symptom monitoring continues through Day 14; and
  - Persons are counseled about the need to adhere strictly through Day 14 to all mitigation strategies, such as wearing a mask, avoiding crowds, practicing physical distancing, and practicing hand and cough hygiene. They should be advised that if any symptoms develop, they should immediately self-isolate and contact their healthcare provider to report this change in clinical status.

- Testing under Alternative #2 above should be considered only if it will have no impact on community diagnostic testing. Testing of persons seeking evaluation for an actual infection must be prioritized.
• Persons can continue to be quarantined for 14 days without testing per existing recommendations. This option is maximally effective.]

[Both alternatives raise the risk of being a less effective than the 14-day quarantine as currently recommended. However, the specific risks are as follows:

• For Alternative #1, the residual post-quarantine transmission risk is estimated to be about 1% with an upper limit of about 10%; and

• For Alternative #2, the residual post-quarantine transmission risk is estimated to be about 5% with an upper limit of about 12%.]

[See Attachment 10 for actions to consider when separating an individual who might have been exposed to COVID-19, including individuals whose status is unknown, and when the individual visits common areas.]

[CDC Guidance changed related to quarantine for COVID-19 recovered residents. The CDC now indicates that people who have tested positive for COVID-19 do not need to quarantine or get tested again for up to 90 days as long as they remain asymptomatic. Therefore, if a resident has recovered from COVID-19 within the previous 90 days, he or she does not have to be quarantined. The resident can return to the non-quarantine area of the facility (e.g., cold zone or COVID-19 negative cohort area) upon admission, readmission, or return to the facility.

The facility still needs to consider what additional precautions it should take for such residents, such as whether staff will wear full PPE when caring for individuals who have recently recovered from COVID-19. The facility also can quarantine these individuals out of an abundance of caution if it has reasonable health and safety concerns. Additionally, as the individual approaches 90 days since illness onset, the facility should consider recent actions or interactions of the individual, such as participation in high-risk activities or contact with persons who are confirmed or suspected of having COVID-19. This will help the facility determine the need for quarantine, as the 90-day timeframe is not an absolute guarantee against transmission and long-term care residents are a high-risk population.

The CDC acknowledges that there is still uncertainty on contagiousness and susceptibility to reinfection with COVID-19. At this time, the CDC cannot say for certain that there is no chance of reinfection in the 90-day post recovery period. However, the CDC maintains that the risk of transmission in recovered persons is outweighed by the personal and societal benefits of avoiding unnecessary quarantine.

If a recovered individual experiences COVID-19 symptoms at any point during the 90-day post recovery period, he or she would need to be tested, quarantined, or isolated, depending on test result, as well as evaluated by an attending physician to determine whether it is a case of reinfection with COVID-19 or another illness.

Please see the CDC’s When to Quarantine and Reinfection for more information.]
Bathing, Showering, and Hygiene

Individuals with active signs and symptoms of respiratory illness and COVID-19 should remain in their bedroom while being evaluated and treated. However, care and services for other individuals should continue with appropriate precautions.

Ideally, individuals with COVID-19 should be accommodated in a private bedroom with a private bathroom if at all possible. If a private bathroom is not available, the ICF should at least designate a bathroom that is separate from the ones used for individuals who do not have COVID-19.

Alternately, the ICF could use other strategies for ensuring individual safety while delivering care, including staggering schedules for individual showering or bathing, for individuals with COVID-19 so there would be less overlap with individuals who do not have COVID-19.

ICFs should continue to follow existing CDC recommendations for cleaning and disinfection of equipment and surfaces in shared spaces, like bathrooms or equipment that must be shared between individuals, between every individual use, using the appropriate EPA-approved products for COVID-19 prevention.

DSPs should also be able to wear and maintain safe use of all recommended PPE while assisting individuals with personal hygiene. Some PPE, including respirators and facemasks, could be compromised if they get wet.

**Individuals who can bathe independently** - If an individual is able to bathe independently, they should continue to do so.

**Individuals who need assistance to bathe** - If an individual needs assistance with bathing and:

- the individual has COVID-19 and is symptomatic or asymptomatic, DSP must also be able to wear and maintain safe use of all recommended PPE while assisting individuals with personal hygiene; or
- the individual has recovered from COVID-19, per the test-based or non-test-based strategy (or otherwise), OR the individual has consistently tested negative and is asymptomatic, follow established policies and procedures for other care that requires close contact for bathing and showering.

**Cleaning and disinfecting the bathing or shower area** - If individuals with COVID-19 have access to a private bathroom or only share a bathroom with other individuals who have the same COVID-19 status, the ICF should clean and sanitize the bathroom frequently.

If the bathroom is shared by both individuals who have COVID-19 and those who don’t, clean and disinfect the area between every individual use.

**Individual education** - Educate individuals and any essential visitors regarding the importance of handwashing. Assist individuals in performing hand hygiene if they are unable to do so themselves. Education should also be provided to individuals to cover their coughs and sneezes.
with a tissue, then throw the tissue away in the trash and wash their hands. If individuals are unable to understand or perform the appropriate hygiene, DSPs should assist as necessary.

**Medical Appointments**

An individual leaving regularly for necessary medical appointments outside the facility does not have to be quarantined each time they return. However, they cannot be cohorted with individuals who do not go into the community or with those who are either COVID-19 positive or COVID-19 negative.

Per CDC guidance, individuals who must regularly leave the facility for medically necessary purposes should wear a facemask whenever they leave their bedroom, including for procedures outside of the facility. They also should continue to practice [physical] distancing in the facility.

**Recovery**

Establish an individual recovery plan, including when an individual is considered recovered and next steps for care. A recovery plan is the guidance for determining when to discontinue transmission-based precautions and continued are of an individual. The recovery plan may be different depending on whether a test-based or non-test-based strategy is used. Criteria should include:

- Discontinuation of transmission-based precautions without testing.
- Discontinuation of transmission-based precautions with testing.
- Whether using a testing-based strategy for discontinuation of transmission-based precautions is preferred.

**[Discontinuation of Transmission-Based Precautions for Individuals with COVID-19]**

[The decision to discontinue transmission-based precautions for individuals with confirmed COVID-19 infection should be made using a symptom-based strategy as described below. The time period since symptoms first appeared depends on the individual’s severity of illness, and if they are severely immunocompromised. A test-based strategy is no longer recommended, except as noted below.]

**[Symptom-Based Strategy for Discontinuing Transmission-Based Precautions]**

[Individuals with mild to moderate illness who are not severely immunocompromised:]

- At least 10 days have passed since symptoms first appeared and
- At least 24 hours have passed since last fever without the use of fever-reducing medications and
- Symptoms (e.g., cough, shortness of breath) have improved

Individuals with severe to critical illness or who are severely immunocompromised:

- At least 20 days have passed since symptoms first appeared and
• At least 24 hours have passed since last fever without the use of fever-reducing medications and
• Symptoms (e.g., cough, shortness of breath) have improved

[Test-Based Strategy for Discontinuing Transmission-Based Precautions.]

[In some instances, a test-based strategy could be considered for discontinuing transmission-based precautions earlier than if the symptom-based strategy were used. A test-based strategy could also be considered for some individuals (e.g., those who are severely immunocompromised) in consultation with local infectious diseases experts if concerns exist about the individual being infectious for more than 20 days.

The criteria for the test-based strategy are:

Individuals who are symptomatic:

• Resolution of fever without the use of fever-reducing medications and
• Symptoms (e.g., cough, shortness of breath) have improved, and
• Results are negative from at least two consecutive PCR tests at least 24 hours apart

Individuals who are not symptomatic:

• Results are negative from at least two consecutive PCR tests at least 24 hours apart]

Control Measures for Staff

Active screening

The CDC and CMS recommend ICFs screen all staff prior to entering the facility at the beginning of their shift for fever and other symptoms consistent with COVID-19. Actively take their temperature and document shortness of breath, new or change in cough, and sore throat. If they are ill, immediately send them home to self-isolate. For the SSLCs, HHSC recognizes that documenting the absence of symptoms on all staff daily might pose a challenge and will educate surveyors accordingly.

Staffing contingency plan

Develop a staffing contingency plan in case a large number of staff must self-quarantine or isolate because of potential exposure, being suspected of, or positive for COVID-19. ICFs must:

• have sufficient direct care staff to manage and supervise individuals in accordance with their individual program plans - 42 CFR §483.430(d)(1);
• have an active program for the prevention, control, and investigation of infection and communicable diseases - 42 CFR §483.470(l)(1); and
• develop and maintain an emergency preparedness plan that is based on a facility-based and community-based risk assessment, utilizing an all-hazards approach, and includes emerging infectious disease - 42 CFR §483.475(a).
**Hand Hygiene and PPE**

**Hand hygiene** - Reinforce the importance of hand hygiene among all facility staff, including any contract staff. Facilities can increase the frequency of hand hygiene audits and implement short in-service sessions on the proper technique for hand hygiene.

Ensure that supplies for performing hand hygiene are readily available and easily accessible by staff. Advise staff not to keep hand sanitizer bottles in their pockets. This practice causes hands and sanitizer bottles to become contaminated. Instead, consider keeping alcohol-based hand rub (ABHR) bottles in easily accessible areas and in different rooms throughout the facility.

**PPE** - Ensure the facility maintains an adequate supply of PPE and that all required PPE is easily accessible to staff entering individual rooms. For individuals with COVID-19, CDC recommends staff adhere to standard and transmission-based precautions. If the facility does not have a supply of N95 respirators, or does not have any fit-tested staff, facemasks should be worn for droplet protection. Follow the CDC [Interim Infection Prevention and Control Recommendations for Patients with Suspected or Confirmed COVID-19 in Healthcare Settings](https://www.cdc.gov/coronavirus/2019-ncov/hcp/infection-control-recommendations.html), which includes detailed information regarding recommended PPE.

Consider designating staff to steward these supplies and encourage appropriate use by staff and individuals.

**PPE and Infection Control Education and Training** - Ensure staff are educated and trained on which PPE they should use, proper procedure for donning (putting on) and doffing (taking off) PPE, and how to determine if the PPE is contaminated or damaged.

ICFs must identify whether the following concerns exist and specifically address them through education and training:

- Improper use of PPE:
  - lack of understanding of proper use of each type of PPE;
  - lack of fit-testing (see [PPE Use When Caring for Individuals with COVID-19](https://www.cdc.gov/coronavirus/2019-ncov/hcp/standard-transmission-based-precautions.html)); and/or
  - lack of user seal check.

- Improper donning and doffing procedures:
  - lack of understanding of appropriate donning and doffing sequence;
  - safety and quality control measures; and/or
  - lack of appropriate donning and doffing locations.

- Cross contamination:
  - lack of understanding of cold, warm, and hot zones within a facility;
  - cold zone - area with no COVID-19 infection present;
  - warm zones - area used to monitor individuals suspected of COVID-19 infection; and/or
  - hot zones - area where COVID-19 infection is present.

If the ICF is following the CDC’s or DSHS’ guidance for optimizing the supply of PPE, inform staff of the expectations specific to the type of PPE they are using. PPE education and training for staff should include at least the following information:
• PPE – simple, easy to understand training that includes:
  o use of PPE in an ICF without a known positive case of COVID-19;
  o use of PPE in an ICF with a suspected or positive case of COVID-19;
  o donning and doffing sequence and procedures;
  o procedures, if any, for optimizing the use of PPE;
  o procedures for determining if the PPE is contaminated or soiled; and
  o procedures for disposal of PPE (contaminated or uncontaminated).

• Infection Control – simple, easy to understand training that includes:
  o Concept of infection control zones including:
    ▪ cold - clean or uncontaminated area;
    ▪ warm - potentially contaminated area;
    ▪ hot - contaminated area; and/or
    ▪ understanding of how cross contamination occurs.
  o Protocols, policies, and procedures for use during:
    ▪ monitoring for COVID-19;
    ▪ suspected COVID-19; and
    ▪ confirmed COVID-19.

Note: See attachment 6 about donning (putting on) and doffing (taking off) PPE, and attachment 5 about optimizing the use of facemasks and do’s and don’ts for facemask use.

**Dedicated staff/COVID-19 response teams** - Facilities [must designate staff to work with each cohort and not change that designation from one day to another, unless required to maintain adequate staffing for a cohort. Staff caring for residents in a COVID-19 positive or unknown COVID-19 status cohort area] should be fit-tested for N95 respirators and prepared to provide an advanced level of care for cases if necessary, or until individuals with COVID-19 can be transferred to a higher level of care. COVID-19 care teams can be implemented if not all staff can be trained and fit-tested for N95 masks, or if supplies of them are insufficient to equip the entire staff. See guidance in the section related to PPE use when caring for individuals with COVID-19.

**Restrict staff movement between facilities** - [Per Executive Order GA-30,] facilities should restrict the movement of staff between facilities to the extent possible.

**Sick leave** - Facilities should review and potentially revise their sick leave policies. Staff who are ill should not come to work. Sick leave policies that do not penalize staff with loss of status, wages, or benefits will encourage staff who are ill to stay home.

**Work exclusion** – Staff who are confirmed or suspected to have COVID-19 must stay at home. See below for guidance on when they may return to work.

**[Return to Work Criteria for DSP with COVID-19]**

**[Symptom-based strategy for determining when DSP can return to work]**

[DSP with mild to moderate illness who are not severely immunocompromised:

  • At least 10 days have passed since symptoms first appeared and
• At least 24 hours have passed since last fever without the use of fever-reducing medications and
• Symptoms (e.g., cough, shortness of breath) have improved.

DSP with severe to critical illness or who are severely immunocompromised:

• At least 20 days have passed since symptoms first appeared and
• At least 24 hours have passed since last fever without the use of fever-reducing medications and
• Symptoms (e.g., cough, shortness of breath) have improved.

[Test-Based Strategy for Discontinuing Transmission-Based Precautions]

In some instances, a test-based strategy could be considered for discontinuing transmission-based precautions earlier than if the symptom-based strategy were used. A test-based strategy could also be considered for some DSP (e.g., those who are severely immunocompromised) in consultation with local infectious diseases experts if concerns exist about the DSP being infectious for more than 20 days.

The criteria for the test-based strategy are:

DSP who are symptomatic:

• Resolution of fever without the use of fever-reducing medications and
• Symptoms (e.g., cough, shortness of breath) have improved, and
• Results are negative from at least two consecutive PCR tests at least 24 hours apart

DSP who are not symptomatic:

• Results are negative from at least two consecutive PCR tests at least 24 hours apart]

Note: If the employee was diagnosed with a different illness (e.g., influenza) and was never tested for COVID-19, base their return to work on the criteria associated with that diagnosis.

[Reporting COVID-19]

[All ICFs must:

• Report the first confirmed case of COVID-19 in staff or residents, as well as the first confirmed case of COVID-19 after a facility has been without new cases for 14 days or more, to CII through TULIP or by calling 1-800-458-9858 within 24 hours of the confirmed positive result.
  o Form 3613-A Provider Investigation Report must also be completed and submitted within five days from the day a confirmed case is reported to CII. The provider investigation report can be submitted:
    ▪ via TULIP;
    ▪ by email at ciiprovder@hhsc.state.tx.us; or
    ▪ by fax at 877-438-5827.
• Report all confirmed COVID-19 cases immediately to the health authority with jurisdiction over the facility. If there is no local health authority, report to DSHS]
• Report all significant incidents or changes in the client’s condition to the client’s parents or guardians (including but not limited to serious illness), no later than 24 hours after the incident.

• ICFs offering point-of-care testing related to COVID-19 must report data for all testing completed, for each individual tested. Reporting is to be made within 24 hours of results being known or determined, on a daily basis. The following steps outline what is needed to begin reporting in order to meet state and federal requirements.

[Once you have CLIA or a CLIA waiver:
  o Submit the online registration webform.
  o Complete DSHS onboarding process.
  o Submit required testing data to DSHS.
  o Locate your local health department or DSHS Region at https://dshs.texas.gov/regions/2019-nCoV-Local-Health-Entities/.
  o The LHD or DSHS region will provide the input forms and process for you. The required data elements are submitted to your Local Health Department or DSHS Region using the forms and process they provided.
  o The required data is submitted to the LHD or DSHS Region for the area in which the facility is located, using the forms and processes indicated.]

• [Report all deaths (COVID-19 and non-COVID-19) that occur in an ICF/IID within one hour to CII. See:
  ▪ PL 17-02 (licensed facilities).
  ▪ PL 17-03 (non-licensed facilities).
  ▪ If the death might have resulted from abuse, neglect, or exploitation, additional reporting requirements might apply.]

You can find contact information for your local/regional health department on the DSHS Local Health Entities website.

**Outbreak Management**

If an outbreak of COVID-19 is suspected or identified in your facility, strict measures must be put in place to halt disease transmission.

**Outbreak definitions** – A confirmed outbreak of COVID-19 is defined as one or more laboratory confirmed cases of COVID-19 identified in either an individual or paid/unpaid staff. All confirmed outbreaks will be reported to the LHD or PHR immediately, or DSHS when a LHD or PHR are not available in that region.

A suspected outbreak is defined as one or more cases of respiratory illness within a one-week period without a positive test for COVID-19. Use the suspected outbreak definition if your facility is awaiting test results from either an individual or paid/unpaid staff. You can contact your local health authority for assistance during this period but are not required to report suspected
outbreaks. If you suspect an individual or staff member might have COVID-19, do not wait for test results to implement outbreak control measures.

If you have two or more individuals or staff with similar symptoms, report to your local health authority (or DSHS when there is no local health authority) as you would for any other cluster of illness.

Maintain a low threshold of suspicion for COVID-19, as early symptoms can be non-specific and include atypical presentations such as diarrhea, nausea, and vomiting, among others.

Implement universal use of facemasks for DSP while inside the facility. Follow the CDC’s guidance for optimizing the supply of facemasks when deciding how long staff should wear one facemask. Masks should be discarded upon exit, and a new mask should be worn upon reentry.

Note that homemade facemasks should only be used when all other options have been entirely exhausted and should only be used as source control. These masks are not considered protective.

Consider having DSP wear all recommended PPE for COVID-19 (gown, gloves, eye protection, a facemask or N95) for the care of all individuals, regardless of presence of symptoms. Implement protocols for extended use of eye protection and facemasks. Refer to DSHS’ strategies for optimizing the supply of PPE.

Restrict individuals (to the extent possible) to their rooms except for medically necessary purposes. If they leave their room, individuals should wear a facemask, perform hand hygiene, limit their movement in the facility, and keep a distance of 6 feet between themselves and other individuals.

Implement protocols for cohorting positive COVID-19 cases with dedicated DSP. These DSP should be appropriately trained and fit-tested for N95 masks if at all possible. If staff cannot be fit-tested for N95s, they should NOT use them and use facemasks instead. Consider designating entire units within the facility, with dedicated DSP, to care for known or suspected COVID-19 cases. See guidance in section related to PPE use when caring for individuals with COVID-19.

Movement and monitoring decisions for DSP with exposure to COVID-19 should be made in consultation with local public health authorities. To learn more, refer to the CDC’s Interim U.S. Guidance for Risk Assessment and Public Health Management of Healthcare Personnel with Potential Exposure in a Healthcare Setting to Patients with COVID-19.

Maintain a line list of all confirmed and suspected COVID-19 cases within your facility. Include details such as name, date of birth, age, gender, whether staff or individual, room number (shared or private) or job description, date of symptom onset, fever, symptoms, and others. If your facility does not already have a line list template, you can find one on the DSHS website.

PPE Use When Caring for Individuals with COVID-19

DSP should wear an N95 respirator and all suggested PPE when caring for individuals with COVID-19. If there is widespread COVID-19 infection in the building, staff should wear an N95 respirator and all suggested PPE when caring for individuals.
Per the CDC, “all suggested PPE” includes:

- N95 respirator;
- eye protection;
- gloves; and
- gown.

**Cloth gowns** - Follow manufacturer’s recommendations for cleaning and laundering, including the number of times the gown can be laundered and re-worn. This might differ by manufacturer and type of cloth gown. Immediately remove the gown to be laundered if it becomes soiled.

Certain types of gowns, sometimes called Level 1 or “minimal risk” gowns, do not provide protection from splashes/sprays of blood or body fluids, depending on the material the gown is made of. For these situations:

- Use a disposable, impervious isolation gown when a splash, spray, or cough might be expected.
- If an ICF does not have disposable, impervious isolation gowns, use a disposable plastic apron over the cloth gown in these situations.

The ICF also should train staff on how to correctly don/doff any cloth or other alternative isolation gown; include a competency check.

Review the CDC’s [Strategies for Optimizing the Supply of Isolation Gowns](https://www.cdc.gov/Features/Strategies-for-Optimizing-the-Supply-of-Isolation-Gowns) for more information.

**N95 respirator fit testing** - Under serious outbreak conditions in which respirator supplies are severely limited, DSP may not have the opportunity to be fit-tested on a respirator before using it. ICFs should make every effort to ensure DSPs who need to use tight-fitting respirators are fit-tested to identify the right respirator for the DSP. Under serious outbreak conditions, there may be limited availability of respirators or fit-test kits.

If ICFs cannot fit-test DSPs for N95 respirators, they should follow the [NIOSH guidance](https://www.cdc.gov/NIOSH.html) for respirator use in a serious outbreak.

While it is not ideal, even without fit-testing, a respirator will provide better protection than a facemask or using no respirator at all. ICFs should assist the DSP in choosing a respirator that fits best.

Even if DSPs begin using respirators without proper fit-testing, ICFs should make every effort to perform fit-testing as respirator supplies allow. ICFs should always perform fit-testing for workers who cannot successfully seal check their own respirators.

DSPs should review the following [OSHA Respiratory Protection Training Videos](https://www.osha.gov/SLTC/respiratoryprotection/training videos.html):

- Respiratory Protection for Healthcare Workers;
- The Differences Between Respirators and Surgical Masks;
- Respirator Safety: Donning & Doffing;
- Respirator Types;
- Respirator Fit Testing;
• Maintenance and Care of Respirators;
• Medical Evaluations;
• Respiratory Protection Training Requirements;
• Voluntary Use of Respirators; and
• Counterfeit and Altered Respirators: The Importance of NIOSH Certification.

Review attachment [7], the “Three Key Factors Required for a Respirator to be Effective” infographic.

ICFs should document that the DSP has reviewed the OSHA respiratory protection training videos.

**User Seal Check** - DSPs wearing tight-fitting respiratory protection should perform a user seal check each time they put on their respirator. A fit test ensures that the respirator fits and provides a secure seal. A user seal check ensures that it’s being worn right each time.

DSPs can either perform a positive-pressure or negative-pressure seal check:

- A positive-pressure check is accomplished by covering the respirator surface on a filtering facepiece (N95) and trying to breathe out. Cover the surface using your hands. If slight pressure builds up, that means air isn’t leaking around the edges of the respirator.
- A negative-pressure check is accomplished by covering the respirator surface on a filtering facepiece N95) and trying to breathe in. Cover the surface using your hands. If no air enters, the seal is tight.

The seal check method may vary by manufacturer and model and will be described in the user instructions. DSPs should follow the PPE manufacturer’s instructions and recommendations for the proper use, donning, doffing, and user seal check of the N95 respirator.

Review attachment 7, the “User Seal Check” infographic.
10. [Expansion of Reopening Visitation]

[Phase 1 Visitation emergency rules were repealed and replaced with Expansion of Reopening Visitation Rules. Providers with a previous approval for Phase 1 visitation do not have to reapply for visitation designation unless the previous visitation approval was withdrawn, rescinded, or cancelled.]

[Under the Expansion of Reopening Visitation rules, an ICF is **not required** to have visitation designation in order to permit:

- Visits by person providing critical assistance, including essential caregivers;
- End-of-life visit; and
- Closed window visit

Note: Specific criteria that apply to essential caregiver visits are listed in 26 TAC §551.47(e)]

[Under the new Expansion of Reopening Visitation rules, an ICF **is required** to have visitation designation in order to permit:

- Outdoor visits;
- Vehicle parades;
- Open window visits; and
- Plexiglass indoor visits.]

[**Important note:** under the rules, an ICF may request visitation designation for PART or ALL of the facility. This is a significant change from the rules for Phase 1 visitation, which only permitted facility-wide designation.]

[To receive a facility visitation designation, an ICF must demonstrate:

- there are separate areas, units, wings, halls, or buildings for individual cohorts who are COVID-19 positive, COVID-19 negative or unknown COVID-19 status;
- separate staff are working in the separate areas, units, wings, halls, or buildings for individuals who are COVID-19 positive, COVID-19 negative or unknown COVID-19 status;
- there have been no confirmed COVID-19 cases for at least 14 consecutive days in staff working in the area, unit, wing, hall, or building which accommodates individuals who are COVID-19 negative;
- there have been no facility-acquired COVID-19 confirmed cases for at least 14 consecutive days in individuals in the COVID-19 negative area, unit, wing, hall, or building;
- staff are designated to work with only one individual cohort and the designation does not change from one day to another; and]
• if an ICF has had previous cases of COVID-19 in staff or individuals in the area, unit, wing, hall, or building which accommodates individuals who are COVID-19 negative, HHSC LTCR has conducted a verification survey and confirmed the following:
  • all staff and individuals in the COVID-19 negative area, unit, wing, hall, or building have fully recovered;
  • the ICF has adequate staffing to continue care for all individuals and supervise visits permitted by this section; and
  • the ICF is in compliance with infection control requirements and emergency rules related to COVID-19.]

[Form 2195]

[To receive visitation designation, complete form 2195, which requires you to submit a facility map with the different COVID-19 cohort areas identified, as applicable. You’ll find this form in PL 20-43. After completing the form, send it to your HHSC Regional Director. You will need to wait for approval prior to implementing expansion of reopening visitation protocols.]

[You do not have to reapply for visitation designation if you had a previous approval for Phase 1 visitation and the previous visitation approval has not been withdrawn, rescinded, or cancelled.]

[The following requirements apply to all visitation allowed for ICFs who have been approved for visitations:
  • By appointment only;
  • Visitor screening;
  • Adequate space and staff;
  • May limit number of visits and length of visit;
  • Enough time between for sanitation;
  • All CDC guidance is followed for disinfecting before and after visits;
  • Hand-washing station or hand sanitizer provided;
  • Visitor and individual perform hand hygiene before and after visit;
  • Individual wears face mask/covering;
  • No physical contact (except essential caregiver or end-of-life visits); and
  • Physical distancing is maintained at 6 feet (except essential caregiver or end-of-life visits).]
[Types of Visits that Require Approval or Designation – Expansion of Reopening Visitation]

[If all requirements are met, an ICF with an Expansion of Reopening Visitation designation (or previous Phase 1 designation) must allow:

- **Outdoor visit** – a visit between individual and one or more personal visitors that occurs in a dedicated outdoor space.
  - Outdoor visits must provide a comfortable and safe outdoor visiting area; and
  - Designated outdoor visitation area must be separated from individuals and limits the ability of the visitor to interact with other individuals.

- **Open window visit** – a personal visit between a visitor and an individual; the window is open.
  Note: Expansion of Reopening Visitation approval is not required for a closed window visit.
  - Open window visits are permitted only for individuals who are COVID-19 negative, and as can be accommodated by the ICF;
  - The ICF must ensure a comfortable and safe outdoor visiting area for open window visits; and
  - The visitor must wear a facemask or face covering over both the mouth and nose throughout the visit, and the individual must wear a facemask or face covering (if tolerated) throughout the visit.

- **Plexiglass indoor visit** – a visit between an individual and one or more visitors, during which the individual and the visitors are both inside the facility but within a booth separated by a plexiglass barrier.
  - The individual must remain on one side of the barrier while the visitor remains on the opposite side. The facility must limit the number of individuals in the visitation area as needed;
  - The plexiglass booth must be installed in an area of the facility that does not impede a means of egress, does not impede or interfere with any fire safety equipment or system, and prevents the movement of visitors through the facility and their contact with other individuals; and
  - To use a plexiglass booth for visitation, prior to use, the ICF must submit for approval photos of the plexiglass visitation booth and its location in the facility to the Life Safety Code Program Manager in the LTCR Region where the facility is located.

- **Vehicle parade** – a visit between individual and one or more personal visitors, during which the individual remains outdoors on the facility property, and visitors drive past in a vehicle. Note: Vehicle parades are only permitted for individuals who are COVID-19 negative.
  - Visitors must remain in their vehicles;
  - Maintain 6 feet between individuals watching the parade;
  - No closer than 10 feet to vehicle; and
  - Wear a facemask or covering.]
[Conditions for Visits]

[All visitors must be screened prior to the visit, except for those participating in vehicle parades or closed window visits. Visitors who meet any of the following screening criteria must leave the facility property and reschedule the visit:

• fever defined as a temperature of 100.4 Fahrenheit and above, or signs or symptoms of a respiratory infection, such as cough, shortness of breath, or sore throat;
• signs or symptoms of COVID-19, including chills, cough, shortness of breath or difficulty breathing, fatigue, muscle or body aches, headache, new loss of taste or smell, sore throat, congestion or runny nose, nausea or vomiting, or diarrhea;
• additional signs and symptoms as defined by the CDC;
• contact in the last 14 days with someone who has a confirmed diagnosis of COVID-19, is under investigation for COVID-19, or is ill with a respiratory illness; or
• international travel within the last 14 days.]

[Physical distancing must take place throughout the visit. Additionally:

• The ICF can limit the number of visitors and individuals in the visitation area as needed;
• The ICF can limit the number of visitors per individual per week and the length of time per visit to ensure equal access by all individuals to visitors;
• The ICF must clean and disinfect the visitation area per CDC guidance before and after the visit;
• The ICF must ensure a comfortable and safe visiting area for outdoor visits (i.e., considering outside air temperatures and ventilation);
• The visitor and individual must follow hand hygiene protocols;
• The ICF must provide hand-washing stations or hand sanitizer to the individual and visitor before and after the visit;
• The visitor must wear a facemask or face covering over both the mouth and nose throughout the visit, except for car parades and closed window visits; and
• The individual must wear a facemask or face covering (if tolerated) throughout the visit.]

[The vehicle parade or a CLOSED window visit in which the window is left closed are the only types of visits which do not require the visitor to be screened. Keep in mind you must have sufficient staff to monitor visits.]

[Note: If, at any time after facility visitation designation is approved by HHSC, the area, unit, wing, hall, or building accommodating individuals who are COVID-19 negative, or facility-wide for small ICFs that received visitation designation experiences an outbreak of COVID-19, the facility must notify the Regional Director in the LTCR Region where the facility is located. The facility no longer meets visitation criteria, and all visitation, except a closed window visit, end-of-life visit, or visits by persons providing critical assistance including essential caregivers, must be cancelled until the area, unit, wing, hall, building or facility meets the criteria described in the Emergency Rules.]

[Types of Visits that Do Not Require Approval or Designation]

[The following do not require the ICF to have approval or designation for visitations:}
• Closed window visit - a personal visit between a visitor and an individual during which the individual and personal visitor are separated by a closed window. During a closed window visit:
  o The visitor cannot enter the building;
  o The window must remain closed during the visit; and
  o Closed window visits are permitted for ALL individuals, including those who are COVID-19 negative, COVID-19 positive or have unknown COVID-19 status, and as can be accommodated by the ICF.

• End-of-Life visits:
  o End-of-life visits are permitted for individuals who are COVID-19 negative, COVID-19 positive, or unknown COVID-19 status, and as can be accommodated by the ICF;
  o While physical contact between individuals and visitors is prohibited during most types of visits, it is NOT prohibited during end-of-life visits;
  o Visits are permitted where adequate space is available that meets criteria and when adequate staff are available to monitor visits;
  o End-of-life visits can take place in the individual’s room or other area of the facility separated from other individuals; and
  o The ICF must limit the movement of the visitor through the facility to ensure interaction with other individuals is minimized.]

[Essential Caregiver Visit]

[An essential caregiver visit is an in-person visit between an individual and a designated caregiver. It is permitted in all facilities, regardless of designation, for all COVID-19 negative individuals.

Note: Essential caregiver visits replace compassionate care visits that required a failure to thrive diagnosis.

An essential caregiver is a family member or other outside caregiver, including a friend, volunteer, private personal caregiver or court appointed guardian, who is at least 18 years old, and designated to provide regular care and support to an individual.

Specifics for essential caregiver visits:
  • There may be up to two permanently designated essential caregiver visitors per individual;
  • Each visit is limited to one essential caregiver at a time;
• Each visit is limited to two hours, unless the ICF can accommodate a visit for a longer duration and approves a longer visit ahead of the scheduled visitation time;

• The visit may occur outdoors, in the individual’s bedroom or in another area in the facility that limits visitor movement through the facility and interaction with other individuals;

• Essential caregiver visitors do not have to maintain physical distancing between themselves and the individual they are visiting but must maintain physical distancing between themselves and all other individuals and staff; and

• The individual must wear a facemask or face covering (if tolerated) throughout the visit.

[The ICF must develop and enforce essential caregiver visitation policies and procedures, which include:

• a testing strategy for designated essential caregivers;

• written agreement that the essential caregiver understands and agrees to follow the applicable policies, procedures, and requirements;

• training each designated essential caregiver on proper PPE usage and infection control measures, hand hygiene and cough and sneeze etiquette;

• the essential caregiver must wear a facemask in accordance with CDC guidance while in the ICF;

• expectations regarding hand hygiene and cough and sneeze etiquette;

• expectations regarding using only designated entrances and exits as directed;

• limiting visitation to the outdoor visitation area, the individual’s room, or other area of the facility that limits the visitor’s movement through the facility and interaction with other individuals; and

• facility staff must escort the essential caregiver from the facility entrance to the designated visitation area at the start of each visit at the end of each visit.]

[The ICF must:

• inform the essential caregiver visitor of applicable policies, procedures, and requirements;

• approve the visitor’s facemask or provide an approved facemask;

• maintain documentation of the essential caregiver visitor’s agreement to follow the applicable policies, procedures and requirements;

• document the identity of each essential caregiver in the individual’s records and verify the identity of the essential caregiver by creating an essential caregiver visitor badge;

• maintain a record of each essential caregiver visit; and]
• prevent visitation by the essential caregiver if the individual has an active COVID-19 infection.]

[The essential caregiver must:

• wear a facemask over both the mouth and nose throughout the visit;

• have a negative COVID-19 test no more than 14 days before the first essential caregiver visit, unless the ICF chooses to perform a rapid test prior to entry in the facility;

• sign an agreement to leave the facility at the appointed time unless otherwise approved by the facility;

• self-monitor for signs and symptoms of COVID-19;

• not participate in visits if the designated essential caregiver has signs and symptoms of COVID-19, active COVID-19 infection, or other communicable diseases; and

• not participate in visits if the individual has an active COVID-19 infection]

[Note: If an executive order or other direction is issued by the Governor of Texas, the President of the United States, or another applicable authority, that is more restrictive than this rule or any minimum standard relating to an ICF, the facility must comply with the executive order or other direction.]

[Salon Services]

A facility may only allow a salon services visitor to enter the facility to provide services to an individual if:

• the salon services visitor passes the screening described below;

• the salon services visitor agrees to comply with the most current version of the Minimum Standard Health Protocols – Checklist for Cosmetology Salons/Hair Salons, located on website: https://open.texas.gov/ ; and

• the requirements below are met.

The following requirements apply to salon services visits:

• each visit is limited to two hours, unless the ICF determines that I can only accommodate a visit for a shorter duration or that it can accommodate a longer duration and adjusts the duration of the visit accordingly;

• the visit may occur outdoors, in the individual’s bedroom, or in another area in the facility that limits visitor movement through the facility and interaction with other individuals;

• salon services visitors do not have to maintain physical distancing between themselves and each individual they are visiting, but must maintain physical distancing between themselves and all other individuals and staff; and
• the individual must wear a facemask or face covering (if tolerated) throughout the visit.

The ICF must develop and enforce salon services visitation policies and procedures, which include:

• a testing strategy for salon services visitors;
• a written agreement that the salon services visitor understands and agrees to follow the applicable policies, procedures, and requirements;
• training each salon services visitor on proper PPE usage and infection control measures, hand hygiene, and cough and sneeze etiquette;
• the salon services visitor must wear a facemask and any other appropriate PPE recommended by CDC guidance and the facility’s policy while in the ICF;
• expectations regarding using only designated entrances and exits as directed;
• limiting visitation to the area designated by the facility;
• facility staff must escort the salon services visitor from the facility entrance to the designated visitation area at the start of each visit; and
• facility staff must escort the salon services visitor from the designated visitation area to the facility exit at the end of each visit.

The ICF must:

• inform the salon services visitor of applicable policies, procedures, and requirements;
• approve the visitor’s facemask or provide an approved facemask;
• maintain documentation of the salon services visitor’s agreement to follow the applicable policies, procedures and requirements;
• maintain documentation of the salon services visitor’s training as required in (o)(5)(C) of this subsection;
• maintain documentation of the date of last COVID-19 test as reported by the salon services visitor;
• document the identity of each salon services visitor in the facility’s records and verify the identity of the salon services visitor by creating a salon services visitor badge; and
• maintain a record of each salon services visit, including:
  • the date and time of the arrival and departure of the salon services visitor;
  • the name of the salon services visitor;
  • the name of the individual being visited;
o attestation that the identity of the salon services visitor was confirmed; and

o prevent visitation by the salon services visitor if the individual has an active COVID-19 infection.

The salon services visitor must:

- wear a facemask over both the mouth and nose and any other appropriate PPE recommended by CDC guidance and the facility’s policy while in the ICF;

- have a negative COVID-19 test result from a test performed no more than 14 days before the first salon services visit, unless the ICF chooses to perform a rapid test prior to entry in the facility;

- sign an agreement to leave the facility at the appointed time unless otherwise approved by the facility;

- self-monitor for signs and symptoms of COVID-19;

- not participate in visits if the salon services visitor has signs and symptoms of COVID-19, active COVID-19 infection, or other communicable diseases; and

- not participate in visits if the individual has an active COVID-19 infection.

The facility may cancel the salon services visit if the salon services visitor fails to comply with the facility’s policy regarding salon services visits or applicable requirements in this section.
Bringing Food During Visitation

Visitors are not prohibited from bringing in outside food for an individual. Visitors other than essential caregivers may bring outside food and drink for an individual during a visit but must drop off the meal or food item in a designated delivery area, determined by the facility.

An essential caregiver may personally bring outside food and drink to an individual during their visit. Essential caregivers are not required to maintain a distance of 6 feet between themselves and the resident they are visiting.

Individuals may eat or drink during the visit.

Visitors (including essential caregivers) may not eat or drink with an individual during the visit as it would require the visitor to remove their facemask. Visitors must wear a facemask over their nose and mouth throughout the entire visit.

The facility should refer to CDC guidance on Food Safety for food brought in from the outside for an individual.

The CDC provides the following about food safety:

- The risk of infection by the virus from food products, food packaging, or bags is thought to be very low.
- Currently, no cases of COVID-19 have been identified where infection was thought to have occurred by touching food, food packaging, or shopping bags.
- Do NOT use disinfectants designed for hard surfaces, such as bleach or ammonia, on food packaged in cardboard or plastic wrap.
- After handling food packages and before eating food, always wash your hands with soap and water for at least 20 seconds. If soap and water are not available, use a hand sanitizer that contains at least 60% alcohol.

Visitors may bring items, including food, for an individual during a visit.

For essential caregivers, the facility informs the essential caregiver of the necessary infection control and food safety protocols for delivered items. The essential caregiver can deliver the items directly to the individual.

For other visitors, facility staff should assist to deliver the item to the individual so that the visitor does not violate physical distancing.

The CDC shared information on Food and COVID-19 that reviewed risks from food or packaging and handling packaged food and produce.
[Holiday Activities and Outings]

[ICFs planning facility-coordinated group activities, including holiday meals, should follow the following bullets:

- Group activities should be for COVID-19 negative individuals
- Maintain physical distancing of at least 6 feet between each individual
- Perform hand hygiene before and after activity
- Staff wear facemasks, and individuals wear facemasks or face coverings if tolerated
- Do not use shared items
- Clean and sanitize the activity area and all items used before and after each activity]

[Individuals have the right to make the informed decision to leave the facility for a holiday activity.

ICFs should educate individuals (or individual families if possible) about risks and infection control protocol, including:

- Avoiding large group gatherings
- Avoiding having a buffet-style meal
- Do not include persons with signs or symptoms of COVID-19 in gatherings
- Wear facemasks as much as possible (or as tolerated for the individual)
- Ensure frequent and proper handwashing]

[Additional recommendations for holiday gatherings per CDC:

- Outdoor events are safer than indoor events
- Limit the number of attendees as much as possible
- If possible, host activities with only people from your local area or ask visitors from outside local area to quarantine 14 days beforehand
- Wash hands before and after preparing, serving, or eating food]

[The CDC recommends that those with increased risk of severe illness from COVID-19 avoid in-person gatherings.]

[Quarantining Specifics when Leaving the Home]

[Per the COVID-19 Response Rule, individuals who leave the facility must be placed in the 'unknown COVID-19 status' and quarantined according to CDC guidance upon return if they:

- Have been gone overnight]
• Had exposure or close contact with a person who is COVID-19 positive, or who was exhibiting symptoms of COVID-19 while awaiting test results.]

[If an individual does not meet either of these conditions, they do not have to be quarantined upon return.]

An ICF must ensure clients the opportunity to participate in social, religious, and community group activities. Facilities must educate the individual on the risks associated with different activities. If an individual makes an informed decision to leave the facility, the facility must educate the individual (and the person accompanying the individual possible) about infection control and prevention procedures, including:

• wearing a facemask or face covering, if tolerated for the individual;
• performing hand hygiene;
• cough and sneeze etiquette;
• physical distancing (meaning maintaining at least six feet of distance between themselves and others);
• being aware of others who may potentially have COVID-19 or are confirmed to have COVID-19; and
• reporting any contact with another person who potentially has COVID-19 or are confirmed to have COVID-19 to the facility.]

[For individuals who leave a facility to go out into the community, the facility will have to determine if the individual meets any of the criteria for “unknown COVID-19 status”, which include:

• spending one or more nights away from the facility; or
• having exposure or close contact with a person who is COVID-19 positive; or
• having exposure or close contact with a person who is exhibiting symptoms of COVID-19 while awaiting test results.

Note: If the individual meets any of these criteria the individual will need to be placed in quarantine upon return to the facility per CDC guidance.]

[An individual who leaves the facility, is not gone overnight and did not have contact with others who may potentially have COVID-19 or are confirmed to have COVID-19, does not have to be quarantined upon returning to the facility. This is regardless of an individual’s means of transportation.]

**[Packages and Receivable Items (i.e., gifts)]**

[Individuals may receive items, including food, flowers, and packages, from family members or persons other than a scheduled visitor. For items delivered outside of a personal visit, facilities should designate an outside area for food and other items to be delivered.

Facility staff would retrieve the items, bring them inside, and disinfect them prior to delivering the items to the individuals. Facilities should follow CDC guidance for appropriate disinfecting guidelines, depending on what the items are.
For handling non-food items, the CDC recommends hand washing after handling items delivered or after handling mail.

Per the CDC, although COVID-19 can survive for a short period on some surfaces, it is unlikely to be spread from domestic or international mail, products, or packaging.

It may be possible to get COVID-19 by touching an object that has the virus on it and then touching your mouth, nose, or eyes, but this is not thought to be the main way the virus spreads.

Individuals have a right to privacy with their mail per federal and state rule.]
ATTACHMENT 3: Facility Actions for COVID-19 Response - Infographic

People who live in long-term care facilities are at higher risk for severe illness. There are actions that an ICF program provider can take to identify a COVID-19 situation, help prevent the spread within facility, and care for individuals who have COVID-19.

**BEFORE THE FIRST CASE**

**PREPARE**

- **COMMUNICATION PLAN**: Who? When? How? What?
- **SUPPLIES**: Do you have enough? Stock up.
- **SCREEN**: Screen staff, residents, and essential visitors.
- **ISOLATION PLAN**: How will you isolate a sick resident?
- **INFECTION CONTROL** policies & procedures: Review, revise, reflect CDC, DSHS & HHSC.
- **EMERGENCY PLAN**: Review; adapt to COVID-19.

**IMMEDIATELY 0-24 HOURS**

**REACT**

- **ACTIVATE** response plans
- **CLEAN & SANITIZE**
- **DEPLOY PPE** for staff & residents
- **REPORT** to local health department/DSHS & to HHSC
- **ENHANCED MONITORING** of signs & symptoms (daily for well residents; 3x daily for sick residents)
- **EVALUATE RESTRICTIONS**: Is a lock-down needed?

**EXTENDED 24-72 HOURS**

**PROTECT**

- **SUSTAIN** supplies of PPE
- **EVALUATE RESTRICTIONS**: Are they working?
- **MAINTAIN** care & services
- **CONSIDER** medical needs
- **CONTINUE** enhanced monitoring signs & symptoms; cleaning & sanitizing; rigorous infection control

**LONG-TERM 72 HOURS+**

**TRANSITION**

- **SUSTAIN** your response
- **EVALUATE**: What is/Isn't working?
- **LOOK AHEAD**: How will you lift restrictions safely?
The practice of wearing the same facemask for repeated close contact with several different residents, without removing the facemask between resident encounters.

- Staff should take care not to touch their facemask.
- If staff touch or adjust their facemask, they must immediately perform hand hygiene.

- Staff should leave the resident care area if they need to remove the facemask.

- Carefully fold so the outer surface is held inward and against itself to reduce contact with the outer surface during storage.
- Folded facemask can be stored between uses in a clean sealable paper bag or breathable container.

- Remove and discard if facemask is soiled, damaged, or hard to breathe through.
Example of a damaged facemask.
**Do's**

- Find the top side, where the metal piece or stiff edge is.
- Ensure the colored-side faces outwards.
- Place the metal piece or stiff edge over your nose.
- Cover your mouth, nose, and chin.
- Adjust the mask to your face without leaving gaps on the sides.
- Wash your hands before touching the mask.
- Inspect the mask for tears or holes.
- Avoid touching the mask.
- Remove the mask from behind the ears or head.
- Keep the mask away from you and surfaces while removing it.
- Discard the mask immediately after use preferably into a closed bin.
- Wash your hands after discarding the mask.

**Don'ts**

- Do not use a ripped or damp mask.
- Do not wear the mask only over mouth or nose.
- Do not wear a loose mask.
- Do not touch the front of the mask.
- Do not remove the mask to talk to someone or do other things that would require touching the mask.
- Do not leave your used mask within the reach of others.
- Do not re-use the mask.

Remember that masks alone cannot protect you from COVID-19. Maintain at least 1 metre distance from others and wash your hands frequently and thoroughly, even while wearing a mask.

ATTACHMENT [5]: PPE Donning and Doffing Infographic

SEQUENCE FOR PUTTING ON PERSONAL PROTECTIVE EQUIPMENT (PPE)

The type of PPE used will very based on the level of precautions required, such as standard and contact, droplet or airborne infection isolation precautions. The procedure for putting on and removing PPE should be tailored to the specific type of PPE.

1. GOWN
   • Fully cover torso from neck to knees, arms to end of wrists, and wrap around the back
   • Fasten in back of neck and waist

2. MASK OR RESPIRATOR
   • Secure ties or elastic bands at middle of head and neck
   • Fit flexible band to nose bridge
   • Fit snug to face and below chin
   • Fit-check respirator

3. GOGGLES OR FACE SHIELD
   • Place over face and eyes and adjust to fit

4. GLOVES
   • Extend to cover wrist of isolation gown

USE SAFE WORK PRACTICES TO PROTECT YOURSELF AND LIMIT THE SPREAD OF CONTAMINATION

• Keep hands away from face
• Limit surfaces touched
• Change gloves when torn or heavily contaminated
• Perform hand hygiene
HOW TO SAFELY REMOVE PERSONAL PROTECTIVE EQUIPMENT (PPE) EXAMPLE 1

There are a variety of ways to safely remove PPE without contaminating your clothing, skin, or mucous membranes with potentially infectious materials. Here is one example. Remove all PPE before exiting the patient room except a respirator, if worn. Remove the respirator after leaving the patient room and closing the door. Remove PPE in the following sequence:

1. GLOVES
   - Outside of gloves are contaminated!
   - If your hands get contaminated during glove removal, immediately wash your hands or use an alcohol-based hand sanitizer
   - Using a gloved hand, grasp the palm area of the other gloved hand and peel off first glove
   - Hold removed glove in gloved hand
   - Slide fingers of ungloved hand under remaining glove at wrist and peel off second glove over first glove
   - Discard gloves in a waste container

2. GOGGLES OR FACE SHIELD
   - Outside of goggles or face shield are contaminated!
   - If your hands get contaminated during goggle or face shield removal, immediately wash your hands or use an alcohol-based hand sanitizer
   - Remove goggles or face shield from the back by lifting head band or ear pieces
   - If the item is reusable, place in designated receptacle for reprocessing. Otherwise, discard in a waste container

3. GOWN
   - Gown front and sleeves are contaminated!
   - If your hands get contaminated during gown removal, immediately wash your hands or use an alcohol-based hand sanitizer
   - Unfasten gown ties, taking care that sleeves don't contact your body when reaching for ties
   - Pull gown away from neck and shoulders, touching inside of gown only
   - Turn gown inside out
   - Fold or roll into a bundle and discard in a waste container

4. MASK OR RESPIRATOR
   - Front of mask/respirator is contaminated — DO NOT TOUCH!
   - If your hands get contaminated during mask/respirator removal, immediately wash your hands or use an alcohol-based hand sanitizer
   - Grasp bottom ties or elastics of the mask/respirator, then the ones at the top, and remove without touching the front
   - Discard in a waste container

5. WASH HANDS OR USE AN ALCOHOL-BASED HAND SANITIZER IMMEDIATELY AFTER REMOVING ALL PPE

PERFORM HAND HYGIENE BETWEEN STEPS IF HANDS BECOME CONTAMINATED AND IMMEDIATELY AFTER REMOVING ALL PPE
HOW TO SAFELY REMOVE PERSONAL PROTECTIVE EQUIPMENT (PPE)  
EXAMPLE 2

Here is another way to safely remove PPE without contaminating your clothing, skin, or mucous membranes with potentially infectious materials. **Remove all PPE before exiting the patient room** except a respirator, if worn. Remove the respirator **after leaving the patient room and closing the door**. Remove PPE in the following sequence:

1. **GOWN AND GLOVES**
   - Gown front and sleeves and the outside of gloves are contaminated!
   - If your hands get contaminated during gown or glove removal, immediately wash your hands or use an alcohol-based hand sanitizer
   - Grasp the gown in the front and pull away from your body so that the ties break, touching outside of gown only with gloved hands
   - While removing the gown, fold or roll the gown inside-out into a bundle
   - As you are removing the gown, peel off your gloves at the same time, only touching the inside of the gloves and gown with your bare hands. Place the gown and gloves into a waste container

2. **GOGGLES OR FACE SHIELD**
   - Outside of goggles or face shield are contaminated!
   - If your hands get contaminated during goggle or face shield removal, immediately wash your hands or use an alcohol-based hand sanitizer
   - Remove goggles or face shield from the back by lifting head band and without touching the front of the goggles or face shield
   - If the item is reusable, place in designated receptacle for reprocessing. Otherwise, discard in a waste container

3. **MASK OR RESPIRATOR**
   - Front of mask/respirator is contaminated — **DO NOT TOUCH**!
   - If your hands get contaminated during mask/respirator removal, immediately wash your hands or use an alcohol-based hand sanitizer
   - Grasp bottom ties or elastics of the mask/respirator, then the ones at the top, and remove without touching the front
   - Discard in a waste container

4. **WASH HANDS OR USE AN ALCOHOL-BASED HAND SANITIZER IMMEDIATELY AFTER REMOVING ALL PPE**

**PERFORM HAND HYGIENE BETWEEN STEPS IF HANDS BECOME CONTAMINATED AND IMMEDIATELY AFTER REMOVING ALL PPE**

Filtering out Confusion: Frequently Asked Questions about Respiratory Protection

User Seal Check

Over 3 million United States employees in approximately 1.3 million workplaces are required to wear respiratory protection. The Occupational Safety and Health Administration (OSHA) (29 CFR 1910.134) requires an annual fit test to confirm the fit of any respirator that forms a tight seal on the wearer’s face before it is used in the workplace. Once a fit test has been done to determine the best respirator model and size for a particular user, a user seal check should be done every time the respirator is to be worn to ensure an adequate seal is achieved.

What is a User Seal Check?

A user seal check is a procedure conducted by the respirator wearer to determine if the respirator is being properly worn. The user seal check can either be a positive pressure or negative pressure check.

During a positive pressure user seal check, the respirator user exhalés gently while blocking the paths for air to exit the facepiece. A successful check is when the facepiece is slightly pressurized before increased pressure causes outward leakage.

During a negative pressure user seal check, the respirator user inhales sharply while blocking the paths for air to enter the facepiece. A successful check is when the facepiece collapses slightly under the negative pressure that is created with this procedure.

A user seal check is sometimes referred to as a fit check. A user seal check should be completed each time the respirator is donned (put on). It is only applicable when a respirator has already been successfully fit tested on the individual.

How do I do a User Seal Check while Wearing a Filtering Facepiece Respirator?

Not every respirator can be checked using both positive and negative pressure. Refer to the manufacturer’s instructions for conducting user seal checks on any specific respirator. This information can be found on the box or individual respirator packaging.

The following positive and negative user seal check procedures for filtering facepiece respirators are provided as examples of how to perform these procedures.
How to do a positive pressure user seal check

Once the particulate respirator is properly donned, place your hands over the facepiece, covering as much surface area as possible. Exhale gently into the facepiece. The face fit is considered satisfactory if no visible air leaks or outward movement of the facepiece occurs, or if the respirator is being held firmly against the face. If the respirator has an exhalation valve, then performing a positive pressure check may be impossible.

How to do a negative pressure user seal check

Negative pressure seal checks are typically conducted on particulate respirators that have exhalation valves. To conduct a negative pressure user seal check, cover the filter surface with your hands and inhale. The facepiece should collapse on your face and you should feel air passing between your face and the facepiece.

In the case of either type of seal check, if air leaks around the nose, use both hands to readjust the nosepiece by placing your fingertips at the top of the metal nose clip. Slide your fingertips down both sides of the metal strip to more efficiently mold the nose area to the shape of your nose. Readjust the straps along the sides of your head until a proper seal is achieved.

If you cannot achieve a proper seal due to air leakage, you may need to be fit tested for a different respirator model or size.

Can a user seal check be considered a substitute for a fit testing?

No. While the user seal check does not have the sensitivity and specificity to replace either fit test methods, qualitative or quantitative, that are accepted by OSHA (29 CFR 1910.134). A user should only wear respirator models with which they have achieved a successful fit test within the last year. NIOSH data suggests that the added care from performing a user seal check leads to higher quality donnings (e.g., reduces the chances of a donning with a poor fit).

Where can I Find More Information?

This information and more is available on the NIOSH Respirator Trusted-Source webpage.

ATTACHMENT [7]: Three Key Factors Required for a Respirator to be Effective - Infographic

Three Key Factors Required for a Respirator to be Effective

① The respirator must be put on correctly and worn during the exposure.

② The respirator must fit snugly against the user’s face to ensure that there are no gaps between the user’s skin and respirator seal.

③ The respirator filter must capture more than 95% of the particles from the air that passes through it.

*If your respirator has a metal bar or a molded nose cushion, it should rest over the nose and not the chin area.
ATTACHMENT [8]: Isolation Planning in ICF Homes

**PRIOR TO COVID-19 Diagnosis**

The time to begin planning is BEFORE a resident is diagnosed with COVID-19.

**WHERE will you isolate a COVID + individual?**

- Is there a room you can repurpose?
- Can you make an arrangement with another ICF?

**WHO will provide care?**

- Can you dedicate certain staff to provide care?
- Keep staff who provide care to resident with COVID-19 from working at other ICFs if possible.

**HOW will you ensure infection control?**

- Train staff on infection control.
- Provide hygiene supplies and PPE.
Upon COVID-19 Diagnosis

MOVE resident’s personal belongings to designated area

TRANSFER resident to designated area

NOTIFY local health department or DSHS; notify HHSC

TEST all residents and staff
After Recovery

CLEAN & DISINFECT resident's personal belongings

TRANSFER resident & belongings out of isolation

MONITOR resident for signs/symptoms

CLEAN & DISINFECT isolation room
ATTACHMENT [9]: Quarantine Vs. Isolation

COVID-19: Quarantine vs. Isolation

**QUARANTINE** keeps someone who was in close contact with someone who has COVID-19 away from others.

- If you had close contact with a person who has COVID-19
  - Stay home until 14 days after your last contact.
  - Check your temperature twice a day and watch for symptoms of COVID-19.
  - If possible, stay away from people who are at higher-risk for getting very sick from COVID-19.

**ISOLATION** keeps someone who is sick or tested positive for COVID-19 without symptoms away from others, even in their own home.

- If you are sick and think or know you have COVID-19
  - Stay home until after
    - At least 10 days since symptoms first appeared and
    - At least 24 hours with no fever without fever-reducing medication and
    - Symptoms have improved

- If you tested positive for COVID-19 but do not have symptoms
  - Stay home until after
    - 10 days have passed since your positive test

If you live with others, stay in a specific “sick room” or area and away from other people or animals, including pets. Use a separate bathroom, if available.

cdc.gov/coronavirus
This chart breaks down quarantine and isolation. Quarantine is the separation of people with unknown COVID-19 status from those who are COVID-19 positive and those who are COVID-19 negative.

Isolation is the separation of people who are COVID-19 status positive from those who are COVID-19 negative and COVID-19 status unknown.

## Things to Consider when Isolating an Individual with COVID-19

- Isolate in a private bedroom with the use of a private bathroom if possible;
- Consider whether other rooms in the ICF can be used as a bedroom during an isolation emergency;
- Consider whether a bathroom can be reserved only for the use of the individual with COVID-19, possibly the one closest to the bedroom;
- Consider cohorting (accommodating in same bedroom) with another individual who also has COVID-19;
- Do not cohort with another individual who does not have COVID-19 or whose status is unknown;
- Maintain at least 6 feet distance between individual’s beds, or more if possible, for individuals who are cohorting in the same room;
- Increase cleaning and disinfection of the bedroom, including commonly touched surfaces and equipment;
- Increase cleaning and disinfection of the bathroom, including after each use by the individual with COVID-19 if a bathroom cannot be dedicated only for use by the individual with COVID-19;
- Keep the bedroom door closed when at all possible;
- Have everyone with COVID-19 wear a facemask always, as tolerated; and
- Educate individuals about hand hygiene, covering coughs and sneezes, and properly discarding used tissues.

## Things to Consider for the Quarantine of an Individual who MIGHT have been exposed to COVID-19, including Individuals whose status is unknown

- Consider whether other rooms in the ICF could be used as a bedroom;
- Consider whether a bathroom can be reserved only for the use of the individual being quarantined, possibly the one closest to the bedroom;
- Consider cohorting an individual who might have been exposed with another individual who also might have been exposed;
- Consider cohorting an individual whose status is unknown with another individual whose status is unknown;
- Do not cohort with an individual who has COVID-19;
- Maintain at least 6 feet distance between individuals’ beds, or more if possible, for individuals who are cohorting in the same room;
- Increase cleaning and disinfection of the bedroom, including commonly touched surfaces and equipment;
- Increase cleaning and disinfection of the bathroom, including after each use by the individual being quarantined if a bathroom cannot be dedicated only for that individual’s use;
- Have everyone who might have been exposed to COVID-19 or whose status is unknown wear a facemask or cloth face covering when out of their bedrooms;
- Are all individuals, including the individual in quarantine, wearing a facemask or cloth face covering when not in their bedrooms;
- Are all individuals practicing hand hygiene, covering coughs and sneezes, and properly discarding used tissues?
- Is the facility frequently cleaning and disinfecting high-touch surfaces and equipment?
- Is the facility monitoring for signs and symptoms at least three times a day (once per shift)?
- Does the facility have a plan for what to do if the individual starts having signs or symptoms of respiratory illness?

## Things to Consider when an Individual in Quarantine Visits Common Areas of the home

- Can the individual visit the common areas and still be separate from other individuals who are not under quarantine?
- Can at least 6 feet of distance be maintained between the individual under quarantine and the other individuals?
- Are all individuals, including the individual in quarantine, wearing a facemask or cloth face covering when out of their bedrooms?
- Are all individuals practicing hand hygiene, covering coughs and sneezes, and properly discarding used tissues?
